

Oregon Administrative Rules  
Chapter 437

Rules for the Administration of the Oregon Safe  
Employment Act

---

Construction

Division

3

## Table of contents

### Subdivision A, General

1926.1	Purpose and scope.....	A-1
437-003-0003	Purpose .....	A-1
437-003-0005	Additional applicability .....	A-1
437-003-0006	General Oregon definitions.....	A-1
1926.2	Variances from safety and health standards.....	A-2
1926.3	Inspections - right of entry .....	A-3
1926.4	Rules of practice for administrative adjudications for enforcement of safety and health standards.....	A-3
437-003-0007	Additional rules of practice for administrative adjudications.....	A-3
1926.6	Incorporation by reference.....	A-4

### Subdivision B, General Interpretations

1926.10	Scope of subpart.....	B-1
1926.11	Coverage under section 103 of the act distinguished .....	B-1
1926.12	Reorganization plan no. 14 of 1950 .....	B-2
1926.13	Interpretation of statutory terms.....	B-13
1926.14	Federal contracts for 'mixed' types of performance .....	B-14
1926.15	Relationship to the service contract act; Walsh-Healy Public Contracts Act .....	B-14
1926.16	Rules of construction .....	B-15

### Subdivision C, General Safety and Health Provisions

1926.20	General safety and health provisions.....	C-3
437-003-0905	Flooring.....	C-3
437-003-0910	Temporary floors.....	C-3
437-003-0915	Shoring, bracing or guying of structures .....	C-4
437-003-0920	Project plans.....	C-4

1926.21	Safety training and education.....	C-5
1926.22	Recording and reporting of injuries (Reserved).....	C-6
1926.23	First aid and medical attention .....	C-6
1926.24	Fire protection and prevention.....	C-7
1926.25	Housekeeping .....	C-7
1926.26	Illumination .....	C-7
1926.27	Sanitation .....	C-8
1926.29	Acceptable certifications .....	C-8
1926.30	Shipbuilding and ship repairing .....	C-8
1926.31	Reserve.....	
1926.32	Definitions .....	C-9
437-003-0011	Additional definitions .....	C-11
1926.33	Access to employee exposure and medical records .....	C-11
1926.34	Means of egress.....	C-11

**NOTE: Subdivision CC follows Subdivision Z**

**Subdivision D, Occupational Health and Environmental Controls**

1926.50	Medical services and first aid .....	D-7
	Appendix A to 1926.50 - First aid kits (Non-mandatory).....	D-9
1926.51	Sanitation .....	D-11
437-003-0015	Drinking water .....	D-11
437-003-0020	Toilets .....	D-13
1926.52	Occupational noise exposure.....	D-14
437-003-0027	Applicable rules.....	D-14
1926.53	Ionizing radiation .....	D-14
1926.54	Nonionizing radiation.....	D-15
1926.55	Gases, vapors, fumes, dusts, and mists .....	D-16
1926.56	Illumination .....	D-16
1926.57	Ventilation .....	D-17

1926.59	Hazard communication <b>Note:</b> <i>Division 2, Subdivision Z 1910.1200, Hazard Communication</i> applies to Construction	
1926.60	Methylenedianiline (MDA).....	D-60
437-003-3060	Methylenedianiline Respiratory Protection Program .....	D-69
	Appendix A - Substance data sheet for 4,4'-Methylenedianiline .....	D-89
	Appendix B - Substance technical guidelines, MDA .....	D-89
	Appendix C - Medical surveillance guidelines for MDA.....	D-89
	Appendix D - Sampling and analytical methods for MDA monitoring and measurement procedures.....	D-89
1926.61	Retention of DOT markings, placards and labels .....	D-91
1926.62	Lead.....	D-91
437-003-0062	Lead Respiratory Protection Program.....	D-100
	Appendix A - Substance data sheet for occupational exposure to lead .....	D-121
	Appendix B - Employee standard summary.....	D-127
	Appendix C - Medical surveillance guidelines.....	D-143
1926.63	Cadmium - Re designated as 1926.1127, Cadmium .....	
1926.65	Hazardous waste operations and emergency response <b>Note:</b> <i>Division 2, Subdivision H, 1910.120, Hazardous Waste Operations and Emergency Response</i> applies to Construction	

### **Subdivision E, Personal Protective and Life Saving Equipment**

437-003-0001	Adoption by Reference .....	E-5
437-003-0134	Personal Protective Equipment .....	E-6
1926.97	Electrical protective equipment.....	E-14
1926.103	Respiratory protection <b>Note:</b> <i>Division 2, Subdivision I, 1910.134 Respiratory Protection</i> applies to Construction .....	E-23
1926.106	Working over or near water .....	E-23
1926.107	Definitions applicable to this subdivision.....	E-23

### **Subdivision F, Fire Protection and Prevention**

1926.150	Fire protection .....	F-1
1926.151	Fire prevention .....	F-5
1926.152	Flammable liquids .....	F-7
1926.153	Liquefied petroleum gas (LP-Gas) .....	F-12
1926.154	Temporary heating devices .....	F-18
1926.155	Definitions applicable to this subdivision .....	F-19

### **Subdivision G, Signs, Signals and Barricades**

1926.200	Accident prevention signs and tags.....	G-1
437-003-0420	Traffic control .....	G-2

### **Subdivision H, Materials Handling, Storage, Use and Disposal**

1926.250	General requirements for storage .....	H-1
1926.251	Rigging equipment for material handling.....	H-3
1926.252	Disposal of waste materials .....	H-21

### **Subdivision I, Tools - Hand and Power**

1926.300	General requirements .....	I-3
1926.301	Hand tools.....	I-9
1926.302	Power-operated hand tools .....	I-9
437-003-0925	Powder-actuated tools .....	I-12
1926.303	Abrasive wheels and tools .....	I-13
1926.304	Woodworking tools.....	I-15
1926.305	Jacks - lever and ratchet, screw, and hydraulic .....	I-17

### **Subdivision J, Welding and Cutting**

437-002-2253	Oxygen-fuel gas welding and cutting (Reprinted from Division 2, Subdivision Q).....	J-1
1926.351	Arc welding and cutting .....	J-41
1926.352	Fire prevention .....	J-43
1926.353	Ventilation and protection in welding, cutting, and heating.....	J-45

1926.354	Welding, cutting, and heating in way of preservative coatings.....	J-49
----------	--	------

### **Subdivision K, Electrical**

1926.400	Introduction .....	K-1
1926.402	Applicability .....	K-3
1926.403	General requirements .....	K-3
1926.404	Wiring design and protection .....	K-9
437-003-0404	Branch circuits .....	K-9
1926.405	Wiring methods, components, and equipment for general use .....	K-21
1926.406	Specific purpose equipment and installations .....	K-31
1926.407	Hazardous (classified) locations .....	K-33
1926.408	Special systems.....	K-35
437-003-0047	Working near overhead high voltage lines and equipment .....	K-41
1926.416	General requirements .....	K-43
1926.417	Lockout and tagging of circuits .....	K-44
1926.431	Maintenance of equipment .....	K-45
1926.432	Environmental deterioration of equipment .....	K-45
1926.441	Batteries and battery charging.....	K-47
1926.449	Definitions applicable to this subdivision.....	K-49

### **Subdivision L, Scaffolding**

1926.450	Scope, application, and definitions applicable to this subpart.....	L-1
1926.451	General requirements .....	L-9
1926.452	Additional requirements applicable to specific types of scaffolds .....	L-27
1926.453	Aerial lifts .....	L-39
437-003-0071	Manually propelled elevating aerial platforms.....	L-41
437-003-0073	Boom supported elevating work platforms.....	L-42
437-003-0074	Scissor lifts - self-propelled elevating work platforms .....	L-42
1926.454	Training requirements.....	L-43
Appendix A to Subpart L - Non-Mandatory Scaffold specifications.....		L-45

Appendix B to Subpart L - Non-Mandatory Criteria for determining the feasibility of providing safe access and fall protection for scaffold erectors and dismantlers (Reserved) .....	
Appendix C to Subpart L - Non-Mandatory List of National Consensus Standards.....	L-57
Appendix D to Subpart L - Non-Mandatory List of training topics for scaffold erectors and dismantlers.....	L-59
Appendix E to Subpart L - Non-Mandatory Drawings and illustrations.....	L-61

### **Subdivision M, Fall Protection**

1926.500	Scope, application, and definitions applicable to this subpart .....	M-3
437-003-1500	Additional definitions .....	M-4
437-003-1501	Fall Protection .....	M-11
437-003-2501	Protection from falling objects .....	M-12
1926.502	Fall protection systems criteria and practices .....	M-13
437-003-0502	Personal fall restraint .....	M-20
437-003-1502	Warning line systems for roofing work .....	M-22
437-003-2502	Safety monitoring systems .....	M-24
437-003-0503	Training requirements .....	M-27
Appendix A to Subpart M - Determining Roof Widths: Non-mandatory guidelines for complying with 437-003-2502(2) .....		M-29
Appendix B to Subpart M - Guardrail Systems: Non-mandatory guidelines for complying with 1926.502(b).....		M-35
Appendix C to Subpart M - Personal Fall Arrest Systems: Non-mandatory guidelines for complying with 1926.502(d) .....		M-37
Appendix D to Subpart M - Positioning Device Systems: Non-mandatory guidelines for complying with 1926.502(e) .....		M-49

### **Subdivision N, Helicopters, Hoists, Elevators and Conveyors**

1926.550	Reserved.....	N-1
1926.551	Helicopters .....	N-1
1926.552	Material hoists, personnel hoists, and elevators.....	N-5
1926.553	Base-mounted drum hoists .....	N-10
1926.554	Overhead hoists .....	N-11

1926.555 Conveyors ..... N-12

**Subdivision O, Motor Vehicles, Mechanized Equipment, and Marine Operations**

1926.600 Equipment ..... O-1
437-003-3600 Equipment ..... O-2
437-003-0085 General requirements ..... O-3
437-003-0090 Pinchpoints ..... O-3
437-003-3224 Vehicle drivers and riders ..... O-5
437-003-3225 Vehicles for highway and road operation characteristics and maintenance ..... O-7
437-003-3226 Vehicles for use on property other than public roads and highways operation, characteristics and maintenance ..... O-10
1926.602 Material handling equipment..... O-13
437-003-0094 Personnel platforms..... O-16
1926.603 Pile driving equipment ..... O-21
1926.604 Site clearing..... O-23
1926.605 Marine operations and equipment ..... O-24
1926.606 Definitions applicable to this subdivision..... O-26

**Subdivision P, Excavations**

1926.650 Scope, application, and definitions applicable to this subdivision ..... P-1
1926.651 Specific excavation requirements ..... P-5
437-003-0096 Underground installations ..... P-5
1926.652 Requirements for protective systems..... P-11
Appendix A Soil classification ..... P-17
Appendix B Sloping and benching ..... P-23
Appendix C Timber shoring for trenches..... P-33
Appendix D Aluminum hydraulic shoring for trenches..... P-45
Appendix E Alternatives to timber shoring ..... P-55
Appendix F Selection of protective systems ..... P-57

### **Subdivision Q, Concrete and Masonry Construction**

1926.700	Scope, application, and definitions applicable to this subpart .....	Q-3
437-003-0017	Additional definitions to concrete and masonry construction.....	Q-4
1926.701	General requirements .....	Q-5
1926.702	Requirements for equipment and tools .....	Q-5
1926.703	Requirements for cast-in-place concrete.....	Q-8
	Appendix to 1926.703(a)(1) - General requirements for formwork(Non-mandatory) .....	Q-11
1911.704	Requirements for precast concrete .....	Q-13
1926.705	Requirements for lift-slab construction operations .....	Q-13
	Appendix to 1926.705 - Lift-slab operations (Non-mandatory).....	Q-17
1926.706	Requirements for masonry construction.....	Q-19
437-003-0706	Protection of employees on or near masonry walls.....	Q-19
	Appendix A to Subpart Q - References to Subpart Q of Part 1926 (Non-mandatory) .....	Q-25

### **Subdivision R, Steel Erection**

1926.750	Scope.....	R-1
1926.751	Definitions .....	R-3
437-003-0045	Additional definitions .....	R-3
1926.752	Site layout, site-specific erection plan and construction sequence.....	R-9
437-003-1752	Written notifications.....	R-9
437-003-0752	Site-specific erection plan .....	R-10
1926.753	Hoisting and rigging .....	R-11
437-003-0753	Tag lines .....	R-11
1926.754	Structural steel assembly .....	R-15
437-003-1754	Roof and floor holes and openings.....	R-16
1926.755	Column anchorage.....	R-18
1926.756	Beams and columns.....	R-19
1926.757	Open web steel joists .....	R-20
1926.758	Systems-engineered metal buildings .....	R-26

1926.759	Falling object protection.....	R-27
1926.760	Fall protection.....	R-27
1926.761	Training.....	R-29
437-003-0761	Additional training requirements .....	R-30
Appendix A to Subpart R - Guidelines for Establishing the Components of a Site-specific Erection Plan: Non-mandatory guidelines for complying with 1926.752(e) ..... R-31		
Appendix C to Subpart R - Illustrations of Bridging Terminus Points: Non-mandatory guidelines for complying with 1926.757(a)(10) and 1926.757(c)(5) ... R-33		
Appendix D to Subpart R - Illustration of the Use of Control Lines to Demarcate Controlled Decking Zones (CDZs): Non-mandatory guidelines for complying with 1926.760(c)(3) ..... R-39		
Appendix E to Subpart R - Training: Non-mandatory guidelines for complying with §1926.761 ..... R-41		
Appendix F to Subpart R - Perimeter Columns: Non-mandatory guidelines for complying with §1926.756(e) to protect the unprotected side or edge of a walking/ working surface..... R-41		
Appendix G to Subpart R - 1926.502(b) through (e) Fall Protection Systems Criteria and Practices..... R-43		
Appendix H to Subpart R - Double Connections: Illustration of a Clipped End Connection and a Staggered Connection: Non-mandatory guidelines for complying with 1926.756(c)(1) ..... R-51		

### **Subdivision S, Underground Construction, Caissons, Cofferdams, and Compressed Air**

1926.800	Underground construction .....	S-1
1926.801	Caissons.....	S-25
1926.802	Cofferdams .....	S-25
1926.803	Compressed air .....	S-27
1926.804	Definitions applicable to this subdivision.....	S-39
Appendix A to Subpart S - Decompression tables ..... S-41		

### **Subdivision T, Demolition**

1926.850	Preparatory operations.....	T-1
1926.851	Stairs, passageways, and ladders.....	T-2
1926.852	Chutes.....	T-3
1926.853	Removal of materials through floor openings.....	T-3
1926.854	Removal of walls, masonry sections, and chimneys .....	T-4
1926.855	Manual removal of floors.....	T-5
1926.856	Removal of walls, floors, and material with equipment.....	T-5
1926.857	Storage .....	T-6
1926.858	Removal of steel construction .....	T-6
1926.859	Mechanical demolition.....	T-7
1926.860	Selective demolition by explosives.....	T-7

### **Subdivision U, Blasting and use of Explosives**

1926.900	General provisions .....	U-1
1926.901	Blaster qualifications .....	U-4
1926.902	Surface transportation of explosives .....	U-4
1926.903	Underground transportation of explosives.....	U-5
1926.904	Storage of explosives and blasting agents.....	U-7
1926.905	Loading of explosives or blasting agents .....	U-7
1926.906	Initiation of explosive charges - electric blasting .....	U-9
1926.907	Use of safety fuse .....	U-11
1926.908	Use of detonating cord .....	U-12
1926.909	Firing the blast.....	U-13
1926.910	Inspection after blasting .....	U-13
1926.911	Misfires.....	U-14
1926.912	Underwater blasting .....	U-15
1926.913	Blasting in excavation work under compressed air .....	U-16
1926.914	Definitions applicable to this subdivision .....	U-17

**Subdivision W, Rollover Protective Structures; Overhead Protection**

1926.1000 Rollover protective structures (ROPS) for material handling equipment ..... W-1

1926.1001 Minimum performance criteria for rollover protective structures for designated scrapers, loaders, dozers, graders, and crawler tractors.. W-3

1926.1002 Protective frame (roll-over protective structures, known as ROPS) for wheel-type agricultural and industrial tractors used in construction.. W-13

1926.1003 Overhead protection for operators of agricultural and industrial tractors ..... W-21

**Subdivision X, Stairways and Ladders**

1926.1050 Scope, application, and definitions applicable to this subdivision ..... X-7

1926.1051 General requirements ..... X-9

1926.1052 Stairways ..... X-10

1926.1053 Ladders..... X-13

437-003-0065 Extension ladders ..... X-21

1926.1060 Training requirements..... X-21

Appendix A to Subdivision X, Ladders (non-mandatory guidelines)..... X-23

**Subdivision Z, Toxic & Hazardous Substances**

437-003-1000 Oregon Rules for Air Contaminants ..... Z-1

1926.1101 Asbestos..... Z-27

437-003-1101 Asbestos Respiratory Protection Program..... Z-48

Appendix A to 1926.1101 - OSHA Reference Method (Mandatory) .. Z-69

Appendix B to 1926.1101 - Sampling and Analysis (Non-Mandatory) ..... Z-73

Appendix C to 1926.1101 - Reserved.....

Appendix D to 1926.1101 - Medical Questionnaires (Mandatory) ..... Z-91

Appendix E to 1926.1101 - Interpretation and Classification of Chest Roentgenograms (Mandatory) ..... Z-109

Appendix F to 1926.1101 - Work Practices and Engineering Controls for Class I Asbestos Operations (Non Mandatory)..... Z-111

	Appendix G to 1926.1101 - Reserved .....	
	Appendix H to 1926.1101 - Substance Technical Information for Asbestos (Non-Mandatory) .....	Z-119
	Appendix I to 1926.1101 - Medical Surveillance Guidelines for Asbestos (Non-Mandatory) .....	Z-123
	Appendix J to 1926.1101 - Smoking Cessation Program Information for Asbestos (Non-Mandatory) .....	Z-127
	Appendix K to 1926.1101 - Polarized Light Microscopy of Asbestos (Non-Mandatory) .....	Z-129
1926.1126	Chromium (VI).....	Z-153
1926.1127	Cadmium.....	Z-165
	<b>Note:</b> <i>Division 2, Subdivision Z, 1910.1027, Cadmium, Appendices A through F</i> applies to Construction .....	
1926.1152	Methylene Chloride .....	Z-195
	<b>Note:</b> <i>Division 2, Subdivision Z, 1910.1052, Methylene Chloride</i> applies to Construction	

### **Subdivision CC, Cranes and Derricks in Construction**

1926.1400	Scope .....	CC-1
1926.1401	Definitions .....	CC-3
1926.1402	Ground Conditions .....	CC-12
1926.1403	Assembly/disassembly – selection of manufacturer or employer procedures .....	CC-13
1926.1404	Assembly/disassembly – general requirements (applies to all assembly and disassembly operations) .....	CC-13
1926.1405	Disassembly - Additional Requirements for Dismantling of Booms and jibs (applies to both the use of manufacturer procedures and employer procedures) .....	CC-18
1926.1406	Assembly/disassembly - employer procedures - general requirements .....	CC-18
1926.1407	Power line safety (up to 350 kV) - assembly and disassembly .....	CC-19
1926.1408	Power line safety (up to 350 kV) - equipment operations.....	CC-21
1926.1409	Power line safety (over 350 kV) .....	CC-25
1926.1410	Power line safety (all voltages) - equipment operations closer than the Table A zone .....	CC-26

1926.1411	Power line safety - while traveling.....	CC-29
1926.1412	Inspections .....	CC-31
1926.1413	Wire rope - inspection.....	CC-37
1926.1414	Wire rope - selection and installation criteria .....	CC-42
1926.1415	Safety devices .....	CC-44
1926.1416	Operational aids.....	CC-45
1926.1417	Operation.....	CC-49
1926.1418	Authority to stop operation.....	CC-54
1926.1419	Signals - general requirements.....	CC-54
1926.1420	Signals - radio, telephone or other electronic transmission of signals .....	CC-56
1926.1421	Signals - voice signals - additional requirements .....	CC-56
1926.1422	Signals - hand signal chart .....	CC-56
1926.1423	Fall protection .....	CC-57
437-003-1423	Fall Protection.....	CC-58
1926.1424	Work area control .....	CC-60
1926.1425	Keeping clear of the load .....	CC-61
1926.1426	Free fall and controlled load lowering .....	CC-62
1926.1427	Operator qualification and certification.....	CC-79
1926.1428	Signal person qualifications .....	CC-86
1926.1429	Qualifications of maintenance & repair employees .....	CC-87
1926.1430	Training.....	CC-87
1926.1431	Hoisting personnel.....	CC-89
1926.1432	Multiple-crane/derrick lifts - supplemental requirements.....	CC-101
1926.1433	Design, construction and testing.....	CC-102
1926.1434	Equipment modifications.....	CC-107
1926.1435	Tower cranes.....	CC-108
1926.1436	Derricks .....	CC-115
1926.1437	Floating cranes/derricks and land cranes/derricks on barges .....	CC-123
1926.1438	Overhead & gantry cranes.....	CC-131
1926.1439	Dedicated pile drivers .....	CC-132

1926.1440	Sideboom cranes .....	CC-132
1926.1441	Equipment with a rated hoisting/lifting capacity of 2,000 pounds or less .....	CC-134
1926.1442	Severability .....	CC-136
	Appendix A to Subdivision CC - Standard Hand Signals.....	CC-137
	Appendix B to Subdivision CC - Assembly/Disassembly: Sample Procedures for Minimizing the Risk of Unintended Dangerous Boom Movement .....	CC-139
	Appendix C to Subdivision CC - Operator Certification: Written Examination: Technical Knowledge Criteria.....	CC-141

**437-003-0001      *Adoption by Reference***

*In addition to, and not in lieu of, any other safety and health codes contained in OAR Chapter 437, the Department adopts by reference the following federal regulations printed as part of the Code of Federal Regulations, in the Federal Register:*

**(1) Subdivision A – General**

- (a) 29 CFR 1926.1 Purpose and Scope, published 4/6/79, FR vol. 44, p. 20940.
- (b) 29 CFR 1926.2 Variances from safety and health standards, published 4/6/79, FR vol. 44, p. 20940.
- (c) 29 CFR 1926.3 Inspections – right of entry, published 4/6/79, FR vol. 44, p. 20940.

**Note:** Division 2/H, 1910.120, Hazardous Waste Operations and Emergency Response, applies to Construction.

## (5) Subdivision E – Personal Protective and Life Saving Equipment

- (a) 29 CFR 1926.95 Criteria for personal protective equipment. REPEALED with Oregon OSHA Admin. Order 2-2013, filed 2/15/13, effective 4/1/13. In Oregon, OAR 437-003-0134 applies.

- (b) 29 CFR 1926.97 Electrical protective equipment, published 4/11/14, FR vol. 79, p. 20316.
  - (c) 29 CFR 1926.100 Head protection. REPEALED with Oregon OSHA Admin. Order 2-2013, filed 2/15/13, effective 4/1/13. In Oregon, OAR 437-003-0134 applies.
  - (d) 29 CFR 1926.101 Hearing protection. REPEALED with Oregon OSHA Admin. Order 2-2013, filed 2/15/13, effective 4/1/13. In Oregon, OAR 437-003-0134 applies.
  - (e) 29 CFR 1926.102 Eye and face protection. REPEALED with Oregon OSHA Admin. Order 2-2013, filed 2/15/13, effective 4/1/13. In Oregon, OAR 437-003-0134 applies.
  - (f) 29 CFR 1926.103 Respiratory protection, published 1/8/98, FR vol. 63, no. 5, p. 1297.
- Note:** 29 CFR 1926.104 Removed, 8/9/94, FR vol. 59, no. 152, p. 40729.
- (g) 29 CFR 1926.105 Reserved, 8/9/94, FR vol. 59, no. 152, p. 40729.
  - (h) 29 CFR 1926.106 Working over or near water, published 4/6/79, FR vol. 44, p. 20940.
  - (i) 29 CFR 1926.107 Definitions applicable to this subpart, published 8/9/94, FR vol. 59, no. 152, p. 40729.

## **(6) Subdivision F – Fire Protection and Prevention**

- (a) 29 CFR 1926.150 Fire protection, published 4/6/79, FR vol. 44, p. 20940.
- (b) 29 CFR 1926.151 Fire prevention, published 7/11/86, FR vol. 51, p. 25318.
- (c) 29 CFR 1926.152 Flammable liquids, published 3/26/12, FR vol. 77, no. 58, p. 17574.
- (d) 29 CFR 1926.153 Liquefied petroleum gas (LP-Gas), published 6/30/93, FR vol. 58, no. 124, p. 35170.
- (e) 29 CFR 1926.154 Temporary heating devices, published 4/6/79, FR vol. 44, p. 20940.
- (f) 29 CFR 1926.155 Definitions applicable to this subpart, published 3/26/12, FR vol. 77, no. 58, p. 17574.

**(7) Subdivision G – Signs, Signals, and Barricades**

- (a) 29 CFR 1926.200 Accident prevention signs and tags, published 6/13/13, FR vol. 78, no. 114, p. 35559; 11/6/13, FR vol. 78, no. 215, p. 66641, amended 5/14/19, FR vol. 84, no. 93, p. 21576.
- (b) 29 CFR 1926.201 Signaling, REPEALED with OR-OSHA Admin. Order 2-2003, f. 1/30/03, ef. 1/30/03.
- (c) 29 CFR 1926.202 Barricades, REPEALED with OR-OSHA Admin. Order 2-2003, f. 1/30/03, ef. 1/30/03.
- (d) 29 CFR 1926.203 Definitions applicable to this subpart, published 4/6/79, FR vol. 44, p. 20940; amended with OR-OSHA Admin. Order 2-2003, f. 1/30/03, ef. 1/30/03, Repealed 5/14/19, FR vol. 84, no. 93, p. 21576.

**(8) Subdivision H – Materials Handling, Storage, Use, and Disposal**

- (a) 29 CFR 1926.250 General requirements for storage, published 6/30/93, FR vol. 58, no. 124, p. 35173, amended 5/14/19, FR vol. 84, no. 93, p. 21576.
- (b) 29 CFR 1926.251 Rigging equipment for material handling, published 4/18/12, FR vol. 77, no. 75, p. 23117.
- (c) 29 CFR 1926.252 Disposal of waste materials, published 4/6/79, FR vol. 44, p. 20940.

**(9) Subdivision I – Tools – Hand and Power**

- (a) 29 CFR 1926.300 General requirements, published 3/7/96, FR vol. 61, no. 46, p. 9250.
- (b) 29 CFR 1926.301 Hand tools, published 4/6/79, FR vol. 44, p. 20940.
- (c) 29 CFR 1926.302 Power operated hand tools, published 6/30/93, FR vol. 58, no. 124, p. 35175.
- (d) 29 CFR 1926.303 Abrasive wheels and tools, published 6/30/93, FR vol. 58, no. 124, p. 35175.
- (e) 29 CFR 1926.304 Woodworking tools, published 3/7/96, FR vol. 61, no. 46, p. 9251.
- (f) 29 CFR 1926.305 Jacks - lever and ratchet, screw, and hydraulic, published Federal Register vol. 58, no. 124, p. 35176.

**(10) Subdivision J – Cutting and Welding**

- (a) 29 CFR 1926.350 Gas welding and cutting. Repealed. Oregon OSHA Admin. Order 6-2014, f. 10/28/14, ef. 5/1/15. In Oregon, OAR 437-002-2253 applies.
- (b) 29 CFR 1926.351 Arc welding and cutting, published 7/11/86, FR vol. 51, p. 25318.
- (c) 29 CFR 1926.352 Fire prevention, published 4/6/79, FR vol. 44, p. 20940.
- (d) 29 CFR 1926.353 Ventilation and protection in welding, cutting, and heating, published 6/30/93, FR vol. 58, no. 124, p. 35179.
- (e) 29 CFR 1926.354 Welding, cutting, and heating in way of preservative coatings, published 4/6/79, FR vol. 44, p. 20940.

**(11) Subdivision K – Electrical**

- (a) 29 CFR 1926.400 Introduction, published 7/11/86, FR vol. 51, no. 133, pp. 25294-25335.
- (b) 29 CFR 1926.401 (Reserved)
- (c) 29 CFR 1926.402 Applicability, published 7/11/86, FR vol. 51, no. 133, pp. 25294-25335.
- (d) 29 CFR 1926.403 General requirements, published 7/11/86, FR vol. 51, no. 133, pp. 25294-25335.
- (e) 29 CFR 1926.404 Wiring design and protection, published 7/11/86, FR vol. 51, no. 133, pp. 25294-25335; amended with AO 5-2002, repeal (b)(1), f. 6/28/02, ef. 10/1/03.
- (f) 29 CFR 1926.405 Wiring methods, components, and equipment for general use, published 7/11/86, FR vol. 51, no. 133, pp. 25294-25335.
- (g) 29 CFR 1926.406 Specific purpose equipment and installations, published 7/11/86, FR vol. 51, no. 133, pp. 25294-25335.
- (h) 29 CFR 1926.407 Hazardous (classified) locations, published 7/11/86, FR vol. 51, no. 133, pp. 25294-25335.
- (i) 29 CFR 1926.408 Special systems, published 7/11/86, FR vol. 51, no. 133, pp. 25294-25335.
- (j) 29 CFR 1926.409 (Reserved)
- (k) 29 CFR 1926.415 (Reserved)

- (l) 29 CFR 1926.416 General requirements, published 8/12/96, FR vol. 61, no. 156, p. 41738.
- (m) 29 CFR 1926.417 Lockout and tagging of circuits, published 8/12/96, FR vol. 61, no. 156, p. 41739.
- (n) 29 CFR 1926.418 (Reserved)
- (o) 29 CFR 1926.430 (Reserved)

- (q) 29 CFR 1926.432 Environmental deterioration of equipment, published 7/11/86, FR vol. 51, no. 133, pp. 25294-25335.
- (r) 29 CFR 1926.433 - 29 CFR 1926.440 (Reserved)
- (s) 29 CFR 1926.441 Battery locations and battery charging, published 7/11/86, FR vol. 51, no. 133, pp. 25294-25335.
- (t) 29 CFR 1926.442 - 29 CFR 1926.448 (Reserved)
- (u) 29 CFR 1926.449 Definitions applicable to this subpart, published 7/11/86, FR vol. 51, no. 133, pp. 25294-25335.

## **(12) Subdivision L – Scaffolding**

- (a) 29 CFR 1926.450 Scope, application and definitions applicable to this subpart, published 8/9/10, FR vol. 75, no. 152, pp. 47906-48177.
- (b) 29 CFR 1926.451 General requirements, published 11/25/96, FR vol. 61, no. 228, p. 59831.
- (c) 29 CFR 1926.452 Additional requirements applicable to specific types of scaffolds, published 8/30/96, FR vol. 61, no. 170, p. 46113.
- (d) 29 CFR 1926.453 Aerial lifts, published 11/25/96, FR vol. 61, no. 228, p. 59832.
- (e) 29 CFR 1926.454 Training, published 8/30/96, FR vol. 61, no. 170, p. 46117.
- (f) Appendix A to Subpart L Scaffold Specifications, published 8/30/96, FR vol. 61, no. 170, p. 46117.
- (g) Appendix B to Subpart L Criteria for determining the feasibility of providing safe access and fall protection for scaffold erectors and dismantlers (Reserved), published 8/30/96, FR vol. 61, no. 170, p. 46122.

- (h) Appendix C to Subpart L List of National Consensus Standards, published 8/30/96, FR vol. 61, no. 170, p. 46122.
- (i) Appendix D to Subpart L List of training topics for scaffold erectors and dismantlers, published 8/30/96, FR vol. 61, no. 170, p. 46122.
- (j) Appendix E to Subpart L Drawing and illustrations, published 11/25/96, FR vol. 61, no. 228, p. 59832.

### **(13) Subdivision M – Fall Protection**

- (a) 29 CFR 1926.500 Scope, application, and definitions applicable to this subpart, published 4/11/14, FR vol. 79, no. 70, p. 20316; amended with AO 1-2016, f. 3/1/16, ef. 1/1/17.
- (b) 29 CFR 1926.501 Duty to have fall protection, repealed with AO 1-2016, f. 3/1/16, ef. 1/1/17. In Oregon 437-003-1501 applies.
- (c) 29 CFR 1926.502 Fall protection systems criteria and practices, published 8/9/94, FR vol. 59, no. 152, p. 40733-40738; amended with AO 6-2002, f. and ef. 7/19/02.
- (d) 29 CFR 1926.503 Training requirements. REPEALED with AO 6-2002, f. and ef. 7/19/02, in Oregon 437-003-0503 applies.
- (e) Appendix A to Subpart M Determining Roof Widths, published 8/9/94, FR vol. 59, no. 152, p. 40738-40742.
- (f) Appendix B to Subpart M Guardrail Systems, published 8/9/94, FR vol. 59, no. 152, p. 40743.
- (g) Appendix C to Subpart M Personal Fall Arrest Systems, published 8/9/94, FR vol. 59, no. 152, p. 40743-40746.
- (h) Appendix D to Subpart M Positioning Device Systems, published 8/9/94, FR vol. 59, no. 152, p. 40746.

### **(14) Subdivision N – Helicopters, Hoists, Elevators and Conveyors**

- (a) 29 CFR 1926.550 (Reserved).
- (b) 29 CFR 1926.551 Helicopters, published 4/6/79, FR vol. 44, p. 20940.
- (c) 29 CFR 1926.552 Material hoists, personnel hoists, and elevators, published 4/6/79, FR vol. 44, p. 20940.
- (d) 29 CFR 1926.553 Base-mounted drum hoist, published 8/9/10, FR vol. 75, no. 152, pp. 47906-48177.

(e) 29 CFR 1926.554 Overhead hoists, published 4/6/79, FR vol. 44, p. 20940.

(f) 29 CFR 1926.555 Conveyors, published 4/6/79, FR vol. 44, p. 20940.

### **(15) Subdivision O – Motor Vehicles, Mechanized Equipment, and Marine Operations**

(a) 29 CFR 1926.600 Equipment, published 8/9/10, FR vol. 75, no. 152, pp. 47906-48177.

(b) 29 CFR 1926.601 Motor vehicles, REPEALED by OR-OSHA Admin. Order 6-2007, f. 9/26/07, ef. 9/26/07.

(c) 29 CFR 1926.602 Material handling equipment, published 12/1/98, FR vol. 63, no. 230, p. 66274; amended by AO 7-2003, f. 12/5/03, ef. 12/5/03.

(d) 29 CFR 1926.603 Pile driving equipment, published 4/6/79, FR vol. 44, p. 20940.

(e) 29 CFR 1926.604 Site clearing, published 7/22/77, FR vol. 42, p. 37674.

(f) 29 CFR 1926.605 Marine operations and equipment, published 4/6/79, FR vol. 44, p. 20940.

(g) 29 CFR 1926.606 Definitions applicable to this subpart, published 4/6/79, FR vol. 44, p. 20940.

### **(16) Subdivision P – Excavations**

(a) 29 CFR 1926.650 Scope, application, and definitions applicable to this subdivision, published 10/31/89, FR vol. 54, no. 209, pp. 45959-45961.

(b) 29 CFR 1926.651 General requirements, published 8/9/94, FR vol. 59, no. 152, p. 40730.

(c) 29 CFR 1926.652 Requirements for protective systems, published 10/31/89, FR vol. 54, no. 209, pp. 45961-45962.

(d) Appendices A-F to Subdivision P, Excavations, published 10/31/89, FR vol. 54, no. 209, pp. 45962-45991.

### **(17) Subdivision Q – Concrete and Masonry Construction**

(a) 29 CFR 1926.700 Scope, application and definitions applicable to this subpart, published 10/18/90, FR vol. 55, no. 202, p. 42326.

- (b) 29 CFR 1926.701 General requirements, published 8/9/94, FR vol. 59, no. 152, p. 40730.
- (c) 29 CFR 1926.702 Requirements for equipment and tools, published 6/16/88, FR vol. 53, p. 22612.
- (d) 29 CFR 1926.703 Requirements for cast-in-place concrete, published 6/16/88, FR vol. 53, p. 22612.
- (e) 29 CFR 1926.704 Requirements for precast concrete, published 10/5/89, FR vol. 54, no. 192, p. 41088.
- (f) 29 CFR 1926.705 Requirements for lift-slab construction operations, published 10/18/90, FR vol. 55, no. 202, p. 42326.
- (g) Appendix A to 1926.705 Lift-slab operations, published 10/18/90, FR vol. 55, no. 202, p. 42326.

- (m) Appendix A to Subpart R Guidelines for establishing the components of a site-specific erection plan: Nonmandatory Guidelines for Complying with 1926.752(e), published 7/17/01, FR vol. 66, no. 137, p. 37137.
- (n) Appendix B to Subpart R Reserved.
- (o) Appendix C to Subpart R Illustrations of bridging terminus points: Nonmandatory Guidelines for Complying with 1926.757(a)(10) and 1926.757(c)(5), published 7/17/01, FR vol. 66, no. 137, p. 37137.
- (p) Appendix D to Subpart R Illustration of the use of control lines to demarcate controlled decking zones (CDZs): Nonmandatory Guidelines for Complying with 1926.760(c)(3), REPEALED with AO 6-2002, f. and ef. 7/19/02; amended with AO 8-2003, f. 12/30/03, ef. 1/1/04.
- (q) Appendix E to Subpart R Training: Nonmandatory Guidelines for Complying with 1926.761, published 7/17/01, FR vol. 66, no. 137, p. 37137.
- (r) Appendix F to Subpart R Perimeter columns: Nonmandatory Guidelines for Complying with 1926.756(e) to Protect the Unprotected Side or Edge of a Walking/Working Surface, published 7/17/01, FR vol. 66, no. 137, p. 37137.
- (s) Appendix G to Subpart R Fall protection systems criteria and practices from 1926.502: Nonmandatory Guidelines for Complying with Complying with 1926.760(d), REPEALED with AO 6-2002, f. and ef. 7/19/02; amended with AO 8-2003, f. 12/30/03, ef. 1/1/04.
- (t) Appendix H to Subpart R Double connections: Illustration of a clipped end connection and a staggered connection: Non-Mandatory Guidelines for Complying with Complying with 1926.756(c)(1), published 7/17/01, FR vol. 66, no. 137, p. 37137.

**(19) Subdivision S – Underground Construction, Caissons, Cofferdams, and Compressed Air**

- (a) 29 CFR 1926.800 Underground construction, published 4/23/13, FR vol. 78, no. 78, p. 23837, amended 5/14/19, FR vol. 84, no. 93, p. 21576.
- (b) 29 CFR 1926.801 Caissons, published 4/6/79, FR vol. 44, p. 20940.
- (c) 29 CFR 1926.802 Cofferdams, published 4/6/79, FR vol. 44, p. 20940.
- (d) 29 CFR 1926.803 Compressed air, published 7/11/86, FR vol. 51, p. 25318.
- (e) 29 CFR 1926.804 Definitions applicable to this subpart, published 4/6/79, FR vol. 44, p. 20940.
- (f) Appendix A to Subpart S Decompression Tables, published 4/6/79, FR vol. 44, p. 20940.

**(20) Subdivision T – Demolition**

- (a) 29 CFR 1926.850 Preparatory operations, published 4/6/79, FR vol. 44, p. 20940.
- (b) 29 CFR 1926.851 Stairs, passageways, and ladders, published 4/6/79, FR vol. 44, p. 20940.
- (c) 29 CFR 1926.852 Chutes, published 4/6/79, FR vol. 44, p. 20940.
- (d) 29 CFR 1926.853 Removal of materials through floor openings, published 4/6/79, FR vol. 44, p. 20940.
- (e) 29 CFR 1926.854 Removal of walls, masonry sections, and chimneys, published 4/6/79, FR vol. 44, p. 20940.
- (f) 29 CFR 1926.855 Manual removal of floors, published 4/6/79, FR vol. 44, p. 20940.
- (g) 29 CFR 1926.856 Removal of walls, floors, and materials with equipment, published 4/23/13, FR vol. 78, no. 78, p. 23837.
- (h) 29 CFR 1926.857 Storage, published 4/6/79, FR vol. 44, p. 20940.
- (i) 29 CFR 1926.858 Removal of steel construction, published 4/23/13, FR vol. 78, no. 78, p. 23837.
- (j) 29 CFR 1926.859 Mechanical demolition, published 4/6/79, FR vol. 44, p. 20940.

- (k) 29 CFR 1926.860 Selective demolition by explosives, published 4/6/79, FR vol. 44, p. 20940.

## **(21) Subdivision U – Blasting and Use of Explosives**

- (a) 29 CFR 1926.900 General provisions, published 4/6/79, FR vol. 44, p. 20940.
- (b) 29 CFR 1926.901 Blaster qualifications, published 4/6/79, FR vol. 44, p. 20940.
- (c) 29 CFR 1926.902 Surface transportation of explosives, published 6/30/93, FR vol. 58, no. 124, p. 35311.
- (d) 29 CFR 1926.903 Underground transportation of explosives, published 4/6/79, FR vol. 44, p. 20940.
- (e) 29 CFR 1926.904 Storage of explosives and blasting agents, published 6/30/93, FR vol. 58, no. 124, p. 35311.
- (f) 29 CFR 1926.905 Loading of explosives or blasting agents, published 6/30/93, FR vol. 58, no. 124, p. 35184.
- (g) 29 CFR 1926.906 Initiation of explosive charges – electric blasting, published 6/18/98, FR vol. 63, no. 117, p. 33469.
- (h) 29 CFR 1926.907 Use of safety fuse, published 4/6/79, FR vol. 44, p. 20940.
- (i) 29 CFR 1926.908 Use of detonating cord, published 4/6/79, FR vol. 44, p. 20940.
- (j) 29 CFR 1926.909 Firing the blast, published 4/6/79, FR vol. 44, p. 20940.
- (k) 29 CFR 1926.910 Inspection after blasting, published 4/6/79, FR vol. 44, p. 20940.
- (l) 29 CFR 1926.911 Misfires, published 4/6/79, FR vol. 44, p. 20940.
- (m) 29 CFR 1926.912 Underwater blasting, published 4/6/79, FR vol. 44, p. 20940.
- (n) 29 CFR 1926.913 Blasting in excavation work under compressed air, published 4/6/79, FR vol. 44, p. 20940.
- (o) 29 CFR 1926.914 Definitions applicable to this subpart, published 6/30/93, FR vol. 58, no. 124, p. 35184, 35311.

**(22) Subdivision V — Power Transmission and Distribution**

29 CFR 1926.950 through 1926.960 are repealed with Oregon OSHA Admin. Order 3-2015, f. 10/9/15, ef. 1/1/16. In Oregon, Division 2/RR applies.

**(23) Subdivision W – Rollover Protective Structures: Overhead Protection**

- (a) 29 CFR 1926.1000 Rollover protective structures (ROPS) for material handling equipment, published 4/6/79, FR vol. 44, p. 20940, amended 5/14/19, FR vol. 84, no. 93, p. 21576.
- (b) 29 CFR 1926.1001 Minimum performance criteria for rollover protective structure for designated scrapers, loaders, dozers, graders, and crawler tractors, published 4/6/79, FR vol. 44, p. 20940, amended 5/14/19, FR vol. 84, no. 93, p. 21576.
- (c) 29 CFR 1926.1002 Protective frame (ROPS) test procedures and performance requirements for wheel-type agricultural and industrial tractors used in construction, published 7/20/06, FR vol. 71, no. 139, p. 41127, amended 5/14/2019, FR vol. 84, no. 93, p. 21576.
- (d) 29 CFR 1926.1003 Overhead protection for operators of agricultural and industrial tractors, published 2/28/06, FR vol. 71, no. 39, p. 9909, amended 5/14/19, FR vol. 84, no. 93, p. 21576.

**(24) Subdivision X – Stairways and Ladders**

- (a) 29 CFR 1926.1050 Scope, application and definitions applicable to this Subdivision, published 8/9/10, FR vol. 75, no. 152, pp. 47906-48177.
- (b) 29 CFR 1926.1051 General requirements, published 11/14/90, FR vol. 55, no. 220, p. 47688.
- (c) 29 CFR 1926.1052 Stairways, published 8/23/91, FR vol. 56, no. 164, pp. 41793-41794.
- (d) 29 CFR 1926.1053 Ladders, published 4/11/14, FR vol. 79, no. 70, p. 20316; amended with Oregon OSHA AO 3-2015, f. 10/9/15, ef. 1/1/16.
- (e) 29 CFR 1926.1054 (Reserved)
- (f) 29 CFR 1926.1055 (Reserved)
- (g) 29 CFR 1926.1056 (Reserved)

- (h) 29 CFR 1926.1057 (Reserved)
- (i) 29 CFR 1926.1058 (Reserved)
- (j) 29 CFR 1926.1059 (Reserved)
- (k) 29 CFR 1926.1060 Training requirements, published 11/14/90, FR vol. 55, no. 220, p. 47691.

## **(25) Subdivision Z – Toxic and Hazardous Substances**

- (a) 29 CFR 1926.1101 Asbestos, published 2/8/13, FR vol. 78, no. 27, p. 9311, amended 5/14/2019, FR vol. 84, no. 93, p. 21576.
- (b) 29 CFR 1926.1126 Chromium (VI), published 3/17/10, FR vol. 75, no. 51, pp. 12681-12686, amended 5/14/19, FR vol. 84, no. 93, p. 21416.
- (c) 29 CFR 1926.1127 Cadmium, published 12/12/08, FR vol. 73, no. 240, pp. 75568-75589, amended 5/14/19, FR vol. 84, no. 93, p. 21416.
- (d) 29 CFR 1926.1152 Methylene Chloride, published 12/18/97, FR vol. 62, no. 243, p. 66275.

## **(26) Subdivision AA — (Reserved)**

## **(27) Subdivision BB — (Reserved)**

## **(28) Subdivision CC – Cranes and Derricks in Construction**

- (a) 29 CFR 1926.1400 Scope, published 4/11/14, FR vol. 79, no. 70, p. 20316; amended with Oregon OSHA AO 3-2015, f. 10/9/15, ef. 1/1/16.
- (b) 29 CFR 1926.1401 Definitions, published 8/9/10, FR vol. 75, no. 152, pp. 47906-48177.

Oregon Administrative Rules  
Chapter 437

Division 3  
Construction

---

General

Subdivision

**A**

Administrative  
Order 3-2019

The Oregon Department of Consumer and Business Services adopted these rules pursuant to ORS 654.025(2).

The Secretary of State designated OAR Chapter 437 as the “Oregon Occupational Safety and Health Code.” Six general subject areas within this code are designated as “Divisions.”

- **Division 1** General Administrative Rules
- **Division 2** General Occupational Safety and Health Rules
- **Division 3** Construction
- **Division 4** Agriculture
- **Division 5** Maritime Activities
- **Division 7** Forest Activities
- **Oregon Revised Statutes (ORS) 654** The Oregon Safe Employment Act (OSEAct)

Oregon-initiated rules in this division of the Oregon Occupational Safety and Health Code are numbered in a uniform system developed by the Secretary of State. This system does not number the rules in sequence (001, 002, 003, etc.). Omitted numbers may be assigned to new rules at the time of their adoption.

**Oregon-initiated rules** are arranged in the following Basic Codification Structure adopted by the Secretary of State for Oregon Administrative Rules (OAR):

Chapter	Division	Rule	Section	Subsection	Paragraphs
437	002	0322	(1)	(a)	(A)(i)(I)

The majority of Oregon OSHA rules are adopted by reference from the Code of Federal Regulations (CFR), and are arranged in the following basic federal numbering system:

Chapter	Division	Part	Subpart (Subdivision)	Section	Paragraphs
437	002	1910	G	.303	(a)(1)(i)(A)(1)

The terms “subdivision” and “subpart” are synonymous within OAR 437, Oregon Occupational Safety and Health Code.

---

To obtain an order form or copies of these codes, address:

**Department of Consumer & Business Services**  
**Oregon Occupational Safety & Health Division (Oregon OSHA)**  
350 Winter St. NE  
Salem, OR 97301-3882

Or call the Oregon OSHA Resource Library at 503-378-3272

The rules referenced in this division are available for viewing in the Office of the Secretary of State, Oregon State Archives Building, Salem, Oregon, or the Central Office, Oregon Occupational Safety and Health Division of the Department of Consumer and Business Services, 350 Winter St. NE, Salem, Oregon, and on our website at [osha.oregon.gov](http://osha.oregon.gov).

**437-003-0001 Adoption by Reference**

*In addition to, and not in lieu of, any other safety and health codes contained in OAR Chapter 437, the Department adopts by reference the following federal regulations printed as part of the Code of Federal Regulations, in the Federal Register:*

## (1) Subdivision A – General.

- (a) 29 CFR 1926.1 Purpose and Scope, published 4/6/79, FR vol. 44, p. 20940.
- (b) 29 CFR 1926.2 Variances from safety and health standards, published 4/6/79, FR vol. 44, p. 20940.
- (c) 29 CFR 1926.3 Inspections – right of entry, published 4/6/79, FR vol. 44, p. 20940.
- (d) 29 CFR 1926.4 Rules of practice for administrative adjudications for enforcement of safety and health standards, published 4/6/79, FR vol. 44, p. 20940.
- (e) 29 CFR 1926.6 Incorporation by reference, published 3/25/16, FR vol. 81, no. 58, p. 16085, amended 5/14/19, FR vol. 84, no. 93, p. 21457.

*These standards are available at the Oregon Occupational Safety and Health Division, Oregon Department of Consumer and Business Services, and the United States Government Printing Office.*

### 437-003-0003 *Purpose*

*The purpose of these rules is to prescribe minimum safety and health requirements for employees engaged in construction work, including demolition, blasting and use of explosives, and power transmission distribution and maintenance work.*

Stat. Auth.: ORS 654.025(2) and ORS 656.726(4).  
 Stats. Implemented: ORS 654.001 through 654.295.  
 Hist: APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89.

### **437-003-0005 Additional Applicability**

*If a specific type of equipment, process or practice is not limited to the construction industry, the provisions contained in other Divisions of OAR 437, Oregon Occupational Safety and Health Code, shall apply.*

Stat. Auth.: ORS 654.025(2) and ORS 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89.

### **1926.1 Purpose and Scope**

- (a) This part sets forth the safety and health standards promulgated by the Secretary of Labor under section 107 of the Contract Work Hours and Safety Standards Act. The standards are published in Subpart C of this part and following Subparts.
- (b) Subpart B of this part contains statements of general policy and interpretations of section 107 of the Contract Work Hours and Safety Standards Act having general applicability.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

### **437-003-0006 General Oregon Definitions**

*For the purposes of administration of the Oregon Safe Employment Act, the following terms mean:*

- (1) **Act** means the Oregon Safe Employment Act, ORS 654.
- (2) **Agency** means the Oregon Occupational Safety and Health Division, Department of Insurance and Finance.
- (3) **Assistant Secretary** means the Administrator of the Oregon Occupational Safety and Health Division or designated representative.
- (4) **Assistant Secretary of Labor for Occupational Safety and Health** means the Administrator of the Oregon Occupational Safety and Health Division or designated representative.
- (5) **Office of the Solicitor of Labor** means Legal Counsel for the Oregon Occupational Safety and Health Division.
- (6) **Occupational Safety and Health Administration or OSHA** means the Oregon Occupational Safety and Health Division, Department of Insurance and Finance.

- (7) **Standards** mean any occupational safety and health standard which has been adopted and promulgated by a nationally-recognized standards-producing organization, the federal government, or the state of Oregon and shall have the same meaning as, and include, the terms code(s) and rule(s).
- (8) **Administrative Rules** means Chapter 437, Division 1, Rules for the Administration of the Oregon Safe Employment Act, and Oregon Revised Statutes (ORS), Chapter 183.

Stat. Auth.: ORS 654.025(2) and ORS 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89.

## 1926.2 Variances from Safety and Health Standards

- (a) Variances from standards which are, or may be, published in this part may be granted under the same circumstances whereunder variances may be granted under section 6(b)(A) or 6(d) of the Williams-Steiger Occupational Safety and Health Act of 1970 (29 U.S.C. 65). The procedures for the granting of variances and for related relief under this part are those published in Part 1905 of this title.
- (b) Any requests for variances under this section shall also be considered requests for variances under the Williams-Steiger Occupational Safety and Health Act of 1970, and any requests for variances under Williams-Steiger Occupational Safety and Health Act with respect to construction safety or health standards shall be considered to be also variances under the Construction Safety Act. Any variance from a construction safety or health standard which is contained in this part and which is incorporated by reference in Part 1910 of this title shall be deemed a variance from the standard under both the Construction Safety Act and the Williams-Steiger Occupational Safety and Health Act of 1970.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

## 1926.3 Inspections – Right of Entry

- (a) It shall be a condition of each contract which is subject to section 107 of the Contract Work Hours and Safety Standards Act that the Secretary of Labor or any authorized representative shall have a right of entry to any site of contract performance for the following purposes:
- (1) To inspect or investigate the matter of compliance with the safety and health standards contained in Subpart C of this part and following Subparts; and

- (2) To carry out the duties of the Secretary under section 107(b) of the Act.
- (b) For the purpose of carrying out his investigative duties under the Act, the Secretary of Labor may, by agreement, use with or without reimbursement the services, personnel, and facilities of any State or Federal agency. Any agreements with States under this section shall be similar to those provided for under the Walsh-Healey Public Contracts Act under 41 CFR Part 50-205.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

### **437-003-0007 Additional Rules of Practice for Administrative Adjudications**

*In addition to and not in lieu of administrative and legal actions outlined in 29 CFR 1926.4, the State of Oregon will use the provisions of ORS Chapter 183, 654, and OAR 437, Division 1, to administer this code.*

Stat. Auth.: ORS 654.025(2) and ORS 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89.

### **1926.4 Rules of Practice for Administrative Adjudications for Enforcement of Safety and Health Standards**

- (a) The rules of practice for administrative adjudications for the enforcement of the safety and health standards contained in Subpart C of this part and the following Subparts shall be the same as those published in Part 6 of this title with respect to safety and health violations of the Service Contract Act of 1965 (69 Stat. 1035), except as provided in paragraph (b) of this section.
- (b) In the case of debarment, the findings required by section 107(d) of the Act shall be made by the hearing examiner or the Assistant Secretary of Labor for Occupational Safety and Health, as the case may be. Whenever, as provided in section 107(d)(2), a contractor requests termination of debarment before the end of the 3-year period prescribed in that section, the request shall be filed in writing with the Assistant Secretary of Labor for Occupational Safety and Health who shall publish a notice in the Federal Register that the request has been received and afford interested persons an opportunity to be heard upon the request, and thereafter the provisions of Part 6 of this title shall apply with respect to prehearing conferences, hearings and related matters, and decisions and orders.

Stat. Auth.: ORS 654.025(2) and 656.726(4).

Stats. Implemented: ORS 654.001 through 654.295.

Hist: APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).

APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

## 1926.6 Incorporation by reference

- (a) The standards of agencies of the U.S. Government, and organizations which are not agencies of the U.S. Government which are incorporated by reference in this part, have the same force and effect as other standards in this part. Only the mandatory provisions (i.e., provisions containing the word "shall" or other mandatory language) of standards incorporated by reference are adopted as standards under the Occupational Safety and Health Act.
- (b) The standards listed in this section are incorporated by reference into this part with the approval of the Director of the Federal Register in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. To enforce any edition other than that specified in this section, OSHA must publish a document in the Federal Register and the material must be available to the public.
- (c) Copies of standards listed in this section and issued by private standards organizations are available for purchase from the issuing organizations at the addresses or through the other contact information listed below for these private standards organizations. In addition, these standards are available for inspection at any Regional Office of the Occupational Safety and Health Administration (OSHA), or at the OSHA Docket Office, U.S. Department of Labor, 200 Constitution Avenue, NW., Room N-3508, Washington, DC 20210; telephone: 202-693-2350 (TTY number: 877-889-5627). These standards are also available for inspection at the National Archives and Records Administration (NARA). For information on the availability of these standards at NARA, telephone: 202-741-6030, or go to [www.archives.gov/federal-register/cfr/ibr-locations.html](http://www.archives.gov/federal-register/cfr/ibr-locations.html).
- (d) The following material is available for purchase from the American Conference of Governmental Industrial Hygienists (ACGIH), 1330 Kemper Meadow Drive, Cincinnati, OH 45240; telephone: 513-742-6163; fax: 513-742-3355; e-mail: [mail@acgih.org](mailto:mail@acgih.org); Web site: <http://www.acgih.org> :
- (1) Threshold Limit Values of Airborne Contaminants for 1970, 1970, IBR approved for 1926.55(a) and Appendix A of 1926.55.
  - (2) [Reserved]
- (e) The following material is available for purchase from the American National Standards Institute (ANSI), 25 West 43rd Street, Fourth Floor, New York, NY 10036; telephone: 212-642-4900; fax: 212-302-1286; e-mail: [info@ansi.org](mailto:info@ansi.org); Web site: <http://www.ansi.org/>

- (1) ANSI A10.3-1970, Safety Requirements for Explosive-Actuated Fastening Tools, IBR approved for 1926.302(e).
- (2) ANSI A10.4-1963, Safety Requirements for Workmen's Hoists, IBR approved for 1926.552(c).
- (3) ANSI A10.5-1969, Safety Requirements for Material Hoists, IBR approved for 1926.552(b).
- (4) ANSI A11.1-1965 (R1970), Practice for Industrial Lighting, IBR approved for 1926.56(b).
- (5) ANSI A17.1-1965, Elevators, Dumbwaiters, Escalators, and Moving Walks, IBR approved for 1926.552(d).
- (6) ANSI A17.1a-1967, Elevators, Dumbwaiters, Escalators, and Moving Walks Supplement, IBR approved for 1926.552(d).
- (7) ANSI A17.1b-1968, Elevators, Dumbwaiters, Escalators, and Moving Walks Supplement, IBR approved for 1926.552(d).
- (8) ANSI A17.1c-1969, Elevators, Dumbwaiters, Escalators, and Moving Walks Supplement, IBR approved for 1926.552(d).
- (9) ANSI A17.1d-1970, Elevators, Dumbwaiters, Escalators, and Moving Walks Supplement, IBR approved for 1926.552(d).
- (10) ANSI A17.2-1960, Practice for the Inspection of Elevators (Inspector's Manual), IBR approved for 1926.552(d).
- (11) ANSI A17.2a-1965, Practice for the Inspection of Elevators (Inspector's Manual) Supplement, IBR approved for 1926.552(d).
- (12) ANSI A17.2b-1967, Practice for the Inspection of Elevators (Inspector's Manual) Supplement, IBR approved for 1926.552(d).
- (13) ANSI A92.2-1969, Vehicle Mounted Elevating and Rotating Work Platforms, IBR approved for 1926.453(a) and 1926.453(b).
- (14) ANSI B7.1-1970, Safety Code for the Use, Care, and Protection of Abrasive Wheels, IBR approved for 1926.57(g), 1926.303(b), 1926.303(c), and 1926.303(d).
- (15) ANSI B20.1-1957, Safety Code for Conveyors, Cableways, and Related Equipment, IBR approved for 1926.555(a).
- (16) ANSI B56.1-1969, Safety Standards for Powered Industrial Trucks, IBR approved for 1926.602(c).

(17-22) [Reserved]

(23) ANSI O1.1-1961, Safety Code for Woodworking Machinery, IBR approved for 1926.304(f).

(24) ANSI Z35.1-1968, Specifications for Accident Prevention Signs; IBR approved for Sec. 1926.200(b), (c), and 1 (i). ## Historical Notes for Subdivision A

**Note:** The Accident Prevention Division adopted Division 3, Construction on a temporary basis effective May 1, 1989. It contained new and revised federal occupational safety and health rules for the Construction industry. APD is now announcing that these same rules have been duly filed for permanent adoption. Division 3, Construction replaced Oregon codes Division 83 and 84. Some individual rules from each of these divisions have been retained and adopted into the new Division 3 as Oregon initiated rules.

This is Oregon OSHA Administrative Order 8-1989, filed and effective July 7, 1989.

**Note:** This rulemaking is to keep Oregon OSHA in harmony with recent changes to federal OSHA's standards. Oregon OSHA held two public hearings in January 2011. Testimony was received at the hearings as well as written comments submitted throughout the comment period. All comments were carefully considered before proceeding with this final rulemaking.

Oregon OSHA adopted most of the changes as they appear in the August 9, 2010 federal register. These changes revise the construction industry crane and derrick rules found in new Subpart CC of 29 CFR Part 1926. The crane and derrick standard was revised to update and specify industry work practices necessary to protect employees. This final standard also addresses advances in the designs of cranes and derricks, related hazards, and the qualifications of employees needed to operate them safely. Under this final rule, employers must determine whether the ground is sufficient to support the anticipated weight and associated loads of hoisting equipment. The employer is also required to assess hazards within the work zone that would affect the safe operation, such as power lines and objects or personnel that would be within the work zone or swing radius. Finally, the employer is required to ensure that the equipment is in safe operating condition through required inspections and that employees in the work zone are trained to recognize hazards associated with the use of the equipment and any related duties that they are assigned to perform.

This is Oregon OSHA Administrative Order 1-2011, filed and effective February 9, 2011.

**Note:** Federal OSHA updated the references in standards to recognize the 2009 edition of the American National Standard for Industrial Head Protection, and is deleting the 1986 edition of that national consensus standard because it is out of date. These changes were published in the June 22, 2012 Federal Register. Federal OSHA corrected an editorial instruction printed in the June 22, 2012 Federal Register. This correction was published in the July 23, 2012 Federal Register. Federal OSHA also removed an unnecessary term in Appendix C of Respiratory Protection; restoring inadvertently removed requirements in Mechanical Power Presses; and, corrected a cross reference in two paragraphs in Appendix A to Subdivision L of scaffold standards in construction. These changes were published in the August 7, 2012 Federal Register.

This is Oregon OSHA Administrative Order 7-2012, filed and effective December 14, 2012.

**Note:** Oregon OSHA amended standards in Division 2, General Industry, and Division 3, Construction, to reflect federal OSHA updates published in the June 13, 2013 Federal Register. Federal OSHA updates its general industry and construction signage rules by adding references to the latest version of the American National Standards Institute (“ANSI”) standards on accident prevention signs and tags, ANSI Z535.1-2006 (R2011), Z535.2-2011 and Z535.5-2011. OSHA retained references to the earlier ANSI signage standards, ANSI Z53.1-1967m Z35.1-1968, and Z35.2-1968. This rulemaking provides employers the option to comply with either the earlier or updated standards. Also included in this rulemaking are minor corrections from federal OSHA of the June 13, 2013 Federal Register with the November 6, 2013 Federal Register. Corrections are to address reference clarifications for graphics. Oregon initiated rules are also amended to reflect the newer ANSI references.

This is Oregon OSHA Administrative Order 7-2013, filed and effective December 12, 2013.

**Note:** Oregon OSHA is adopting changes to our administrative (recordkeeping), general industry, and construction standards, and updating references in the maritime activity standards in response to federal OSHA’s adoption of final rules published in the May 14, 2019 Federal Register. This is Phase IV of federal OSHA’s Standards Improvement Project (SIP-IV), the fourth in a series of rulemakings to improve and streamline workplace safety and health standards. Oregon’s response removes or revises rules or requirements within our corresponding rules that are outdated, duplicative, or inconsistent. This rulemaking is anticipated to reduce regulatory burden and compliance costs while maintaining or enhancing worker safety and health as well as worker privacy protections.

In Division 3A, Oregon OSHA adopted updates to the incorporation by reference rule, 1926.6, including updated standards and reorganization of paragraphs.

This is Oregon OSHA Administrative Order 3-2019, filed and effective 10/29/2019.

**OREGON OCCUPATIONAL  
SAFETY AND HEALTH STANDARDS**

Oregon Administrative Rules, Chapter 437

**DIVISION 3 (29 CFR 1926)  
CONSTRUCTION**

**CONSTRUCTION  
Subdivision B  
General Interpretations**

Oregon Occupational Safety and Health Division (Oregon OSHA)  
Department of Consumer and Business Services  
Salem, Oregon 97301-3882

AO 8-1989

The Oregon Department of Consumer and Business Services adopted these rules pursuant to ORS 654.025(2).

The Secretary of State Designated OAR Chapter 437 as the “Oregon Occupational Safety and Health Code.” Six general subject areas within this code are designated as “Divisions.”

- **Division 1** General Administrative Rules
- **Division 2** General Occupational Safety and Health Rules
- **Division 3** Construction
- **Division 4** Agriculture
- **Division 5** Maritime Activities
- **Division 7** Forest Activities
- **Oregon Revised Statutes (ORS) 654** The Oregon Safe Employment Act (OSEAct)

Oregon-initiated rules in this division of the Oregon Occupational Safety and Health Code are numbered in a uniform system developed by the Secretary of State. This system does not number the rules in sequence (001, 002, 003, etc.). Omitted numbers may be assigned to new rules at the time of their adoption.

**Oregon-initiated rules** are arranged in the following Basic Codification Structure adopted by the Secretary of State for Oregon Administrative Rules (OAR):

Chapter	Division	Rule	Section	Subsection	Paragraphs
437	003	1760	(1)	(a)	(A)(i)(I)

The majority of Oregon OSHA codes are adopted by reference from the Code of Federal Regulations (CFR), and are arranged in the following basic federal numbering system:

Chapter	Division	Part	Subpart (Subdivision)	Section	Paragraphs
437	003	1926	M	.502	(a)

The terms “subdivision” and “subpart” are synonymous within OAR 437, Oregon Occupational Safety and Health Code.

---

To obtain an order form or copies of these codes, address:

**Department of Consumer & Business Services**  
**Oregon Occupational Safety & Health Division (Oregon OSHA)**  
**350 Winter St. NE, Room 430**  
**Salem, OR 97301-3882**

Or call the Oregon OSHA Resource Library at 503-378-3272

The rules referenced in this division are available for viewing in the Office of the Secretary of State, Administrative Rules and Office Document Section, Oregon State Archives Building, Salem, Oregon 97310, or the Central Office, Oregon Occupational Safety and Health Division of the Department of Consumer and Business Services, Room 430, 350 Winter St. NE Salem, OR 97301-3882. # SCOPE OF SUBPART/ COVERAGE UNDER SECTION **B** 103 OF THE ACT DISTINGUISHED

## SUBDIVISION B

### GENERAL INTERPRETATIONS

**Authority:** Sec. 107, Contract Work Hours and Safety Standards Act (Construction Safety Act) (40 U.S.C. 333).

#### **§1926.10 Scope of Subpart.**

(a) This subpart contains the general rules of the Secretary of Labor interpreting and applying the construction safety and health provisions of section 107 of the Contract Work Hours and Safety Standards Act (83 Stat. 96). Section 107 requires as a condition of each contract which is entered into under legislation subject to Reorganization Plan Number 14 of 1950 (64 Stat. 1267), and which is for construction, alteration, and/or repair, including painting and decorating, that no contractor or subcontractor contracting for any part of the contract work shall require any laborer or mechanic employed in the performance of the contract to work in surroundings or under working conditions which are unsanitary, hazardous, or dangerous to his health or safety, as determined under construction safety and health standards promulgated by the Secretary by regulation.

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

#### **§1926.11 Coverage Under Section 103 of the Act Distinguished.**

(a) **Coverage under section 103.** It is important to note that the coverage of section 107 differs from that for the overtime requirements of the Contract Work Hours and Safety Standards Act. The application of the overtime requirements is governed by section 103, which subject to specific exemptions, includes: (1) Federal contracts requiring or involving the employment of laborers or mechanics (thus including, but not limited to, contracts for construction), and (2) contracts assisted in whole or in part by Federal loans, grants, or guarantees under any statute "providing wage standards for such work." The statutes "providing wage standards for such work" include statutes for construction which require the payment of minimum wages in accordance with prevailing wage findings by the Secretary of Labor in accordance with the Davis-Bacon Act. A provision to section 103 excludes from the overtime requirements work where the Federal assistance is only in the form of a loan guarantee or insurance.

(b) **Coverage under section 107.** To be covered by section 107 of the Contract Work Hours and Safety Standards Act, a contract must be one which (1) is entered into under a statute that is subject to Reorganization Plan No. 14 of 1950 (64 Stat. 1267); and (2) is for "construction, alteration, and/or repair, including painting and decorating."

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

# REORGANIZATION PLAN NO. 14 OF 1950

## §1926.12 Reorganization Plan No. 14 of 1950.

(a) **General provisions.** Reorganization Plan No. 14 of 1950 relates to the prescribing by the Secretary of Labor of “appropriate standards, regulations, and procedures” with respect to the enforcement of labor standards under Federal and federally assisted contracts which are subject to various statutes subject to the Plan. The rules of the Secretary of Labor implementing the Plan are published in Part 5 of this title. Briefly, the statutes subject to the Plan include the Davis-Bacon Act, including its extension to Federal-aid highway legislation subject to 23 U.S.C. 113, and other statutes subject to the Plan by its original terms, statutes by which the Plan is expressly applied, such as the Contract Work Hours Standards Act by virtue of section 104(d) thereof.

### (b) The Plan.

(1) **The statutes subject to Reorganization Plan No. 14 of 1950 are cited and briefly described in the remaining paragraphs of this section.** These descriptions are general in nature and not intended to convey the full scope of the work to be performed under each statute. The individual statutes should be resorted to for a more detailed scope of the work.

(2) **Federal-Aid Highway Acts.** The provisions codified in 23 U.S.C. 113 apply to the initial construction, reconstruction, or improvement work performed by contractors or subcontractors on highway projects on the Federal-aid systems, the primary and secondary, as well as their extensions in urban areas, and the Interstate System, authorized under the highway laws providing for the expenditure of Federal funds upon the Federal-aid system. As cited in 41 OPTMS. A.G. 488, 496, the Attorney General ruled that the Federal-Aid Highway Acts are subject to Reorganization Plan No. 14 of 1950.

(3) **National Housing Act (12 U.S.C. 1713, 1715a, 1715e, 1715k, 1715l(d)(3) and (4), 1715v, 1715w, 1715x, 1743, 1747, 1748, 1748h-2, 1750g, 1715l(h)(1), 1715z(j)(1), 1715z-1, 1715y(d), Subchapter 1x-A and 1x-B, 1715z-7).** This act covers construction which is financed with assistance by the Federal Government through programs of loan and mortgage insurance for the following purposes:

(i) **Rental Housing** – Section 1713 provides mortgage and insurance on rental housing of eight or more units and on mobile-home courts.

(ii) **Section 1715a** – Repealed.

(iii) **Cooperative Housing** – Section 1715e authorizes mortgage insurance on cooperative housing of five or more units as well as supplementary loans for improvement of repair or resale of memberships.

(iv) **Urban Renewal Housing** – Section 1715k provides mortgage insurance on single family or multifamily housing in approved urban renewal areas.

# REORGANIZATION PLAN NO. 14 OF 1950

**B**

- (v)** Low or Moderate Income Housing – Section 1715L(d)(3) and (4) insures mortgages on low-cost single family or multifamily housing.
- (vi)** Housing for Elderly – Section 1715v provides mortgage insurance on rental housing for elderly or handicapped persons.
- (vii)** Nursing Homes – Section 1715w authorizes mortgage insurance on nursing home facilities and major equipment.
- (viii)** Experimental Housing – Section 1715x provides mortgage insurance on single family or multifamily housing with experimental design of materials.
- (ix)** War Housing Insurance – Section 1743 not active.
- (x)** Yield Insurance – Section 1747 insures investment returns on multifamily housing.
- (xi)** Armed Services Housing – Section 1748b to assist in relieving acute shortage and urgent need for family housing at or in areas adjacent to military installations.
- (xii)** Defense Housing for Impacted Areas – Section 1748h-2 provides mortgage insurance on single family or multifamily housing for sale or rent primarily to military or civilian personnel of the Armed Services, National Aeronautics and Space Administration, or Atomic Energy Commission.
- (xiii)** Defense Rental Housing – Section 1750g provides for mortgage insurance in critical defense housing areas.
- (xiv)** Rehabilitation – Section 1715L(h)(1) provides mortgage insurance for nonprofit organizations to finance the purchase and rehabilitation of deteriorating or substandard housing for subsequent resale to low-income home purchasers. There must be located on the property five or more single family dwellings of detached, semidetached, or row construction.
- (xv)** Homeowner Assistance – Section 1715Z (j)(1) authorizes mortgage insurance to non-profit organizations or public bodies or agencies executed to finance sale of individual dwellings to lower income individuals or families. Also includes the rehabilitation of such housing if it is deteriorating or substandard for subsequent resale to lower income home purchasers.
- (xvi)** Rental Housing Assistance – Section 1715 Z-1 authorizes mortgage insurance and interest reduction payments on behalf of owners of rental housing projects designed for occupancy by lower income families. Payments are also authorized for certain State or locally aided projects.

# REORGANIZATION PLAN NO. 14 OF 1950

(xvii) Condominium Housing – Section 1715y(d) provides mortgage insurance on property purchased for the development of building sites. This includes waterlines and water supply installations, sewer lines and sewage disposal installations, steam, gas, and electrical lines and installations, roads, streets, curbs, gutters, sidewalks, storm drainage facilities, and other installations or work.

(xviii) Group Medical Practice Facilities – Subchapter LX-B authorizes mortgage insurance for the financing of construction and equipment, of facilities for group practice of medicine, optometry, or dentistry.

(xix) Nonprofit Hospitals – 1715z-7 authorizes mortgage insurance to cover new and rehabilitated hospitals, including initial equipment.

**(4) Hospital Survey and Construction Act, as amended by the Hospital and Medical Facilities Amendments of 1964 (42 U.S.C. 291e).** The provisions of this Act cover construction contracts made by State or local authorities or private institutions under Federal grant-in-aid programs for the construction of hospitals and other medical facilities.

**(5) Federal Airport Act (49 U.S.C. 1114(b)).** The act provides grant-in-aid funds for airport construction limited to general site preparation runways, taxiways, aprons, lighting appurtenant thereto, and fire, rescue, and maintenance buildings. The act excludes construction intended for use as a public parking facility for passenger automobiles and the cost of construction of any part of an airport building except such of those buildings or parts of buildings to house facilities or activities directly related to the safety of persons at the airport.

**(6) Housing Act of 1949 (42 U.S.C. 1459).** Construction contracts awarded by local authorities financed with the assistance of loans and grants from the Federal Government. The construction programs are for slum clearance and urban renewal which includes rehabilitation grants, neighborhood development programs, neighborhood renewal plans, community renewal, demolition projects, and assistance for blighted areas. See the Housing Act of 1964, paragraph (b)(21) of this section, concerning financial assistance for low-rent housing for domestic farm labor.

**(7) School Survey and Construction Act of 1950 (20 U.S.C. 636).** This act provides for a Federal grant-in-aid program to assist in the construction of schools in federally affected areas.

**(8) Defense Housing & Community Facilities & Services Act of 1951 (42 U.S.C. 1592i).** Inactive Program.

**(9) United States Housing Act of 1937 (42 U.S.C. 1416).** This statute covers the construction of low-rent public housing and slum clearance projects awarded by local authorities. These projects are financed with the assistance of loans and grants from the Federal Government. The slum clearance is the demolition and removal of buildings from any slum area to be used for a low-rent housing project.

# REORGANIZATION PLAN NO. 14 OF 1950

B

**(10) Federal Civil Defense Act of 1950 (50 U.S.C. App. 2281).** This act provides for Federal assistance to the several States and their political subdivisions in the field of civil defense which includes procurement, construction, leasing, or renovating of materials and facilities.

**(11) Delaware River Basin Compact (sec. 15.1, 75 Stat. 714).** This joint resolution creates, by intergovernmental compact between the United States, Delaware, New Jersey, New York, and Pennsylvania, a regional agency for planning, conservation, utilization, development, management and control of the water and related sources of the Delaware River.

**(12) Cooperative Research Act (20 U.S.C. 332a(c)).** This act provides Federal grants to a university, college, or other appropriate public or nonprofit private agency or institution for part or all of the cost of constructing a facility for research or for research and related purposes. Research and related purposes means research, research training, surveys, or demonstrations in the field of education, or the dissemination of information derived therefrom, or all of such activities, including (but without limitation) experimental schools, except that such term does not include research, research training, surveys, or demonstrations in the field of sectarian instruction or the dissemination of information derived therefrom. Construction includes new buildings, and the acquisition, expansion, remodeling, replacement, and alteration of existing buildings and the equipping of new buildings and existing buildings.

**(13) Health Professions Educational Assistance Act of 1963 (42 U.S.C. 292d(c)(4), 293a(c)(5)).** The provisions of this act provide for grants to assist public and nonprofit medical, dental, and similar schools for the construction, expansion, or renovation of teaching facilities.

**(14) Mental Retardation Facilities Construction Act (42 U.S.C. 295(a)(2)(D), 2662(5), 2675(a)(5)).** This act authorizes Federal financial assistance in the construction of centers for research on mental retardation and related aspects of human development, of university-affiliated facilities for the mentally retarded and of facilities for the mentally retarded.

**(15) Community Mental Health Centers Act (42 U.S.C. 2685(a)(5)).** This act authorizes Federal grants for the construction of public and other nonprofit community mental health centers.

**(16) Higher Education Facilities Act of 1963 (20 U.S.C. 753).** This act authorizes the grant or loan of Federal funds to assist public and other non-profit institutions of higher education in financing the construction, rehabilitation, or improvement of academic and related facilities in undergraduate and graduate schools.

**(17) Vocational Educational Act of 1963 (20 U.S.C. 35f).** This act provides for Federal grants to the various States for construction of area vocational education school facilities.

# REORGANIZATION PLAN NO. 14 OF 1950

---

**(18) Library Services and Construction Act (20 U.S.C. 355e(a)(4)).** This act provides for Federal assistance to the various States for the construction of public libraries.

**(19) Urban Mass Transportation Act of 1954 (49 U.S.C. 1609).** This act provides for grants and loans to assist States and local public bodies and agencies thereof in financing the acquisition, construction, reconstruction, and improvement of facilities and equipment for use, by operation or lease or otherwise, in mass transportation service in urban areas and in coordinating such service with highway and other transportation in such areas.

**(20) Economic Opportunity Act of 1964 (42 U.S.C. 2947).** This act covers construction which is financed with assistance of the Federal Government for the following purposes:

**(i)** Authorizes Federal assistance for construction of projects, buildings and works which will provide young men and women in rural and urban residential centers with education, vocational training, and useful work experience (Title I).

**(ii)** Authorizes financial assistance for construction work planned and carried out at the community level for antipoverty programs (Title II):

**(A)** Authorizes loans to low income rural families by assisting them to acquire or improve real estate or reduce encumbrances or erect improvements thereon, and to participate in cooperative associations and/or to finance nonagricultural enterprises which will enable such families to supplement their income (Title III);

**(B)** Authorizes loans to local cooperative associations furnishing essential processing, purchasing, or marketing services, supplies, or facilities predominantly to low-income rural families (Title III);

**(C)** Authorizes financial assistance to States, political subdivisions of States, public and nonprofit agencies, institutions, organizations, farm associations, or individuals in establishing housing, sanitation, education, and child day-care programs for migrants and other seasonally employed agricultural employees and their families (Title III).

**(iii)** Authorizes loans or guarantees loans to small businesses for construction work (Title IV).

**(iv)** Authorizes the payment of the cost of experimental, pilot, or demonstration projects to foster State programs providing construction work experience or training for unemployed fathers and needy people (Title V).

# REORGANIZATION PLAN NO. 14 OF 1950

B

**(21) Housing Act of 1964 (42 U.S.C. 1486(f); 42 U.S.C. 1452b(e)).** Provides financial assistance for low-rent housing for domestic farm labor. The Act further provides for loans, through public or private agencies, where feasible, to owners or tenants of property in urban renewal areas to finance rehabilitation required to conform the property to applicable code requirements or carry out the objectives of the urban renewal plan for the area.

**(22) The Commercial Fisheries Research and Development Act of 1964 (16 U.S.C. 779e(b)).** This Act authorizes financial assistance to State agencies for construction projects designed for the research and development of the commercial fisheries resources of the Nation.

**(23) The Nurse Training Act of 1964 (42 U.S.C. 296a(b)(5)).** This act provides for grants to assist in the construction of new facilities for collegiate, associate degree, and diploma schools of nursing, or replacement or rehabilitation of existing facilities of such schools.

**(24) Elementary and Secondary Education Act of 1965 (20 U.S.C. 241i, 848).** The purpose of the act is to provide financial assistance to local educational agencies serving areas with concentrations of children from low-income families for construction in connection with the expansion or improvement of their educational programs.

**(25) Federal Water Pollution Control Act, as amended by the Water Quality Act of 1965 (3 U.S.C. 466e(g)).** Provides for financial assistance to States or municipalities for construction of facilities in connection with the prevention and control of water pollution. This includes projects that will control the discharge into any waters of untreated or inadequately treated sewage.

**(26) Appalachian Regional Development Act of 1965 (40 U.S.C. App. 402).** Authorizes Federal assistance in the construction of an Appalachian development highway system; construction of multicounty demonstration health facilities, hospitals, regional health, diagnostic and treatment centers, and other facilities for health; seal and fill voids in abandoned mines and to rehabilitate strip mine areas; construction of school facilities for vocational education; and to assist in construction of sewage treatment works.

**(27) National Technical Institute for the Deaf Act (20 U.S.C. 684(b)(5)).** Provides for financial assistance for institutions of higher education for the establishment, construction, including equipment and operation, of a National Institution for the Deaf.

**(28) Housing Act of 1959 (12 U.S.C. 1701(q)(c)(3)).** This act authorizes loans to nonprofit corporations to be used for the construction of housing and related facilities for elderly families. Also, the provisions of the act provide for rehabilitation, alteration, conversion or improvement of existing structures which are otherwise inadequate for proposed dwellings used by such families.

# REORGANIZATION PLAN NO. 14 OF 1950

---

**(29) College Housing Act of 1950, as amended (12 U.S.C. 1749a(f)).** This act provides for Federal loans to assist educational institutions in providing housing and other educational facilities for students and faculties.

**(30) Housing and Urban Development Act of 1965 (42 U.S.C. 1500c-3, 3107).** This act provides for Federal assistance for the following purposes:

(i) Grants to States and local public bodies to assist in any construction work to be carried out under the open-space land and urban beautification provisions contained therein. It provides for parks and recreation areas, conservation of land and other natural resources, and historical and scenic purposes.

(ii) Grants to local public bodies and agencies to finance specific projects for basic public water facilities (including works for the storage, treatment, purification, and distribution of water), and for basic public sewer facilities (other than "treatment works" as defined in the Federal Water Pollution Control Act).

(iii) Grants to any local public body or agency to assist in financing neighborhood facilities. These facilities must be necessary for carrying out a program of health, recreational, social, or similar community service and located so as to be available for the use of the area's low or moderate income residents.

**(31) National Foundation on the Arts and the Humanities Act of 1965 (20 U.S.C. 954(k)).** The act establishes the "National Foundation on the Arts and the Humanities" which may provide matching grants to groups (nonprofit organizations and State and other public organizations) and to individuals engaged in creative and performing arts for the entire range of artistic activity, including construction of necessary facilities.

**(32) Public Works and Economic Development Act of 1965 (42 U.S.C. 3222).** This act provides for Federal assistance for the following purposes:

(i) Grants for the acquisition or development of land or improvements for public works or development facility usage in redevelopment areas. It authorizes loans to assist in financing the purchase or development of land for public works which will assist in the creation of long-term employment opportunities in the area.

(ii) Loans for the purchase or development of land and facilities (including machinery and equipment) for industrial or commercial usage within redevelopment areas; guarantee of loans for working capital made to private borrowers by private lending institutions in connection with direct loan projects; and to contract to pay to, or on behalf of, business entities locating in redevelopment areas, a portion of the interest costs which they incur in financing their expansions from private sources.

(iii) Loans and grants to create economic development centers within designated county economic development districts.

# REORGANIZATION PLAN NO. 14 OF 1950

B

**(33) High-Speed Ground Transportation Study (40 U.S.C. 1636(b)).** This act provides for financial assistance for construction activities in connection with research and development of different forms of high-speed ground transportation and demonstration projects relating to intercity rail passenger service.

**(34) Heart Disease, Cancer and Stroke Amendments of 1965 (42 U.S.C. 299(b)(4)).** This act provides for grants to public or nonprofit private universities, medical schools, research, institutions, hospitals, and other public and non-profit agencies and institutions, or associations thereof to assist in construction and equipment of facilities in connection with research, training, demonstration of patient care, diagnostic and treatment related to heart disease, cancer, stroke, and other major diseases.

**(35) Mental Retardation Facilities and Community Mental Health Centers Construction Act Amendments of 1965 (20 U.S.C. 618(g)).** These provisions provide for grants to institutions of higher education for construction of facilities for research or for research and related purposes relating to education for mentally retarded, hard of hearing, deaf, speech impaired, visually handicapped, seriously emotionally disturbed, crippled, or other health impaired children who by reason thereof require special education.

**(36) Vocational Rehabilitation Act Amendments of 1965 (29 U.S.C. 41a(b)(4)).** This act authorizes grants to assist in meeting the costs of construction of public or other nonprofit workshops and rehabilitation facilities.

**(37) Clean Air and Solid Waste Disposal Acts (42 U.S.C. 3256).** This act provides for financial assistance to public (Federal, State, interstate, or local) authorities, agencies, and institutions, private agencies and institutions, and individuals in the construction of facilities for solid-waste disposal. The term construction includes the installation of initial equipment.

**(38) Medical Library Assistance Act of 1965 (42 U.S.C. 280b-3(b)(3)).** This act provides for grants to public or private non-profit agencies or institutions for the cost of construction of medical library facilities.

**(39) Veterans Nursing Home Care Act (38 U.S.C. 5035(a)(8)).** The construction industry health and safety standards do not apply to this act since it is not subject to Reorganization Plan No. 14 of 1950.

**(40) National Capital Transportation Act of 1965 (40 U.S.C. 682(b)(4)).** This act provides for Federal assistance to the National Capital Transportation Agency for construction of a rail rapid transit system and related facilities for the Nation's Capital.

**(41) Alaska Centennial-1967 (80 Stat. 82).** The program under this legislation has expired.

# REORGANIZATION PLAN NO. 14 OF 1950

---

**(42) Model Secondary School for the Deaf Act (80 Stat. 1028).** This act provides for funds to establish and operate, including construction and initial equipment of new buildings, expansion, remodeling, and alteration of existing buildings and equipment thereof, a model secondary school for the deaf to serve the residents of the District of Columbia and nearby States.

**(43) Allied Health Professions Personnel Training Act of 1966 (42 U.S.C. 295h (b)(2)(E)).** This act provides for grants to assist in the construction of new facilities for training centers for allied health professions, or replacement or rehabilitation of existing facilities for such centers.

**(44) Demonstration Cities and Metropolitan Development Act of 1966 (42 U.S.C. 3310; 12 U.S.C. 1715c; 42 U.S.C. 1416).** This act provides for Federal assistance for the following purposes:

(i) Grants to assist in the construction, rehabilitation, alteration, or repair of residential property only if such residential property is designed for residential use for eight or more families to enable city demonstration agencies to carry out comprehensive city demonstration programs (42 U.S.C. 3310).

(ii) Amends the National Housing Act (12 U.S.C. 1715c) and the Housing Act of 1937 (42 U.S.C. 1416). See these acts for coverage.

**(45) Air Quality Act of 1967 (42 U.S.C. 1857j-3).** This act provides for Federal assistance to public or nonprofit agencies, institutions, and organizations and to individuals, and contracts with public or private agencies, institutions, or persons for construction of research and development facilities and demonstration plants relating to the application of preventing or controlling discharges into the air of various types of pollutants.

**(46) Elementary and Secondary Education Amendments of 1967 (Title VII – Bilingual Education Act) (20 U.S.C. 880b-6).** This act provides for Federal assistance to local educational agencies or to an institution of higher education applying jointly with a local educational agency for minor remodeling projects in connection with bilingual education programs to meet the special needs of children with limited English-speaking ability in the United States.

**(47) Vocational Rehabilitation Amendments of 1967 (29 U.S.C. 42a(c)(3)).** This act authorizes Federal assistance to any public or nonprofit private agency or organization for the construction of a center for vocational rehabilitation of handicapped individuals who are both deaf and blind which shall be known as the National Center for Deaf-Blind Youths and Adults. Construction includes new buildings and expansion, remodeling, alteration and renovation of existing buildings, and initial equipment of such new, newly acquired, expanded, remodeled, altered, or renovated buildings.

# REORGANIZATION PLAN NO. 14 OF 1950

B

**(48) National Visitor Center Facilities Act of 1968 (40 U.S.C. 808).** This act authorizes agreements and leases with the owner of property in the District of Columbia known as Union Station for the use of all or a part of such property for a national visitor center to be known as the National Visitor Center. The agreements and leases shall provide for such alterations of the Union Station Building as necessary to provide adequate facilities for visitors. They also provide for the construction of a parking facility, including necessary approaches and ramps.

**(49) Juvenile Delinquency Prevention and Control Act of 1968 (42 U.S.C. 3843).** This act provides for Federal grants to State, county, municipal, or other public agency or combination thereof for the construction of facilities to be used in connection with rehabilitation services for the diagnosis, treatment, and rehabilitation of delinquent youths and youths in danger of becoming delinquent.

**(50) Housing and Urban Development Act of 1968 (including New Communities Act of 1968) (42 U.S.C. 3909).** This act provides for Federal assistance for the following purposes:

(i) Guarantees, and commitments to guarantee, the bonds, debentures, notes, and other obligations issued by new community developers to help finance new community development projects.

(ii) Amends section 212(a) of the National Housing Act, adding section 236 for "Rental Housing for Lower Income Families" and section 242 "Mortgage Insurance for Non-profit Hospitals" thereto.

**(51) Public Health Service Act Amendment (Alcoholic and Narcotic Addict Rehabilitation Amendments of 1968) (42 U.S.C. 2681, et seq.).** This act provides for grants to a public and nonprofit private agency or organization for construction projects consisting of any facilities (including post-hospitalization treatment facilities for the prevention and treatment of alcoholism or treatment of narcotic addicts.)

**(52) Vocational Education Amendments of 1968 (20 U.S.C. 1246).** This act provides for grants to States for the construction of area vocational education school facilities. The act further provides grants to public educational agencies, organizations, or institutions for construction of residential schools to provide vocational education for the purpose of demonstrating the feasibility and desirability of such schools. The act still further provides grants to State boards, to colleges and universities, to public educational agencies, organizations or institutions to reduce the cost of borrowing funds for the construction of residential schools and dormitories.

**(53) Postal Reorganization Act (39 U.S.C. 410(d)(2)).** This Act provides for construction, modification, alteration, repair, and other improvements of postal facilities located in leased buildings.

**(54) Airport and Airway Development Act of 1970 (Pub. L. 91-258, section 52(b)(7)).** This Act provides for Federal financial assistance to States and localities for the construction, improvement, or repair of public airports.

# REORGANIZATION PLAN NO. 14 OF 1950

(55)

(i) Public Law 91-230. This Act provides for federal financial assistance to institutions of higher learning for the construction of a National Center on Educational Media and Materials for the Handicapped. The program under this statute expires on July 1, 1971. Public Law 91-230, section 662(1).

(ii) Education of the Handicapped Act (20 U.S.C. 12326, 1404(a)). This Act provides for financial assistance to States for construction, expansion, remodeling, or alteration of facilities for the education of handicapped children at the preschool, elementary school, and secondary school levels.

**(56) Housing and Urban Development Act of 1970 (Pub. L. 91-609, section 707(b)).** This Act provides for grants to States and local public agencies to help finance the development of open-space or other land in urban areas for open-space uses. This Act becomes effective on July 1, 1971.

**(57) Developmental Disabilities Services and Facilities Construction Amendments of 1970 (Pub. L. 91-517, section 135(a)(5)).** This Act authorizes grants to States for construction of facilities for the provision of services to persons with developmental disabilities who are unable to pay for such services.

**(58) Rail Passenger Service Act of 1970 (Pub. L. 91-518, section 405(d)).** This statute provides that the National Railroad Passenger Corporation may construct physical facilities necessary to intercity rail passenger operations within the basic national rail passenger system designated by the Secretary of Transportation.

**(c) VA and FHA housing.** In the course of the legislative development of section 107, it was recognized that section 107 would not apply to housing construction for which insurance was issued by the Federal Housing Authority and Veterans' Administration for individual home ownership. Concerning construction under the National Housing Act, Reorganization Plan No. 14 of 1950 applies to construction which is subject to the minimum wage requirements of section 212(a) thereof (12 U.S.C. 1715c).

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).

# INTERPRETATION OF STATUTORY TERMS

## B

### §1926.13 Interpretation of Statutory Terms.

(a) The terms “**construction**,” “**alteration**,” and “**repair**” used in section 107 of the Act are also used in section 1 of the Davis-Bacon Act (40 U.S.C. 276a), providing minimum wage protection on Federal construction contracts, and section 1 of the Miller Act (40 U.S.C. 270a), providing performance and payment bond protection on Federal construction contracts. Similarly, the terms “**contractor**” and “**subcontractor**” are used in those statutes, as well as in Copeland (Anti-Kickback) Act (40 U.S.C. 276c) and the Contract Work Hours and Safety Standards Act itself, which apply concurrently with the Miller Act and the Davis-Bacon Act on Federal construction contracts and also apply to most federally assisted construction contracts. The use of the same or identical terms in these statutes which apply concurrently with section 107 of the Act have considerable precedential value in ascertaining the coverage of section 107.

(b) It should be noted that section 1 of the Davis-Bacon Act limits minimum wage protection to laborers and mechanics “employed directly” upon the “site of the work.” There is no comparable limitation in section 107 of the Act. Section 107 expressly requires as a self-executing condition of each covered contract that no contractor or subcontractor shall require “any laborer or mechanic employed in the performance of the contract to work in surroundings or under working conditions which are unsanitary, hazardous, or dangerous to his health or safety” as these health and safety standards are applied in the rules of the Secretary of Labor.

(c) The term “subcontractor” under section 107 is considered to mean a person who agrees to perform any part of the labor or material requirements of a contract for construction, alteration or repair. Cf. *MacEvoy Co. v. United States*, 322 U.S. 102, 108-9 (1944). A person who undertakes to perform a portion of a contract involving the furnishing of supplies or materials will be considered a “subcontractor” under this part and section 107 if the work in question involves the performance of construction work and is to be performed:

(1) Directly on or near the construction site, or (2) by the employer for the specific project on a customized basis. Thus, a supplier of materials which will become an integral part of the construction is a “subcontractor” if the supplier fabricates or assembles the goods or materials in question specifically for the construction project and the work involved may be said to be construction activity. If the goods or materials in question are ordinarily sold to other customers from regular inventory, the supplier is not a “subcontractor.” Generally, the furnishing of prestressed concrete beams and prestressed structural steel would be considered manufacturing; therefore a supplier of such materials would not be considered a “subcontractor.” An example of material supplied “for the specific project on a customized basis” as that phrase is used in this section would be ventilating ducts, fabricated in a shop away from the construction job site and specifically cut for the project according to design specifications. On the other hand, if a contractor buys standard size nails from a foundry, the foundry would not be a covered “subcontractor.” Ordinarily a contract for the supplying of construction equipment to a contractor would not, in and of itself, be considered a “subcontractor” for purposes of this part.

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

**B** FEDERAL CONTRACT FOR “MIXED” TYPES  
OF PERFORMANCE / SERVICE CONTRACT  
ACT RELATIONSHIP; WALSH-HEALEY  
PUBLIC CONTRACTS ACT

---

**§1926.14 Federal Contract for “Mixed” Types of Performance.**

(a) It is the intent of the Congress to provide safety and health protection of Federal, federally financed, or federally assisted construction. See, for example, H. Report No. 91-241, 91st Cong., first session, p. 1 (1969). Thus, it is clear that when a Federal contract calls for mixed types of performance, such as both manufacturing and construction, section 107 would apply to the construction. By its express terms, section 107 applies to a contract which is “for construction, alteration, and/or repair.” Such a contract is not required to be exclusively for such services. The application of the section is not limited to contracts which permit an overall characterization as “construction contracts.” The text of section 107 is not so limited.

(b) When the mixed types of performances include both construction and manufacturing, see also §1926.15(b) concerning the relationship between the Walsh-Healey Public Contracts Act and section 107.

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).  
**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

**§1926.15 Relationship to the Service Contract Act; Walsh-Healey Public Contracts Act.**

(a) A contract for “**construction**” is one for non-personal service. See, e.g., 41 CFR 1-1.208. Section 2(e) of the Service Contract Act of 1965 requires as a condition of every Federal contract (and bid specification therefor) exceeding \$2,500, the “principal purpose” of which is to furnish services to the United States through the use of “service employees,” that certain safety and health standards be met. See 29 CFR Part 1925, which contains the Department rules concerning these standards. Section 7 of the Service Contract Act provides that the Act shall not apply to “any contract of the United States or District of Columbia for construction, alteration, and/or repair, including painting and decorating of public buildings or public works.” It is clear from the legislative history of section 107 that no gaps in coverage between the two statutes are intended.

(b) The Walsh-Healey Public Contracts Act requires that contracts entered into by any Federal agency for the manufacture or furnishing of materials, supplies, articles, and equipment in any amount exceeding \$10,000 must contain, among other provisions, a requirement that “no part of such contract will be performed nor will any of the materials, supplies, articles or equipment to be manufactured or furnished under said contract be manufactured or fabricated in any plants, factories, buildings, or surroundings or under working conditions which are unsanitary or hazardous or dangerous to the health and safety of employees engaged in the performance of said contract.” The rules of the Secretary concerning these standards are published in 41 CFR Part 50-204, and express the Secretary of Labor’s interpretation and application of section 1(e) of the Walsh-Healey Public Contracts Act to certain particular working conditions. None of the described working conditions are intended to deal with construction activities, although such activities may

**SERVICE CONTRACT ACT RELATIONSHIP;  
WALSH-HEALEY PUBLIC CONTRACTS  
ACT / RULES OF CONSTRUCTION**

**B**

conceivably be a part of a contract which is subject to the Walsh-Healey Public Contracts Act. Nevertheless, such activities remain subject to the general statutory duty prescribed by section 1(e). Section 103(b) of the Contract Work Hours and Safety Standards Act provides, among other things, that the Act shall not apply to any work required to be done in accordance with the provisions of the Walsh-Healey Public Contracts Act.

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

**§1926.16 Rules of Construction.**

**(a)** The prime contractor and any subcontractors may make their own arrangements with respect to obligations which might be more appropriately treated on a jobsite basis rather than individually. Thus, for example, the prime contractor and his subcontractors may wish to make an express agreement that the prime contractor or one of the subcontractors will provide all required first-aid or toilet facilities, thus relieving the subcontractors from the actual, but not any legal, responsibility (or, as the case may be, relieving the other subcontractors from this responsibility). In no case shall the prime contractor be relieved of overall responsibility for compliance with the requirements of this part for all work to be performed under the contract.

**(b)** By contracting for full performance of a contract subject to section 107 of the Act, the prime contractor assumes all obligations prescribed as employer obligations under the standards contained in this part, whether or not he subcontracts any part of the work.

**(c)** To the extent that a subcontractor of any tier agrees to perform any part of the contract, he also assumes responsibility for complying with the standards in this part with respect to that part. Thus, the prime contractor assumes the entire responsibility under the contract and the subcontractor assumes responsibility with respect to his portion of the work. With respect to subcontracted work, the prime contractor and any subcontractor or subcontractors shall be deemed to have joint responsibility.

**(d)** Where joint responsibility exists, both the prime contractor and his subcontractor or subcontractors, regardless of tier, shall be considered subject to the enforcement provisions of the Act.

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).

- END OF DOCUMENT -

Oregon Administrative Rules  
Chapter 437

Division 3  
Construction

---

General Safety and Health  
Provisions

Subdivision

**C**

Administrative  
Order 2-2013

The Oregon Department of Consumer and Business Services adopted these rules pursuant to ORS 654.025(2).

The Secretary of State designated OAR Chapter 437 as the "Oregon Occupational Safety and Health Code." Six general subject areas within this code are designated as "Divisions."

- **Division 1** General Administrative Rules
- **Division 2** General Occupational Safety and Health Rules
- **Division 3** Construction
- **Division 4** Agriculture
- **Division 5** Maritime Activities
- **Division 7** Forest Activities
- **Oregon Revised Statutes (ORS) 654** The Oregon Safe Employment Act (OSEAct)

Oregon-initiated rules in this division of the Oregon Occupational Safety and Health Code are numbered in a uniform system developed by the Secretary of State. This system does not number the rules in sequence (001, 002, 003, etc.). Omitted numbers may be assigned to new rules at the time of their adoption.

**Oregon-initiated rules** are arranged in the following Basic Codification Structure adopted by the Secretary of State for Oregon Administrative Rules (OAR):

Chapter	Division	Rule	Section	Subsection	Paragraphs
<i>437</i>	<i>002</i>	<i>0322</i>	<i>(1)</i>	<i>(a)</i>	<i>(A)(i)(I)</i>

The majority of Oregon OSHA rules are adopted by reference from the Code of Federal Regulations (CFR), and are arranged in the following basic federal numbering system:

Chapter	Division	Part	Subpart (Subdivision)	Section	Paragraphs
437	002	1910	G	.303	(a)(1)(i)(A)(1)

The terms "subdivision" and "subpart" are synonymous within OAR 437, Oregon Occupational Safety and Health Code.

---

To obtain an order form or copies of these codes, address:

**Department of Consumer & Business Services**  
**Oregon Occupational Safety & Health Division (Oregon OSHA)**  
**350 Winter St. NE**  
**Salem, OR 97301-3882**

Or call the Oregon OSHA Resource Library at 503-378-3272

The rules referenced in this division are available for viewing in the Office of the Secretary of State, Oregon State Archives Building, Salem, Oregon, or the Central Office, Oregon Occupational Safety and Health Division of the Department of Consumer and Business Services, 350 Winter St. NE, Salem, Oregon, and on our website at [osha.oregon.gov](http://osha.oregon.gov).

**437-003-0001 Adoption by Reference**

*In addition to, and not in lieu of, any other safety and health codes contained in OAR Chapter 437, the Department adopts by reference the following federal regulations printed as part of the Code of Federal Regulations, in the Federal Register:*

**(3) Subdivision C – General Safety and Health Provisions**

- (a) 29 CFR 1926.20 General safety and health provisions, published 12/12/08, FR vol. 73, no. 240, pp. 75568-75589.
- (b) 29 CFR 1926.21 Safety training and education, published 4/6/79, FR vol. 44, p. 20940; amended with Oregon OSHA AO 6-2012, repealed (b)(6), f. 9/28/12, ef. 4/1/13.
- (c) 29 CFR 1926.22 Recording and reporting of injuries (Reserved)
- (d) 29 CFR 1926.23 First aid and medical attention, published 4/6/79, FR vol. 44, p. 20940.
- (e) 29 CFR 1926.24 Fire protection and prevention, published 4/6/79, FR vol. 44, p. 20940.
- (f) 29 CFR 1926.25 Housekeeping, published 4/6/79, FR vol. 44, p. 20940.
- (g) 29 CFR 1926.26 Illumination, published 4/6/79, FR vol. 44, p. 20940.
- (h) 29 CFR 1926.27 Sanitation, published 4/6/79, FR vol. 44, p. 20940.
- (i) 29 CFR 1926.28 Personal protective equipment. REPEALED with Oregon OSHA Admin. Order 2-2013, filed 2/15/13, effective 4/1/13. In Oregon, OAR 437-003-0134 applies.
- (j) 29 CFR 1926.29 Acceptable certifications, published 4/6/79, FR vol. 44, p. 20940.
- (k) 29 CFR 1926.30 Shipbuilding and ship repairing, published 3/7/96, FR vol. 61, no. 46, p. 9249.
- (l) 29 CFR 1926.31 (Reserved).
- (m) 29 CFR 1926.32 Definitions, published 6/30/93, FR vol. 58, no. 124, p. 35078.
- (n) 29 CFR 1926.33 Access to employee exposure and medical records, published 6/20/96, FR vol. 61, no. 46, p. 31427.

(o) 29 CFR 1926.34 Means of egress, published 6/30/93, Federal Register, vol. 58, no. 124, p. 35083.

*These standards are available at the Oregon Occupational Safety and Health Division, Oregon Department of Consumer and Business Services, and the United States Government Printing Office.*

## 1926.20 General Safety and Health Provisions

### (a) Contractor requirements.

- (1) Section 107 of the Act requires that it shall be a condition of each contract which is entered into under legislation subject to Reorganization Plan Number 14 of 1950 (64 Stat. 1267), as defined in 1926.12, and is for construction, alteration, and/or repair, including painting and decorating, that no contractor or subcontractor for any part of the contract work shall require any laborer or mechanic employed in the performance of the contract to work in surroundings or under working conditions which are unsanitary, hazardous, or dangerous to his health or safety.

### Other Structural Requirements

#### **437-003-0905** *Flooring*

*In buildings or other structures of wood floor construction, the under-flooring shall be laid on each tier of joists as the structure progresses, or if double floors are not to be used, the tier of joists next below where work is being performed shall be entirely floored over except for such spaces as are required for ladders and shaftways.*

Stat. Auth.: ORS 654.025(2) and 656.726(3).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: APD Admin. Order 5-1989, f. 3/1/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89.

#### **437-003-0910** *Temporary Floors*

*Temporary floors shall be of sufficient strength to support expected loading.*

Stat. Auth.: ORS 654.025(2) and 656.726(3).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: APD Admin. Order 5-1989, f. 3/1/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89.

### **437-003-0915    *Shoring, Bracing or Guying of Structures***

*During erection, alteration, or repair, structures, including each part thereof, shall be braced or guyed as necessary to prevent overturning or collapse. All temporary shoring, bracing, or guying used for this purpose shall be maintained until the structure or any part of same is otherwise secured against overturning or collapse.*

Stat. Auth.: ORS 654.025(2) and 656.726(3).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: APD Admin. Order 5-1989, f. 3/1/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89.

### **437-003-0920    *Project Plans***

*The Administrator of the Oregon Occupational Safety and Health Division (OR-OSHA) may require plans and specifications of temporary shoring and bracing used in the construction or alteration of any building, structure, or excavation project. Required plans shall be certified by a qualified engineer whenever there is a question as to compliance with requirements of this code.*

Stat. Auth.: ORS 654.025(2) and 656.726(3).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: APD Admin. Order 5-1989, f. 3/1/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89.

## **1926.20 (b) Accident prevention responsibilities**

- (1) It shall be the responsibility of the employer to initiate and maintain such programs as may be necessary to comply with this part.
- (2) Such programs shall provide for frequent and regular inspections of the job sites, materials, and equipment to be made by competent persons designated by the employers.
- (3) The use of any machinery, tool, material, or equipment which is not in compliance with any applicable requirement of this part is prohibited. Such machine, tool, material, or equipment shall either be identified as unsafe by tagging or locking the controls to render them inoperable or shall be physically removed from its place of operation.
- (4) The employer shall permit only those employees qualified by training or experience to operate equipment and machinery.

NOTE: Oregon did not adopt 1926.20(c), (d), and (e).

(f) Compliance duties owed to each employee.

- (1) Personal protective equipment. Standards in this part requiring the employer to provide personal protective equipment (PPE), including respirators and other types of PPE, because of hazards to employees impose a separate compliance duty with respect to each employee covered by the requirement. The employer must provide PPE to each employee required to use the PPE, and each failure to provide PPE to an employee may be considered a separate violation.
- (2) Training. Standards in this part requiring training on hazards and related matters, such as standards requiring that employees receive training or that the employer train employees, provide training to employees, or institute or implement a training program, impose a separate compliance duty with respect to each employee covered by the requirement. The employer must train each affected employee in the manner required by the standard, and each failure to train an employee may be considered a separate violation.

[44 FR 8577, Feb. 9, 1979; 44 FR 20940, Apr. 6, 1979, as amended at 58 FR 35078, June 30, 1993; 73 FR 75588, Dec. 12, 2008]

OR-OSHA Admin. Order 5-2009, f. 5/29/09, ef. 5/29/09.

## 1926.21 Safety Training and Education

- (a) General requirements. The Secretary shall, pursuant to section 107(f) of the Act, establish and supervise programs for the education and training of employers and employees in the recognition, avoidance and prevention of unsafe conditions in employments covered by the act.
- (b) Employer responsibility.
  - (1) The employer should avail himself of the safety and health training programs the Secretary provides.
  - (2) The employer shall instruct each employee in the recognition and avoidance of unsafe conditions and the regulations applicable to his work environment to control or eliminate any hazards or other exposure to illness or injury.

- (3) Employees required to handle or use poisons, caustics, and other harmful substances shall be instructed regarding the safe handling and use, and be made aware of the potential hazards, personal hygiene, and personal protective measures required.
- (4) In job site areas where harmful plants or animals are present, employees who may be exposed shall be instructed regarding the potential hazards, and how to avoid injury, and the first aid procedures to be used in the event of injury.
- (5) Employees required to handle or use flammable liquids, gases, or toxic materials shall be instructed in the safe handling and use of these materials and made aware of the specific requirements contained in Subparts D, F, and other applicable subparts of this part.

[44 FR 8577, Feb. 9, 1979; 44 FR 20940, Apr. 6, 1979, as amended at 80 FR 25518, May 4, 2015]

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.

## 1926.22 Recording and Reporting of Injuries (RESERVED)

## 1926.23 First Aid and Medical Attention

First aid services and provisions for medical care shall be made available by the employer for every employee covered by these regulations.

Regulations prescribing specific requirements for first aid, medical attention, and emergency facilities are contained in Subpart D of this part.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

## 1926.24 Fire Protection and Prevention

The employer shall be responsible for the development and maintenance of an effective fire protection and prevention program at the job site throughout all phases of the construction, repair, alteration, or demolition work. The employer shall ensure the availability of the fire protection and suppression equipment required by Subpart F of this part.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

## 1926.25 Housekeeping

- (a) During the course of construction, alteration, or repairs, form and scrap lumber with protruding nails, and all other debris, shall be kept cleared from work areas, passageways, and stairs, in and around buildings or other structures.
- (b) Combustible scrap and debris shall be removed at regular intervals during the course of construction. Safe means shall be provided to facilitate such removal.
- (c) Containers shall be provided for the collection and separation of waste, trash, oily and used rags, and other refuse. Containers used for garbage and other oily, flammable, or hazardous wastes, such as caustics, acids, harmful dusts, etc. shall be equipped with covers. Garbage and other waste shall be disposed of at frequent and regular intervals.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

## 1926.26 Illumination

Construction areas, aisles, stairs, ramps, runways, corridors, offices, shops, and storage areas where work is in progress shall be lighted with either natural or artificial illumination. The minimum illumination requirements for work areas are contained in Subpart D of this part.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

## 1926.27 Sanitation

Health and sanitation requirements for drinking water are contained in Subpart D of this part.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

NOTE: Oregon OSHA did not adopt 1926.28 Personal Protective Equipment, and repealed OAR 437-003-0128 High Visibility Garments, with Administrative Order 2-2013. In Oregon, [OAR 437-003-0134](#) Personal Protective Equipment, in Division 3/E applies.

## 1926.29 Acceptable Certifications

- (a) Pressure vessels. Current and valid certification by an insurance company or regulatory authority shall be deemed as acceptable evidence of safe installation, inspection, and testing of pressure vessels provided by the employer.
- (b) Boilers. Boilers provided by the employer shall be deemed to be in compliance with the requirements of this part when evidence of current and valid certification by an insurance company or regulatory authority attesting to the safe installation, inspection, and testing is presented.
- (c) Other requirements. Regulations prescribing specific requirements for other types of pressure vessels and similar equipment are contained in Subparts F and O of this part.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

## 1926.30 Shipbuilding and Ship Repairing

- (a) General. Shipbuilding, ship repairing, alterations, and maintenance performed on ships under Government contract, except naval ship construction, is work subject to the Act.
- (b) Applicable safety and health standards. For the purpose of work carried out under this section, the safety and health regulations in Part 1915 of this title, Shipyard Employment, shall apply.

[44 FR 8577, Feb. 9, 1979; 44 FR 20940, Apr. 6, 1979, as amended at 61 FR 9249, March 7, 1996]

Stat. Auth.: ORS 654.025(2) and 656.726(4).

Stats. Implemented: ORS 654.001 through 654.295.

Hist: APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).

APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

OR-OSHA Admin. Order 4-1997, f. 4/2/97, ef. 4/2/97.

## 1926.31 Reserved

## 1926.32 Definitions

The following definitions shall apply in the application of the regulations in this part:

- (a) **Act** means section 107 of the Contract Work Hours and Safety Standards Act, commonly known as the Construction Safety Act (86 Stat. 96; 40 U.S.C. 333).
- (b) **ANSI** means American National Standards Institute.
- (c) **Approved** means sanctioned, endorsed, accredited, certified, or accepted as satisfactory by a duly constituted and nationally recognized authority or agency.
- (d) **Authorized person** means a person approved or assigned by the employer to perform a specific type of duty or duties or to be at a specific location or locations at the jobsite.
- (e) **Administration** means the Occupational Safety and Health Administration.
- (f) **Competent person** means one who is capable of identifying existing and predictable hazards in the surroundings or working conditions which are unsanitary, hazardous, or dangerous to employees, and who has authorization to take prompt corrective measures to eliminate them.
- (g) **Construction work**. For purposes of this section, "Construction work" means work for construction, alteration, and/or repair, including painting and decorating.
- (h) **Defect** means any characteristic or condition which tends to weaken or reduce the strength of the tool, object, or structure of which it is a part.
- (i) **Designated person** means "authorized person" as defined in paragraph (d) of this section.

- (j) **Employee** means every laborer or mechanic under the Act regardless of the contractual relationship which may be alleged to exist between the laborer and mechanic and the contractor or subcontractor who engaged him. "Laborer and mechanic" are not defined in the Act, but the identical terms are used in the Davis-Bacon Act (40 U.S.C. 276a), which provides for minimum wage protection on Federal and federally assisted construction contracts. The use of the same term in a statute which often applies concurrently with section 107 of the Act has considerable precedential value in ascertaining the meaning of "laborer and mechanic" as used in the Act. "Laborer" generally means one who performs manual labor or who labors at an occupation requiring physical strength; "mechanic" generally means a worker skilled with tools. See 18 Comp. Gen. 341.
- (k) **Employer** means contractor or subcontractor within the meaning of the Act and of this part.
- (l) **Hazardous** substance means a substance which, by reason of being explosive, flammable, poisonous, corrosive, oxidizing, irritating, or otherwise harmful, is likely to cause death or injury.
- (m) **Qualified** means one who, by possession of a recognized degree, certificate, or professional standing, or who by extensive knowledge, training, and experience, has successfully demonstrated his ability to solve or resolve problems relating to the subject matter, the work, or the project.
- (n) **Safety factor** means the ratio of the ultimate breaking strength of a member or piece of material or equipment to the actual working stress or safe load when in use.
- (o) **Secretary** means the Secretary of Labor.
- (p) **SAE** means Society of Automotive Engineers.
- (q) **Shall** means mandatory.
- (r) **Should** means recommended.
- (s) **Suitable** means that which fits, and has the qualities or qualifications to meet a given purpose, occasion, condition, function, or circumstance.

[44 FR 8577, Feb. 9, 1979; 44 FR 20940, Apr. 6, 1979, as amended at 58 FR 35078, June 30, 1993]

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89.  
OR-OSHA Admin Order 3-2000, f. 2/8/00, ef. 2/8/00.

**437-003-0011 Additional Definitions**

*The following definitions are in addition to those found in 29 CFR 1926.32:*

- (1) **Department** – The Department of Consumer and Business Services.*
- (2) **Employee** – Any individual, including a minor whether lawfully or unlawfully employed, who engages to furnish his services for a remuneration, financial or otherwise, subject to the direction and control of an employer, and includes salaried, elected and appointed officials of the state, state agencies, counties, cities, school districts and other public corporations, or any individual who is provided with workers' compensation coverage as a subject worker pursuant to ORS Chapter 656, whether by operation of law or by election.*
- (3) **Employer** – Any person who has one or more employees, or any sole proprietor or member of a partnership who elects workers' compensation coverage as a subject worker pursuant to ORS 656.128.*

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: APD Admin. Order 5-1989, f. 3/31/89, ef. 5/1/89.  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89.

**1926.33 Access to Employee Exposure and Medical Records**

NOTE: The requirements applicable to construction work under this section are identical to those set forth at 1910.1020 of this chapter.

**1926.34 Means of Egress**

- (a) General. In every building or structure exits shall be so arranged and maintained as to provide free and unobstructed egress from all parts of the building or structure at all times when it is occupied. No lock or fastening to prevent free escape from the inside of any building shall be installed except in mental, penal, or corrective institutions where supervisory personnel is continually on duty and effective provisions are made to remove occupants in case of fire or other emergency.
- (b) Exit marking. Exits shall be marked by a readily visible sign. Access to exits shall be marked by readily visible signs in all cases where the exit or way to reach it is not immediately visible to the occupants.
- (c) Maintenance and workmanship. Means of egress shall be continually maintained free of all obstructions or impediments to full instant use in the case of fire or other emergency.

[58 FR 35083, June 30, 1993.]

Stat. Auth.: ORS 654.025(2) and 656.726(4).

Stats. Implemented: ORS 654.001 through 654.295.

Hist: OR-OSHA Admin Order 3-2000, f. 2/8/00, ef. 2/8/00.

## Historical Notes for Subdivision C

**Note:** The accident prevention division has adopted new and revised federal occupational health and safety rules for the construction industry on an emergency basis effective May 1, 1989. The new rules cover masonry and concrete construction standards, and limits the use of construction cranes and derricks as personnel hoists. The revised rules reduce occupational exposures to asbestos, tremolite, anthophyllite, and actinolite. Hazard communication rules are now included in Division 3, construction. The emergency adoption also includes the repeal of Division 83, construction, and Division 84, Electrical Transmission and Distribution Facilities, effective May 1, 1989. However, some individual rules from each of these divisions are retained and adopted into the new Division 3, construction, as Oregon-initiated rules.

This is Oregon OSHA Administrative Order 5-1989 (temp), Adopted March 1, 1989, and effective May 1, 1989.

**Note:** The Accident Prevention Division adopted Division 3, Construction on a temporary basis effective May 1, 1989. It contained new and revised federal occupational health and safety rules for the construction industry. APD is now announcing that these same rules have been duly filed for permanent adoption, effective July 7, 1989. In the interim between the temporary and permanent rules, some revisions and minor editorial changes were made.

Redesignation of 29 CFR 1926.550(g)(3)(i)(D) to 1926.550(g)(3)(ii)(D) due to confusion caused by the location of the rule.

Correction of a conflict in federal language contained in separate documents regarding 1926.58(j)(2)(iv). The word "or" has been corrected to read "and".

Federal rules 1926.52 and 1926.55 have been replaced by Oregon-Initiated rules 437-03-027 and 030, which apply appropriate rules for noise and hearing protection and air contaminants to the construction industry.

This is Oregon OSHA Administrative Order 8-1989 (perm), Adopted and effective on July 7, 1989.

**Note:** Oregon OSHA adopts by reference corrections and technical amendments issued by federal OSHA. OSHA made simple corrections, deleted redundant provisions, and clarified and reorganized various other provisions throughout the standards. Thirteen similar standards for carcinogenic chemicals are consolidated under one single rule in general industry and maritime activities. This action does not change the substantive requirements of the standards. These changes affect general industry, construction, and maritime activities standards.

This is Oregon OSHA Administrative Order 4-1997, Adopted and effective April 2, 1997.

**Note:** On June 30, 1993, Federal OSHA incorporated a large number of its 1910 general industry standards into its 1926 construction standard in order to consolidate all standards actually applicable to the construction industry in one place. This was done at the request of both employers and employees in construction work in order to facilitate compliance with all the applicable standards from general industry. Oregon OSHA proposed to adopt most of the applicable general industry standards into Division 3, Construction. This will help achieve more uniform reporting information and compliance, with a safer work environment for construction workers.

1926.501(b)(13), which was originally adopted from the federal construction standard, is being repealed because of confusion between this rule for residential construction and the other fall protection rules governing specific activities such as roofing or leading edge work. The more specific standards in 1926.501 will now be used for all industries. The current residential exceptions will be retained.

There should be no additional financial impact generated by the incorporation of applicable general industry standards into construction because the construction industry has been subject to these standards for a number of years. This action is to better provide access to all standards applicable to the construction industry.

This is Oregon OSHA Administrative Order 3-2000, Adopted and effective February 8, 2000.

**Note:** In this rulemaking, Oregon OSHA is amending its standards to add language clarifying that the personal protective equipment (PPE) and training requirements impose a compliance duty to each and every employee covered by the standards and that noncompliance may expose the employer to liability on a per-employee basis. The amendments consist of new paragraphs added to the introductory sections of the affected rules and changes to the language of some existing respirator and training requirements.

These federal OSHA changes are in general industry, construction, and maritime and were published in the December 12, 2008 federal register.

This is Oregon administrative order 5-2009, adopted and effective May 29, 2009.

**Note:** Oregon OSHA adopts new rule, OAR 437-002-0146 Confined Spaces, which replaces 1910.146 Permit-Required Confined Spaces, in Division 2/J General Environmental Controls. This expands the scope of the new rule to include the construction industry.

During the 2011 proposal, several issues were discovered that needed to be resolved. We reconvened our stakeholder groups to resolve those issues and addressed any other areas for clarification. The identified issues include: revising and including several definitions, language for closing permits, ensuring employee access to written materials, ensuring all actions required by the permit are followed, and clarifying when alternate entry cannot be used.

Other areas amended for clarification include:

Permit Space Program.

- Changed the requirement to catalog all confined spaces to catalog all permit spaces.
- If the permit program needs to be revised, the language was changed that prohibiting entry into any space; to any space that is affected by that revision until the revision is complete.

Evacuation. Added language on what to do if entrants need to evacuate a permit space.

Decontamination. There was language requiring patient decontamination. The group consensus was to move this language to the appendix on rescue. In its place, language was added requiring MSDSs and providing them to the medical providers.

Rescue.

- For non-entry rescue – modified the language to include a rescue person, as the rescue “team” may only consist of the attendant retrieving the entrant from the space.
- For entry rescue – language change from ensuring the rescue team can proficiently perform rescues to ensuring rescue teams can efficiently perform rescues.
- Added language requiring that, if a third-party rescue service is used, that the agreement is in writing.

Alternate Entry.

- Changed the language in the exception for alternate entry.
- Added language to specify which parts of the rule don’t apply when one uses alternate entry.
- Added a condition on when the space must be evacuated during alternate entry (new hazard or conditions change).

Training. Moved the awareness training piece to the bottom of the training section to avoid confusion and clarified that it is only for employees who work around permit spaces.

Records. Modified the record retention section to refer back to the rule that requires a review of the permit program.

The requirements of this standard are similar to the requirements of the existing general industry standard, but are written to clarify employer obligations and eliminate confusing requirements.

This rulemaking amends Oregon-initiated rules OAR 437-002-0182, 437-002-0256, and 437-002-0312 to update the rule reference to the new Oregon rule 437-002-0146 Confined Spaces. Also amended to reflect the new Confined Spaces rules are 1910.120 Appendix E, and 1910.269 that currently refer the reader to 1910.146. We also repeal 1926.21(b)(6) in Division 3/C, and place a note referring the reader to Division 2/J, 437-002-0146 Confined Spaces.

This is Oregon OSHA Administrative Order 6-2012, adopted September 25, 2012, and effective April 1, 2013.

**Note:** Oregon OSHA is revising the personal protective equipment (PPE) sections of its construction standards regarding requirements for eye and face protective devices, head protection, foot protection, extremities and torso to include protective clothing, respiratory devices, and protective shields and barriers. Oregon OSHA updated the Division 2, subdivision I, Personal Protective Equipment references in its regulations on December 8, 2011. The update referenced more recent editions of applicable national consensus standards and removed requirements that employers prepare and maintain written training certification records. Oregon OSHA repealed all of Division 2/I rules with some exceptions and replaced them with a new Oregon initiated rule, 437-002-0134 Personal Protective Equipment, that includes sections covering the scope/application, hazard assessment, equipment, training, payment, fall protection, clothing, high visibility garments, and eye, head, foot, leg, hand and skin protection. The change was mostly a format change that simplified the existing text while making little change to the overall rule requirements with a few exceptions. Oregon OSHA modified the hazard assessment requirement to clarify that employers must identify hazards to the entire body, including the torso and extremities, when performing the assessment. The assessment previously was limited to head, hands, eyes and face and foot protection.

We are removing the current PPE requirements in various locations of the construction standard and replacing them with the same requirements that are in General Industry standards of Division 2, Subdivision I. These requirements (with the exception of a written assessment certification) will be substantially similar allowing for greater consistency in construction and general industry. The design requirements for eye and face-protective devices, head protection, and foot protection are currently the same in Division 2 General Industry, Shipyard Employment, Marine Terminals, Longshoring, and Division 3 Construction. These revisions are a continuation of Oregon OSHA's effort to update consensus and industry standards.

**Personal Protective Equipment in General Industry:** Oregon OSHA is also amending the general industry PPE rule 437-002-0134, to include ANSI Z89.1-2009, American National Standard for Industrial Head Protection, as another option of compliance, as published in the June 22, 2012 Federal Register. [http://www.osha.gov/FedReg\\_oshapdf/FED20120622A.pdf](http://www.osha.gov/FedReg_oshapdf/FED20120622A.pdf)

**Hole Openings (including skylights) in General Industry:** Oregon OSHA is also changing the hole covering requirements for holes in floors, roofs, and other walking/working surfaces (to include skylights and skylight screens). Currently employers in construction and general industry have different hole cover strength criteria. To eliminate the confusion and inconsistency, Oregon OSHA is changing the general industry requirements to be the same as the construction requirements as referenced in the Federal OSHA proposal for walking working surfaces and personal protective equipment (fall protection) found in the May 24, 2010 Federal Register [http://www.osha.gov/FedReg\\_oshapdf/FED20100524.pdf](http://www.osha.gov/FedReg_oshapdf/FED20100524.pdf).

This is Oregon OSHA Administrative Order 2-2013, Adopted February 5, 2013, and effective April 1, 2013

Oregon Administrative Rules  
Chapter 437

Division 3  
Construction

---

Occupational Health and  
Environmental Controls

Subdivision

**D**

Administrative  
Order 3-2019

The Oregon Department of Consumer and Business Services adopted these rules pursuant to ORS 654.025(2).

The Secretary of State designated OAR Chapter 437 as the “Oregon Occupational Safety and Health Code.” Six general subject areas within this code are designated as “Divisions.”

- **Division 1** General Administrative Rules
- **Division 2** General Occupational Safety and Health Rules
- **Division 3** Construction
- **Division 4** Agriculture
- **Division 5** Maritime Activities
- **Division 7** Forest Activities
- **Oregon Revised Statutes (ORS) 654** The Oregon Safe Employment Act (OSEAct)

Oregon-initiated rules in this division of the Oregon Occupational Safety and Health Code are numbered in a uniform system developed by the Secretary of State. This system does not number the rules in sequence (001, 002, 003, etc.). Omitted numbers may be assigned to new rules at the time of their adoption.

**Oregon-initiated rules** are arranged in the following Basic Codification Structure adopted by the Secretary of State for Oregon Administrative Rules (OAR):

Chapter	Division	Rule	Section	Subsection	Paragraphs
437	002	0322	(1)	(a)	(A)(i)(I)

The majority of Oregon OSHA rules are adopted by reference from the Code of Federal Regulations (CFR), and are arranged in the following basic federal numbering system:

Chapter	Division	Part	Subpart (Subdivision)	Section	Paragraphs
437	002	1910	G	.303	(a)(1)(i)(A)(1)

The terms “subdivision” and “subpart” are synonymous within OAR 437, Oregon Occupational Safety and Health Code.

---

To obtain an order form or copies of these codes, address:

**Department of Consumer & Business Services**  
**Oregon Occupational Safety & Health Division (Oregon OSHA)**  
350 Winter St. NE  
Salem, OR 97301-3882

Or call the Oregon OSHA Resource Library at 503-378-3272

The rules referenced in this division are available for viewing in the Office of the Secretary of State, Oregon State Archives Building, Salem, Oregon, or the Central Office, Oregon Occupational Safety and Health Division of the Department of Consumer and Business Services, 350 Winter St. NE, Salem, Oregon, and on our website at [osha.oregon.gov](http://osha.oregon.gov).

**437-003-0001 Adoption by Reference**

*In addition to, and not in lieu of, any other safety and health codes contained in OAR Chapter 437, the Department adopts by reference the following federal regulations printed as part of the Code of Federal Regulations, in the Federal Register:*

**(4) Subdivision D – Occupational Health and Environmental Controls.**

- (a) 29 CFR 1926.50 Medical services and first aid, published 6/18/98, FR vol. 63, no. 117, p. 33469, amended 5/14/19, FR Vol. 84, no. 93, p. 21576.
- (b) 29 CFR 1926.51 Sanitation, published 6/30/93, FR vol. 58, no. 124, p. 35084.
- (c) 29 CFR 1926.52 Occupational noise exposure, published 4/6/79, FR vol. 44, p. 20940.
- (d) 29 CFR 1926.53 Ionizing radiation, published 4/6/79, FR vol. 44, p. 20940.
- (e) 29 CFR 1926.54 Nonionizing radiation, published 4/6/79, FR vol. 44, p. 20940.
- (f) 29 CFR 1926.55 Gases, vapors, fumes, dusts, and mists.  
**Note:** Oregon OSHA did not adopt 1926.55. In Oregon, 437-003-1000 applies.
- (g) 29 CFR 1926.56 Illumination, published 4/6/79, FR vol. 44, p. 20940.
- (h) 29 CFR 1926.57 Ventilation, published 1/8/98, FR vol. 63, no. 5, p. 1295.
- (i) 29 CFR 1926.58 Reserved, 1926.58, Asbestos, tremolite, anthophyllite and actinolite is redesignated as 1926.1101, Asbestos, and 1926.58 is reserved (8/10/94, FR vol. 59, no. 153, pp. 41131-62).
- (j) 29 CFR 1926.59 Hazard Communication, published 6/20/96, FR vol. 61, p. 31427; amended with Oregon OSHA Admin. Order 5-2012, f. 9/25/12, ef. 9/25/12.
- (k) 29 CFR 1926.60 Methylenedianiline (MDA), published 5/14/19, FR vol. 84, no. 93, p. 21416.
- (l) 29 CFR 1926.61 Retention of DOT markings, placards and labels, published 6/20/96, FR vol. 61, p. 31427.
- (m) 29 CFR 1926.62 Lead, published 5/14/19, FR vol. 84, no. 93, p. 21416.  
**Note:** Cadmium has been redesignated as 1926.1127.
- (n) 29 CFR 1926.64 Process Safety Management of Highly Hazardous Chemicals

**Note:** Division 2/H, 1910.119, Process Safety Management of Highly Hazardous Chemicals, applies to Construction.

(o) 29 CFR 1926.65 Hazardous Waste Operations and Emergency Response.

**Note:** Division 2/H, 1910.120, Hazardous Waste Operations and Emergency Response, applies to Construction.

## 1926.50 Medical Services and First Aid

- (a) The employer shall insure the availability of medical personnel for advice and consultation on matters of occupational health.
- (b) Provisions shall be made prior to commencement of the project for prompt medical attention in case of serious injury.
- (c) In the absence of an infirmary, clinic, hospital, or physician, that is reasonably accessible in terms of time and distance to the worksite, which is available for the treatment of injured employees, a person who has a valid certificate in first aid training from the U.S. Bureau of Mines, the American Red Cross, or equivalent training that can be verified by documentary evidence, shall be available at the worksite to render first aid.
- (d)
  - (1) First aid supplies shall be easily accessible when required.
  - (2) The contents of the first aid kit shall be placed in a weatherproof container with individual sealed packages for each type of item, and shall be checked by the employer before being sent out on each job and at least weekly on each job to ensure that the expended items are replaced.

- (e) Proper equipment for prompt transportation of the injured person to a physician or hospital, or a communication system for contacting necessary ambulance service, shall be provided.
- (f)
- (1) In areas where 911 emergency dispatch services are not available, the telephone numbers of the physicians, hospitals, or ambulances shall be conspicuously posted.
  - (2) In areas where 911 emergency dispatch services are available and an employer uses a communication system for contacting necessary emergency-medical service, the employer must:
    - (i) Ensure that the communication system is effective in contacting the emergency-medical service; and
    - (ii)
      - (A) When using a communication system in an area that does not automatically supply the caller's latitude and longitude information to the 911 emergency dispatcher, the employer must post in a conspicuous location at the worksite either:
        - (1) The latitude and longitude of the worksite; or
        - (2) Other location-identification information that communicates effectively to employees the location of the worksite.
      - (B) The requirement specified in paragraph (f)(2)(ii)(A) of this section does not apply to worksites with readily available telephone land lines that have 911 emergency service that automatically identifies the location of the caller.
- (g) Where the eyes or body of any person may be exposed to injurious corrosive materials, suitable facilities for quick drenching or flushing of the eyes and body shall be provided within the work area for immediate emergency use.

## Appendix A to 1926.50 First Aid Kits (Non-mandatory)

First aid supplies are required to be easily accessible under paragraph 1926.50(d)(1). An example of the minimal contents of a generic first aid kit is described in American National Standard (ANSI) Z308.1-1978 "Minimum Requirements for Industrial Unit-Type First aid Kits." The contents of the kit listed in the ANSI standard should be adequate for small work sites. When larger operations or multiple operations are being conducted at the same location, employers should determine the need for additional first aid kits at the worksite, additional types of first aid equipment and supplies and additional quantities and types of supplies and equipment in the first aid kits.

In a similar fashion, employers who have unique or changing first-aid needs in their workplace, may need to enhance their first-aid kits. The employer can use the OSHA 300 log, OSHA 301 log or other reports to identify these unique problems. Consultation from the local Fire/Rescue Department, appropriate medical professional, or local emergency room may be helpful to employers in these circumstances. By assessing the specific needs of their workplace, employers can ensure that reasonably anticipated supplies are available. Employers should assess the specific needs of their worksite periodically and augment the first-aid kit appropriately.

If it is reasonably anticipated employees will be exposed to blood or other potentially infectious materials while using first-aid supplies, employers should provide personal protective equipment (PPE). Appropriate PPE includes gloves, gowns, face shields, masks and eye protection (see "Occupational Exposure to Bloodborne Pathogens," 29 CFR 1910.1030(d)(3)) (56 FR 64175).

Stat. Auth.: ORS 654.025(2) and 656.726(4).

Stats. Implemented: ORS 654.001 through 654.295.

OR-OSHA Admin. Order 1-2012, f. 4/10/12, ef. 4/10/12.

## 1926.51 Sanitation

### (a) Potable water.

- (1) An adequate supply of potable water shall be provided in all places of employment.
- (2) Portable containers used to dispense drinking water shall be capable of being tightly closed, and equipped with a tap. Water shall not be dipped from containers.
- (3) Any container used to distribute drinking water shall be clearly marked as to the nature of its contents and not used for any other purpose.
- (4) The common drinking cup is prohibited.
- (5) Where single service cups (to be used but once) are supplied, both a sanitary container for the unused cups and a receptacle for disposing of the used cups shall be provided.
- (6) **“Potable water”** means water that meets the standards for drinking purposes by the State or local authority having jurisdiction, or water that meets the quality standards prescribed by the U.S. Environmental Protection Agency’s National Primary Drinking Water Regulations (40 CFR Part 141).

### 437-003-0015 *Drinking Water*

- (1) *Potable water means water meeting the bacteriological and chemical quality requirements prescribed in the OAR Chapter 333, Division 61, Public Water Systems, of the Oregon State Health Division.*
- (2) *In addition to and not in lieu of any provisions in 1926.51(a), drinking water containers shall be constructed of materials that maintain water quality, shall be refilled daily or more often as necessary, shall be kept covered, and shall be regularly cleaned.*

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats Implemented: ORS 654.001 through 654.295.  
Hist: APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89.  
OR-OSHA Admin. Order 4-2011, f. 12/8/11, ef. 12/8/11.

### 1926.51 (b) Nonpotable water.

- (1) Outlets for nonpotable water, such as water for industrial or firefighting purposes only, shall be identified by signs meeting the requirements of Subpart G of this part, to indicate clearly that the water is unsafe and is not to be used for drinking, washing, or cooking purposes.
- (2) There shall be no cross-connection, open or potential, between a system furnishing potable water and a system furnishing nonpotable water.

(c) Toilets at construction jobsites.

- (1) Toilets shall be provided for employees according to the following table:

Table D-1

Number of employee	Minimum number of facilities
20 or less	1
20 or more	1 toilet seat and 1 urinal per 40 workers
200 or more	1 toilet seat and 1 urinal per 50 workers

- (2) Under temporary field conditions, provisions shall be made to assure not less than one toilet facility is available.
- (3) Job sites, not provided with a sanitary sewer, shall be provided with one of the following toilet facilities unless prohibited by local codes:
  - (i) Privies (where their use will not contaminate ground or surface water);
  - (ii) Chemical toilets;
  - (iii) Recirculating toilets;
  - (iv) Combustion toilets.
- (4) The requirements of this paragraph, (c) for sanitation facilities shall not apply to mobile crews having transportation readily available to nearby toilet facilities.

(d) Food handling.

- (1) All employees' food service facilities and operations shall meet the applicable laws, ordinances, and regulations of the jurisdictions in which they are located.

- (2) All employee food service facilities and operations shall be carried out in accordance with sound hygienic principles. In all places of employment where all or part of the food service is provided, the food dispensed shall be wholesome, free from spoilage, and shall be processed, prepared, handled, and stored in such a manner as to be protected against contamination.
- (e) Temporary sleeping quarters. When temporary sleeping quarters are provided, they shall be heated, ventilated, and lighted
- Note:** Oregon does not have 1926.51(f). Please refer to OAR 437-002-0141(5) Washing Facilities, in Division 2/J.
- (g) Eating and drinking areas. No employee shall be allowed to consume food or beverages in a toilet room nor in any area exposed to a toxic material.
- (h) Vermin control. Every enclosed workplace shall be so constructed, equipped, and maintained, so far as reasonably practicable, as to prevent the entrance or harborage of rodents, insects, and other vermin. A continuing and effective extermination program shall be instituted where their presence is detected.
- (i) Change rooms. Whenever employees are required by a particular standard to wear protective clothing because of the possibility of contamination with toxic materials, change rooms equipped with storage facilities for street clothes and separate storage facilities for the protective clothing shall be provided.

## **437-003-0020 Toilets**

*In addition to and not in lieu of any provisions in 26 CFR 1926.51(c):*

- (1) *At the site of every project with an estimated cost of \$1,000,000 or more, the employer or owner of such place of employment shall provide flush toilet facilities in accordance with subparagraph (1) of 29 CFR 1926.51(c) and washing facilities which include wash basins, warm water and soap.*

**Note:** *Section (1) of this rule does not apply to highway construction or maintenance projects or to electricity, water, sewer or gas transmission facility construction or maintenance projects. The director may, by order, exempt or partially exempt, individual or classes of construction projects from the requirements of section (1) of this rule when conditions are such that compliance is impractical or impossible.*

- (2) *Where toilet facilities will not be used by women, urinals may be provided instead of toilets, except that the number of toilets in such cases shall not be reduced to less than 2/3 of the minimum specified.*
- (3) *Toilets and toilet area shall be maintained in good repair and in a clean and sanitary condition.*

Stat. Auth.: ORS 654.025(2) and 656.726(4).

Stat. Implemented: ORS 654.150.

## 1926.52 Occupational Noise Exposure

**Note:** 1926.52 was not adopted by the Department. In Oregon, 437-003-0027 applies:

### **437-003-0027 Applicable Rules**

*Whenever any employee is exposed to noise in the workplace, the requirements of OAR 437, Division 2/G, 1910.95, Occupational Noise Exposure, shall apply.*

Stat. Auth.: ORS 654.025(2) and 656.726(4).

Stat. Implemented: ORS 654.001 through 654.295.

Hist: APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89.

## 1926.53 Ionizing Radiation

- (a) In construction and related activities involving the use of sources of ionizing radiation, the pertinent provisions of the Atomic Energy Commission's Standards for Protection Against Radiation (10 CFR Part 20), relating to protection against occupational radiation exposure, shall apply.
- (b) Any activity which involves the use of radioactive materials or X-rays, whether or not under license from the Atomic Energy Commission, shall be performed by competent persons specially trained in the proper and safe operation of such equipment. In the case of materials used under Commission license, only persons actually licensed, or competent persons under direction and supervision of the licensee, shall perform such work.
- (c) through (r) Reserved.

**Note:** The requirements applicable to construction work under paragraphs (c) through (r) of this section are identical to those set forth at paragraphs (a) through (p) of 1910.1096 of this chapter.

[44 FR 8577, Feb. 9, 1979; 44 FR 20940, Apr. 6, 1979, as amended at 61 FR 5510, Feb. 13, 1996; 61 FR 31431, June 20, 1996]

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stat. Implemented: ORS 654.001 through 654.295.  
Hist: APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

## 1926.54 Nonionizing Radiation

- (a) Only qualified and trained employees shall be assigned to install, adjust, and operate laser equipment.
- (b) Proof of qualification of the laser equipment operator shall be available and in possession of the operator at all times.
- (c) Employees, when working in areas in which a potential exposure to direct or reflected laser light greater than 0.005 watts (5 milliwatts) exists, shall be provided with antilaser eye protection devices as specified in Subpart E of this part.
- (d) Areas in which lasers are used shall be posted with standard laser warning placards.
- (e) Beam shutters or caps shall be utilized, or the laser turned off, when laser transmission is not actually required. When the laser is left unattended for a substantial period of time, such as during lunch hour, overnight, or at change of shifts, the laser shall be turned off.
- (f) Only mechanical or electronic means shall be used as a detector for guiding the internal alignment of the laser.
- (g) The laser beam shall not be directed at employees.
- (h) When it is raining or snowing, or when there is dust or fog in the air, the operation of laser systems shall be prohibited where practicable; in any event, employees shall be kept out of range of the area of source and target during such weather conditions.
- (i) Laser equipment shall bear a label to indicate maximum output.
- (j) Employees shall not be exposed to light intensities above:
  - (1) Direct staring: 1 micro-watt per square centimeter;
  - (2) Incidental observing: 1 milliwatt per square centimeter;
  - (3) Diffused reflected light: 2-1/2 watts per square centimeter.
- (k) Laser unit in operation should be set up above the heads of the employees, when possible.

(l) Employees shall not be exposed to microwave power densities in excess of 10 milliwatts per square centimeter.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
 Stat. Implemented: ORS 654.001 through 654.295.  
 Hist: APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
 APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

**1926.55 Gases, Vapors, Fumes, Dusts, and Mists**

**Note:** 1926.55 was not adopted by the Department. In Oregon, OAR 437-003-1000 applies.

**1926.56 Illumination**

(a) General. Construction areas, ramps, runways, corridors, offices, shops, and storage areas shall be lighted to not less than the minimum illumination intensities listed in Table D-3 while any work is in progress:

Table D-3 - Minimum Illumination Intensities in Foot-Candles

Foot candles	Area or operation
5	General construction area lighting.
3	General construction areas, concrete placement, excavation and waste areas, access ways, active storage areas, loading platforms, refueling, and field maintenance areas.
5	Indoors: warehouses, corridors, hallways, and exit ways.
5	Tunnels, shafts, and general underground work areas: (Exception: minimum of 10 foot-candles is required at tunnel and shaft heading during drilling, mucking, and scaling. Bureau of Mines approved cap lights shall be acceptable for use in the tunnel heading.)
10	General construction plant and shops (e.g., batch plants, screening plants, mechanical and electrical equipment rooms, carpenter shops, rigging lofts and active storerooms, barracks or living quarters, locker or dressing rooms, mess halls, and indoor toilets and workrooms).
30	First aid stations, infirmaries, and offices.

(b) Other areas. For areas or operations not covered above, refer to the American National Standard A11.1-1965, R1970, Practice for Industrial Lighting, for recommended values of illumination.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
 Stat. Implemented: ORS 654.001 through 654.295.  
 Hist: APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
 APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

**1926.57 Ventilation**

- (a) General. Whenever hazardous substances such as dusts, fumes, mists, vapors, or gases exist or are produced in the course of construction work, their concentrations shall not exceed the limits specified in 1926.55(a). When ventilation is used as an engineering control method, the system shall be installed and operated according to the requirements of this section.
- (b) Local exhaust ventilation. Local exhaust ventilation when used as described in (a) shall be designed to prevent dispersion into the air of dusts, fumes, mists, vapors, and gases in concentrations causing harmful exposure. Such exhaust systems shall be so designed that dusts, fumes, mists, vapors, or gases are not drawn through the work area of employees.
- (c) Design and operation. Exhaust fans, jets, ducts, hoods, separators, and all necessary appurtenances, including refuse receptacles, shall be so designed, constructed, maintained and operated as to ensure the required protection by maintaining a volume and velocity of exhaust air sufficient to gather dusts, fumes, vapors, or gases from said equipment or process, and to convey them to suitable points of safe disposal, thereby preventing their dispersion in harmful quantities into the atmosphere where employees work.
- (d) Duration of operations.
- (1) The exhaust system shall be in operation continually during all operations which it is designed to serve. If the employee remains in the contaminated zone, the system shall continue to operate after the cessation of said operations, the length of time to depend upon the individual circumstances and effectiveness of the general ventilation system.
  - (2) Since dust capable of causing disability is, according to the best medical opinion, of microscopic size, tending to remain for hours in suspension in still air, it is essential that the exhaust system be continued in operation for a time after the work process or equipment served by the same shall have ceased, in order to ensure the removal of the harmful elements to the required extent. For the same reason, employees wearing respiratory equipment should not remove same immediately until the atmosphere seems clear.

(e) Disposal of exhaust materials. The air outlet from every dust separator, and the dusts, fumes, mists, vapors, or gases collected by an exhaust or ventilating system shall discharge to the outside atmosphere. Collecting systems which return air to work area may be used if concentrations which accumulate in the work area air do not result in harmful exposure to employees. Dust and refuse discharged from an exhaust system shall be disposed of in such a manner that it will not result in harmful exposure to employees.

(f) Abrasive blasting.

(1) Definitions applicable to this paragraph.

- (i) **Abrasive.** A solid substance used in an abrasive blasting operation.
- (ii) **Abrasive-blasting respirator.** A respirator constructed so that it covers the wearer's head, neck, and shoulders to protect the wearer from rebounding abrasive.
- (iii) **Blast cleaning barrel.** A complete enclosure which rotates on an axis, or which has an internal moving tread to tumble the parts, in order to expose various surfaces of the parts to the action of an automatic blast spray.
- (iv) **Blast cleaning room.** A complete enclosure in which blasting operations are performed and where the operator works inside of the room to operate the blasting nozzle and direct the flow of the abrasive material.
- (v) **Blasting cabinet.** An enclosure where the operator stands outside and operates the blasting nozzle through an opening or openings in the enclosure.
- (vi) **Clean air.** Air of such purity that it will not cause harm or discomfort to an individual if it is inhaled for extended periods of time.
- (vii) **Dust collector.** A device or combination of devices for separating dust from the air handled by an exhaust ventilation system.
- (viii) **Exhaust ventilation system.** A system for removing contaminated air from a space, comprising two or more of the following elements (A) enclosure or hood, (B) duct work, (C) dust collecting equipment, (D) exhauster, and (E) discharge stack.
- (ix) **Particulate-filter respirator.** An air purifying respirator, commonly referred to as a dust or a fume respirator, which removes most of the dust or fume from the air passing through the device.

- (x) **Respirable dust.** Airborne dust in sizes capable of passing through the upper respiratory system to reach the lower lung passages.
  - (xi) **Rotary blast cleaning table.** An enclosure where the pieces to be cleaned are positioned on a rotating table and are passed automatically through a series of blast sprays.
  - (xii) **Abrasive blasting.** The forcible application of an abrasive to a surface by pneumatic pressure, hydraulic pressure, or centrifugal force.
- (2) Dust hazards from abrasive blasting.
- (i) Abrasives and the surface coatings on the materials blasted are shattered and pulverized during blasting operations and the dust formed will contain particles of respirable size. The composition and toxicity of the dust from these sources shall be considered in making an evaluation of the potential health hazards.
  - (ii) The concentration of respirable dust or fume in the breathing zone of the abrasive-blasting operator or any other worker shall be kept below the levels specified in 1926.55 or other pertinent sections of this part.
  - (iii) Organic abrasives which are combustible shall be used only in automatic systems. Where flammable or explosive dust mixtures may be present, the construction of the equipment, including the exhaust system and all electric wiring, shall conform to the requirements of American National Standard Installation of Blower and Exhaust Systems for Dust, Stock, and Vapor Removal or Conveying, Z33.1-1961 (NFPA 91-1961), and Subpart S of this part. The blast nozzle shall be bonded and grounded to prevent the build up of static charges. Where flammable or explosive dust mixtures may be present, the abrasive blasting enclosure, the ducts, and the dust collector shall be constructed with loose panels or explosion venting areas, located on sides away from any occupied area, to provide for pressure relief in case of explosion, following the principles set forth in the National Fire Protection Association Explosion Venting Guide, NFPA 68-1954.
- (3) Blast-cleaning enclosures.
- (i) Blast-cleaning enclosures shall be exhaust ventilated in such a way that a continuous inward flow of air will be maintained at all openings in the enclosure during the blasting operation.

- (A) All air inlets and access openings shall be baffled or so arranged that by the combination of inward air flow and baffling the escape of abrasive or dust particles into an adjacent work area will be minimized and visible spurts of dust will not be observed.
- (B) The rate of exhaust shall be sufficient to provide prompt clearance of the dust-laden air within the enclosure after the cessation of blasting.
- (C) Before the enclosure is opened, the blast shall be turned off and the exhaust system shall be run for a sufficient period of time to remove the dusty air within the enclosure.
- (D) Safety glass protected by screening shall be used in observation windows, where hard deep-cutting abrasives are used.
- (E) Slit abrasive-resistant baffles shall be installed in multiple sets at all small access openings where dust might escape, and shall be inspected regularly and replaced when needed.
  - (1) Doors shall be flanged and tight when closed.
  - (2) Doors on blast-cleaning rooms shall be operable from both inside and outside, except that where there is a small operator access door, the large work access door may be closed or opened from the outside only.

(4) Exhaust ventilation systems.

- (i) The construction, installation, inspection, and maintenance of exhaust systems shall conform to the principles and requirements set forth in American National Standard Fundamentals Governing the Design and Operation of Local Exhaust Systems, Z9.2-1960, and ANSI Z33.1-1961.
  - (A) When dust leaks are noted, repairs shall be made as soon as possible.
  - (B) The static pressure drop at the exhaust ducts leading from the equipment shall be checked when the installation is completed and periodically thereafter to assure continued satisfactory operation. Whenever an appreciable change in the pressure drop indicates a partial blockage, the system shall be cleaned and returned to normal operating condition.
- (ii) In installations where the abrasive is recirculated, the exhaust ventilation system for the blasting enclosure shall not be relied upon for the removal of fines from the spent abrasive instead of an abrasive separator. An abrasive separator shall be provided for the purpose.

- (iii) The air exhausted from blast-cleaning equipment shall be discharged through dust collecting equipment. Dust collectors shall be set up so that the accumulated dust can be emptied and removed without contaminating other working areas.

(5) Personal protective equipment.

- (i) Employers must use only respirators approved by NIOSH under 42 CFR part 84 for protecting employees from dusts produced during abrasive-blasting operations.
- (ii) Abrasive-blasting respirators shall be worn by all abrasive-blasting operators:
  - (A) When working inside of blast-cleaning rooms, or
  - (B) When using silica sand in manual blasting operations where the nozzle and blast are not physically separated from the operator in an exhaust ventilated enclosure, or
  - (C) Where concentrations of toxic dust dispersed by the abrasive blasting may exceed the limits set in 1926.55 or other pertinent part sections of this part and the nozzle and blast are not physically separated from the operator in an exhaust-ventilated enclosure.
- (iii) Properly fitted particulate-filter respirators, commonly referred to as dust-filter respirators, may be used for short, intermittent, or occasional dust exposures such as cleanup, dumping of dust collectors, or unloading shipments of sand at a receiving point when it is not feasible to control the dust by enclosure, exhaust ventilation, or other means. The respirators used must be approved by NIOSH under 42 CFR part 84 for protection against the specific type of dust encountered.
- (iv) A respiratory protection program as defined and described in 1926.103, shall be established wherever it is necessary to use respiratory protective equipment.
- (v) Operators shall be equipped with heavy canvas or leather gloves and aprons or equivalent protection to protect them from the impact of abrasives. Safety shoes shall be worn to protect against foot injury where heavy pieces of work are handled.
  - (A) Safety shoes shall conform to the requirements of American National Standard for Men's Safety-Toe Footwear, Z41.1-1967.

- (B) Equipment for protection of the eyes and face shall be supplied to the operator when the respirator design does not provide such protection and to any other personnel working in the vicinity of abrasive blasting operations. This equipment shall conform to the requirements of 1926.102.
- (6) Air supply and air compressors. Air for abrasive-blasting respirators must be free of harmful quantities of dusts, mists, or noxious gases, and must meet the requirements for supplied-air quality and use specified in 29 CFR 1910.134(i).
- (7) Operational procedures and general safety. Dust shall not be permitted to accumulate on the floor or on ledges outside of an abrasive-blasting enclosure, and dust spills shall be cleaned up promptly. Aisles and walkways shall be kept clear of steel shot or similar abrasive which may create a slipping hazard.
- (8) Scope. This paragraph applies to all operations where an abrasive is forcibly applied to a surface by pneumatic or hydraulic pressure, or by centrifugal force. It does not apply to steam blasting, or steam cleaning, or hydraulic cleaning methods where work is done without the aid of abrasives.
- (g) Grinding, polishing, and buffing operations.
- (1) Definitions applicable to this paragraph.
- (i) **Abrasive cutting-off wheels.** Organic-bonded wheels, the thickness of which is not more than one forty-eighth of their diameter for those up to, and including, 20 inches (50.8 cm) in diameter, and not more than one-sixtieth of their diameter for those larger than 20 inches (50.8 cm) in diameter, used for a multitude of operations variously known as cutting, cutting off, grooving, slotting, coping, and jointing, and the like. The wheels may be "solid" consisting of organic-bonded abrasive material throughout, "steel centered" consisting of a steel disc with a rim of organic-bonded material moulded around the periphery, or of the "inserted tooth" type consisting of a steel disc with organic-bonded abrasive teeth or inserts mechanically secured around the periphery.
- (ii) **Belts.** All power-driven, flexible, coated bands used for grinding, polishing, or buffing purposes.
- (iii) **Branch pipe.** The part of an exhaust system piping that is connected directly to the hood or enclosure.
- (iv) **Cradle.** A movable fixture, upon which the part to be ground or polished is placed.

- (v) **Disc wheels.** All power-driven rotatable discs faced with abrasive materials, artificial or natural, and used for grinding or polishing on the side of the assembled disc.
- (vi) **Entry loss.** The loss in static pressure caused by air flowing into a duct or hood. It is usually expressed in inches of water gauge.
- (vii) **Exhaust system.** A system consisting of branch pipes connected to hoods or enclosures, one or more header pipes, an exhaust fan, means for separating solid contaminants from the air flowing in the system, and a discharge stack to outside.
- (viii) **Grinding wheels.** All power-driven rotatable grinding or abrasive wheels, except disc wheels as defined in this standard, consisting of abrasive particles held together by artificial or natural bonds and used for peripheral grinding.
- (ix) **Header pipe (main pipe).** A pipe into which one or more branch pipes enter and which connects such branch pipes to the remainder of the exhaust system.
- (x) **Hoods and enclosures.** The partial or complete enclosure around the wheel or disc through which air enters an exhaust system during operation.
- (xi) **Horizontal double-spindle disc grinder.** A grinding machine carrying two power-driven, rotatable, coaxial, horizontal spindles upon the inside ends of which are mounted abrasive disc wheels used for grinding two surfaces simultaneously.
- (xii) **Horizontal single-spindle disc grinder.** A grinding machine carrying an abrasive disc wheel upon one or both ends of a power-driven, rotatable single horizontal spindle.
- (xiii) **Polishing and buffing wheels.** All power-driven rotatable wheels composed all or in part of textile fabrics, wood, felt, leather, paper, and may be coated with abrasives on the periphery of the wheel for purposes of polishing, buffing, and light grinding.
- (xiv) **Portable grinder.** Any power-driven rotatable grinding, polishing, or buffing wheel mounted in such manner that it may be manually manipulated.
- (xv) **Scratch brush wheels.** All power-driven rotatable wheels made from wire or bristles, and used for scratch cleaning and brushing purposes.

- (xvi) **Swing-frame grinder.** Any power-driven rotatable grinding, polishing, or buffing wheel mounted in such a manner that the wheel with its supporting framework can be manipulated over stationary objects.
- (xvii) **Velocity pressure (vp).** The kinetic pressure in the direction of flow necessary to cause a fluid at rest to flow at a given velocity. It is usually expressed in inches of water gauge.
- (xviii) **Vertical spindle disc grinder.** A grinding machine having a vertical, rotatable power-driven spindle carrying a horizontal abrasive disc wheel.
- (2) Application. Wherever dry grinding, dry polishing or buffing is performed, and employee exposure, without regard to the use of respirators, exceeds the permissible exposure limits prescribed in 1926.55 or other pertinent sections of this part, a local exhaust ventilation system shall be provided and used to maintain employee exposures within the prescribed limits.
- (3) Hood and branch pipe requirements.
- (i) Hoods connected to exhaust systems shall be used, and such hoods shall be designed, located, and placed so that the dust or dirt particles shall fall or be projected into the hoods in the direction of the air flow. No wheels, discs, straps, or belts shall be operated in such manner and in such direction as to cause the dust and dirt particles to be thrown into the operator's breathing zone.
- (ii) Grinding wheels on floor stands, pedestals, benches, and special-purpose grinding machines and abrasive cutting-off wheels shall have not less than the minimum exhaust volumes shown in Table D-57.1 with a recommended minimum duct velocity of 4,500 feet per minute in the branch and 3,500 feet per minute in the main. The entry losses from all hoods except the vertical-spindle disc grinder hood, shall equal 0.65 velocity pressure for a straight takeoff and 0.45 velocity pressure for a tapered takeoff. The entry loss for the vertical-spindle disc grinder hood is shown in figure D-57.1 (following paragraph (g) of this section).

Table D-57.1 - Grinding and Abrasive Cutting-Off Wheels

Wheel diameter, inches (cm)	Wheel width, inches (cm)	Minimum exhaust volume (feet <sup>3</sup> /min.)
To 9 (22.86)	1½ (3.81)	220
Over 9 to 16 (22.86 to 40.64)	2 (5.08)	390
Over 16 to 19 (40.64 to 48.26)	3 (7.62)	500
Over 19 to 24 (48.26 to 60.96)	4 (10.16)	610
Over 24 to 30 (60.96 to 76.2)	5 (12.7)	880
Over 30 to 36 (76.2 to 91.44)	6 (15.24)	1,200

For any wheel wider than wheel diameters shown in Table D-57.1, increase the exhaust volume by the ratio of the new width to the width shown.

Example:

If wheel width = 4½ inches (11.43 cm), then  $4.5 \div 4 \times 610 = 686$  (rounded to 690).

- (iii) Scratch-brush wheels and all buffing and polishing wheels mounted on floor stands, pedestals, benches, or special-purpose machines shall have not less than the minimum exhaust volume shown in Table D-57.2.

Table D-57.2 - Buffing and Polishing Wheels

Wheel diameter, inches (cm)	Wheel width, inches (cm)	Minimum exhaust volume (feet <sup>3</sup> /min.)
To 9 (22.86)	2 (5.08)	300
Over 9 to 16 (22.86 to 40.64)	3 (7.62)	500
Over 16 to 19 (40.64 to 48.26)	4 (10.16)	610
Over 19 to 24 (48.26 to 60.96)	5 (12.7)	740
Over 24 to 30 (60.96 to 76.2)	6 (15.24)	1,040
Over 30 to 36 (76.2 to 91.44)	6 (15.24)	1,200

- (iv) Grinding wheels or discs for horizontal single-spindle disc grinders shall be hooded to collect the dust or dirt generated by the grinding operation and the hoods shall be connected to branch pipes having exhaust volumes as shown in Table D-57.3.

Table D-57.3 - Horizontal Single-Spindle Disc Grinder

Disc diameter, inches (cm)	Exhaust volume (ft. <sup>3</sup> /min.)
Up to 12 (30.48)	220
Over 12 to 19 (30.48 to 48.26)	390
Over 19 to 30 (48.26 to 76.2)	610
Over 30 to 36 (76.2 to 91.44)	880

(v) Grinding wheels or discs for horizontal double-spindle disc grinders shall have a hood enclosing the grinding chamber and the hood shall be connected to one or more branch pipes having exhaust volumes as shown in Table D-57.4.

Table D-57.4 - Horizontal Double-Spindle Disc Grinder

Disc diameter, inches (cm)	Exhaust volume (ft. <sup>3</sup> /min.)
Up to 19 (48.26)	610
Over 19 to 25 (48.26 to 63.5)	880
Over 25 to 30 (63.5 to 76.2)	1,200
Over 30 to 53 (76.2 to 134.62)	1,770
Over 53 to 72 (134.62 to 182.88)	6,280

(vi) Grinding wheels or discs for vertical single-spindle disc grinders shall be encircled with hoods to remove the dust generated in the operation. The hoods shall be connected to one or more branch pipes having exhaust volumes as shown in Table D-57.5.

Table D-57.5 - Vertical Spindle Disc Grinder

Disc diameter, inches (cm)	One-half or more of disc covered		Disc not covered	
	Number <sup>1</sup>	Exhaust foot <sup>3</sup> /min.	Number <sup>1</sup>	Exhaust foot <sup>3</sup> /min.
Up to 20 (50.8)	1	500	2	780
Over 20 to 30 (50.8 to 76.2)	2	780	2	1,480
Over 30 to 53 (76.2 to 134.62)	2	1,770	4	3,530
Over 53 to 72 (134.62 to 182.88)	2	3,140	5	6,010

<sup>1</sup>Number of exhaust outlets around periphery of hood, or equal distribution provided by other means

(vii) Grinding and polishing belts shall be provided with hoods to remove dust and dirt generated in the operations and the hoods shall be connected to branch pipes having exhaust volumes as shown in Table D-57.6

Table D-57.6 - Grinding and Polishing Belts

Belts width, inches (cm)	Exhaust volume (ft. <sup>3</sup> /min.)
Up to 3 (7.62)	220
Over 3 to 5 (7.62 to 12.7)	300
Over 5 to 7 (12.7 to 17.78)	390
Over 7 to 9 (17.78 to 22.86)	500
Over 9 to 11 (22.86 to 27.94)	610
Over 11 to 13 (27.94 to 33.02)	740

(viii) Cradles and swing-frame grinders. Where cradles are used for handling the parts to be ground, polished, or buffed, requiring large partial enclosures to house the complete operation, a minimum average air velocity of 150 feet per minute shall be maintained over the entire opening of the enclosure. Swing-frame grinders shall also be exhausted in the same manner as provided for cradles. (See fig. D-57.3)

(ix) Where the work is outside the hood, air volumes must be increased as shown in American Standard Fundamentals Governing the Design and Operation of Local Exhaust Systems, Z9.2-1960 (section 4, exhaust hoods).

(4) Exhaust systems.

(i) Exhaust systems for grinding, polishing, and buffing operations should be designed in accordance with American Standard Fundamentals Governing the Design and Operation of Local Exhaust Systems, Z9.2-1960.

(ii) Exhaust systems for grinding, polishing, and buffing operations shall be tested in the manner described in American Standard Fundamentals Governing the Design and Operation of Local Exhaust Systems, Z9.2-1960.

(iii) All exhaust systems shall be provided with suitable dust collectors.

(5) Hood and enclosure design.

(i)

(A) It is the dual function of grinding and abrasive cutting-off wheel hoods to protect the operator from the hazards of bursting wheels as well as to provide a means for the removal of dust and dirt generated. All hoods shall be not less in structural strength than specified in the American National Standard Safety Code for the Use, Care, and Protection of Abrasive Wheels, B7.1-1970.

- (B) Due to the variety of work and types of grinding machines employed, it is necessary to develop hoods adaptable to the particular machine in question, and such hoods shall be located as close as possible to the operation.
- (ii) Exhaust hoods for floor stands, pedestals, and bench grinders shall be designed in accordance with figure D-57.2. The adjustable tongue shown in the figure shall be kept in working order and shall be adjusted within one-fourth inch (0.635 cm) of the wheel periphery at all times.
  - (iii) Swing-frame grinders shall be provided with exhaust booths as indicated in figure D-57.3.
  - (iv) Portable grinding operations, whenever the nature of the work permits, shall be conducted within a partial enclosure. The opening in the enclosure shall be no larger than is actually required in the operation and an average face air velocity of not less than 200 feet per minute shall be maintained.
  - (v) Hoods for polishing and buffing and scratch-brush wheels shall be constructed to conform as closely to figure D-57.4 as the nature of the work will permit.
  - (vi) Cradle grinding and polishing operations shall be performed within a partial enclosure similar to figure D-57.5. The operator shall be positioned outside the working face of the opening of the enclosure. The face opening of the enclosure should not be any greater in area than that actually required for the performance of the operation and the average air velocity into the working face of the enclosure shall not be less than 150 feet per minute.
  - (vii) Hoods for horizontal single-spindle disc grinders shall be constructed to conform as closely as possible to the hood shown in figure D-57.6. It is essential that there be a space between the back of the wheel and the hood, and a space around the periphery of the wheel of at least 1 inch (2.54 cm) in order to permit the suction to act around the wheel periphery. The opening on the side of the disc shall be no larger than is required for the grinding operation, but must never be less than twice the area of the branch outlet.
  - (viii) Horizontal double-spindle disc grinders shall have a hood encircling the wheels and grinding chamber similar to that illustrated in figure D-57.7. The openings for passing the work into the grinding chamber should be kept as small as possible, but must never be less than twice the area of the branch outlets.

- (ix) Vertical-spindle disc grinders shall be encircled with a hood so constructed that the heavy dust is drawn off a surface of the disc and the lighter dust exhausted through a continuous slot at the top of the hood as shown in figure D-57.1.
- (x) Grinding and polishing belt hoods shall be constructed as close to the operation as possible. The hood should extend almost to the belt, and 1-inch (2.54 cm) wide openings should be provided on either side. Figure D-57.8 shows a typical hood for a belt operation.

Figure D-57.1 - Vertical Spindle Disc Grinder Exhaust Hood and Branch Pipe Connections

Dia <i>D</i> . inches (cm)		Exhaust <i>E</i>		Volume Exhausted at 4,500 ft/min ft <sup>3</sup> /min	Notes
Min.	Max.	No Pipes	Dia.		
	20 (50.8)	1	4¼ (10.795)	500	When one-half or more of the disc can be hooded, use exhaust ducts as shown at the left.
Over 20 (50.8)	30 (76.2)	2	4 (10.16)	780	
Over 30 (76.2)	72 (182.88)	2	6 (15.24)	1,770	
Over 53 (134.62)	72 (182.88)	2	8 (20.32)	3,140	
	20 (50.8)	2	4 (10.16)	780	When no hood can be used over disc, use exhaust ducts as shown at left.
Over 20 (50.8)	20 (50.8)	2	4 (10.16)	780	
Over 30 (76.2)	30 (76.2)	2	5½ (13.97)	1,480	
Over 53 (134.62)	53 (134.62)	4	6 (15.24)	3,530	
	72 (182.88)	5	7 (17.78)	6,010	

Entry loss = 1.0 slot velocity pressure + 0.5 branch velocity pressure.  
 Minimum slot velocity = 2,000 ft/min - ½-inch (1.27 cm) slot width.

Figure D-57.2 - Standard Grinder Hood

Wheel dimension, inches (centimeters)			Exhaust outlet, inches (centimeters) <i>E</i>	Volume of air at 4,500 ft/min
Diameter		Width, Max		
Min = <i>d</i>	Max = <i>D</i>			
	9 (22.86)	1½ (3.81)	3	220
Over 9 (22.86)	16 (40.64)	2 (5.08)	4	390
Over 16 (40.64)	19 (48.26)	3 (7.62)	4½	500
Over 19 (48.26)	24 (60.96)	4 (10.16)	5	610
Over 24 (60.96)	30 (76.2)	5 (12.7)	6	880
Over 30 (76.2)	36 (91.44)	6 (15.24)	7	1,200

Entry loss = 0.45 velocity pressure for tapered takeoff; 0.65 velocity pressure for straight takeoff.

Figure D-57.3 A Method of Applying an Exhaust Enclosure to Swing-Frame Grinders

**Note:** Baffle to reduce front opening as much as possible

Figure D-57.4 - Standard Buffing and Polishing Hood

Wheel dimension, inches (centimeters)		Width, Max	Exhaust outlet, inches $E$	Volume of air at 4,500 ft/min
Diameter				
Min = $d$	Max = $D$			
	9 (22.86)	2 (5.08)	3½ (3.81)	300
Over 9 (22.86)	16 (40.64)	3 (5.08)	4	500
Over 16 (40.64)	19 (48.26)	4 (11.43)	5	610
Over 19 (48.26)	24 (60.96)	5 (12.7)	5½	740
Over 24 (60.96)	30 (76.2)	6 (15.24)	6½	1,040
Over 30 (76.2)	36 (91.44)	6 (15.24)	7	1,200

Entry loss = 0.15 velocity pressure for tapered takeoff; 0.65 velocity pressure for straight takeoff.

MINIMUM VELOCITY IN E IS 3,000 FT/MIN

VELOCITY AT ENCLOSURE FACE IS 150 FT/MIN

Figure D-57.5 - Cradle Polishing or Grinding Enclosure

Entry loss = 0.45 velocity pressure for tapered takeoff

Figure D-57.6 - Horizontal Single-Spindle Disc Grinder Exhaust Hood and Branch Pipe Connections

Dia $D$ , inches (centimeters)		Exhaust $E$ , dia. inches (cm)	Volume exhausted at 4,500 ft/min ft <sup>3</sup> /min
Min.	Max.		
	12 (30.48)	3 (7.6)	220
Over 12 (30.48)	19 (48.26)	4 (10.16)	390
Over 19 (48.26)	30 (76.2)	5 (12.7)	610
Over 30 (76.2)	36 (91.44)	6 (15.24)	880

**Note:** If grinding wheels are used for disc grinding purposes, hoods must conform to structural strength and materials as described in 9.1.

Entry loss = 0.45 velocity pressure for tapered takeoff.

Figure D-57.7 - Horizontal Double-Spindle Disc Grinder Exhaust Hood and Branch Pipe Connections

Disc dia. inches (centimeters)		Exhaust E		Volume exhaust at 4,500 ft/min. ft <sup>3</sup> /min	Notes
Min.	Max.	No Pipes	Dia.		
	19 (48.26)	1	5	610	When width "W" permits, exhaust ducts should be as near heaviest grinding as possible.
Over 19 (48.26)	25 (63.5)	1	6	880	
Over 25 (63.5)	30 (76.2)	1	7	1,200	
Over 30 (76.2)	53 (134.62)	2	6	1,770	
Over 53 (134.62)	72 (182.88)	4	8	6,280	

Entry loss = 0.45 velocity pressure for tapered takeoff.

Figure D-57.8 - A Typical Hood for a Belt Operation

Entry loss = 0.45 velocity pressure for tapered takeoff

Belt width W. inches (centimeters)	Exhaust volume, ft. <sup>3</sup> /min
Up to 3 (7.62)	220
3 to 5 (7.62 to 12.7)	300
5 to 7 (12.7 to 17.78)	390
7 to 9 (17.78 to 22.86)	500
9 to 11 (22.86 to 27.94)	610
11 to 13 (27.94 to 33.02)	740

Minimum duct velocity = 4,500 ft/min branch, 3,500 ft/min main.

Entry loss = 0.45 velocity pressure for tapered takeoff; 0.65 velocity pressure for straight takeoff.

- (6) Scope. This paragraph (g), prescribes the use of exhaust hood enclosures and systems in removing dust, dirt, fumes, and gases generated through the grinding, polishing, or buffing of ferrous and nonferrous metals.
- (h) Spray finishing operations.
- (1) Definitions applicable to this paragraph.

- (i) Spray-finishing operations. Spray-finishing operations are employment of methods wherein organic or inorganic materials are utilized in dispersed form for deposit on surfaces to be coated, treated, or cleaned. Such methods of deposit may involve either automatic, manual, or electrostatic deposition but do not include metal spraying or metallizing, dipping, flow coating, roller coating, tumbling, centrifuging, or spray washing and degreasing as conducted in self-contained washing and degreasing machines or systems.
  - (ii) Spray booth. Spray booths are defined and described in 1926.66(a). (See sections 103, 104, and 105 of the Standard for Spray Finishing Using Flammable and Combustible Materials, NFPA No. 33-1969).
  - (iii) Spray room. A spray room is a room in which spray-finishing operations not conducted in a spray booth are performed separately from other areas.
  - (iv) Minimum maintained velocity. Minimum maintained velocity is the velocity of air movement which must be maintained in order to meet minimum specified requirements for health and safety.
- (2) Location and application. Spray booths or spray rooms are to be used to enclose or confine all operations. Spray-finishing operations shall be located as provided in sections 201 through 206 of the Standard for Spray Finishing Using Flammable and Combustible Materials, NFPA No. 33-1969.
- (3) Design and construction of spray booths.
- (i) Spray booths shall be designed and constructed in accordance with 1926.66 (b)(1) through (4) and (6) through (10) (see sections 301-304 and 306-310 of the Standard for Spray Finishing Using Flammable and Combustible Materials, NFPA No. 33-1969), for general construction specifications. For a more detailed discussion of fundamentals relating to this subject, see ANSI Z9.2-1960.
    - (A) Lights, motors, electrical equipment, and other sources of ignition shall conform to the requirements of 1926.66(b)(10) and (c). (See section 310 and chapter 4 of the Standard for Spray Finishing Using Flammable and Combustible Materials NFPA No. 33-1969.)
    - (B) In no case shall combustible material be used in the construction of a spray booth and supply or exhaust duct connected to it.

- (ii) Unobstructed walkways shall not be less than 6 1/2 feet (1.976 m) high and shall be maintained clear of obstruction from any work location in the booth to a booth exit or open booth front. In booths where the open front is the only exit, such exits shall be not less than 3 feet (0.912 m) wide. In booths having multiple exits, such exits shall not be less than 2 feet (0.608 m) wide, provided that the maximum distance from the work location to the exit is 25 feet (7.6 m) or less. Where booth exits are provided with doors, such doors shall open outward from the booth.
- (iii) Baffles, distribution plates, and dry-type overspray collectors shall conform to the requirements of 1926.66(b)(4) and (5). (See sections 304 and 305 of the Standard for Spray Finishing Using Flammable and Combustible Materials, NFPA No. 33-1969.)
  - (A) Overspray filters shall be installed and maintained in accordance with the requirements of 1926.66(b)(5), (see section 305 of the Standard for Spray Finishing Using Flammable and Combustible Materials, NFPA No. 33-1969), and shall only be in a location easily accessible for inspection, cleaning, or replacement.
  - (B) Where effective means, independent of the overspray filters, are installed which will result in design air distribution across the booth cross section, it is permissible to operate the booth without the filters in place.
- (iv)
  - (A) For wet or water-wash spray booths, the water-chamber enclosure, within which intimate contact of contaminated air and cleaning water or other cleaning medium is maintained, if made of steel, shall be 18 gage or heavier and adequately protected against corrosion.
  - (B) Chambers may include scrubber spray nozzles, headers, troughs, or other devices. Chambers shall be provided with adequate means for creating and maintaining scrubbing action for removal of particulate matter from the exhaust air stream.
- (v) Collecting tanks shall be of welded steel construction or other suitable non-combustible material. If pits are used as collecting tanks, they shall be concrete, masonry, or other material having similar properties.

- (A) Tanks shall be provided with weirs, skimmer plates, or screens to prevent sludge and floating paint from entering the pump suction box. Means for automatically maintaining the proper water level shall also be provided. Fresh water inlets shall not be submerged. They shall terminate at least one pipe diameter above the safety overflow level of the tank.
  - (B) Tanks shall be so constructed as to discourage accumulation of hazardous deposits.
  - (vi) Pump manifolds, risers, and headers shall be adequately sized to insure sufficient water flow to provide efficient operation of the water chamber.
- (4) Design and construction of spray rooms.
- (i) Spray rooms, including floors, shall be constructed of masonry, concrete, or other noncombustible material.
  - (ii) Spray rooms shall have noncombustible fire doors and shutters.
  - (iii) Spray rooms shall be adequately ventilated so that the atmosphere in the breathing zone of the operator shall be maintained in accordance with the requirements of paragraph (h)(6)(ii) of this section.
  - (iv) Spray rooms used for production spray-finishing operations shall conform to the requirements for spray booths.
- (5) Ventilation.
- (i) Ventilation shall be provided in accordance with provisions of 1926.66(d) (see chapter 5 of the Standard for Spray Finishing Using Flammable or Combustible Materials, NFPA No. 33-1969), and in accordance with the following:
    - (A) Where a fan plenum is used to equalize or control the distribution of exhaust air movement through the booth, it shall be of sufficient strength or rigidity to withstand the differential air pressure or other superficially imposed loads for which the equipment is designed and also to facilitate cleaning. Construction specifications shall be at least equivalent to those of paragraph (h)(5)(iii) of this section.
    - (B) [Reserved]
  - (ii) Inlet or supply ductwork used to transport makeup air to spray booths or surrounding areas shall be constructed of noncombustible materials.

- (A) If negative pressure exists within inlet ductwork, all seams and joints shall be sealed if there is a possibility of infiltration of harmful quantities of noxious gases, fumes, or mists from areas through which ductwork passes.
  - (B) Inlet ductwork shall be sized in accordance with volume flow requirements and provide design air requirements at the spray booth.
  - (C) Inlet ductwork shall be adequately supported throughout its length to sustain at least its own weight plus any negative pressure which is exerted upon it under normal operating conditions.
- (iii) [Reserved]
- (A) Exhaust ductwork shall be adequately supported throughout its length to sustain its weight plus any normal accumulation in interior during normal operating conditions and any negative pressure exerted upon it.
  - (B) Exhaust ductwork shall be sized in accordance with good design practice which shall include consideration of fan capacity, length of duct, number of turns and elbows, variation in size, volume, and character of materials being exhausted. See American National Standard Z9.2-1960 for further details and explanation concerning elements of design.
  - (C) Longitudinal joints in sheet steel ductwork shall be either lock-seamed, riveted, or welded. For other than steel construction, equivalent securing of joints shall be provided.
  - (D) Circumferential joints in ductwork shall be substantially fastened together and lapped in the direction of airflow. At least every fourth joint shall be provided with connecting flanges, bolted together, or of equivalent fastening security.
  - (E) Inspection or clean-out doors shall be provided for every 9 to 12 feet (2.736 to 3.648 m) of running length for ducts up to 12 inches (0.304 m) in diameter, but the distance between clean-out doors may be greater for larger pipes. (See 8.3.21 of American National Standard Z9.1-1951.) A clean-out door or doors shall be provided for servicing the fan, and where necessary, a drain shall be provided.

(F) Where ductwork passes through a combustible roof or wall, the roof or wall shall be protected at the point of penetration by open space or fire-resistive material between the duct and the roof or wall. When ducts pass through firewalls, they shall be provided with automatic fire dampers on both sides of the wall, except that three-eighth-inch steel plates may be used in lieu of automatic fire dampers for ducts not exceeding 18 inches (45.72 cm) in diameter.

(G) Ductwork used for ventilating any process covered in this standard shall not be connected to ducts ventilating any other process or any chimney or flue used for conveying any products of combustion.

(6) Velocity and air flow requirements.

- (i) Except where a spray booth has an adequate air replacement system, the velocity of air into all openings of a spray booth shall be not less than that specified in Table D-57.7 for the operating conditions specified. An adequate air replacement system is one which introduces replacement air upstream or above the object being sprayed and is so designed that the velocity of air in the booth cross section is not less than that specified in Table D-57.7 when measured upstream or above the object being sprayed.

Table D-57.7 - Minimum Maintained Velocities Into Spray Booths

Operating conditions for objects completely inside booth	Crossdraft, f.p.m.	Airflow velocities, f.p.m.	
		Design	Range
Electrostatic and automatic airless operation contained in booth without operator.	Negligible	50 large booth	50-75
		100 small booth	75-125
Air-operated guns, manual or automatic	Up to 50	100 large booth	75-125
		150 small booth	125-175
Air-operated guns, manual or automatic	Up to 100	150 large booth	125-175
		200 small booth	150-250

**Notes:**

- (1) Attention is invited to the fact that the effectiveness of the spray booth is dependent upon the relationship of the depth of the booth to its height and width.
- (2) Crossdrafts can be eliminated through proper design and such design should be sought. Crossdrafts in excess of 100 fpm (feet per minute) should not be permitted.
- (3) Excessive air pressures result in loss of both efficiency and material waste in addition to creating a backlash that may carry overspray and fumes into adjacent work areas.
- (4) Booths should be designed with velocities shown in the column headed "Design." However, booths operating with velocities shown in the column headed "Range" are in compliance with this standard.

- (ii) In addition to the requirements in paragraph (h)(6)(i) of this section the total air volume exhausted through a spray booth shall be such as to dilute solvent vapor to at least 25 percent of the lower explosive limit of the solvent being sprayed. An example of the method of calculating this volume is given below.

Example: To determine the lower explosive limits of the most common solvents used in spray finishing, see Table D-57.8. Column 1 gives the number of cubic feet of vapor per gallon of solvent and column 2 gives the lower explosive limit (LEL) in percentage by volume of air. Note that the quantity of solvent will be diminished by the quantity of solids and nonflammables contained in the finish.

To determine the volume of air in cubic feet necessary to dilute the vapor from 1 gallon of solvent to 25 percent of the lower explosive limit, apply the following formula:

Dilution volume required per gallon of solvent =  $4 (100 - \text{LEL}) (\text{cubic feet of vapor per gallon}) \div \text{LEL}$

Using toluene as the solvent.

1. LEL of toluene from Table D-57.8, column 2, is 1.4 percent.
2. Cubic feet of vapor per gallon from Table D-57.8, column 1, is 30.4 cubic feet per gallon.
3. Dilution volume required =  $4 (100 - 1.4) 30.4 \div 1.4 = 8,564$  cubic feet.
4. To convert to cubic feet per minute of required ventilation, multiply the dilution volume required per gallon of solvent by the number of gallons of solvent evaporated per minute.

Table D-57.8 - Lower Explosive Limit of Some Commonly Used Solvents

Solvent	Cubic feet per gallon of vapor of liquid at 70° F (21.11° C)	Lower explosive limit in percent by volume of air at 70° F (21.11° C)
	Column 1	Column 2
Acetone	44.0	2.6
Amyl Acetate (iso)	21.6	<sup>1</sup> 1.0
Amyl Alcohol (n)	29.6	1.2
Amyl Alcohol (iso)	29.6	1.2
Benzene	36.8	<sup>1</sup> 1.4
Butyl Acetate (n)	24.8	1.7
Butyl Alcohol (n)	35.2	1.4
Butyl Cellosolve	24.8	1.1
Cellosolve	33.6	1.8
Cellosolve Acetate	23.2	1.7

(iii)

(A) When an operator is in a booth downstream of the object being sprayed, an air-supplied respirator or other type of respirator approved by NIOSH under 42 CFR part 84 for the material being sprayed should be used by the operator.

(B) Where downdraft booths are provided with doors, such doors shall be closed when spray painting.

(7) Make-up air.

(i) Clean fresh air, free of contamination from adjacent industrial exhaust systems, chimneys, stacks, or vents, shall be supplied to a spray booth or room in quantities equal to the volume of air exhausted through the spray booth.

(ii) Where a spray booth or room receives make-up air through self-closing doors, dampers, or louvers, they shall be fully open at all times when the booth or room is in use for spraying. The velocity of air through such doors, dampers, or louvers shall not exceed 200 feet per minute. If the fan characteristics are such that the required air flow through the booth will be provided, higher velocities through the doors, dampers, or louvers may be used.

(iii)

(A) Where the air supply to a spray booth or room is filtered, the fan static pressure shall be calculated on the assumption that the filters are dirty to the extent that they require cleaning or replacement.

(B) The rating of filters shall be governed by test data supplied by the manufacturer of the filter. A pressure gage shall be installed to show the pressure drop across the filters. This gage shall be marked to show the pressure drop at which the filters require cleaning or replacement. Filters shall be replaced or cleaned whenever the pressure drop across them becomes excessive or whenever the air flow through the face of the booth falls below that specified in Table D-57.7.

(iv)

- (A) Means for heating make-up air to any spray booth or room, before or at the time spraying is normally performed, shall be provided in all places where the outdoor temperature may be expected to remain below 55° F. (12.77° C.) for appreciable periods of time during the operation of the booth except where adequate and safe means of radiant heating for all operating personnel affected is provided. The replacement air during the heating seasons shall be maintained at not less than 65° F. (18.33° C.) at the point of entry into the spray booth or spray room. When otherwise unheated make-up air would be at a temperature of more than 10° F. below room temperature, its temperature shall be regulated as provided in section 3.6.3 of ANSI Z9.2-1960.
- (B) As an alternative to an air replacement system complying with the preceding section, general heating of the building in which the spray room or booth is located may be employed provided that all occupied parts of the building are maintained at not less than 65° F (18.33° C.) when the exhaust system is in operation or the general heating system supplemented by other sources of heat may be employed to meet this requirement.
- (C) No means of heating make-up air shall be located in a spray booth.
- (D) Where make-up air is heated by coal or oil, the products of combustion shall not be allowed to mix with the make-up air, and the products of combustion shall be conducted outside the building through a flue terminating at a point remote from all points where make-up air enters the building.
- (E) Where make-up air is heated by gas, and the products of combustion are not mixed with the make-up air but are conducted through an independent flue to a point outside the building remote from all points where make-up air enters the building, it is not necessary to comply with paragraph (h)(7)(iv)(F) of this section.
- (F) Where make-up air to any manually operated spray booth or room is heated by gas and the products of combustion are allowed to mix with the supply air, the following precautions must be taken:
- (1) The gas must have a distinctive and strong enough odor to warn workmen in a spray booth or room of its presence if in an unburned state in the make-up air.

- (2) The maximum rate of gas supply to the make-up air heater burners must not exceed that which would yield in excess of 200 p.p.m. (parts per million) of carbon monoxide or 2,000 p.p.m. of total combustible gases in the mixture if the unburned gas upon the occurrence of flame failure were mixed with all of the make-up air supplied.
- (3) A fan must be provided to deliver the mixture of heated air and products of combustion from the plenum chamber housing the gas burners to the spray booth or room.
- (8) Scope. Spray booths or spray rooms are to be used to enclose or confine all spray finishing operations covered by this paragraph (h). This paragraph does not apply to the spraying of the exteriors of buildings, fixed tanks, or similar structures, nor to small portable spraying apparatus not used repeatedly in the same location.
- (i) Open surface tanks.
- (1) General.
- (i) This paragraph applies to all operations involving the immersion of materials in liquids, or in the vapors of such liquids, for the purpose of cleaning or altering the surface or adding to or imparting a finish thereto or changing the character of the materials, and their subsequent removal from the liquid or vapor, draining, and drying. These operations include washing, electroplating, anodizing, pickling, quenching, dyeing, dipping, tanning, dressing, bleaching, degreasing, alkaline cleaning, stripping, rinsing, digesting, and other similar operations.
- (ii) Except where specific construction specifications are prescribed in this section, hoods, ducts, elbows, fans, blowers, and all other exhaust system parts, components, and supports thereof shall be so constructed as to meet conditions of service and to facilitate maintenance and shall conform in construction to the specifications contained in American National Standard Fundamentals Governing the Design and Operation of Local Exhaust Systems, Z9.2-1960.
- (2) Classification of open-surface tank operations.
- (i) Open-surface tank operations shall be classified into 16 classes, numbered A-1 to D 4, inclusive.

- (ii) Determination of class. Class is determined by two factors, hazard potential designated by a letter from A to D, inclusive, and rate of gas, vapor, or mist evolution designated by a number from 1 to 4, inclusive (for example, B.3).
- (iii) Hazard potential is an index, on a scale of from A to D, inclusive, of the severity of the hazard associated with the substance contained in the tank because of the toxic, flammable, or explosive nature of the vapor, gas, or mist produced therefrom. The toxic hazard is determined from the concentration, measured in parts by volume of a gas or vapor, per million parts by volume of contaminated air (p.p.m.), or in milligrams of mist per cubic meter of air (mg./m.<sup>3</sup>), below which ill effects are unlikely to occur to the exposed worker. The concentrations shall be those in 1926.55 or other pertinent sections of this part.
- (iv) The relative fire or explosion hazard is measured in degrees Fahrenheit in terms of the closed-cup flash point of the substance in the tank. Detailed information on the prevention of fire hazards in dip tanks may be found in Dip Tanks Containing Flammable or Combustible Liquids, NFPA No. 34-1966, National Fire Protection Association. Where the tank contains a mixture of liquids, other than organic solvents, whose effects are additive, the hygienic standard of the most toxic component (for example, the one having the lowest p.p.m. or mg./m.<sup>3</sup>) shall be used, except where such substance constitutes an insignificantly small fraction of the mixture. For mixtures of organic solvents, their combined effect, rather than that of either individually, shall determine the hazard potential. In the absence of information to the contrary, the effects shall be considered as additive. If the sum of the ratios of the airborne concentration of each contaminant to the toxic concentration of that contaminant exceeds unity, the toxic concentration shall be considered to have been exceeded. (See note A to paragraph (i)(2)(v) of this section.)
- (v) Hazard potential shall be determined from Table D-57.9, with the value indicating greater hazard being used. When the hazardous material may be either a vapor with a threshold limit value (TLV) in p.p.m. or a mist with a TLV in mg./m.<sup>3</sup>, the TLV indicating the greater hazard shall be used (for example, A takes precedence over B or C; B over C; C over D).

**Note A:**

$$(c_1 \div TLV_1) + (c_2 \div TLV_2) + (c_3 \div TLV_3) + \dots + (c_N \div TLV_N) \leq 1$$

where:

c = Concentration measured at the operation in p.p.m.

Table D-57.9 - Determination of Hazard Potential

Hazard potential	Toxicity group		
	Gas or vapor (p.p.m.)	Mist (mg./m <sup>3</sup> )	Flash point in degrees F. (C.)
A	0-10	0-0.1	
B	11-100	0.11-1.0	Under 100 (37.77)
C	101-500	1.1-10	100-200 (37.77-93.33)
D	Over 500	Over 10	Over 200 (93.33)

- (vi) Rate of gas, vapor, or mist evolution is a numerical index, on a scale of from 1 to 4, inclusive, both of the relative capacity of the tank to produce gas, vapor, or mist and of the relative energy with which it is projected or carried upwards from the tank. Rate is evaluated in terms of
- (A) The temperature of the liquid in the tank in degrees Fahrenheit;
  - (B) The number of degrees Fahrenheit that this temperature is below the boiling point of the liquid in degrees Fahrenheit;
  - (C) The relative evaporation of the liquid in still air at room temperature in an arbitrary scale-fast, medium, slow, or nil; and
  - (D) The extent that the tank gases or produces mist in an arbitrary scale-high, medium, low, and nil. (See Table D-57.10, Note 2.) Gassing depends upon electrochemical or mechanical processes, the effects of which have to be individually evaluated for each installation (see Table D-57.10, Note 3).
- (vii) Rate of evolution shall be determined from Table D-57.10. When evaporation and gassing yield different rates, the lowest numerical value shall be used.

Table D-57.10 - Determination of Rate of Gas, Vapor, or Mist Evolution <sup>1</sup>

Rate	Liquid temperature, ° F. (C.)	Degrees below boiling point	Relative evaporation <sup>2</sup>	Gassing <sup>3</sup>
1	Over 200 (93.33)	0-20	Fast	High
2	150-200 (65.55-93.33)	21-50	Medium	Medium
3	94-149 (34.44-65)	51-100	Slow	Low
4	Under 94 (34.44)	Over 100	Nil	Nil

<sup>1</sup> In certain classes of equipment, specifically vapor degreasers, an internal condenser or vapor level thermostat is used to prevent the vapor from leaving the tank during normal operation. In such cases, rate of vapor evolution from the tank into the workroom is not dependent upon the factors listed in the table, but rather upon abnormalities of operating procedure, such as carryout of vapors from excessively fast action, dragout of liquid by entrainment in parts, contamination of solvent by water and other materials, or improper heat balance. When operating procedure is excellent, effective rate of evolution may be taken as 4. When operating procedure is average, the effective rate of evolution may be taken as 3. When operation is poor, a rate of 2 or 1 is indicated, depending upon observed conditions.

<sup>2</sup> Relative evaporation rate is determined according to the methods described by A. K. Doolittle in Industrial and Engineering Chemistry, vol. 27, p. 1169, (3) where time for 100-percent evaporation is as follows: Fast: 0-3 hours; Medium: 3-12 hours; Slow: 12-50 hours; Nil: more than 50 hours.

<sup>3</sup> Gassing means the formation by chemical or electrochemical action of minute bubbles of gas under the surface of the liquid in the tank and is generally limited to aqueous solutions.

(3) Ventilation. Where ventilation is used to control potential exposures to workers as defined in paragraph (i)(2)(iii) of this section, it shall be adequate to reduce the concentration of the air contaminant to the degree that a hazard to the worker does not exist. Methods of ventilation are discussed in American National Standard Fundamentals Governing the Design and Operation of Local Exhaust Systems, Z9.2-1960.

(4) Control requirements.

(i) Control velocities shall conform to Table D-57.11 in all cases where the flow of air past the breathing or working zone of the operator and into the hoods is undisturbed by local environmental conditions, such as open windows, wall fans, unit heaters, or moving machinery.

(ii) All tanks exhausted by means of hoods which

(A) Project over the entire tank;

(B) Are fixed in position in such a location that the head of the workman, in all his normal operating positions while working at the tank, is in front of all hood openings; and

(C) Are completely enclosed on at least two sides, shall be considered to be exhausted through an enclosing hood.

(D) The quantity of air in cubic feet per minute necessary to be exhausted through an enclosing hood shall be not less than the product of the control velocity times the net area of all openings in the enclosure through which air can flow into the hood.

Table D-57.11 - Control Velocities in Feet Per Minute (f.p.m.) for Undisturbed Locations

Class	Enclosing hood		Lateral exhaust <sup>1</sup>	Canopy hood <sup>2</sup>	
	One open side	Two open sides		Three open sides	Four open sides
B-1 and A-2	100	150	150	Do not use	Do not use
A-3 <sup>2</sup> , B-1, B-2, and C-1	75	100	100	125	175
A-3, C-2, and D-1 <sup>3</sup>	65	90	75	100	150
B-4 <sup>2</sup> , C-3, and D-2 <sup>3</sup>	50	75	50	75	125
A-4, C-4, D-3 <sup>3</sup> , and D-4 <sup>4</sup>					

<sup>1</sup> See Table D-57.12 for computation of ventilation rate.

<sup>2</sup> Do not use canopy hood for Hazard Potential A processes.

<sup>3</sup> Where complete control of hot water is desired, design as next highest class.

<sup>4</sup> General room ventilation required.

(iii) All tanks exhausted by means of hoods which do not project over the entire tank, and in which the direction of air movement into the hood or hoods is substantially horizontal, shall be considered to be laterally exhausted. The quantity of air in cubic feet per minute necessary to be laterally exhausted per square foot of tank area in order to maintain the required control velocity shall be determined from Table D-57.12 for all variations in ratio of tank width (W) to tank length (L). The total quantity of air in cubic feet per minute required to be exhausted per tank shall be not less than the product of the area of tank surface times the cubic feet per minute per square foot of tank area, determined from Table D-57.12.

(A) For lateral exhaust hoods over 42 inches (1.06 m) wide, or where it is desirable to reduce the amount of air removed from the workroom, air supply slots or orifices shall be provided along the side or the center of the tank opposite from the exhaust slots. The design of such systems shall meet the following criteria:

(1) The supply air volume plus the entrained air shall not exceed 50 percent of the exhaust volume.

- (2) The velocity of the supply airstream as it reaches the effective control area of the exhaust slot shall be less than the effective velocity over the exhaust slot area.

Table D-57.12 - Minimum Ventilation Rate in Cubic Feet of Air Per Minute Per Square Foot of Tank Area for Lateral Exhaust

Required minimum control velocity, f.p.m. (from Table D-57.11)	C.f.m. per sq. ft. to maintain required minimum velocities at following ratios (tank width (W)/tank length (L)). <sup>1, 2</sup>				
	0.0-0.09	0.1-0.24	0.25-0.49	0.5-0.99	1.0-2.0
Hood along one side or two parallel sides of tank when one hood is against a wall or baffle. <sup>2</sup> Also for a manifold along tank centerline. <sup>3</sup>					
50	50	60	75	90	100
75	75	90	110	130	150
100	100	125	150	175	200
150	150	190	225	260	300
Hood along one side or two parallel sides of free standing tank not against wall or baffle.					
50	75	90	100	110	125
75	110	130	150	170	190
100	150	175	200	225	250
150	225	260	300	340	375

<sup>1</sup> It is not practicable to ventilate across the long dimension of a tank whose ratio W/L exceeds 2.0.

It is undesirable to do so when W/L exceeds 1.0. For circular tanks with lateral exhaust along up to 1/2 the circumference, use W/L = 1.0; for over one-half the circumference use W/L = 0.5.

<sup>2</sup> Baffle is a vertical plate the same length as the tank, and with the top of the plate as high as the tank is wide. If the exhaust hood is on the side of a tank against a building wall or close to it, it is perfectly baffled.

<sup>3</sup> Use W/2 as tank width in computing when manifold is along centerline, or when hoods are used on two parallel sides of a tank.

Tank Width (W) means the effective width over which the hood must pull air to operate (for example, where the hood face is set back from the edge of the tank, this set back must be added in measuring tank width). The surface area of tanks can frequently be reduced and better control obtained (particularly on conveyORIZED systems) by using covers extending from the upper edges of the slots toward the center of the tank.

- (3) The vertical height of the receiving exhaust hood, including any baffle, shall not be less than one-quarter the width of the tank.
- (4) The supply airstream shall not be allowed to impinge on obstructions between it and the exhaust slot in such a manner as to significantly interfere with the performance of the exhaust hood.

- (5) Since most failure of push-pull systems result from excessive supply air volumes and pressures, methods of measuring and adjusting the supply air shall be provided. When satisfactory control has been achieved, the adjustable features of the hood shall be fixed so that they will not be altered.
- (iv) All tanks exhausted by means of hoods which project over the entire tank, and which do not conform to the definition of enclosing hoods, shall be considered to be overhead canopy hoods. The quantity of air in cubic feet per minute necessary to be exhausted through a canopy hood shall be not less than the product of the control velocity times the net area of all openings between the bottom edges of the hood and the top edges of the tank.
- (v) The rate of vapor evolution (including steam or products of combustion) from the process shall be estimated. If the rate of vapor evolution is equal to or greater than 10 percent of the calculated exhaust volume required, the exhaust volume shall be increased in equal amount.
- (5) Spray cleaning and degreasing. Wherever spraying or other mechanical means are used to disperse a liquid above an open-surface tank, control must be provided for the airborne spray. Such operations shall be enclosed as completely as possible. The inward air velocity into the enclosure shall be sufficient to prevent the discharge of spray into the workroom. Mechanical baffles may be used to help prevent the discharge of spray. Spray painting operations are covered by paragraph (h) of this section.
- (6) Control means other than ventilation. Tank covers, foams, beads, chips, or other materials floating on the tank surface so as to confine gases, mists, or vapors to the area under the cover or to the foam, bead, or chip layer; or surface tension depressive agents added to the liquid in the tank to minimize mist formation, or any combination thereof, may all be used as gas, mist, or vapor control means for open-surface tank operations, provided that they effectively reduce the concentrations of hazardous materials in the vicinity of the worker below the limits set in accordance with paragraph (i)(2) of this section.
- (7) System design.
- (i) The equipment for exhausting air shall have sufficient capacity to produce the flow of air required in each of the hoods and openings of the system.
- (ii) The capacity required in paragraph (i)(7)(i) of this section shall be obtained when the airflow producing equipment is operating against the following pressure losses, the sum of which is the static pressure:

- (A) Entrance losses into the hood.
  - (B) Resistance to airflow in branch pipe including bends and transformations.
  - (C) Entrance loss into the main pipe.
  - (D) Resistance to airflow in main pipe including bends and transformations.
  - (E) Resistance of mechanical equipment; that is, filters, washers, condensers, absorbers, etc., plus their entrance and exit losses.
  - (F) Resistance in outlet duct and discharge stack.
- (iii) Two or more operations shall not be connected to the same exhaust system where either one or the combination of the substances removed may constitute a fire, explosion, or chemical reaction hazard in the duct system. Traps or other devices shall be provided to insure that condensate in ducts does not drain back into any tank.
  - (iv) The exhaust system, consisting of hoods, ducts, air mover, and discharge outlet, shall be designed in accordance with American National Standard Fundamentals Governing the Design and Operation of Local Exhaust Systems, Z9.2-1960, or the manual, Industrial Ventilation, published by the American Conference of Governmental Industrial Hygienists 1970. Airflow and pressure loss data provided by the manufacturer of any air cleaning device shall be included in the design calculations.
- (8) Operation.

- (i) The required airflow shall be maintained at all times during which gas, mist, or vapor is emitted from the tank, and at all times the tank, the draining, or the drying area is in operation or use. When the system is first installed, the air flow from each hood shall be measured by means of a pitot traverse in the exhaust duct and corrective action taken if the flow is less than that required. When the proper flow is obtained, the hood static pressure shall be measured and recorded. At intervals of not more than 3 months operation, or after a prolonged shutdown period, the hoods and duct system shall be inspected for evidence of corrosion or damage. In any case where the airflow is found to be less than required, it shall be increased to the required value. (Information on airflow and static pressure measurement and calculations may be found in American National Standard Fundamental Governing the Design and Operation of Local Exhaust Systems, Z9.2-1960, or in the manual, Industrial Ventilation, published by the American Conference of Governmental Industrial Hygienists.)
  - (ii) The exhaust system shall discharge to the outer air in such a manner that the possibility of its effluent entering any building is at a minimum. Recirculation shall only be through a device for contaminant removal which will prevent the creation of a health hazard in the room or area to which the air is recirculated.
  - (iii) A volume of outside air in the range of 90 percent to 110 percent of the exhaust volume shall be provided to each room having exhaust hoods. The outside air supply shall enter the workroom in such a manner as not to be detrimental to any exhaust hood. The airflow of the makeup air system shall be measured on installation. Corrective action shall be taken when the airflow is below that required. The makeup air shall be uncontaminated.
- (9) Personal protection.
- (i) All employees working in and around open-surface tank operations must be instructed as to the hazards of their respective jobs, and in the personal protection and first aid procedures applicable to these hazards.
  - (ii) All persons required to work in such a manner that their feet may become wet shall be provided with rubber or other impervious boots or shoes, rubbers, or wooden-soled shoes sufficient to keep feet dry.

- (iii) All persons required to handle work wet with a liquid other than water shall be provided with gloves impervious to such a liquid and of a length sufficient to prevent entrance of liquid into the tops of the gloves. The interior of gloves shall be kept free from corrosive or irritating contaminants.
- (iv) All persons required to work in such a manner that their clothing may become wet shall be provided with such aprons, coats, jackets, sleeves, or other garments made of rubber, or of other materials impervious to liquids other than water, as are required to keep their clothing dry. Aprons shall extend well below the top of boots to prevent liquid splashing into the boots. Provision of dry, clean, cotton clothing along with rubber shoes or short boots and an apron impervious to liquids other than water shall be considered a satisfactory substitute where small parts are cleaned, plated, or acid dipped in open tanks and rapid work is required.
- (v) Whenever there is a danger of splashing, for example, when additions are made manually to the tanks, or when acids and chemicals are removed from the tanks, the employees so engaged shall be required to wear either tight-fitting chemical goggles or an effective face shield. See 1926.102.
- (vi) When, during the emergencies specified in paragraph (i)(11)(v) of this section, employees must be in areas where concentrations of air contaminants are greater than the limits set by paragraph (i)(2)(iii) of this section or oxygen concentrations are less than 19.5 percent, they must use respirators that reduce their exposure to a level below these limits or that provide adequate oxygen. Such respirators must also be provided in marked, quickly accessible storage compartments built for this purpose when the possibility exists of accidental release of hazardous concentrations of air contaminants. Respirators must be approved by NIOSH under 42 CFR part 84, selected by a competent industrial hygienist or other technically-qualified source, and used in accordance with 29 CFR 1926.103.

- (vii) Near each tank containing a liquid which may burn, irritate, or otherwise be harmful to the skin if splashed upon the worker's body, there shall be a supply of clean cold water. The water pipe (carrying a pressure not exceeding 25 pounds (11.325 kg)) shall be provided with a quick opening valve and at least 48 inches (1.216 m) of hose not smaller than three-fourths inch, so that no time may be lost in washing off liquids from the skin or clothing. Alternatively, deluge showers and eye flushes shall be provided in cases where harmful chemicals may be splashed on parts of the body.
  - (viii) Operators with sores, burns, or other skin lesions requiring medical treatment shall not be allowed to work at their regular operations until so authorized by a physician. Any small skin abrasions, cuts, rash, or open sores which are found or reported shall be treated by a properly designated person so that chances of exposures to the chemicals are removed. Workers exposed to chromic acids shall have a periodic examination made of the nostrils and other parts of the body, to detect incipient ulceration.
  - (ix) Sufficient washing facilities, including soap, individual towels, and hot water, shall be provided for all persons required to use or handle any liquids which may burn, irritate, or otherwise be harmful to the skin, on the basis of at least one basin (or its equivalent) with a hot water faucet for every 10 employees. See 1926.51(f).
  - (x) Locker space or equivalent clothing storage facilities shall be provided to prevent contamination of street clothing.
  - (xi) First aid facilities specific to the hazards of the operations conducted shall be readily available.
- (10) Special precautions for cyanide. Dikes or other arrangements shall be provided to prevent the possibility of intermixing of cyanide and acid in the event of tank rupture.
- (11) Inspection, maintenance, and installation.
- (i) Floors and platforms around tanks shall be prevented from becoming slippery both by original type of construction and by frequent flushing. They shall be firm, sound, and of the design and construction to minimize the possibility of tripping.

- (ii) Before cleaning the interior of any tank, the contents shall be drained off, and the cleanout doors shall be opened where provided. All pockets in tanks or pits, where it is possible for hazardous vapors to collect, shall be ventilated and cleared of such vapors.
- (iii) Tanks which have been drained to permit employees to enter for the purposes of cleaning, inspection, or maintenance may contain atmospheres which are hazardous to life or health, through the presence of flammable or toxic air contaminants, or through the absence of sufficient oxygen. Before employees shall be permitted to enter any such tank, appropriate tests of the atmosphere shall be made to determine if the limits set by paragraph (i)(2)(iii) of this section are exceeded, or if the oxygen concentration is less than 19.5 percent.
- (iv) If the tests made in accordance with paragraph(i)(11)(iii) of this section indicate that the atmosphere in the tank is unsafe, before any employee is permitted to enter the tank, the tank shall be ventilated until the hazardous atmosphere is removed, and ventilation shall be continued so as to prevent the occurrence of a hazardous atmosphere as long as an employee is in the tank.
- (v) If, in emergencies, such as rescue work, it is necessary to enter a tank which may contain a hazardous atmosphere, suitable respirators, such as self-contained breathing apparatus; hose mask with blower, if there is a possibility of oxygen deficiency; or a gas mask, selected and operated in accordance with paragraph (i)(9)(vi) of this section, shall be used. If a contaminant in the tank can cause dermatitis, or be absorbed through the skin, the employee entering the tank shall also wear protective clothing. At least one trained standby employee, with suitable respirator, shall be present in the nearest uncontaminated area. The standby employee must be able to communicate with the employee in the tank and be able to haul him out of the tank with a lifeline if necessary.
- (vi) Maintenance work requiring welding or open flame, where toxic metal fumes such as cadmium, chromium, or lead may be evolved, shall be done only with sufficient local exhaust ventilation to prevent the creation of a health hazard, or be done with respirators selected and used in accordance with paragraph (i)(9)(vi) of this section. Welding, or the use of open flames near any solvent cleaning equipment shall be permitted only after such equipment has first been thoroughly cleared of solvents and vapors.

(12) Vapor degreasing tanks.

- (i) In any vapor degreasing tank equipped with a condenser or vapor level thermostat, the condenser or thermostat shall keep the level of vapors below the top edge of the tank by a distance at least equal to one-half the tank width, or at least 36 inches (0.912 m), whichever is shorter.
- (ii) Where gas is used as a fuel for heating vapor degreasing tanks, the combustion chamber shall be of tight construction, except for such openings as the exhaust flue, and those that are necessary for supplying air for combustion. Flues shall be of corrosion-resistant construction and shall extend to the outer air. If mechanical exhaust is used on this flue, a draft diverter shall be used. Special precautions must be taken to prevent solvent fumes from entering the combustion air of this or any other heater when chlorinated or fluorinated hydrocarbon solvents (for example, trichloroethylene, Freon) are used.
- (iii) Heating elements shall be so designed and maintained that their surface temperature will not cause the solvent or mixture to decompose, break down, or be converted into an excessive quantity of vapor.
- (iv) Tanks or machines of more than 4 square feet (0.368 m<sup>2</sup>) of vapor area, used for solvent cleaning or vapor degreasing, shall be equipped with suitable cleanout or sludge doors located near the bottom of each tank or still. These doors shall be so designed and gasketed that there will be no leakage of solvent when they are closed.

### (13) Scope.

- (i) This paragraph (i) applies to all operations involving the immersion of materials in liquids, or in the vapors of such liquids, for the purpose of cleaning or altering their surfaces, or adding or imparting a finish thereto, or changing the character of the materials, and their subsequent removal from the liquids or vapors, draining, and drying. Such operations include washing, electroplating, anodizing, pickling, quenching, dyeing, dipping, tanning, dressing, bleaching, degreasing, alkaline cleaning, stripping, rinsing, digesting, and other similar operations, but do not include molten materials handling operations, or surface coating operations.
- (ii) **“Molten materials handling operations”** means all operations, other than welding, burning, and soldering operations, involving the use, melting, smelting, or pouring of metals, alloys, salts, or other similar substances in the molten state. Such operations also include heat treating baths, descaling baths, die casting stereotyping, galvanizing, tinning, and similar operations.

- (iii) **“Surface coating operations”** means all operations involving the application of protective, decorative, adhesive, or strengthening coating or impregnation to one or more surfaces, or into the interstices of any object or material, by means of spraying, spreading, flowing, brushing, roll coating, pouring, cementing, or similar means; and any subsequent draining or drying operations, excluding open-tank operations.

## 1926.58 (RESERVED)

(Asbestos redesignated 1926.1101.)

## 1926.59 Hazard Communication

**Note:** The requirements to construction work under this section are identical to those in [1910.1200. Hazard Communication](#) (General Industry, Division 2/Z).

## 1926.60 Methylenedianiline

(a) Scope and application.

- (1) This section applies to all construction work as defined in 29 CFR 1910.12(b), in which there is exposure to MDA, including but not limited to the following:
  - (i) Construction, alteration, repair, maintenance, or renovation of structures, substrates, or portions thereof, that contain MDA;
  - (ii) Installation or the finishing of surfaces with products containing MDA;
  - (iii) MDA spill/emergency cleanup at construction sites; and
  - (iv) Transportation, disposal, storage, or containment of MDA or products containing MDA on the site or location at which construction activities are performed.

- (2) Except as provided in paragraphs (a)(7) and (f)(5) of this section, this section does not apply to the processing, use, and handling of products containing MDA where initial monitoring indicates that the product is not capable of releasing MDA in excess of the action level under the expected conditions of processing, use, and handling which will cause the greatest possible release; and where no “dermal exposure to MDA” can occur.
  - (3) Except as provided in paragraph (a)(7) of this section, this section does not apply to the processing, use, and handling of products containing MDA where objective data are reasonably relied upon which demonstrate the product is not capable of releasing MDA under the expected conditions of processing, use, and handling which will cause the greatest possible release; and where no “dermal exposure to MDA” can occur.
  - (4) Except as provided in paragraph (a)(7) of this section, this section does not apply to the storage, transportation, distribution or sale of MDA in intact containers sealed in such a manner as to contain the MDA dusts, vapors, or liquids, except for the provisions of 29 CFR 1910.1200 and paragraph (e) of this section.
  - (5) Except as provided in paragraph (a)(7) of this section, this section does not apply to materials in any form which contain less than 0.1% MDA by weight or volume.
  - (6) Except as provided in paragraph (a)(7) of this section, this section does not apply to “finished articles containing MDA.”
  - (7) Where products containing MDA are exempted under paragraphs (a)(2) through (a)(6) of this section, the employer shall maintain records of the initial monitoring results or objective data supporting that exemption and the basis for the employer’s reliance on the data, as provided in the recordkeeping provision of paragraph (o) of this section.
- (b) Definitions. For the purpose of this section, the following definitions shall apply:
- Action level** means a concentration of airborne MDA of 5 ppb as an eight (8)-hour time-weighted average.
- Assistant Secretary** means the Assistant Secretary of Labor for Occupational Safety and Health, U.S. Department of Labor, or designee.

**Authorized person** means any person specifically authorized by the employer whose duties require the person to enter a regulated area, or any person entering such an area as a designated representative of employees for the purpose of exercising the right to observe monitoring and measuring procedures under paragraph (p) of this section, or any other person authorized by the Act or regulations issued under the Act.

**Container** means any barrel, bottle, can, cylinder, drum, reaction vessel, storage tank, commercial packaging or the like, but does not include piping systems.

**Decontamination area** means an area outside of but as near as practical to the regulated area, consisting of an equipment storage area, wash area, and clean change area, which is used for the decontamination of workers, materials, and equipment contaminated with MDA.

**Dermal exposure to MDA** occurs where employees are engaged in the handling, application or use of mixtures or materials containing MDA, with any of the following non-airborne forms of MDA:

- (i) Liquid, powdered, granular, or flaked mixtures containing MDA in concentrations greater than 0.1% by weight or volume; and
- (ii) Materials other than “finished articles” containing MDA in concentrations greater than 0.1% by weight or volume.

**Director** means the Director of the National Institute for Occupational Safety and Health, U.S. Department of Health and Human Services, or designee.

**Emergency** means any occurrence such as, but not limited to, equipment failure, rupture of containers, or failure of control equipment which results in an unexpected and potentially hazardous release of MDA.

**Employee exposure** means exposure to MDA which would occur if the employee were not using respirators or protective work clothing and equipment.

**Finished article containing MDA** is defined as a manufactured item:

- (i) Which is formed to a specific shape or design during manufacture;
- (ii) Which has end use function(s) dependent in whole or part upon its shape or design during end use; and
- (iii) Where applicable, is an item which is fully cured by virtue of having been subjected to the conditions (temperature, time) necessary to complete the desired chemical reaction.

**Historical monitoring data** means monitoring data for construction jobs that meet the following conditions:

- (i) The data upon which judgments are based are scientifically sound and were collected using methods that are sufficiently accurate and precise;
- (ii) The processes and work practices that were in use when the historical monitoring data were obtained are essentially the same as those to be used during the job for which initial monitoring will not be performed;
- (iii) The characteristics of the MDA-containing material being handled when the historical monitoring data were obtained are the same as those on the job for which initial monitoring will not be performed;
- (iv) Environmental conditions prevailing when the historical monitoring data were obtained are the same as those on the job for which initial monitoring will not be performed; and
- (v) Other data relevant to the operations, materials, processing, or employee exposures covered by the exception are substantially similar. The data must be scientifically sound, the characteristics of the MDA-containing material must be similar and the environmental conditions comparable.

**4,4' Methylenedianiline or MDA** means the chemical; 4,4'-diaminodiphenylmethane, Chemical Abstract Service Registry number 101-77-9, in the form of a vapor, liquid, or solid. The definition also includes the salts of MDA.

**Regulated Areas** means areas where airborne concentrations of MDA exceed or can reasonably be expected to exceed, the permissible exposure limits, or where "dermal exposure to MDA" can occur.

**STEL** means short term exposure limit as determined by any 15-minute sample period.

- (c) Permissible exposure limits. The employer shall assure that no employee is exposed to an airborne concentration of MDA in excess of ten parts per billion (10 ppb) as an 8-hour time-weighted average and a STEL of one hundred parts per billion (100 ppb).
- (d) Communication among employers. On multi-employer worksites, an employer performing work involving the application of MDA or materials containing MDA for which establishment of one or more regulated areas is required shall inform other employers on the site of the nature of the employer's work with MDA and of the existence of, and requirements pertaining to, regulated areas.
- (e) Emergency situations.

(1) Written plan.

- (i) A written plan for emergency situations shall be developed for each construction operation where there is a possibility of an emergency. The plan shall include procedures where the employer identifies emergency escape routes for his employees at each construction site before the construction operation begins. Appropriate portions of the plan shall be implemented in the event of an emergency.
- (ii) The plan shall specifically provide that employees engaged in correcting emergency conditions shall be equipped with the appropriate personal protective equipment and clothing as required in paragraphs (i) and (j) of this section until the emergency is abated.
- (iii) The plan shall specifically include provisions for alerting and evacuating affected employees as well as the applicable elements prescribed in 29 CFR 1910.38 and 29 CFR 1910.39, "Emergency action plans" and "Fire prevention plans," respectively.

**Note:** In Oregon, use Division 2/E, 437-002-0042, Emergency Action Plans, and 437-002-0043, Fire Prevention Plan.

- (2) Alerting employees. Where there is the possibility of employee exposure to MDA due to an emergency, means shall be developed to promptly alert employees who have the potential to be directly exposed. Affected employees not engaged in correcting emergency conditions shall be evacuated immediately in the event that an emergency occurs. Means shall also be developed for alerting other employees who may be exposed as a result of the emergency.

(f) Exposure monitoring.

(1) General.

- (i) Determinations of employee exposure shall be made from breathing zone air samples that are representative of each employee's exposure to airborne MDA over an eight (8) hour period. Determination of employee exposure to the STEL shall be made from breathing zone air samples collected over a 15 minute sampling period.
- (ii) Representative employee exposure shall be determined on the basis of one or more samples representing full shift exposure for each shift for each job classification in each work area where exposure to MDA may occur.

- (iii) Where the employer can document that exposure levels are equivalent for similar operations in different work shifts, the employer shall only be required to determine representative employee exposure for that operation during one shift.
- (2) Initial monitoring. Each employer who has a workplace or work operation covered by this standard shall perform initial monitoring to determine accurately the airborne concentrations of MDA to which employees may be exposed unless:
  - (i) The employer can demonstrate, on the basis of objective data, that the MDA-containing product or material being handled cannot cause exposures above the standard's action level, even under worst-case release conditions; or
  - (ii) The employer has historical monitoring or other data demonstrating that exposures on a particular job will be below the action level.
- (3) Periodic monitoring and monitoring frequency.
  - (i) If the monitoring required by paragraph (f)(2) of this section reveals employee exposure at or above the action level, but at or below the PELs, the employer shall repeat such monitoring for each such employee at least every six (6) months.
  - (ii) If the monitoring required by paragraph (f)(2) of this section reveals employee exposure above the PELs, the employer shall repeat such monitoring for each such employee at least every three (3) months.
  - (iii) Employers who are conducting MDA operations within a regulated area can forego periodic monitoring if the employees are all wearing supplied-air respirators while working in the regulated area.
  - (iv) The employer may alter the monitoring schedule from every three months to every six months for any employee for whom two consecutive measurements taken at least 7 days apart indicate that the employee exposure has decreased to below the PELs but above the action level.
- (4) Termination of monitoring.
  - (i) If the initial monitoring required by paragraph (f)(2) of this section reveals employee exposure to be below the action level, the employer may discontinue the monitoring for that employee, except as otherwise required by paragraph (f)(5) of this section.

- (ii) If the periodic monitoring required by paragraph (f)(3) of this section reveals that employee exposures, as indicated by at least two consecutive measurements taken at least 7 days apart, are below the action level the employer may discontinue the monitoring for that employee, except as otherwise required by paragraph (f)(5) of this section.
- (5) Additional monitoring. The employer shall institute the exposure monitoring required under paragraphs (f)(2) and (f)(3) of this section when there has been a change in production process, chemicals present, control equipment, personnel, or work practices which may result in new or additional exposures to MDA, or when the employer has any reason to suspect a change which may result in new or additional exposures.
- (6) Accuracy of monitoring. Monitoring shall be accurate, to a confidence level of 95 percent, to within plus or minus 25 percent for airborne concentrations of MDA.
- (7) Employee notification of monitoring results.
  - (i) The employer must, as soon as possible but no later than 5 working days after the receipt of the results of any monitoring performed under this section, notify each affected employee of these results either individually in writing or by posting the results in an appropriate location that is accessible to employees.
  - (ii) The written notification required by paragraph (f)(7)(i) of this section shall contain the corrective action being taken by the employer or any other protective measures which have been implemented to reduce the employee exposure to or below the PELs, wherever the PELs are exceeded.
- (8) Visual monitoring. The employer shall make routine inspections of employee hands, face and forearms potentially exposed to MDA. Other potential dermal exposures reported by the employee must be referred to the appropriate medical personnel for observation. If the employer determines that the employee has been exposed to MDA the employer shall:
  - (i) Determine the source of exposure;
  - (ii) Implement protective measures to correct the hazard; and
  - (iii) Maintain records of the corrective actions in accordance with paragraph (o) of this section.
- (g) Regulated areas.
  - (1) Establishment.

- (i) Airborne exposures. The employer shall establish regulated areas where airborne concentrations of MDA exceed or can reasonably be expected to exceed, the permissible exposure limits.
    - (ii) Dermal exposures. Where employees are subject to “dermal exposure to MDA” the employer shall establish those work areas as regulated areas.
  - (2) Demarcation. Regulated areas shall be demarcated from the rest of the workplace in a manner that minimizes the number of persons potentially exposed.
  - (3) Access. Access to regulated areas shall be limited to authorized persons.
  - (4) Personal protective equipment and clothing. Each person entering a regulated area shall be supplied with, and required to use, the appropriate personal protective clothing and equipment in accordance with paragraphs (i) and (j) of this section.
  - (5) Prohibited activities. The employer shall ensure that employees do not eat, drink, smoke, chew tobacco or gum, or apply cosmetics in regulated areas.
- (h) Methods of compliance.
- (1) Engineering controls and work practices and respirators.
    - (i) The employer shall use one or any combination of the following control methods to achieve compliance with the permissible exposure limits prescribed by paragraph (c) of this section:
      - (A) Local exhaust ventilation equipped with HEPA filter dust collection systems;
      - (B) General ventilation systems;
      - (C) Use of work practices; or
      - (D) Other engineering controls such as isolation and enclosure that the Assistant Secretary can show to be feasible.
    - (ii) Wherever the feasible engineering controls and work practices “which can be instituted are not sufficient to reduce employee exposure to or below the PELs, the employer shall use them to reduce employee exposure to the lowest levels achievable by these controls and shall supplement them by the use of respiratory protective devices which comply with the requirements of paragraph (i) of this section.

- (2) Special Provisions. For workers engaged in spray application methods, respiratory protection must be used in addition to feasible engineering controls and work practices to reduce employee exposure to or below the PELs.
  - (3) Prohibitions. Compressed air shall not be used to remove MDA, unless the compressed air is used in conjunction with an enclosed ventilation system designed to capture the dust cloud created by the compressed air.
  - (4) Employee rotation. The employer shall not use employee rotation as a means of compliance with the exposure limits prescribed in paragraph (c) of this section.
  - (5) Compliance program.
    - (i) The employer shall establish and implement a written program to reduce employee exposure to or below the PELs by means of engineering and work practice controls, as required by paragraph (h)(1) of this section, and by use of respiratory protection where permitted under this section.
    - (ii) Upon request this written program shall be furnished for examination and copying to the Assistant Secretary, the Director, affected employees and designated employee representatives. The employer shall review and, as necessary, update such plans at least once every 12 months to make certain they reflect the current status of the program.
- (i) Respiratory protection.
- (1) General. For employees who use respirators required by this section, the employer must provide each employee an appropriate respirator that complies with the requirements of this paragraph. Respirators must be used during:
    - (i) Periods necessary to install or implement feasible engineering and work-practice controls.
    - (ii) Work operations, such as maintenance and repair activities and spray-application processes, for which engineering and work-practice controls are not feasible.
    - (iii) Work operations for which feasible engineering and work-practice controls are not yet sufficient to reduce employee exposure to or below the PELs.
    - (iv) Emergencies.

Oregon OSHA repealed 1926.60(i)(2). In Oregon, OAR 437-003-3060 applies.

**437-003-3060     Methylenedianiline Respiratory Protection Program**

*The employer must implement a respiratory protection program in accordance with Division 2/I, 1910.134(b) through (d) (except (d)(1)(iii)), and (e) through (m) and (o), which covers each employee required by Division 3/D, 1926.60 Methylenedianiline, to use a respirator.*

**Note:** This is in addition to other respiratory protection and medical surveillance requirements specified in these Methylenedianiline rules.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 5-2011, f. 12/8/11, ef. 7/1/12.

**1926.60 (i)(3) Respirator selection.****(i) Employers must:**

- (A) Select, and provide to employees, the appropriate respirators specified in paragraph (d)(3)(i)(A) of 29 CFR 1910.134.
- (B) Provide HEPA filters for powered and non-powered air-purifying respirators.
- (C) For escape, provide employees with one of the following respirator options: Any self-contained breathing apparatus with a full facepiece or hood operated in the positive-pressure or continuous-flow mode; or a full facepiece air-purifying respirator.
- (D) Provide a combination HEPA filter and organic vapor canister of cartridge with air-purifying respirators when MDA is in liquid form or used as part of a process requiring heat.

- (ii) An employee who cannot use a negative-pressure respirator must be given the option of using a positive-pressure respirator, or a supplied-air respirator operated in the continuous-flow or pressure-demand mode.

**(j) Protective work clothing and equipment.**

- (1) Provision and use. Where employees are subject to dermal exposure to MDA, where liquids containing MDA can be splashed into the eyes, or where airborne concentrations of MDA are in excess of the PEL, the employer shall provide, at no cost to the employee, and ensure that the employee uses, appropriate protective work clothing and equipment which prevent contact with MDA such as, but not limited to:

- (i) Aprons, coveralls or other full-body work clothing;

- (ii) Gloves, head coverings, and foot coverings; and
- (iii) Face shields, chemical goggles; or
- (iv) Other appropriate protective equipment which comply with OAR 437-003-0134(8).

(2) Removal and storage.

- (i) The employer shall ensure that, at the end of their work shift, employees remove MDA-contaminated protective work clothing and equipment that is not routinely removed throughout the day in change areas provided in accordance with the provisions in paragraph (k) of this section.
- (ii) The employer shall ensure that, during their work shift, employees remove all other MDA-contaminated protective work clothing or equipment before leaving a regulated area.
- (iii) The employer shall ensure that no employee takes MDA-contaminated work clothing or equipment out of the decontamination areas, except those employees authorized to do so for the purpose of laundering, maintenance, or disposal.
- (iv) MDA-contaminated work clothing or equipment shall be placed and stored and transported in sealed, impermeable bags, or other closed impermeable containers.
- (v) Containers of MDA-contaminated protective work clothing or equipment which are to be taken out of decontamination areas or the workplace for cleaning, maintenance, or disposal, shall bear labels warning of the hazards of MDA.

(3) Cleaning and replacement.

- (i) The employer shall provide the employee with clean protective clothing and equipment. The employer shall ensure that protective work clothing or equipment required by this paragraph is cleaned, laundered, repaired, or replaced at intervals appropriate to maintain its effectiveness.
- (ii) The employer shall prohibit the removal of MDA from protective work clothing or equipment by blowing, shaking, or any methods which allow MDA to re-enter the workplace.
- (iii) The employer shall ensure that laundering of MDA-contaminated clothing shall be done so as to prevent the release of MDA in the workplace.

- (iv) Any employer who gives MDA-contaminated clothing to another person for laundering shall inform such person of the requirement to prevent the release of MDA.
  - (v) The employer shall inform any person who launders or cleans protective clothing or equipment contaminated with MDA of the potentially harmful effects of exposure.
- (4) Visual Examination.
- (i) The employer shall ensure that employees' work clothing is examined periodically for rips or tears that may occur during performance of work.
  - (ii) When rips or tears are detected, the protective equipment or clothing shall be repaired and replaced immediately.
- (k) Hygiene facilities and practices.
- (1) General.
- (i) The employer shall provide decontamination areas for employees required to work in regulated areas or required by paragraph (j)(1) of this section to wear protective clothing. Exception: In lieu of the decontamination area requirement specified in paragraph (k)(1)(i) of this section, the employer may permit employees engaged in small scale, short duration operations, to clean their protective clothing or dispose of the protective clothing before such employees leave the area where the work was performed.
  - (ii) Change areas. The employer shall ensure that change areas are equipped with separate storage facilities for protective clothing and street clothing, in accordance with 29 CFR 1910.141(e).
  - (iii) Equipment area. The equipment area shall be supplied with impermeable, labeled bags and containers for the containment and disposal of contaminated protective clothing and equipment.
- (2) Shower area.
- (i) Where feasible, shower facilities shall be provided which comply with 29 CFR 1910.141(d)(3) wherever the possibility of employee exposure to airborne levels of MDA in excess of the permissible exposure limit exists.
  - (ii) Where dermal exposure to MDA occurs, the employer shall ensure that materials spilled or deposited on the skin are removed as soon as possible by methods which do not facilitate the dermal absorption of MDA.

(3) Lunch Areas.

- (i) Whenever food or beverages are consumed at the worksite and employees are exposed to MDA the employer shall provide clean lunch areas where MDA levels are below the action level and where no dermal exposure to MDA can occur.
- (ii) The employer shall ensure that employees wash their hands and faces with soap and water prior to eating, drinking, smoking, or applying cosmetics.
- (iii) The employer shall ensure that employees do not enter lunch facilities with contaminated protective work clothing or equipment.

(l) Communication of hazards to employees.

- (1) Hazard communication. The employer shall include Methylenedianiline (MDA) in the program established to comply with the Hazard Communication Standard (HCS) (1910.1200). The employer shall ensure that each employee has access to labels on containers of MDA and safety data sheets, and is trained in accordance with the provisions of HCS and paragraph (l)(3) of this section. The employer shall ensure that at least the following hazards are addressed: Cancer; liver effects; and skin sensitization.

(2) Signs and labels.

(i) Signs.

- (A) The employer shall post and maintain legible signs demarcating regulated areas and entrances or access-ways to regulated areas that bear the following legend:

**DANGER**  
**MDA**  
**MAY CAUSE CANCER**  
**CAUSES DAMAGE TO THE LIVER**  
**RESPIRATORY PROTECTION AND PROTECTIVE CLOTHING MAY BE**  
**REQUIRED**  
**IN THIS AREA**  
**AUTHORIZED PERSONNEL ONLY**

- (B) Prior to June 1, 2016, employers may use the following legend in lieu of that specified in paragraph (l)(2)(i)(A) of this section: (B) Prior to June 1, 2016, employers may use the following legend in lieu of that specified in paragraph (l)(2)(i)(A) of this section:

**DANGER**

**MDA**

**MAY CAUSE CANCER**

**LIVER TOXIN**

**AUTHORIZED PERSONNEL ONLY**

**RESPIRATORS AND PROTECTIVE CLOTHING MAY BE REQUIRED TO BE  
WORN IN THIS AREA**

- (ii) Labels.

- (A) The employer shall ensure that labels or other appropriate forms of warning are provided for containers of MDA within the workplace. The labels shall comply with the requirements of 1910.1200(f) and shall include at least the following information for pure MDA and mixtures containing MDA:

**DANGER**

**CONTAINS MDA**

**MAY CAUSE CANCER**

**CAUSES DAMAGE TO LIVER**

- (B) Prior to June 1, 2015, employers may include the following information workplace labels in lieu of the labeling requirements in paragraph (l)(2)(ii)(A) of this section:

- (1) For Pure MDA:

**DANGER**

**CONTAINS MDA**

**MAY CAUSE CANCER**

**LIVER TOXIN**

(2) For mixtures containing MDA:

**DANGER**  
**CONTAINS MDA**  
**CONTAINS MATERIALS WHICH MAY CAUSE CANCER**  
**LIVER TOXIN**

(3) Information and training.

- (i) The employer shall provide employees with information and training on MDA, in accordance with 29 CFR 1910.1200(h), at the time of initial assignment and at least annually thereafter.
- (ii) In addition to the information required under 29 CFR 1910.1200, the employer shall:
  - (A) Provide an explanation of the contents of this section, including Appendices A and B of this section, and indicate to employees where a copy of the standard is available;
  - (B) Describe the medical surveillance program required under paragraph (n) of this section, and explain the information contained in Appendix C of this section; and
  - (C) Describe the medical removal provision required under paragraph (n) of this section.

(4) Access to training materials.

- (i) The employer shall make readily available to all affected employees, without cost, all written materials relating to the employee training program, including a copy of this regulation.
- (ii) The employer shall provide to the Assistant Secretary and the Director, upon request, all information and training materials relating to the employee information and training program.

(m) Housekeeping.

- (1) All surfaces shall be maintained as free as practicable of visible accumulations of MDA.
- (2) The employer shall institute a program for detecting MDA leaks, spills, and discharges, including regular visual inspections of operations involving liquid or solid MDA.

- (3) All leaks shall be repaired and liquid or dust spills cleaned up promptly.
  - (4) Surfaces contaminated with MDA may not be cleaned by the use of compressed air.
  - (5) Shoveling, dry sweeping, and other methods of dry clean-up of MDA may be used where HEPA filtered vacuuming and/or wet cleaning are not feasible or practical.
  - (6) Waste, scrap, debris, bags, containers, equipment, and clothing contaminated with MDA shall be collected and disposed of in a manner to prevent the re-entry of MDA into the workplace.
- (n) Medical surveillance.
- (1) General.
    - (i) The employer shall make available a medical surveillance program for employees exposed to MDA under the following circumstances:
      - (A) Employees exposed at or above the action level for 30 or more days per year;
      - (B) Employees who are subject to dermal exposure to MDA for 15 or more days per year;
      - (C) Employees who have been exposed in an emergency situation;
      - (D) Employees whom the employer, based on results from compliance with paragraph (f)(8) of this section, has reason to believe are being dermally exposed; and
      - (E) Employees who show signs or symptoms of MDA exposure.
    - (ii) The employer shall ensure that all medical examinations and procedures are performed by or under the supervision of a licensed physician at a reasonable time and place, and provided without cost to the employee.
  - (2) Initial examinations.
    - (i) Within 150 days of the effective date of this standard, or before the time of initial assignment, the employer shall provide each employee covered by paragraph (n)(1)(i) of this section with a medical examination including the following elements:
      - (A) A detailed history which includes:
        - (1) Past work exposure to MDA or any other toxic substances;

- (2) A history of drugs, alcohol, tobacco, and medication routinely taken (duration and quantity); and
      - (3) A history of dermatitis, chemical skin sensitization, or previous hepatic disease.
    - (B) A physical examination which includes all routine physical examination parameters, skin examination, and examination for signs of liver disease.
    - (C) Laboratory tests including:
      - (1) Liver function tests and
      - (2) Urinalysis.
    - (D) Additional tests as necessary in the opinion of the physician.
  - (ii) No initial medical examination is required if adequate records show that the employee has been examined in accordance with the requirements of this section within the previous six months prior to the effective date of this standard or prior to the date of initial assignment.
- (3) Periodic examinations.
- (i) The employer shall provide each employee covered by this section with a medical examination at least annually following the initial examination. These periodic examinations shall include at least the following elements:
    - (A) A brief history regarding any new exposure to potential liver toxins, changes in drug, tobacco, and alcohol intake, and the appearance of physical signs relating to the liver, and the skin;
    - (B) The appropriate tests and examinations including liver function tests and skin examinations; and
    - (C) Appropriate additional tests or examinations as deemed necessary by the physician.
  - (ii) If in the physician's opinion the results of liver function tests indicate an abnormality, the employee shall be removed from further MDA exposure in accordance with paragraph (n)(9) of this section. Repeat liver function tests shall be conducted on advice of the physician.

- (4) Emergency examinations. If the employer determines that the employee has been exposed to a potentially hazardous amount of MDA in an emergency situation under paragraph (e) of this section, the employer shall provide medical examinations in accordance with paragraphs (n)(3)(i) and (ii) of this section. If the results of liver function testing indicate an abnormality, the employee shall be removed in accordance with paragraph (n)(9) of this section. Repeat liver function tests shall be conducted on the advice of the physician. If the results of the tests are normal, tests must be repeated two to three weeks from the initial testing. If the results of the second set of tests are normal and on the advice of the physician, no additional testing is required.
- (5) Additional examinations. Where the employee develops signs and symptoms associated with exposure to MDA, the employer shall provide the employee with an additional medical examination including liver function tests. Repeat liver function tests shall be conducted on the advice of the physician. If the results of the tests are normal, tests must be repeated two to three weeks from the initial testing. If the results of the second set of tests are normal and on the advice of the physician, no additional testing is required.
- (6) Multiple physician review mechanism.
- (i) If the employer selects the initial physician who conducts any medical examination or consultation provided to an employee under this section, and the employee has signs or symptoms of occupational exposure to MDA (which could include an abnormal liver function test), and the employee disagrees with the opinion of the examining physician, and this opinion could affect the employee's job status, the employee may designate an appropriate and mutually acceptable second physician:
- (A) To review any findings, determinations or recommendations of the initial physician; and
- (B) To conduct such examinations, consultations, and laboratory tests as the second physician deems necessary to facilitate this review.
- (ii) The employer shall promptly notify an employee of the right to seek a second medical opinion after each occasion that an initial physician conducts a medical examination or consultation pursuant to this section. The employer may condition its participation in, and payment for, the multiple physician review mechanism upon the employee doing the following within fifteen (15) days after receipt of the foregoing notification, or receipt of the initial physician's written opinion, whichever is later:

- (A) The employee informing the employer that he or she intends to seek a second medical opinion, and
  - (B) The employee initiating steps to make an appointment with a second physician.
- (iii) If the findings, determinations, or recommendations of the second physician differ from those of the initial physician, then the employer and the employee shall assure that efforts are made for the two physicians to resolve any disagreement.
  - (iv) If the two physicians have been unable to quickly resolve their disagreement, then the employer and the employee through their respective physicians shall designate a third physician:
    - (A) To review any findings, determinations, or recommendations of the prior physicians; and
    - (B) To conduct such examinations, consultations, laboratory tests, and discussions with the prior physicians as the third physician deems necessary to resolve the disagreement of the prior physicians.
  - (v) The employer shall act consistent with the findings, determinations, and recommendations of the second physician, unless the employer and the employee reach a mutually acceptable agreement.
- (7) Information provided to the examining physician.
- (i) The employer shall provide the following information to the examining physician:
    - (A) A copy of this regulation and its appendices;
    - (B) A description of the affected employee's duties as they relate to the employee's potential exposure to MDA;
    - (C) The employee's current actual or representative MDA exposure level;
    - (D) A description of any personal protective equipment used or to be used; and
    - (E) Information from previous employment related medical examinations of the affected employee.
  - (ii) The employer shall provide the foregoing information to a second physician under this section upon request either by the second physician, or by the employee.

(8) Physician's written opinion.

- (i) For each examination under this section, the employer shall obtain, and provide the employee with a copy of, the examining physician's written opinion within 15 days of its receipt. The written opinion shall include the following:
  - (A) The occupationally pertinent results of the medical examination and tests;
  - (B) The physician's opinion concerning whether the employee has any detected medical conditions which would place the employee at increased risk of material impairment of health from exposure to MDA;
  - (C) The physician's recommended limitations upon the employee's exposure to MDA or upon the employee's use of protective clothing or equipment and respirators; and
  - (D) A statement that the employee has been informed by the physician of the results of the medical examination and any medical conditions resulting from MDA exposure which require further explanation or treatment.
- (ii) The written opinion obtained by the employer shall not reveal specific findings or diagnoses unrelated to occupational exposures.

(9) Medical removal.

- (i) Temporary medical removal of an employee.
  - (A) Temporary removal resulting from occupational exposure. The employee shall be removed from work environments in which exposure to MDA is at or above the action level or where dermal exposure to MDA may occur, following an initial examination (paragraph (n)(2) of this section), periodic examinations (paragraph (n)(3) of this section), an emergency situation (paragraph (n)(4) of this section), or an additional examination (paragraph (n)(5) of this section) in the following circumstances:
    - (1) When the employee exhibits signs and/or symptoms indicative of acute exposure to MDA; or

- (2) When the examining physician determines that an employee's abnormal liver function tests are not associated with MDA exposure but that the abnormalities may be exacerbated as a result of occupational exposure to MDA.
  - (B) Temporary removal due to a final medical determination.
    - (1) The employer shall remove an employee from work having an exposure to MDA at or above the action level or where the potential for dermal exposure exists on each occasion that a final medical determination results in a medical finding, determination, or opinion that the employee has a detected medical condition which places the employee at increased risk of material impairment to health from exposure to MDA.
    - (2) For the purposes of this section, the phrase "final medical determination" shall mean the outcome of the physician review mechanism used pursuant to the medical surveillance provisions of this section.
    - (3) Where a final medical determination results in any recommended special protective measures for an employee, or limitations on an employee's exposure to MDA, the employer shall implement and act consistent with the recommendation.
- (ii) Return of the employee to former job status.
  - (A) The employer shall return an employee to his or her former job status:
    - (1) When the employee no longer shows signs or symptoms of exposure to MDA, or upon the advice of the physician.
    - (2) When a subsequent final medical determination results in a medical finding, determination, or opinion that the employee no longer has a detected medical condition which places the employee at increased risk of material impairment to health from exposure to MDA.
  - (B) For the purposes of this section, the requirement that an employer return an employee to his or her former job status is not intended to expand upon or restrict any rights an employee has or would have had, absent temporary medical removal, to a specific job classification or position under the terms of a collective bargaining agreement.

- (iii) Removal of other employee special protective measure or limitations. The employer shall remove any limitations placed on an employee or end any special protective measures provided to an employee pursuant to a final medical determination when a subsequent final medical determination indicates that the limitations or special protective measures are no longer necessary.
- (iv) Employer options pending a final medical determination. Where the physician review mechanism used pursuant to the medical surveillance provisions of this section, has not yet resulted in a final medical determination with respect to an employee, the employer shall act as follows:
  - (A) Removal. The employer may remove the employee from exposure to MDA, provide special protective measures to the employee, or place limitations upon the employee, consistent with the medical findings, determinations, or recommendations of the physician who has reviewed the employee's health status.
  - (B) Return. The employer may return the employee to his or her former job status, and end any special protective measures provided to the employee, consistent with the medical findings, determinations, or recommendations of any of the physicians who have reviewed the employee's health status, with two exceptions:
    - (1) If the initial removal, special protection, or limitation of the employee resulted from a final medical determination which differed from the findings, determinations, or recommendations of the initial physician; or
    - (2) The employee has been on removal status for the preceding six months as a result of exposure to MDA, then the employer shall await a final medical determination.
- (v) Medical removal protection benefits.
  - (A) Provisions of medical removal protection benefits. The employer shall provide to an employee up to six (6) months of medical removal protection benefits on each occasion that an employee is removed from exposure to MDA or otherwise limited pursuant to this section.

- (B) Definition of medical removal protection benefits. For the purposes of this section, the requirement that an employer provide medical removal protection benefits means that the employer shall maintain the earnings, seniority, and other employment rights and benefits of an employee as though the employee had not been removed from normal exposure to MDA or otherwise limited.
- (C) Follow-up medical surveillance during the period of employee removal or limitations. During the period of time that an employee is removed from normal exposure to MDA or otherwise limited, the employer may condition the provision of medical removal protection benefits upon the employee's participation in follow-up medical surveillance made available pursuant to this section.
- (D) Workers' compensation claims. If a removed employee files a claim for workers' compensation payments for a MDA-related disability, then the employer shall continue to provide medical removal protection benefits pending disposition of the claim. To the extent that an award is made to the employee for earnings lost during the period of removal, the employer's medical removal protection obligation shall be reduced by such amount. The employer shall receive no credit for workers' compensation payments received by the employee for treatment-related expenses.
- (E) Other credits. The employer's obligation to provide medical removal protection benefits to a removed employee shall be reduced to the extent that the employee receives compensation for earnings lost during the period of removal either from a publicly or employer-funded compensation program, or receives income from employment with any employer made possible by virtue of the employee's removal.
- (F) Employees who do not recover within the 6 months of removal. The employer shall take the following measures with respect to any employee removed from exposure to MDA:
- (1) The employer shall make available to the employee a medical examination pursuant to this section to obtain a final medical determination with respect to the employee;
  - (2) The employer shall assure that the final medical determination obtained indicates whether or not the employee may be returned to his or her former job status, and, if not, what steps should be taken to protect the employee's health;

- (3) Where the final medical determination has not yet been obtained, or once obtained indicates that the employee may not yet be returned to his or her former job status, the employer shall continue to provide medical removal protection benefits to the employee until either the employee is returned to former job status, or a final medical determination is made that the employee is incapable of ever safely returning to his or her former job status; and
- (4) Where the employer acts pursuant to a final medical determination which permits the return of the employee to his or her former job status despite what would otherwise be an unacceptable liver function test, later questions concerning removing the employee again shall be decided by a final medical determination. The employer need not automatically remove such an employee pursuant to the MDA removal criteria provided by this section.
- (vi) Voluntary removal or restriction of an employee. Where an employer, although not required by this section to do so, removes an employee from exposure to MDA or otherwise places limitations on an employee due to the effects of MDA exposure on the employee's medical condition, the employer shall provide medical removal protection benefits to the employee equal to that required by paragraph (n)(9)(v) of this section.
- (o) Recordkeeping.
- (1) Objective data for exempted operations.
- (i) Where the employer has relied on objective data that demonstrate that products made from or containing MDA are not capable of releasing MDA or do not present a dermal exposure problem under the expected conditions of processing, use, or handling to exempt such operations from the initial monitoring requirements under paragraph (f)(2) of this section, the employer shall establish and maintain an accurate record of objective data reasonably relied upon in support of the exemption.
- (ii) The record shall include at least the following information:
- (A) The product qualifying for exemption;
- (B) The source of the objective data;
- (C) The testing protocol, results of testing, and/or analysis of the material for the release of MDA;

- (D) A description of the operation exempted and how the data support the exemption; and
    - (E) Other data relevant to the operations, materials, processing, or employee exposures covered by the exemption.
  - (iii) The employer shall maintain this record for the duration of the employer's reliance upon such objective data.
- (2) Historical monitoring data.
- (i) Where the employer has relied on historical monitoring data that demonstrate that exposures on a particular job will be below the action level to exempt such operations from the initial monitoring requirements under paragraph (f)(2) of this section, the employer shall establish and maintain an accurate record of historical monitoring data reasonably relied upon in support of the exception.
  - (ii) The record shall include information that reflect the following conditions:
    - (A) The data upon which judgments are based are scientifically sound and were collected using methods that are sufficiently accurate and precise;
    - (B) The processes and work practices that were in use when the historical monitoring data were obtained are essentially the same as those to be used during the job for which initial monitoring will not be performed;
    - (C) The characteristics of the MDA-containing material being handled when the historical monitoring data were obtained are the same as those on the job for which initial monitoring will not be performed;
    - (D) Environmental conditions prevailing when the historical monitoring data were obtained are the same as those on the job for which initial monitoring will not be performed; and
    - (E) Other data relevant to the operations, materials, processing, or employee exposures covered by the exception.
  - (iii) The employer shall maintain this record for the duration of the employer's reliance upon such historical monitoring data.
- (3) The employer may utilize the services of competent organizations such as industry trade associations and employee associations to maintain the records required by this section.
- (4) Exposure measurements.

- (i) The employer shall keep an accurate record of all measurements taken to monitor employee exposure to MDA.
  - (ii) This record shall include at least the following information:
    - (A) The date of measurement;
    - (B) The operation involving exposure to MDA;
    - (C) Sampling and analytical methods used and evidence of their accuracy;
    - (D) Number, duration, and results of samples taken;
    - (E) Type of protective devices worn, if any; and
    - (F) Name and exposure of the employees whose exposures are represented.
  - (iii) The employer shall maintain this record for at least thirty (30) years, in accordance with 29 CFR 1910.1020.
- (5) Medical surveillance.
- (i) The employer shall establish and maintain an accurate record for each employee subject to medical surveillance by paragraph (n) of this section, in accordance with 29 CFR 1910.1020.
  - (ii) The record shall include at least the following information:
    - (A) The name of the employee;
    - (B) A copy of the employee's medical examination results, including the medical history, questionnaire responses, results of any tests, and physician's recommendations.
    - (C) Physician's written opinions;
    - (D) Any employee medical complaints related to exposure to MDA; and
    - (E) A copy of the information provided to the physician as required by paragraph (n) of this section.
  - (iii) The employer shall ensure that this record is maintained for the duration of employment plus thirty (30) years, in accordance with 29 CFR 1910.1020.
  - (iv) A copy of the employee's medical removal and return to work status.
- (6) Training records. The employer shall maintain all employee training records for one (1) year beyond the last date of employment.

(7) Availability.

- (i) The employer, upon written request, shall make all records required to be maintained by this section available to the Assistant Secretary and the Director for examination and copying.
- (ii) The employer, upon request, shall make any exposure records required by paragraphs (f) and (n) of this section available for examination and copying to affected employees, former employees, designated representatives, and the Assistant Secretary, in accordance with 29 CFR 1910.1020(a) through (e) and (g) through (i).
- (iii) The employer, upon request, shall make employee medical records required by paragraphs (n) and (o) of this section available for examination and copying to the subject employee, anyone having the specific written consent of the subject employee, and the Assistant Secretary, in accordance with 29 CFR 1910.1020.

(8) Transfer of records. The employer shall comply with the requirements concerning transfer of records set forth in 29 CFR 1910.1020(h).

(p) Observation of monitoring.

- (1) Employee observation. The employer shall provide affected employees, or their designated representatives, an opportunity to observe the measuring or monitoring of employee exposure to MDA conducted pursuant to paragraph (f) of this section.
- (2) Observation procedures. When observation of the measuring or monitoring of employee exposure to MDA requires entry into areas where the use of protective clothing and equipment or respirators is required, the employer shall provide the observer with personal protective clothing and equipment or respirators required to be worn by employees working in the area, assure the use of such clothing and equipment or respirators, and require the observer to comply with all other applicable safety and health procedures.

(q) Appendices. The information contained in Appendices A, B, C and D of this section is not intended, by itself, to create any additional obligations not otherwise imposed by this standard nor detract from any existing obligation.

## 1926.62 Lead

(a) **Scope.** This section applies to all construction work where an employee may be occupationally exposed to lead. All construction work excluded from coverage in the general industry standard for lead by 29 CFR 1910.1025(a)(2) is covered by this standard. Construction work is defined as work for construction, alteration and/or repair, including painting and decorating. It includes but is not limited to the following:

- (1) Demolition or salvage of structures where lead or materials containing lead are present;
- (2) Removal or encapsulation of materials containing lead;
- (3) New construction, alteration, repair, or renovation of structures, substrates, or portions thereof, that contain lead, or materials containing lead;
- (4) Installation of products containing lead;
- (5) Lead contamination/emergency cleanup;
- (6) Transportation, disposal, storage, or containment of lead or materials containing lead on the site or location at which construction activities are performed, and
- (7) Maintenance operations associated with the construction activities described in this paragraph.

(b) **Definitions.**

**Action level** means employee exposure, without regard to the use of respirators, to an airborne concentration of lead of 30 micrograms per cubic meter of air (30 µg/m<sup>3</sup>) calculated as an 8-hour time-weighted average (TWA).

**Assistant Secretary** means the Assistant Secretary of Labor for Occupational Safety and Health, U.S. Department of Labor, or designee.

**Competent person** means one who is capable of identifying existing and predictable lead hazards in the surroundings or working conditions and who has authorization to take prompt corrective measures to eliminate them.

**Director** means the Director, National Institute for Occupational Safety and Health (NIOSH), U.S. Department of Health and Human Services, or designee.

**Lead** means metallic lead, all inorganic lead compounds, and organic lead soaps. Excluded from this definition are all other organic lead compounds.

**This section** means this standard.

(c) Permissible exposure limit.

- (1) The employer shall assure that no employee is exposed to lead at concentrations greater than fifty micrograms per cubic meter of air (50 µg/m<sup>3</sup>) averaged over an 8-hour period.
- (2) If an employee is exposed to lead for more than 8 hours in any work day the employees' allowable exposure, as a time weighted average (TWA) for that day, shall be reduced according to the following formula:

Allowable employee exposure (in µg/m<sup>3</sup>) = 400 divided by hours worked in the day.

- (3) When respirators are used to limit employee exposure as required under paragraph (c) of this section and all the requirements of paragraphs (e)(1) and (f) of this section have been met, employee exposure may be considered to be at the level provided by the protection factor of the respirator for those periods the respirator is worn. Those periods may be averaged with exposure levels during periods when respirators are not worn to determine the employee's daily TWA exposure.

(d) Exposure assessment.

(1) General.

- (i) Each employer who has a workplace or operation covered by this standard shall initially determine if any employee may be exposed to lead at or above the action level.
- (ii) For the purposes of paragraph (d) of this section, employee exposure is that exposure which would occur if the employee were not using a respirator.

- (iii) With the exception of monitoring under paragraph (d)(3), where monitoring is required under this section, the employer shall collect personal samples representative of a full shift including at least one sample for each job classification in each work area either for each shift or for the shift with the highest exposure level.
- (iv) Full shift personal samples shall be representative of the monitored employee's regular, daily exposure to lead.

(2) Protection of employees during assessment of exposure.

- (i) With respect to the lead related tasks listed in paragraph (d)(2)(i) of this section, where lead is present, until the employer performs an employee exposure assessment as required in paragraph (d) of this section and documents that the employee performing any of the listed tasks is not exposed above the PEL, the employer shall treat the employee as if the employee were exposed above the PEL, and not in excess of ten (10) times the PEL, and shall implement employee protective measures prescribed in paragraph (d)(2)(v) of this section. The tasks covered by this requirement are:
  - (A) Where lead containing coatings or paint are present: Manual demolition of structures (e.g., dry wall), manual scraping, manual sanding, heat gun applications, and power tool cleaning with dust collection systems;
  - (B) Spray painting with lead paint.
- (ii) In addition, with regard to tasks not listed in paragraph (d)(2)(i), where the employee has any reason to believe that an employee performing the task may be exposed to lead in excess of the PEL, until the employer performs an employee exposure assessment as required by paragraph (d) of this section and documents that the employee's lead exposure is not above the PEL the employer shall treat the employee as if the employee were exposed above the PEL and shall implement employee protective measures as prescribed in paragraph (d)(2)(v) of this section.

- (iii) With respect to the tasks listed in paragraph (d)(2)(iii) of this section, where lead is present, until the employer performs an employee exposure assessment as required in paragraph (d) of this section, and documents that the employee performing any of the listed tasks is not exposed in excess of 500  $\mu\text{g}/\text{m}^3$ , the employer shall treat the employee as if the employee were exposed to lead in excess of 500  $\mu\text{g}/\text{m}^3$  and shall implement employee protective measures as prescribed in paragraph (d)(2)(v) of this section. Where the employer does establish that the employee is exposed to levels of lead below 500  $\mu\text{g}/\text{m}^3$ , the employer may provide the exposed employee with the appropriate respirator prescribed for such use at such lower exposures, in accordance with Table 1 of this section. The tasks covered by this requirement are:
- (A) Using lead containing mortar; lead burning
  - (B) Where lead containing coatings or paint are present: rivet busting; power tool cleaning without dust collection systems; cleanup activities where dry expendable abrasives are used; and abrasive blasting enclosure movement and removal.
- (iv) With respect to the tasks listed in paragraph (d)(2)(iv) of this section, where lead is present, until the employer performs an employee exposure assessment as required in paragraph (d) of this section and documents that the employee performing any of the listed tasks is not exposed to lead in excess of 2,500  $\mu\text{g}/\text{m}^3$  (50 x PEL), the employer shall treat the employee as if the employee were exposed to lead in excess of 2,500  $\mu\text{g}/\text{m}^3$  and shall implement employee protective measures as prescribed in paragraph (d)(2)(v) of this section. Where the employer does establish that the employee is exposed to levels of lead below 2,500  $\mu\text{g}/\text{m}^3$ , the employer may provide the exposed employee with the appropriate respirator prescribed for use at such lower exposures, in accordance with Table I of this section. Interim protection as described in this paragraph is required where lead containing coatings or paint are present on structures when performing:
- (A) Abrasive blasting,
  - (B) Welding,
  - (C) Cutting, and
  - (D) Torch burning.

- (v) Until the employer performs an employee exposure assessment as required under paragraph (d) of this section and determines actual employee exposure, the employer shall provide to employees performing the tasks described in paragraphs (d)(2)(i), (d)(2)(ii), (d)(2)(iii), and (d)(2)(iv) of this section with interim protection as follows:
  - (A) Appropriate respiratory protection in accordance with paragraph (f) of this section.
  - (B) Appropriate personal protective clothing and equipment in accordance with paragraph (g) of this section.
  - (C) Change areas in accordance with paragraph (i)(2) of this section.
  - (D) Hand washing facilities in accordance with paragraph (i)(5) of this section.
  - (E) Biological monitoring in accordance with paragraph (j)(1)(i) of this section, to consist of blood sampling and analysis for lead and zinc protoporphyrin levels, and
  - (F) Training as required under paragraph (l)(1)(i) of this section regarding 29 CFR 1926.59, Hazard Communication; training as required under paragraph (l)(2)(iii) of this section, regarding use of respirators; and training in accordance with 29 CFR 1926.21, Safety training and education.
- (3) Basis of initial determination.
  - (i) Except as provided under paragraphs (d)(3)(iii) and (d)(3)(iv) of this section the employer shall monitor employee exposures and shall base initial determinations on the employee exposure monitoring results and any of the following, relevant considerations:
    - (A) Any information, observations, or calculations which would indicate employee exposure to lead;
    - (B) Any previous measurements of airborne lead; and
    - (C) Any employee complaints of symptoms which may be attributable to exposure to lead.
  - (ii) Monitoring for the initial determination where performed may be limited to a representative sample of the exposed employees who the employer reasonably believes are exposed to the greatest airborne concentrations of lead in the workplace.

- (iii) Where the employer has previously monitored for lead exposures, and the data were obtained within the past 12 months during work operations conducted under workplace conditions closely resembling the processes, type of material, control methods, work practices, and environmental conditions used and prevailing in the employer's current operations, the employer may rely on such earlier monitoring results to satisfy the requirements of paragraphs (d)(3)(i) and (d)(6) of this section if the sampling and analytical methods meet the accuracy and confidence levels of paragraph (d)(10) of this section.
  - (iv) Where the employer has objective data, demonstrating that a particular product or material containing lead or a specific process, operation or activity involving lead cannot result in employee exposure to lead at or above the action level during processing, use, or handling, the employer may rely upon such data instead of implementing initial monitoring.
    - (A) The employer shall establish and maintain an accurate record documenting the nature and relevancy of objective data as specified in paragraph (n)(4) of this section, where used in assessing employee exposure in lieu of exposure monitoring.
    - (B) Objective data, as described in paragraph (d)(3)(iv) of this section, is not permitted to be used for exposure assessment in connection with paragraph (d)(2) of this section.
- (4) Positive initial determination and initial monitoring.
- (i) Where a determination conducted under paragraphs (d)(1), (2) and (3) of this section shows the possibility of any employee exposure at or above the action level the employer shall conduct monitoring which is representative of the exposure for each employee in the workplace who is exposed to lead.
  - (ii) Where the employer has previously monitored for lead exposure, and the data were obtained within the past 12 months during work operations conducted under workplace conditions closely resembling the processes, type of material, control methods, work practices, and environmental conditions used and prevailing in the employer's current operations, the employer may rely on such earlier monitoring results to satisfy the requirements of paragraph (d)(4)(i) of this section if the sampling and analytical methods meet the accuracy and confidence levels of paragraph (d)(10) of this section

- (5) Negative initial determination. Where a determination, conducted under paragraphs (d)(1), (2), and (3) of this section is made that no employee is exposed to airborne concentrations of lead at or above the action level the employer shall make a written record of such determination. The record shall include at least the information specified in paragraph (d)(3)(i) of this section and shall also include the date of determination, location within the worksite, and the name of each employee monitored.
- (6) Frequency.
- (i) If the initial determination reveals employee exposure to be below the action level further exposure determination need not be repeated except as otherwise provided in paragraph (d)(7) of this section.
  - (ii) If the initial determination or subsequent determination reveals employee exposure to be at or above the action level but at or below the PEL the employer shall perform monitoring in accordance with this paragraph at least every 6 months. The employer shall continue monitoring at the required frequency until at least two consecutive measurements, taken at least 7 days apart, are below the action level at which time the employer may discontinue monitoring for that employee except as otherwise provided in paragraph (d)(7) of this section.
  - (iii) If the initial determination reveals that employee exposure is above the PEL the employer shall perform monitoring quarterly. The employer shall continue monitoring at the required frequency until at least two consecutive measurements, taken at least 7 days apart, are at or below the PEL but at or above the action level at which time the employer shall repeat monitoring for that employee at the frequency specified in paragraph (d)(6)(ii) of this section, except as otherwise provided in paragraph (d)(7) of this section. The employer shall continue monitoring at the required frequency until at least two consecutive measurements, taken at least 7 days apart, are below the action level at which time the employer may discontinue monitoring for that employee except as otherwise provided in paragraph (d)(7) of this section.
- (7) Additional exposure assessments. Whenever there has been a change of equipment, process, control, personnel or a new task has been initiated that may result in additional employees being exposed to lead at or above the action level or may result in employees already exposed at or above the action level being exposed above the PEL, the employer shall conduct additional monitoring in accordance with this paragraph.
- (8) Employee notification.

- (i) The employer must, as soon as possible but no later than 5 working days after the receipt of the results of any monitoring performed under this section, notify each affected employee of these results either individually in writing or by posting the results in an appropriate location that is accessible to employees.
  - (ii) Whenever the results indicate that the representative employee exposure, without regard to respirators, is at or above the PEL the employer shall include in the written notice a statement that the employees exposure was at or above that level and a description of the corrective action taken or to be taken to reduce exposure to below that level.
- (9) Accuracy of measurement. The employer shall use a method of monitoring and analysis which has an accuracy (to a confidence level of 95%) of not less than plus or minus 25 percent for airborne concentrations of lead equal to or greater than 30  $\mu\text{g}/\text{m}^3$ .
- (e) Methods of compliance.
- (1) Engineering and work practice controls. The employer shall implement engineering and work practice controls, including administrative controls, to reduce and maintain employee exposure to lead to or below the permissible exposure limit to the extent that such controls are feasible. Wherever all feasible engineering and work practices controls that can be instituted are not sufficient to reduce employee exposure to or below the permissible exposure limit prescribed in paragraph (c) of this section, the employer shall nonetheless use them to reduce employee exposure to the lowest feasible level and shall supplement them by the use of respiratory protection that complies with the requirements of paragraph (f) of this section.
  - (2) Compliance program.
    - (i) Prior to commencement of the job each employer shall establish and implement a written compliance program to achieve compliance with paragraph (c) of this section.
    - (ii) Written plans for these compliance programs shall include at least the following:
      - (A) A description of each activity in which lead is emitted; e.g., equipment used, material involved, controls in place, crew size, employee job responsibilities, operating procedures and maintenance practices;

- (B) A description of the specific means that will be employed to achieve compliance and, where engineering controls are required engineering plans and studies used to determine methods selected for controlling exposure to lead;
  - (C) A report of the technology considered in meeting the PEL;
  - (D) Air monitoring data which documents the source of lead emissions;
  - (E) A detailed schedule for implementation of the program, including documentation such as copies of purchase orders for equipment, construction contracts, etc.;
  - (F) A work practice program which includes items required under paragraphs (g), (h) and (i) of this section and incorporates other relevant work practices such as those specified in paragraph (e)(5) of this section;
  - (G) An administrative control schedule required by paragraph (e)(4) of this section, if applicable;
  - (H) A description of arrangements made among contractors on multi-contractor sites with respect to informing affected employees of potential exposure to lead and with respect to responsibility for compliance with this section as set-forth in 1926.16.
  - (I) Other relevant information.
- (iii) The compliance program shall provide for frequent and regular inspections of job sites, materials, and equipment to be made by a competent person.
  - (iv) Written programs shall be submitted upon request to any affected employee or authorized employee representatives, to the Assistant Secretary and the Director, and shall be available at the worksite for examination and copying by the Assistant Secretary and the Director.
  - (v) Written programs must be revised and updated at least annually to reflect the current status of the program.
- (3) Mechanical ventilation. When ventilation is used to control lead exposure, the employer shall evaluate the mechanical performance of the system in controlling exposure as necessary to maintain its effectiveness.
  - (4) Administrative controls. If administrative controls are used as a means of reducing employees TWA exposure to lead, the employer shall establish and implement a job rotation schedule which includes:

- (i) Name or identification number of each affected employee;
  - (ii) Duration and exposure levels at each job or work station where each affected employee is located; and
  - (iii) Any other information which may be useful in assessing the reliability of administrative controls to reduce exposure to lead.
- (5) The employer shall ensure that, to the extent relevant, employees follow good work practices such as described in Appendix B of this section.
- (f) Respiratory protection.
- (1) General. For employees who use respirators required by this section, the employer must provide each employee an appropriate respirator that complies with the requirements of this paragraph. Respirators must be used during:
    - (i) Periods when an employee's exposure to lead exceeds the PEL.
    - (ii) Work operations for which engineering and work-practice controls are not sufficient to reduce employee exposures to or below the PEL.
    - (iii) Periods when an employee requests a respirator.
    - (iv) Periods when respirators are required to provide interim protection of employees while they perform the operations specified in paragraph (d)(2) of this section.
  - (2) Respirator program.

Oregon OSHA repealed 1926.62(f)(2)(i). In Oregon, OAR 437-003-0062 applies.

#### **437-003-0062    *Lead Respiratory Protection Program***

*The employer must implement a respiratory protection program in accordance with Division 2/I, 1910.134(b) through (d) (except (d)(1)(iii)), and (e) through (m) and (o), which covers each employee required by Division 3/D, 1926.62 Lead, to use a respirator.*

**Note:** This is in addition to other respiratory protection and medical surveillance requirements specified in these Lead rules.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 5-2011, f. 12/8/11, ef. 7/1/12.

1926.62(f)(2)(ii) If an employee has breathing difficulty during fit testing or respirator use, the employer must provide the employee with a medical examination in accordance with paragraph (j)(3)(i)(B) of this section to determine whether or not the employee can use a respirator while performing the required duty.

(3) Respirator selection.

(i) Employers must:

(A) Select, and provide to employees, the appropriate respirators specified in paragraph (d)(3)(i)(A) of 29 CFR 1910.134.

(B) Provide employees with a full facepiece respirator instead of a half mask respirator for protection against lead aerosols that may cause eye or skin irritation at the use concentrations.

(C) Provide HEPA filters for powered and non-powered air-purifying respirators.

(ii) The employer must provide a powered air-purifying respirator when an employee chooses to use such a respirator and it will provide adequate protection to the employee.

(g) Protective work clothing and equipment.

(1) Provision and use. Where an employee is exposed to lead above the PEL without regard to the use of respirators, where employees are exposed to lead compounds which may cause skin or eye irritation (e.g., lead arsenate, lead azide), and as interim protection for employees performing tasks as specified in paragraph (d)(2) of this section, the employer shall provide at no cost to the employee and assure that the employee uses appropriate protective work clothing and equipment that prevents contamination of the employee and the employee's garments such as, but not limited to:

(i) Coveralls or similar full-body work clothing;

(ii) Gloves, hats, and shoes or disposable shoe coverlets; and

(iii) Face shields, vented goggles, or other appropriate protective equipment which complies with OAR 437-003-0134(8).

(2) Cleaning and replacement.

- (i) The employer shall provide the protective clothing required in paragraph (g)(1) of this section in a clean and dry condition at least weekly, and daily to employees whose exposure levels without regard to a respirator are over 200 µg/m<sup>3</sup> of lead as an 8-hour TWA.
- (ii) The employer shall provide for the cleaning, laundering, and disposal of protective clothing and equipment required by paragraph (g)(1) of this section.
- (iii) The employer shall repair or replace required protective clothing and equipment as needed to maintain their effectiveness.
- (iv) The employer shall assure that all protective clothing is removed at the completion of a work shift only in change areas provided for that purpose as prescribed in paragraph (i)(2) of this section.
- (v) The employer shall assure that contaminated protective clothing which is to be cleaned, laundered, or disposed of, is placed in a closed container in the change area which prevents dispersion of lead outside the container.
- (vi) The employer shall inform in writing any person who cleans or launders protective clothing or equipment of the potentially harmful effects of exposure to lead.
- (vii)
  - (A) The employer shall ensure that the containers of contaminated protective clothing and equipment required by paragraph (g)(2)(v) of this section are labeled as follows:

**DANGER: CLOTHING AND EQUIPMENT CONTAMINATED WITH LEAD. MAY DAMAGE FERTILITY OR THE UNBORN CHILD. CAUSES DAMAGE TO THE CENTRAL NERVOUS SYSTEM. DO NOT EAT, DRINK OR SMOKE WHEN HANDLING. DO NOT REMOVE DUST BY BLOWING OR SHAKING. DISPOSE OF LEAD CONTAMINATED WASH WATER IN ACCORDANCE WITH APPLICABLE LOCAL, STATE, OR FEDERAL REGULATIONS.**
  - (B) Prior to June 1, 2015, employers may include the following information on bags or containers of contaminated protective clothing and equipment required by paragraph (g)(2)(v) in lieu of the labeling requirements in paragraph (g)(2)(vii)(A) of this section:

**Caution:** Clothing contaminated with lead. Do not remove dust by blowing or shaking. Dispose of lead contaminated wash water in accordance with applicable local, state, or federal regulations.

(viii) The employer shall prohibit the removal of lead from protective clothing or equipment by blowing, shaking, or any other means which disperses lead into the air.

(h) Housekeeping.

- (1) All surfaces shall be maintained as free as practicable of accumulations of lead.
- (2) Clean-up of floors and other surfaces where lead accumulates shall wherever possible, be cleaned by vacuuming or other methods that minimize the likelihood of lead becoming airborne.
- (3) Shoveling, dry or wet sweeping, and brushing may be used only where vacuuming or other equally effective methods have been tried and found not to be effective.
- (4) Where vacuuming methods are selected, the vacuums shall be equipped with HEPA filters and used and emptied in a manner which minimizes the reentry of lead into the workplace.
- (5) Compressed air shall not be used to remove lead from any surface unless the compressed air is used in conjunction with a ventilation system designed to capture the airborne dust created by the compressed air.

(i) Hygiene facilities and practices.

- (1) The employer shall assure that in areas where employees are exposed to lead above the PEL without regard to the use of respirators, food or beverage is not present or consumed, tobacco products are not present or used, and cosmetics are not applied.
- (2) Change areas.
  - (i) The employer shall provide clean change areas for employees whose airborne exposure to lead is above the PEL, and as interim protection for employees performing tasks as specified in paragraph (d)(2) of this section, without regard to the use of respirators.
  - (ii) The employer shall assure that change areas are equipped with separate storage facilities for protective work clothing and equipment and for street clothes which prevent cross-contamination.

- (iii) The employer shall assure that employees do not leave the workplace wearing any protective clothing or equipment that is required to be worn during the work shift.

(3) Showers.

- (i) The employer shall provide shower facilities, where feasible, for use by employees whose airborne exposure to lead is above the PEL.
- (ii) The employer shall assure, where shower facilities are available, that employees shower at the end of the work shift and shall provide an adequate supply of cleansing agents and towels for use by affected employees.

(4) Eating facilities.

- (i) The employer shall provide lunchroom facilities or eating areas for employees whose airborne exposure to lead is above the PEL, without regard to the use of respirators.
- (ii) The employer shall assure that lunchroom facilities or eating areas are as free as practicable from lead contamination and are readily accessible to employees.
- (iii) The employer shall assure that employees whose airborne exposure to lead is above the PEL, without regard to the use of a respirator, wash their hands and face prior to eating, drinking, smoking or applying cosmetics.
- (iv) The employer shall assure that employees do not enter lunchroom facilities or eating areas with protective work clothing or equipment unless surface lead dust has been removed by vacuuming, downdraft booth, or other cleaning method that limits dispersion of lead dust.

(5) Hand washing facilities.

- (i) The employer shall provide adequate handwashing facilities for use by employees exposed to lead in accordance with 29 CFR 1926.51(f).

*Note: Oregon does not have 1926.51(f). Please refer to OAR 437-002-0141(5) Washing Facilities, in Division 2/J.*

- (ii) Where showers are not provided the employer shall assure that employees wash their hands and face at the end of the workshift.

(j) Medical surveillance.

(1) General.

- (i) The employer shall make available initial medical surveillance to employees occupationally exposed on any day to lead at or above the action level. Initial medical surveillance consists of biological monitoring in the form of blood sampling and analysis for lead and zinc protoporphyrin levels.
- (ii) The employer shall institute a medical surveillance program in accordance with paragraphs (j)(2) and (j)(3) of this section for all employees who are or may be exposed by the employer at or above the action level for more than 30 days in any consecutive 12 months;
- (iii) The employer shall assure that all medical examinations and procedures are performed by or under the supervision of a licensed physician.
- (iv) The employer shall make available the required medical surveillance including multiple physician review under paragraph (j)(3)(iii) without cost to employees and at a reasonable time and place.

(2) Biological monitoring.

- (i) Blood lead and ZPP level sampling and analysis. The employer shall make available biological monitoring in the form of blood sampling and analysis for lead and zinc protoporphyrin levels to each employee covered under paragraphs (j)(1)(i) and (ii) of this section on the following schedule:
  - (A) For each employee covered under paragraph (j)(1)(ii) of this section, at least every 2 months for the first 6 months and every 6 months thereafter;
  - (B) For each employee covered under paragraphs (j)(1)(i) or (ii) of this section whose last blood sampling and analysis indicated a blood lead level at or above 40 µg/dl, at least every two months. This frequency shall continue until two consecutive blood samples and analyses indicate a blood lead level below 40 µg/dl; and
  - (C) For each employee who is removed from exposure to lead due to an elevated blood lead level at least monthly during the removal period.
- (ii) Follow-up blood sampling tests. Whenever the results of a blood lead level test indicate that an employee's blood lead level is at or above the numerical criterion for medical removal under paragraph (k)(1)(i) of this section, the employer shall provide a second (follow-up) blood sampling test within two weeks after the employer receives the results of the first blood sampling test.

- (iii) Accuracy of blood lead level sampling and analysis. Blood lead level sampling and analysis provided pursuant to this section shall have an accuracy (to a confidence level of 95 percent) within plus or minus 15 percent or 6 µg/dl, whichever is greater, and shall be conducted by a laboratory approved by OSHA.
- (iv) Employee notification.
  - (A) Within five working days after the receipt of biological monitoring results, the employer shall notify each employee in writing of his or her blood lead level; and
  - (B) the employer shall notify each employee whose blood lead level is at or above 40 µg/dl that the standard requires temporary medical removal with Medical Removal Protection benefits when an employee's blood lead level is at or above the numerical criterion for medical removal under paragraph (k)(1)(i) of this section.

(3) Medical examinations and consultations.

- (i) Frequency. The employer shall make available medical examinations and consultations to each employee covered under paragraph (j)(1)(ii) of this section on the following schedule:
  - (A) At least annually for each employee for whom a blood sampling test conducted at any time during the preceding 12 months indicated a blood lead level at or above 40 µg/dl;
  - (B) As soon as possible, upon notification by an employee either that the employee has developed signs or symptoms commonly associated with lead intoxication, that the employee desires medical advice concerning the effects of current or past exposure to lead on the employee's ability to procreate a healthy child, that the employee is pregnant, or that the employee has demonstrated difficulty in breathing during a respirator fitting test or during use; and
  - (C) As medically appropriate for each employee either removed from exposure to lead due to a risk of sustaining material impairment to health, or otherwise limited pursuant to a final medical determination.
- (ii) Content. The content of medical examinations made available pursuant to paragraph (j)(3)(i)(B)-(C) of this section shall be determined by an examining physician and, if requested by an employee, shall include pregnancy testing or laboratory evaluation of male fertility. Medical examinations made available pursuant to paragraph (j)(3)(i)(A) of this section shall include the following elements:

- (A) A detailed work history and a medical history, with particular attention to past lead exposure (occupational and non-occupational), personal habits (smoking, hygiene), and past gastrointestinal, hematologic, renal, cardiovascular, reproductive and neurological problems;
  - (B) A thorough physical examination, with particular attention to teeth, gums, hematologic, gastrointestinal, renal, cardiovascular, and neurological systems. Pulmonary status should be evaluated if respiratory protection will be used;
  - (C) A blood pressure measurement;
  - (D) A blood sample and analysis which determines:
    - (1) Blood lead level;
    - (2) Hemoglobin and hematocrit determinations, red cell indices, and examination of peripheral smear morphology;
    - (3) Zinc protoporphyrin;
    - (4) Blood urea nitrogen; and,
    - (5) Serum creatinine;
  - (E) A routine urinalysis with microscopic examination; and
  - (F) Any laboratory or other test relevant to lead exposure which the examining physician deems necessary by sound medical practice.
- (iii) Multiple physician review mechanism.
- (A) If the employer selects the initial physician who conducts any medical examination or consultation provided to an employee under this section, the employee may designate a second physician:
    - (1) To review any findings, determinations or recommendations of the initial physician; and
    - (2) To conduct such examinations, consultations, and laboratory tests as the second physician deems necessary to facilitate this review.

- (B) The employer shall promptly notify an employee of the right to seek a second medical opinion after each occasion that an initial physician conducts a medical examination or consultation pursuant to this section. The employer may condition its participation in, and payment for, the multiple physician review mechanism upon the employee doing the following within fifteen (15) days after receipt of the foregoing notification, or receipt of the initial physician's written opinion, whichever is later:
- (1) The employee informing the employer that he or she intends to seek a second medical opinion, and
  - (2) The employee initiating steps to make an appointment with a second physician.
- (C) If the findings, determinations or recommendations of the second physician differ from those of the initial physician, then the employer and the employee shall assure that efforts are made for the two physicians to resolve any disagreement.
- (D) If the two physicians have been unable to quickly resolve their disagreement, then the employer and the employee through their respective physicians shall designate a third physician:
- (1) To review any findings, determinations or recommendations of the prior physicians; and
  - (2) To conduct such examinations, consultations, laboratory tests and discussions with the prior physicians as the third physician deems necessary to resolve the disagreement of the prior physicians.
- (E) The employer shall act consistent with the findings, determinations and recommendations of the third physician, unless the employer and the employee reach an agreement which is otherwise consistent with the recommendations of at least one of the three physicians.
- (iv) Information provided to examining and consulting physicians.
- (A) The employer shall provide an initial physician conducting a medical examination or consultation under this section with the following information:
- (1) A copy of this regulation for lead including all Appendices;
  - (2) A description of the affected employee's duties as they relate to the employee's exposure;

- (3) The employee's exposure level or anticipated exposure level to lead and to any other toxic substance (if applicable);
  - (4) A description of any personal protective equipment used or to be used;
  - (5) Prior blood lead determinations; and
  - (6) All prior written medical opinions concerning the employee in the employer's possession or control.
- (B) The employer shall provide the foregoing information to a second or third physician conducting a medical examination or consultation under this section upon request either by the second or third physician, or by the employee.
- (v) Written medical opinions.
- (A) The employer shall obtain and furnish the employee with a copy of a written medical opinion from each examining or consulting physician which contains only the following information:
- (1) The physician's opinion as to whether the employee has any detected medical condition which would place the employee at increased risk of material impairment of the employee's health from exposure to lead;
  - (2) Any recommended special protective measures to be provided to the employee, or limitations to be placed upon the employee's exposure to lead;
  - (3) Any recommended limitation upon the employee's use of respirators, including a determination of whether the employee can wear a powered air purifying respirator if a physician determines that the employee cannot wear a negative pressure respirator; and
  - (4) The results of the blood lead determinations.
- (B) The employer shall instruct each examining and consulting physician to:
- (1) Not reveal either in the written opinion or orally, or in any other means of communication with the employer, findings, including laboratory results, or diagnoses unrelated to an employee's occupational exposure to lead; and

(2) Advise the employee of any medical condition, occupational or nonoccupational, which dictates further medical examination or treatment.

(vi) Alternate physician determination mechanisms. The employer and an employee or authorized employee representative may agree upon the use of any alternate physician determination mechanism in lieu of the multiple physician review mechanism provided by paragraph (j)(3)(iii) of this section so long as the alternate mechanism is as expeditious and protective as the requirements contained in this paragraph.

(4) Chelation.

(i) The employer shall assure that any person whom he retains, employs, supervises or controls does not engage in prophylactic chelation of any employee at any time.

(ii) If therapeutic or diagnostic chelation is to be performed by any person in paragraph (j)(4)(i) of this section, the employer shall assure that it be done under the supervision of a licensed physician in a clinical setting with thorough and appropriate medical monitoring and that the employee is notified in writing prior to its occurrence.

(k) Medical removal protection.

(1) Temporary medical removal and return of an employee.

(i) Temporary removal due to elevated blood lead level. The employer shall remove an employee from work having an exposure to lead at or above the action level on each occasion that a periodic and a follow-up blood sampling test conducted pursuant to this section indicate that the employee's blood lead level is at or above 50 µg/dl; and,

(ii) Temporary removal due to a final medical determination.

(A) The employer shall remove an employee from work having an exposure to lead at or above the action level on each occasion that a final medical determination results in a medical finding, determination, or opinion that the employee has a detected medical condition which places the employee at increased risk of material impairment to health from exposure to lead.

- (B) For the purposes of this section, the phrase “final medical determination” means the written medical opinion on the employees’ health status by the examining physician or, where relevant, the outcome of the multiple physician review mechanism or alternate medical determination mechanism used pursuant to the medical surveillance provisions of this section.
- (C) Where a final medical determination results in any recommended special protective measures for an employee, or limitations on an employee’s exposure to lead, the employer shall implement and act consistent with the recommendation.
- (iii) Return of the employee to former job status.
- (A) The employer shall return an employee to his or her former job status:
- (1) For an employee removed due to a blood lead level at or above 50 µg/dl when two consecutive blood sampling tests indicate that the employee’s blood lead level is below 40 µg/dl;
  - (2) For an employee removed due to a final medical determination, when a subsequent final medical determination results in a medical finding, determination, or opinion that the employee no longer has a detected medical condition which places the employee at increased risk of material impairment to health from exposure to lead.
- (B) For the purposes of this section, the requirement that an employer return an employee to his or her former job status is not intended to expand upon or restrict any rights an employee has or would have had, absent temporary medical removal, to a specific job classification or position under the terms of a collective bargaining agreement.
- (iv) Removal of other employee special protective measure or limitations. The employer shall remove any limitations placed on an employee or end any special protective measures provided to an employee pursuant to a final medical determination when a subsequent final medical determination indicates that the limitations or special protective measures are no longer necessary.
- (v) Employer options pending a final medical determination. Where the multiple physician review mechanism, or alternate medical determination mechanism used pursuant to the medical surveillance provisions of this section, has not yet resulted in a final medical determination with respect to an employee, the employer shall act as follows:

- (A) Removal. The employer may remove the employee from exposure to lead, provide special protective measures to the employee, or place limitations upon the employee, consistent with the medical findings, determinations, or recommendations of any of the physicians who have reviewed the employee's health status.
- (B) Return. The employer may return the employee to his or her former job status, end any special protective measures provided to the employee, and remove any limitations placed upon the employee, consistent with the medical findings, determinations, or recommendations of any of the physicians who have reviewed the employee's health status, with two exceptions.
- (1) If the initial removal, special protection, or limitation of the employee resulted from a final medical determination which differed from the findings, determinations, or recommendations of the initial physician or;
- (2) If the employee has been on removal status for the preceding eighteen months due to an elevated blood lead level, then the employer shall await a final medical determination.

(2) Medical removal protection benefits.

- (i) Provision of medical removal protection benefits. The employer shall provide an employee up to eighteen (18) months of medical removal protection benefits on each occasion that an employee is removed from exposure to lead or otherwise limited pursuant to this section.
- (ii) Definition of medical removal protection benefits. For the purposes of this section, the requirement that an employer provide medical removal protection benefits means that, as long as the job the employee was removed from continues, the employer shall maintain the total normal earnings, seniority and other employment rights and benefits of an employee, including the employee's right to his or her former job status as though the employee had not been medically removed from the employee's job or otherwise medically limited.
- (iii) Follow-up medical surveillance during the period of employee removal or limitation. During the period of time that an employee is medically removed from his or her job or otherwise medically limited, the employer may condition the provision of medical removal protection benefits upon the employee's participation in follow-up medical surveillance made available pursuant to this section.

- (iv) Workers' compensation claims. If a removed employee files a claim for workers' compensation payments for a lead-related disability, then the employer shall continue to provide medical removal protection benefits pending disposition of the claim. To the extent that an award is made to the employee for earnings lost during the period of removal, the employer's medical removal protection obligation shall be reduced by such amount. The employer shall receive no credit for workers' compensation payments received by the employee for treatment-related expenses.
  - (v) Other credits. The employer's obligation to provide medical removal protection benefits to a removed employee shall be reduced to the extent that the employee receives compensation for earnings lost during the period of removal either from a publicly or employer-funded compensation program, or receives income from employment with another employer made possible by virtue of the employee's removal.
  - (vi) Voluntary removal or restriction of an employee. Where an employer, although not required by this section to do so, removes an employee from exposure to lead or otherwise places limitations on an employee due to the effects of lead exposure on the employee's medical condition, the employer shall provide medical removal protection benefits to the employee equal to that required by paragraph (k)(2)(i) and (ii) of this section.
- (l) Communication of hazards.
- (1) General.
    - (i) Hazard communication. The employer shall include lead in the program established to comply with the Hazard Communication Standard (HCS) (1910.1200). The employer shall ensure that each employee has access to labels on containers of lead and safety data sheets, and is trained in accordance with the provisions of HCS and paragraph (l) of this section. The employer shall ensure that at least the following hazards are addressed:
      - (A) Reproductive/developmental toxicity;
      - (B) Central nervous system effects;
      - (C) Kidney effects;
      - (D) Blood effects; and
      - (E) Acute toxicity effects.

- (ii) The employer shall train each employee who is subject to exposure to lead at or above the action level on any day, or who is subject to exposure to lead compounds which may cause skin or eye irritation (e.g., lead arsenate, lead azide), in accordance with the requirements of this section. The employer shall institute a training program and ensure employee participation in the program.
  - (iii) The employer shall provide the training program as initial training prior to the time of job assignment or prior to the start up date for this requirement, whichever comes last.
  - (iv) The employer shall also provide the training program at least annually for each employee who is subject to lead exposure at or above the action level on any day.
- (2) Training program. The employer shall assure that each employee is trained in the following:
- (i) The content of this standard and its appendices;
  - (ii) The specific nature of the operations which could result in exposure to lead above the action level;
  - (iii) The purpose, proper selection, fitting, use, and limitations of respirators;
  - (iv) The purpose and a description of the medical surveillance program, and the medical removal protection program including information concerning the adverse health effects associated with excessive exposure to lead (with particular attention to the adverse reproductive effects on both males and females and hazards to the fetus and additional precautions for employees who are pregnant);
  - (v) The engineering controls and work practices associated with the employee's job assignment including training of employees to follow relevant good work practices described in Appendix B of this section;
  - (vi) The contents of any compliance plan in effect;
  - (vii) Instructions to employees that chelating agents should not routinely be used to remove lead from their bodies and should not be used at all except under the direction of a licensed physician; and
  - (viii) The employee's right of access to records under 29 CFR 1910.1020.
- (3) Access to information and training materials.

- (i) The employer shall make readily available to all affected employees a copy of this standard and its appendices.
- (ii) The employer shall provide, upon request, all materials relating to the employee information and training program to affected employees and their designated representatives, and to the Assistant Secretary and the Director.

(m) Signs.

(1) General.

- (i) The employer shall post the following warning signs in each work area where an employee's exposure to lead is above the PEL.

**DANGER**

**LEAD WORK AREA**

**MAY DAMAGE FERTILITY OR THE UNBORN CHILD**

**CAUSES DAMAGE TO THE CENTRAL NERVOUS SYSTEM**

**DO NOT EAT, DRINK OR SMOKE IN THIS AREA**

- (ii) The employer shall ensure that no statement appears on or near any sign required by this paragraph (m) that contradicts or detracts from the meaning of the required sign.
- (iii) The employer shall ensure that signs required by this paragraph (m) are illuminated and cleaned as necessary so that the legend is readily visible.
- (iv) The employer may use signs required by other statutes, regulations or ordinances in addition to, or in combination with, signs required by this paragraph (m).
- (v) Prior to June 1, 2016, employers may use the following legend in lieu of that specified in paragraph (m)(1)(i) of this section:

**DANGER**

**LEAD WORK AREA**

**POISON**

**NO SMOKING OR EATING**

(n) Recordkeeping.

(1) Exposure assessment.

- (i) The employer shall establish and maintain an accurate record of all monitoring and other data used in conducting employee exposure assessments as required in paragraph (d) of this section.
- (ii) Exposure monitoring records shall include:
  - (A) The date(s), number, duration, location and results of each of the samples taken if any, including a description of the sampling procedure used to determine representative employee exposure where applicable;
  - (B) A description of the sampling and analytical methods used and evidence of their accuracy;
  - (C) The type of respiratory protective devices worn, if any;
  - (D) Name and job classification of the employee monitored and of all other employees whose exposure the measurement is intended to represent; and
  - (E) The environmental variables that could affect the measurement of employee exposure.
- (iii) The employer shall maintain monitoring and other exposure assessment records in accordance with the provisions of 29 CFR 1910.1020.

(2) Medical surveillance.

- (i) The employer shall establish and maintain an accurate record for each employee subject to medical surveillance as required by paragraph (j) of this section.
- (ii) This record shall include:
  - (A) The name and description of the duties of the employee;
  - (B) A copy of the physician's written opinions;
  - (C) Results of any airborne exposure monitoring done on or for that employee and provided to the physician; and
  - (D) Any employee medical complaints related to exposure to lead.
- (iii) The employer shall keep, or assure that the examining physician keeps, the following medical records:
  - (A) A copy of the medical examination results including medical and work history required under paragraph (j) of this section;

- (B) A description of the laboratory procedures and a copy of any standards or guidelines used to interpret the test results or references to that information;
  - (C) A copy of the results of biological monitoring.
- (iv) The employer shall maintain or assure that the physician maintains medical records in accordance with the provisions of 29 CFR 1910.1020.
- (3) Medical removals.
  - (i) The employer shall establish and maintain an accurate record for each employee removed from current exposure to lead pursuant to paragraph (k) of this section.
  - (ii) Each record shall include:
    - (A) The name of the employee;
    - (B) The date of each occasion that the employee was removed from current exposure to lead as well as the corresponding date on which the employee was returned to his or her former job status;
    - (C) A brief explanation of how each removal was or is being accomplished; and
    - (D) A statement with respect to each removal indicating whether or not the reason for the removal was an elevated blood lead level.
  - (iii) The employer shall maintain each medical removal record for at least the duration of an employee's employment.
- (4) Objective data for exemption from requirement for initial monitoring.
  - (i) For purposes of this section, objective data are information demonstrating that a particular product or material containing lead or a specific process, operation, or activity involving lead cannot release dust or fumes in concentrations at or above the action level under any expected conditions of use. Objective data can be obtained from an industry-wide study or from laboratory product test results from manufacturers of lead containing products or materials. The data the employer uses from an industry-wide survey must be obtained under workplace conditions closely resembling the processes, types of material, control methods, work practices and environmental conditions in the employer's current operations.

- (ii) The employer shall maintain the record of the objective data relied upon for at least 30 years.
- (5) Availability. The employer shall make available upon request all records required to be maintained by paragraph (n) of this section to affected employees, former employees, and their designated representatives, and to the Assistant Secretary and the Director for examination and copying.
- (6) Transfer of records.
  - (i) Whenever the employer ceases to do business, the successor employer shall receive and retain all records required to be maintained by paragraph (n) of this section.
  - (ii) The employer shall also comply with any additional requirements involving transfer of records set forth in 29 CFR 1910.1020(h).
- (o) Observation of monitoring.
  - (1) Employee observation. The employer shall provide affected employees or their designated representatives an opportunity to observe any monitoring of employee exposure to lead conducted pursuant to paragraph (d) of this section.
  - (2) Observation procedures.
    - (i) Whenever observation of the monitoring of employee exposure to lead requires entry into an area where the use of respirators, protective clothing or equipment is required, the employer shall provide the observer with and assure the use of such respirators, clothing and equipment, and shall require the observer to comply with all other applicable safety and health procedures.
    - (ii) Without interfering with the monitoring, observers shall be entitled to:
      - (A) Receive an explanation of the measurement procedures;
      - (B) Observe all steps related to the monitoring of lead performed at the place of exposure; and
      - (C) Record the results obtained or receive copies of the results when returned by the laboratory.
- (p) Appendices. The information contained in the appendices to this section is not intended by itself, to create any additional obligations not otherwise imposed by this standard nor detract from any existing obligation.

## Appendix A to 1926.62 Substance Data Sheet For Occupational Exposure to Lead

### I. Substance Identification

- A. Substance: Pure lead (Pb) is a heavy metal at room temperature and pressure and is a basic chemical element. It can combine with various other substances to form numerous lead compounds.
- B. Compounds covered by the standard: The word “lead” when used in this interim final standard means elemental lead, all inorganic lead compounds and a class of organic lead compounds called lead soaps. This standard does not apply to other organic lead compounds.
- C. Uses: Exposure to lead occurs in several different occupations in the construction industry, including demolition or salvage of structures where lead or lead-containing materials are present; removal or encapsulation of lead-containing materials, new construction, alteration, repair, or renovation of structures that contain lead or materials containing lead; installation of products containing lead. In addition, there are construction related activities where exposure to lead may occur, including transportation, disposal, storage, or containment of lead or materials containing lead on construction sites, and maintenance operations associated with construction activities.
- D. Permissible exposure: The permissible exposure limit (PEL) set by the standard is 50 micrograms of lead per cubic meter of air (50  $\mu\text{g}/\text{m}^3$ ), averaged over an 8-hour workday.
- E. Action level: The interim final standard establishes an action level of 30 micrograms of lead per cubic meter of air (30  $\mu\text{g}/\text{m}^3$ ), averaged over an 8-hour workday. The action level triggers several ancillary provisions of the standard such as exposure monitoring, medical surveillance, and training.

### II. Health Hazard Data

- A. Ways in which lead enters your body.

When absorbed into your body in certain doses, lead is a toxic substance. The object of the lead standard is to prevent absorption of harmful quantities of lead. The standard is intended to protect you not only from the immediate toxic effects of lead, but also from the serious toxic effects that may not become apparent until years of exposure have passed. Lead can be absorbed into your body by inhalation (breathing) and ingestion (eating). Lead (except for certain organic lead compounds not covered by the standard, such as tetraethyl lead) is not absorbed through your skin. When lead is scattered in the air as a dust, fume respiratory tract. Inhalation of airborne lead is generally the most important source of occupational lead absorption. You can also absorb lead through your digestive system if lead gets into your mouth and is swallowed. If you handle food, cigarettes, chewing tobacco, or make-up which have lead on them or handle them with hands contaminated with lead, this will contribute to ingestion. A significant portion of the lead that you inhale or ingest gets into your blood stream. Once in your blood stream, lead is circulated throughout your body and stored in various organs and body tissues. Some of this lead is quickly filtered out of your body and excreted, but some remains in the blood and other tissues. As exposure to lead continues, the amount stored in your body will increase if you are absorbing more lead than your body is excreting. Even though you may not be aware of any immediate symptoms of disease, this lead stored in your tissues can be slowly causing irreversible damage, first to individual cells, then to your organs and whole body systems.

#### B. Effects of overexposure to lead.

##### (1) Short term (acute) overexposure.

Lead is a potent, systemic poison that serves no known useful function once absorbed by your body. Taken in large enough doses, lead can kill you in a matter of days. A condition affecting the brain called acute encephalopathy may arise which develops quickly to seizures, coma, and death from cardiorespiratory arrest. A short term dose of lead can lead to acute encephalopathy. Short term occupational exposures of this magnitude are highly unusual, but not impossible. Similar forms of encephalopathy may, however, arise from extended, chronic exposure to lower doses of lead. There is no sharp dividing line between rapidly developing acute effects of lead, and chronic effects which take longer to acquire. Lead adversely affects numerous body systems, and causes forms of health impairment and disease which arise after periods of exposure as short as days or as long as several years.

##### (2) Long-term (chronic) overexposure.

Chronic overexposure to lead may result in severe damage to your blood-forming, nervous, urinary and reproductive systems. Some common symptoms of chronic overexposure include loss of appetite, metallic taste in the mouth, anxiety, constipation, nausea, pallor, excessive tiredness, weakness, insomnia, headache, nervous irritability, muscle and joint pain or soreness, fine tremors, numbness, dizziness, hyperactivity and colic. In lead colic there may be severe abdominal pain. Damage to the central nervous system in general and the brain (encephalopathy) in particular is one of the most severe forms of lead poisoning. The most severe, often fatal, form of encephalopathy may be preceded by vomiting, a feeling of dullness progressing to drowsiness and stupor, poor memory, restlessness, irritability, tremor, and convulsions. It may arise suddenly with the onset of seizures, followed by coma, and death. There is a tendency for muscular weakness to develop at the same time. This weakness may progress to paralysis often observed as a characteristic "wrist drop" or "foot drop" and is a manifestation of a disease to the nervous system called peripheral neuropathy. Chronic overexposure to lead also results in kidney disease with few, if any, symptoms appearing until extensive and most likely permanent kidney damage has occurred. Routine laboratory tests reveal the presence of this kidney disease only after about two-thirds of kidney function is lost. When overt symptoms of urinary dysfunction arise, it is often too late to correct or prevent worsening conditions, and progression to kidney dialysis or death is possible. Chronic overexposure to lead impairs the reproductive systems of both men and women. Overexposure to lead may result in decreased sex drive, impotence and sterility in men. Lead can alter the structure of sperm cells raising the risk of birth defects. There is evidence of miscarriage and stillbirth in women whose husbands were exposed to lead or who were exposed to lead themselves. Lead exposure also may result in decreased fertility, and abnormal menstrual cycles in women. The course of pregnancy may be adversely affected by exposure to lead since lead crosses the placental barrier and poses risks to developing fetuses. Children born of parents either one of whom were exposed to excess lead levels are more likely to have birth defects, mental retardation, behavioral disorders or die during the first year of childhood. Over-exposure to lead also disrupts the blood-forming system resulting in decreased hemoglobin (the substance in the blood that carries oxygen to the cells) and ultimately anemia. Anemia is characterized by weakness, pallor and fatigability as a result of decreased oxygen carrying capacity in the blood.

(3) Health protection goals of the standard.

Prevention of adverse health effects for most workers from exposure to lead throughout a working lifetime requires that a worker's blood lead level (BLL, also expressed as PbB) be maintained at or below forty micrograms per deciliter of whole blood (40 µg/dl). The blood lead levels of workers (both male and female workers) who intend to have children should be maintained below 30 µg/dl to minimize adverse reproductive health effects to the parents and to the developing fetus. The measurement of your blood lead level (BLL) is the most useful indicator of the amount of lead being absorbed by your body. Blood lead levels are most often reported in units of milligrams (mg) or micrograms (µg) of lead (1 mg = 1000 µg) per 100 grams (100g), 100 milliliters (100 ml) or deciliter (dl) of blood. These three units are essentially the same. Sometime BLLs are expressed in the form of mg% or µg%. This is a shorthand notation for 100g, 100 ml, or dl. (References to BLL measurements in this standard are expressed in the form of µg/dl.)

BLL measurements show the amount of lead circulating in your blood stream, but do not give any information about the amount of lead stored in your various tissues. BLL measurements merely show current absorption of lead, not the effect that lead is having on your body or the effects that past lead exposure may have already caused. Past research into lead-related diseases, however, has focused heavily on associations between BLLs and various diseases. As a result, your BLL is an important indicator of the likelihood that you will gradually acquire a lead-related health impairment or disease.

Once your blood lead level climbs to 40 µg/dl, your risk of disease increases. There is a wide variability of individual response to lead, thus it is difficult to say that a particular BLL in a given person will cause a particular effect. Studies have associated fatal encephalopathy with BLLs as low as 150 µg/dl. Other studies have shown other forms of diseases in some workers with BLLs well below 80 µg/dl. Your BLL is a crucial indicator of the risks to your health, but one other factor is also extremely important. This factor is the length of time you have had elevated BLLs. The longer you have an elevated BLL, the greater the risk that large quantities of lead are being gradually stored in your organs and tissues (body burden). The greater your overall body burden, the greater the chances of substantial permanent damage. The best way to prevent all forms of lead-related impairments and diseases – both short term and long term – is to maintain your BLL below 40 µg/dl. The provisions of the standard are designed with this end in mind.

Your employer has prime responsibility to assure that the provisions of the standard are complied with both by the company and by individual workers. You, as a worker, however, also have a responsibility to assist your employer in complying with the standard. You can play a key role in protecting your own health by learning about the lead hazards and their control, learning what the standard requires, following the standard where it governs your own actions, and seeing that your employer complies with provisions governing his or her actions.

(4) Reporting signs and symptoms of health problems.

You should immediately notify your employer if you develop signs or symptoms associated with lead poisoning or if you desire medical advice concerning the effects of current or past exposure to lead or your ability to have a healthy child. You should also notify your employer if you have difficulty breathing during a respirator fit test or while wearing a respirator. In each of these cases, your employer must make available to you appropriate medical examinations or consultations. These must be provided at no cost to you and at a reasonable time and place. The standard contains a procedure whereby you can obtain a second opinion by a physician of your choice if your employer selected the initial physician.

OR-OSHA Admin. Order 1-2012, f. 4/10/12, ef. 4/10/12.

## Appendix B to 1926.62 Employee Standard Summary

This appendix summarizes key provisions of the interim final standard for lead in construction that you as a worker should become familiar with.

### I. Permissible Exposure Limit (PEL) – Paragraph (C)

The standard sets a permissible exposure limit (PEL) of 50 micrograms of lead per cubic meter of air ( $50 \mu\text{g}/\text{m}^3$ ), averaged over an 8-hour workday which is referred to as a time-weighted average (TWA). This is the highest level of lead in air to which you may be permissibly exposed over an 8-hour workday. However, since this is an 8-hour average, short exposures above the PEL are permitted so long as for each 8-hour work day your average exposure does not exceed this level. This interim final standard, however, takes into account the fact that your daily exposure to lead can extend beyond a typical 8-hour workday as the result of overtime or other alterations in your work schedule. To deal with this situation, the standard contains a formula which reduces your permissible exposure when you are exposed more than 8 hours. For example, if you are exposed to lead for 10 hours a day, the maximum permitted average exposure would be  $40 \mu\text{g}/\text{m}^3$ .

### II. Exposure Assessment – Paragraph (D)

If lead is present in your workplace in any quantity, your employer is required to make an initial determination of whether any employee's exposure to lead exceeds the action level ( $30 \mu\text{g}/\text{m}^3$  averaged over an 8-hour day). Employee exposure is that exposure which would occur if the employee were not using a respirator. This initial determination requires your employer to monitor workers' exposures unless he or she has objective data which can demonstrate conclusively that no employee will be exposed to lead in excess of the action level. Where objective data is used in lieu of actual monitoring the employer must establish and maintain an accurate record, documenting its relevancy in assessing exposure levels for current job conditions. If such objective data is available, the employer need proceed no further on employee exposure assessment until such time that conditions have changed and the determination is no longer valid.

Objective data may be compiled from various sources, e.g., insurance companies and trade associations and information from suppliers or exposure data collected from similar operations. Objective data may also comprise previously-collected sampling data including area monitoring. If it cannot be determined through using objective data that worker exposure is less than the action level, your employer must conduct monitoring or must rely on relevant previous personal sampling, if available. Where monitoring is required for the initial determination, it may be limited to a representative number of employees who are reasonably expected to have the highest exposure levels. If your employer has conducted appropriate air sampling for lead in the past 12 months, he or she may use these results, provided they are applicable to the same employee tasks and exposure conditions and meet the requirements for accuracy as specified in the standard. As with objective data, if such results are relied upon for the initial determination, your employer must establish and maintain a record as to the relevancy of such data to current job conditions.

If there have been any employee complaints of symptoms which may be attributable to exposure to lead or if there is any other information or observations which would indicate employee exposure to lead, this must also be considered as part of the initial determination.

If this initial determination shows that a reasonable possibility exists that any employee may be exposed, without regard to respirators, over the action level, your employer must set up an air monitoring program to determine the exposure level representative of each employee exposed to lead at your workplace. In carrying out this air monitoring program, your employer is not required to monitor the exposure of every employee, but he or she must monitor a representative number of employees and job types. Enough sampling must be done to enable each employee's exposure level to be reasonably represent full shift exposure. In addition, these air samples must be taken under conditions which represent each employee's regular, daily exposure to lead. Sampling performed in the past 12 months may be used to determine exposures at or above the action level if such sampling was conducted during work activities essentially similar to present work conditions.

The standard lists certain tasks which may likely result in exposures to lead in excess of the PEL and, in some cases, exposures in excess of 50 times the PEL. If you are performing any of these tasks, your employer must provide you with appropriate respiratory protection, protective clothing and equipment, change areas, hand washing facilities, biological monitoring, and training until such time that an exposure assessment is conducted which demonstrates that your exposure level is below the PEL.

If you are exposed to lead and air sampling is performed, your employer is required to notify you in writing within 5 working days of the air monitoring results which represent your exposure. If the results indicate that your exposure exceeds the PEL (without regard to your use of a respirator), then your employer must also notify you of this in writing, and provide you with a description of the corrective action that has been taken or will be taken to reduce your exposure.

Your exposure must be rechecked by monitoring, at least every six months if your exposure is at or over the action level but below the PEL. Your employer may discontinue monitoring for you if 2 consecutive measurements, taken at least 7 days apart, are at or below the action level. Air monitoring must be repeated every 3 months if you are exposed over the PEL. Your employer must continue monitoring for you at this frequency until 2 consecutive measurements, taken at least 7 days apart, are at or below the PEL but at or above the action level, at which time your employer must repeat monitoring of your exposure every six months and may discontinue monitoring only after your exposure drops to or below the action level. However, whenever there is a change of equipment, process, control, or personnel or a new type of job is added at your workplace which may result in new or additional exposure to lead, your employer must perform additional monitoring.

### III. Methods of Compliance – Paragraph (E)

Your employer is required to assure that no employee is exposed to lead in excess of the PEL as an 8-hour TWA. The interim final standard for lead in construction requires employers to institute engineering and work practice controls including administrative controls to the extent feasible to reduce employee exposure to lead. Where such controls are feasible but not adequate to reduce exposures below the PEL they must be used nonetheless to reduce exposures to the lowest level that can be accomplished by these means and then supplemented with appropriate respiratory protection.

Your employer is required to develop and implement a written compliance program prior to the commencement of any job where employee exposures may reach the PEL as an 8-hour TWA. The interim final standard identifies the various elements that must be included in the plan. For example, employers are required to include a description of operations in which lead is emitted, detailing other relevant information about the operation such as the type of equipment used, the type of material involved, employee job responsibilities, operating procedures and maintenance practices. In addition, your employer's compliance plan must specify the means that will be used to achieve compliance and, where engineering controls are required, include any engineering plans or studies that have been used to select the control methods. If administrative controls involving job rotation are used to reduce employee exposure to lead, the job rotation schedule must be included in the compliance plan. The plan must also detail the type of protective clothing and equipment, including respirators, housekeeping and hygiene practices that will be used to protect you from the adverse effects of exposure to lead.

The written compliance program must be made available, upon request, to affected employees and their designated representatives, the Assistant Secretary and the Director. Finally, the plan must be reviewed and updated at least every 6 months to assure it reflects the current status in exposure control.

#### IV. Respiratory Protection – Paragraph (F)

Your employer is required to provide and assure your use of respirators when your exposure to lead is not controlled below the PEL by other means. The employer must pay the cost of the respirator. Whenever you request one, your employer is also required to provide you a respirator even if your air exposure level is not above the PEL. You might desire a respirator when, for example, you have received medical advice that your lead absorption should be decreased. Or, you may intend to have children in the near future, and want to reduce the level of lead in your body to minimize adverse reproductive effects. While respirators are the least satisfactory means of controlling your exposure, they are capable of providing significant protection if properly chosen, fitted, worn, cleaned, maintained, and replaced when they stop providing adequate protection.

Your employer is required to select respirators from the types listed in Table I of the Respiratory Protection section of the standard (Sec. 1926.62(f)). Any respirator chosen must be approved by the National Institute for Occupational Safety and Health (NIOSH) under the provisions of 42 CFR part 84. This respirator selection table will enable your employer to choose a type of respirator that will give you a proper amount of protection based on your airborne lead exposure. Your employer may select a type of respirator that provides greater protection than that required by the standard; that is, one recommended for a higher concentration of lead than is present in your workplace. For example, a powered air-purifying respirator (PAPR) is much more protective than a typical negative pressure respirator, and may also be more comfortable to wear. A PAPR has a filter, cartridge, or canister to clean the air, and a power source that continuously blows filtered air into your breathing zone. Your employer might make a PAPR available to you to ease the burden of having to wear a respirator for long periods of time. The standard provides that you can obtain a PAPR upon request.

Your employer must also start a Respiratory Protection Program. This program must include written procedures for the proper selection, use, cleaning, storage, and maintenance of respirators.

Your employer must ensure that your respirator facepiece fits properly. Proper fit of a respirator facepiece is critical to your protection from airborne lead. Obtaining a proper fit on each employee may require your employer to make available several different types of respirator masks. To ensure that your respirator fits properly and that facepiece leakage is minimal, your employer must give you either a qualitative or quantitative fit test as specified in Appendix A of the Respiratory Protection standard located at 29 CFR 1910.134.

You must also receive from your employer proper training in the use of respirators. Your employer is required to teach you how to wear a respirator, to know why it is needed, and to understand its limitations.

The standard provides that if your respirator uses filter elements, you must be given an opportunity to change the filter elements whenever an increase in breathing resistance is detected. You also must be permitted to periodically leave your work area to wash your face and respirator facepiece whenever necessary to prevent skin irritation. If you ever have difficulty in breathing during a fit test or while using a respirator, your employer must make a medical examination available to you to determine whether you can safely wear a respirator. The result of this examination may be to give you a positive pressure respirator (which reduces breathing resistance) or to provide alternative means of protection.

#### V. Protective Work Clothing and Equipment – Paragraph (G)

If you are exposed to lead above the PEL as an 8-hour TWA, without regard to your use of a respirator, or if you are exposed to lead compounds such as lead arsenate or lead azide which can cause skin and eye irritation, your employer must provide you with protective work clothing and equipment appropriate for the hazard. If work clothing is provided, it must be provided in a clean and dry condition at least weekly, and daily if your airborne exposure to lead is greater than  $200 \mu\text{g}/\text{m}^3$ . Appropriate protective work clothing and equipment can include coveralls or similar full-body work clothing, gloves, hats, shoes or disposable shoe coverlets, and face shields or vented goggles. Your employer is required to provide all such equipment at no cost to you. In addition, your employer is responsible for providing repairs and replacement as necessary, and also is responsible for the cleaning, laundering or disposal of protective clothing and equipment.

The interim final standard requires that your employer assure that you follow good work practices when you are working in areas where your exposure to lead may exceed the PEL. With respect to protective clothing and equipment, where appropriate, the following procedures should be observed prior to beginning work:

1. Change into work clothing and shoe covers in the clean section of the designated changing areas;
2. Use work garments of appropriate protective gear, including respirators before entering the work area; and
3. Store any clothing not worn under protective clothing in the designated changing area.

Workers should follow these procedures upon leaving the work area:

1. HEPA vacuum heavily contaminated protective work clothing while it is still being worn. At no time may lead be removed from protective clothing by any means which result in uncontrolled dispersal of lead into the air;
2. Remove shoe covers and leave them in the work area;
3. Remove protective clothing and gear in the dirty area of the designated changing area. Remove protective coveralls by carefully rolling down the garment to reduce exposure to dust.
4. Remove respirators last; and
5. Wash hands and face.

Workers should follow these procedures upon finishing work for the day (in addition to procedures described above):

1. Where applicable, place disposal coveralls and shoe covers with the abatement waste;
2. Contaminated clothing which is to be cleaned, laundered or disposed of must be placed in closed containers in the change room.
3. Clean protective gear, including respirators, according to standard procedures;
4. Wash hands and face again. If showers are available, take a shower and wash hair. If shower facilities are not available at the work site, shower immediately at home and wash hair.

#### VI. Housekeeping – Paragraph (H)

Your employer must establish a housekeeping program sufficient to maintain all surfaces as free as practicable of accumulations of lead dust. Vacuuming is the preferred method of meeting this requirement, and the use of compressed air to clean floors and other surfaces is generally prohibited unless removal with compressed air is done in conjunction with ventilation systems designed to contain dispersal of the lead dust. Dry or wet sweeping, shoveling, or brushing may not be used except where vacuuming or other equally effective methods have been tried and do not work. Vacuums must be used equipped with a special filter called a high-efficiency particulate air (HEPA) filter and emptied in a manner which minimizes the reentry of lead into the workplace.

#### VII. Hygiene Facilities and Practices – Paragraph (I)

The standard requires that hand washing facilities be provided where occupational exposure to lead occurs. In addition, change areas, showers (where feasible), and lunchrooms or eating areas are to be made available to workers exposed to lead above the PEL. Your employer must assure that except in these facilities, food and beverage is not present or consumed, tobacco products are not present or used, and cosmetics are not applied, where airborne exposures are above the PEL. Change rooms provided by your employer must be equipped with separate storage facilities for your protective clothing and equipment and street clothes to avoid cross-contamination. After showering, no required protective clothing or equipment worn during the shift may be worn home. It is important that contaminated clothing or equipment be removed in change areas and not be worn home or you will extend your exposure and expose your family since lead from your clothing can accumulate in your house, car, etc.

Lunchrooms or eating areas may not be entered with protective clothing or equipment unless surface dust has been removed by vacuuming, downdraft booth, or other cleaning method. Finally, workers exposed above the PEL must wash both their hands and faces prior to eating, drinking, smoking or applying cosmetics.

All of the facilities and hygiene practices just discussed are essential to minimize additional sources of lead absorption from inhalation or ingestion of lead that may accumulate on you, your clothes, or your possessions. Strict compliance with these provisions can virtually eliminate several sources of lead exposure which significantly contribute to excessive lead absorption.

#### VIII. Medical Surveillance – Paragraph (J)

The medical surveillance program is part of the standard's comprehensive approach to the prevention of lead-related disease. Its purpose is to supplement the main thrust of the standard which is aimed at minimizing airborne concentrations of lead and sources of ingestion. Only medical surveillance can determine if the other provisions of the standard have effectively protected you as an individual.

Compliance with the standard's provision will protect most workers from the adverse effects of lead exposure, but may not be satisfactory to protect individual workers (1) who have high body burdens of lead acquired over past years, (2) who have additional uncontrolled sources of non-occupational lead exposure, (3) who exhibit unusual variations in lead absorption rates, or (4) who have specific non-work related medical conditions which could be aggravated by lead exposure (e.g., renal disease, anemia). In addition, control systems may fail, or hygiene and respirator programs may be inadequate. Periodic medical surveillance of individual workers will help detect those failures. Medical surveillance will also be important to protect your reproductive ability – regardless of whether you are a man or woman.

All medical surveillance required by the interim final standard must be performed by or under the supervision of a licensed physician. The employer must provide required medical surveillance without cost to employees and at a reasonable time and place. The standard's medical surveillance program has two parts – periodic biological monitoring and medical examinations. Your employer's obligation to offer you medical surveillance is triggered by the results of the air monitoring program. Full medical surveillance must be made available to all employees who are or may be exposed to lead at or above the action level for more than 30 days a year and whose blood lead level is at or above 40 µg/dl. Initial medical surveillance consisting of blood sampling and analysis for lead and zinc protoporphyrin must be provided to all employees exposed at any time (1 day) at or above the action level.

Biological monitoring under the standard must be provided at least every 2 months for the first 6 months and every 6 months thereafter until your blood lead level is below 40 µg/dl. A zinc protoporphyrin (ZPP) test is a very useful blood test which measures an adverse metabolic effect of lead on your body and is therefore an indicator of lead toxicity.

If your BLL exceeds 40 µg/dl the monitoring frequency must be increased from every 6 months to at least every 2 months and not reduced until two consecutive BLLs indicate a blood lead level below 40 µg/dl. Each time your BLL is determined to be over 40 µg/dl, your employer must notify you of this in writing within five working days of his or her receipt of the test results. The employer must also inform you that the standard requires temporary medical removal with economic protection when your BLL exceeds 50 µg/dl. (See Discussion of Medical Removal Protection – Paragraph (k).) Anytime your BLL exceeds 50 µg/dl your employer must make available to you within two weeks of receipt of these test results a second follow-up BLL test to confirm your BLL. If the two tests both exceed 50 µg/dl, and you are temporarily removed, then your employer must make successive BLL tests available to you on a monthly basis during the period of your removal.

Medical examinations beyond the initial one must be made available on an annual basis if your blood lead level exceeds 40 µg/dl at any time during the preceding year and you are being exposed above the airborne action level of 30 µg/m<sup>3</sup> for 30 or more days per year. The initial examination will provide information to establish a baseline to which subsequent data can be compared.

An initial medical examination to consist of blood sampling and analysis for lead and zinc protoporphyrin must also be made available (prior to assignment) for each employee being assigned for the first time to an area where the airborne concentration of lead equals or exceeds the action level at any time. In addition, a medical examination or consultation must be made available as soon as possible if you notify your employer that you are experiencing signs or symptoms commonly associated with lead poisoning or that you have difficulty breathing while wearing a respirator or during a respirator fit test. You must also be provided a medical examination or consultation if you notify your employer that you desire medical advice concerning the effects of current or past exposure to lead on your ability to procreate a healthy child.

Finally, appropriate follow-up medical examinations or consultations may also be provided for employees who have been temporarily removed from exposure under the medical removal protection provisions of the standard. (See Part IX, below.)

The standard specifies the minimum content of pre-assignment and annual medical examinations. The content of other types of medical examinations and consultations is left up to the sound discretion of the examining physician. Pre-assignment and annual medical examinations must include (1) a detailed work history and medical history; (2) a thorough physical examination, including an evaluation of your pulmonary status if you will be required to use a respirator; (3) a blood pressure measurement; and (4) a series of laboratory tests designed to check your blood chemistry and your kidney function. In addition, at any time upon your request, a laboratory evaluation of male fertility will be made (microscopic examination of a sperm sample), or a pregnancy test will be given.

The standard does not require that you participate in any of the medical procedures, tests, etc., which your employer is required to make available to you. Medical surveillance can, however, play a very important role in protecting your health. You are strongly encouraged, therefore, to participate in a meaningful fashion. The standard contains a multiple physician review mechanism which will give you a chance to have a physician of your choice directly participate in the medical surveillance program. If you are dissatisfied with an examination by a physician chosen by your employer, you can select a second physician to conduct an independent analysis. The two doctors would attempt to resolve any differences of opinion, and select a third physician to resolve any firm dispute. Generally your employer will choose the physician who conducts medical surveillance under the lead standard – unless you and your employer can agree on the choice of a physician or physicians. Some companies and unions have agreed in advance, for example, to use certain independent medical laboratories or panels of physicians. Any of these arrangements are acceptable so long as required medical surveillance is made available to workers.

The standard requires your employer to provide certain information to a physician to aid in his or her examination of you. This information includes (1) the standard and its appendices, (2) a description of your duties as they relate to occupational lead exposure, (3) your exposure level or anticipated exposure level, (4) a description of any personal protective equipment you wear, (5) prior blood lead level results, and (6) prior written medical opinions concerning you that the employer has.

After a medical examination or consultation the physician must prepare a written report which must contain (1) the physician's opinion as to whether you have any medical condition which places you at increased risk of material impairment to health from exposure to lead, (2) any recommended special protective measures to be provided to you, (3) any blood lead level determinations, and (4) any recommended limitation on your use of respirators. This last element must include a determination of whether you can wear a powered air purifying respirator (PAPR) if you are found unable to wear a negative pressure respirator.

The medical surveillance program of the interim lead standard may at some point in time serve to notify certain workers that they have acquired a disease or other adverse medical condition as a result of occupational lead exposure. If this is true, these workers might have legal rights to compensation from public agencies, their employers, firms that supply hazardous products to their employers, or other persons. Some states have laws, including worker compensation laws, that disallow a worker who learns of a job-related health impairment to sue, unless the worker sues within a short period of time after learning of the impairment. (This period of time may be a matter of months or years.) An attorney can be consulted about these possibilities. It should be stressed that OSHA is in no way trying to either encourage or discourage claims or lawsuits. However, since results of the standard's medical surveillance program can significantly affect the legal remedies of a worker who has acquired a job-related disease or impairment, it is proper for OSHA to make you aware of this.

The medical surveillance section of the standard also contains provisions dealing with chelation. Chelation is the use of certain drugs (administered in pill form or injected into the body) to reduce the amount of lead absorbed in body tissues. Experience accumulated by the medical and scientific communities has largely confirmed the effectiveness of this type of therapy for the treatment of very severe lead poisoning. On the other hand, it has also been established that there can be a long list of extremely harmful side effects associated with the use of chelating agents. The medical community has balanced the advantages and disadvantages resulting from the use of chelating agents in various circumstances and has established when the use of these agents is acceptable. The standard includes these accepted limitations due to a history of abuse of chelation therapy by some lead companies. The most widely used chelating agents are calcium disodium EDTA, (Ca Na<sub>2</sub> EDTA), Calcium Disodium Versenate (Versenate), and d-penicillamine (pencillamine or Cupramine).

The standard prohibits "prophylactic chelation" of any employee by any person the employer retains, supervises or controls. "Prophylactic chelation" is the routine use of chelating or similarly acting drugs to prevent elevated blood levels in workers who are occupationally exposed to lead, or the use of these drugs to routinely lower blood lead levels to predesignated concentrations believed to be "safe". It should be emphasized that where an employer takes a worker who has no symptoms of lead poisoning and has chelation carried out by a physician (either inside or outside of a hospital) solely to reduce the worker's blood lead level, that will generally be considered prophylactic chelation. The use of a hospital and a physician does not mean that prophylactic chelation is not being performed. Routine chelation to prevent increased or reduce current blood lead levels is unacceptable whatever the setting.

The standard allows the use of “therapeutic” or “diagnostic” chelation if administered under the supervision of a licensed physician in a clinical setting with thorough and appropriate medical monitoring. Therapeutic chelation responds to severe lead poisoning where there are marked symptoms. Diagnostic chelation involved giving a patient a dose of the drug then collecting all urine excreted for some period of time as an aid to the diagnosis of lead poisoning.

In cases where the examining physician determines that chelation is appropriate, you must be notified in writing of this fact before such treatment. This will inform you of a potentially harmful treatment, and allow you to obtain a second opinion.

#### IX. Medical Removal Protection – Paragraph (K)

Excessive lead absorption subjects you to increased risk of disease. Medical removal protection (MRP) is a means of protecting you when, for whatever reasons, other methods, such as engineering controls, work practices, and respirators, have failed to provide the protection you need. MRP involves the temporary removal of a worker from his or her regular job to a place of significantly lower exposure without any loss of earnings, seniority, or other employment rights or benefits. The purpose of this program is to cease further lead absorption and allow your body to naturally excrete lead which has previously been absorbed. Temporary medical removal can result from an elevated blood lead level, or a medical opinion. For up to 18 months, or for as long as the job the employee was removed from lasts, protection is provided as a result of either form of removal. The vast majority of removed workers, however, will return to their former jobs long before this eighteen month period expires.

You may also be removed from exposure even if your blood lead level is below 50 µg/dl if a final medical determination indicates that you temporarily need reduced lead exposure for medical reasons. If the physician who is implementing your employers medical program makes a final written opinion recommending your removal or other special protective measures, your employer must implement the physician’s recommendation. If you are removed in this manner, you may only be returned when the doctor indicates that it is safe for you to do so.

The standard does not give specific instructions dealing with what an employer must do with a removed worker. Your job assignment upon removal is a matter for you, your employer and your union (if any) to work out consistent with existing procedures for job assignments. Each removal must be accomplished in a manner consistent with existing collective bargaining relationships. Your employer is given broad discretion to implement temporary removals so long as no attempt is made to override existing agreements. Similarly, a removed worker is provided no right to veto an employer’s choice which satisfies the standard.

In most cases, employers will likely transfer removed employees to other jobs with sufficiently low lead exposure. Alternatively, a worker's hours may be reduced so that the time weighted average exposure is reduced, or he or she may be temporarily laid off if no other alternative is feasible.

In all of these situation, MRP benefits must be provided during the period of removal – i.e., you continue to receive the same earnings, seniority, and other rights and benefits you would have had if you had not been removed. Earnings includes more than just your base wage; it includes overtime, shift differentials, incentives, and other compensation you would have earned if you had not been removed. During the period of removal you must also be provided with appropriate follow-up medical surveillance. If you were removed because your blood lead level was too high, you must be provided with a monthly blood test. If a medical opinion caused your removal, you must be provided medical tests or examinations that the doctor believes to be appropriate. If you do not participate in this follow up medical surveillance, you may lose your eligibility for MRP benefits.

When you are medically eligible to return to your former job, your employer must return you to your “former job status.” This means that you are entitled to the position, wages, benefits, etc., you would have had if you had not been removed. If you would still be in your old job if no removal had occurred that is where you go back. If not, you are returned consistent with whatever job assignment discretion your employer would have had if no removal had occurred. MRP only seeks to maintain your rights, not expand them or diminish them.

If you are removed under MRP and you are also eligible for worker compensation or other compensation for lost wages, your employer's MRP benefits obligation is reduced by the amount that you actually receive from these other sources. This is also true if you obtain other employment during the time you are laid off with MRP benefits.

The standard also covers situations where an employer voluntarily removes a worker from exposure to lead due to the effects of lead on the employee's medical condition, even though the standard does not require removal. In these situations MRP benefits must still be provided as though the standard required removal. Finally, it is important to note that in all cases where removal is required, respirators cannot be used as a substitute. Respirators may be used before removal becomes necessary, but not as an alternative to a transfer to a low exposure job, or to a lay-off with MRP benefits.

#### X. Employee Information and Training – Paragraph (L)

Your employer is required to provide an information and training program for all employees exposed to lead at or above the action level or who may suffer skin or eye irritation from lead compounds such as lead arsenate or lead azide. The program must train these employees regarding the specific hazards associated with their work environment, protective measures which can be taken, including the contents of any compliance plan in effect, the danger of lead to their bodies (including their reproductive systems), and their rights under the standard. All employees must be trained prior to initial assignment to areas where there is a possibility of exposure above the action level.

This training program must also be provided at least annually thereafter unless further exposure above the action level will not occur.

#### XI. Signs – Paragraph (M)

The standard requires that the following warning sign be posted in work areas when the exposure to lead is above the PEL:

**DANGER**  
**LEAD WORK AREA**  
**MAY DAMAGE FERTILITY OR THE UNBORN CHILD**  
**CAUSES DAMAGE TO THE CENTRAL NERVOUS SYSTEM**  
**DO NOT EAT, DRINK OR SMOKE IN THIS AREA**

Prior to June 1, 2016, employers may use the following legend in lieu of that specified above:

**WARNING**  
**LEAD WORK AREA**  
**POISON**  
**NO SMOKING OR EATING**

#### XII. Recordkeeping – Paragraph (N)

Your employer is required to keep all records of exposure monitoring for airborne lead. These records must include the name and job classification of employees measured, details of the sampling and analytical techniques, the results of this sampling, and the type of respiratory protection being worn by the person sampled. Such records are to be retained for at least 30 years. Your employer is also required to keep all records of biological monitoring and medical examination results. These records must include the names of the employees, the physician's written opinion, and a copy of the results of the examination. Medical records must be preserved and maintained for the duration of employment plus 30 years. However, if the employee's duration of employment is less than one year, the employer need not retain that employee's medical records beyond the period of employment if they are provided to the employee upon termination of employment.

Recordkeeping is also required if you are temporarily removed from your job under the medical removal protection program. This record must include your name, the date of your removal and return, how the removal was or is being accomplished, and whether or not the reason for the removal was an elevated blood lead level. Your employer is required to keep each medical removal record only for as long as the duration of an employee's employment.

The standard requires that if you request to see or copy environmental monitoring, blood lead level monitoring, or medical removal records, they must be made available to you or to a representative that you authorize. Your union also has access to these records. Medical records other than BLL's must also be provided upon request to you, to your physician or to any other person whom you may specifically designate. Your union does not have access to your personal medical records unless you authorize their access.

#### XIII. Observation of Monitoring – Paragraph (O)

When air monitoring for lead is performed at your workplace as required by this standard, your employer must allow you or someone you designate to act as an observer of the monitoring. Observers are entitled to an explanation of the measurement procedure, and to record the results obtained. Since results will not normally be available at the time of the monitoring, observers are entitled to record or receive the results of the monitoring when returned by the laboratory. Your employer is required to provide the observer with any personal protective devices required to be worn by employees working in the area that is being monitored. The employer must require the observer to wear all such equipment and to comply with all other applicable safety and health procedures.

#### XIV. For Additional Information

- A. A copy of the interim standard for lead in construction can be obtained free of charge by calling or writing the OSHA Office of Publications, room N-3101, United States Department of Labor, Washington, DC 20210: Telephone (202) 219-4667.
- B. Additional information about the standard, its enforcement, and your employer's compliance can be obtained from the nearest OSHA Area Office listed in your telephone directory under United States Government/Department of Labor.

## Appendix C to 1926.62 Medical Surveillance Guidelines

### Introduction

The primary purpose of the Occupational Safety and Health Act of 1970 is to assure, so far as possible, safe and healthful working conditions for every working man and woman. The interim final occupational health standard for lead in construction is designed to protect workers exposed to inorganic lead including metallic lead, all inorganic lead compounds and organic lead soaps.

Under this interim final standard occupational exposure to inorganic lead is to be limited to 50  $\mu\text{g}/\text{m}^3$  (micrograms per cubic meter) based on an 8 hour time-weighted average (TWA). This permissible exposure limit (PEL) must be achieved through a combination of engineering, work practice and administrative controls to the extent feasible. Where these controls are in place but are found not to reduce employee exposures to or below the PEL, they must be used nonetheless, and supplemented with respirators to meet the 50  $\mu\text{g}/\text{m}^3$  exposure limit.

The standard also provides for a program of biological monitoring for employees exposed to lead above the action level at any time, and additional medical surveillance for all employees exposed to levels of inorganic lead above 30  $\mu\text{g}/\text{m}^3$  (TWA) for more than 30 days per year and whose BLL is at or above 40  $\mu\text{g}/\text{dl}$ . The purpose of this document is to outline the medical surveillance provisions of the interim standard for inorganic lead in construction, and to provide further information to the physician regarding the examination and evaluation of workers exposed to inorganic lead.

Section 1 provides a detailed description of the monitoring procedure including the required frequency of blood testing for exposed workers, provisions for medical removal protection (MRP), the recommended right of the employee to a second medical opinion, and notification and recordkeeping requirements of the employer. A discussion of the requirements for respirator use and respirator monitoring and OSHA's position on prophylactic chelation therapy are also included in this section.

Section 2 discusses the toxic effects and clinical manifestations of lead poisoning and effects of lead intoxication on enzymatic pathways in heme synthesis. The adverse effects on both male and female reproductive capacity and on the fetus are also discussed.

Section 3 outlines the recommended medical evaluation of the worker exposed to inorganic lead, including details of the medical history, physical examination, and recommended laboratory tests, which are based on the toxic effects of lead as discussed in Section 2.

Section 4 provides detailed information concerning the laboratory tests available for the monitoring of exposed workers. Included also is a discussion of the relative value of each test and the limitations and precautions which are necessary in the interpretation of the laboratory results.

#### I. Medical Surveillance and Monitoring Requirements for Workers Exposed to Inorganic Lead

Under the interim final standard for inorganic lead in the construction industry, initial medical surveillance consisting of biological monitoring to include blood lead and ZPP level determination shall be provided to employees exposed to lead above the action level on any one day. In addition, a program of biological monitoring is to be made available to all employees exposed above the action level at any time and additional medical surveillance is to be made available to all employees exposed to lead above 30  $\mu\text{g}/\text{m}^3$  TWA for more than 30 days each year and whose BLL exceeds 40  $\mu\text{g}/\text{dl}$ . This program consists of periodic blood sampling and medical evaluation to be performed on a schedule which is defined by previous laboratory results, worker complaints or concerns, and the clinical assessment of the examining physician.

Under this program, the blood lead level (BLL) of all employees who are exposed to lead above 30  $\mu\text{g}/\text{m}^3$  for more than 30 days per year or whose blood lead is above 40  $\mu\text{g}/\text{dl}$  but exposed for no more than 30 days per year is to be determined at least every two months for the first six months of exposure and every six months thereafter. The frequency is increased to every two months for employees whose last blood lead level was 40  $\mu\text{g}/\text{dl}$  or above. For employees who are removed from exposure to lead due to an elevated blood lead, a new blood lead level must be measured monthly. A zinc protoporphyrin (ZPP) measurement is strongly recommended on each occasion that a blood lead level measurement is made.

An annual medical examination and consultation performed under the guidelines discussed in Section 3 is to be made available to each employee exposed above  $30 \mu\text{g}/\text{m}^3$  for more than 30 days per year for whom a blood test conducted at any time during the preceding 12 months indicated a blood lead level at or above  $40 \mu\text{g}/\text{dl}$ . Also, an examination is to be given to all employees prior to their assignment to an area in which airborne lead concentrations reach or exceed the  $30 \mu\text{g}/\text{m}^3$  for more than 30 days per year. In addition, a medical examination must be provided as soon as possible after notification by an employee that the employee has developed signs or symptoms commonly associated with lead intoxication, that the employee desires medical advice regarding lead exposure and the ability to procreate a healthy child, or that the employee has demonstrated difficulty in breathing during a respirator fitting test or during respirator use. An examination is also to be made available to each employee removed from exposure to lead due to a risk of sustaining material impairment to health, or otherwise limited or specially protected pursuant to medical recommendations.

Results of biological monitoring or the recommendations of an examining physician may necessitate removal of an employee from further lead exposure pursuant to the standard's medical removal protection (MRP) program. The object of the MRP program is to provide temporary medical removal to workers either with substantially elevated blood lead levels or otherwise at risk of sustaining material health impairment from continued substantial exposure to lead.

Under the standard's ultimate worker removal criteria, a worker is to be removed from any work having an eight hour TWA exposure to lead of  $30 \mu\text{g}/\text{m}^3$  when his or her blood lead level reaches  $50 \mu\text{g}/\text{dl}$  and is confirmed by a second follow-up blood lead level performed within two weeks after the employer receives the results of the first blood sampling test. Return of the employee to his or her job status depends on a worker's blood lead level declining to  $40 \mu\text{g}/\text{dl}$ .

As part of the interim standard, the employer is required to notify in writing each employee whose blood lead level exceeds  $40 \mu\text{g}/\text{dl}$ . In addition each such employee is to be informed that the standard requires medical removal with MRP benefits, discussed below, when an employee's blood lead level exceeds the above defined limit.

In addition to the above blood lead level criterion, temporary worker removal may also take place as a result of medical determinations and recommendations. Written medical opinions must be prepared after each examination pursuant to the standard. If the examining physician includes a medical finding, determination or opinion that the employee has a medical condition which places the employee at increased risk of material health impairment from exposure to lead, then the employee must be removed from exposure to lead at or above  $30 \mu\text{g}/\text{m}^3$ . Alternatively, if the examining physician recommends special protective measures for an employee (e.g., use of a powered air purifying respirator) or recommends limitations on an employee's exposure to lead, then the employer must implement these recommendations.

Recommendations may be more stringent than the specific provisions of the standard. The examining physician, therefore, is given broad flexibility to tailor special protective procedures to the needs of individual employees. This flexibility extends to the evaluation and management of pregnant workers and male and female workers who are planning to raise children. Based on the history, physical examination, and laboratory studies, the physician might recommend special protective measures or medical removal for an employee who is pregnant or who is planning to conceive a child when, in the physician's judgment, continued exposure to lead at the current job would pose a significant risk. The return of the employee to his or her former job status, or the removal of special protections or limitations, depends upon the examining physician determining that the employee is no longer at increased risk of material impairment or that special measures are no longer needed.

During the period of any form of special protection or removal, the employer must maintain the worker's earnings, seniority, and other employment rights and benefits (as though the worker had not been removed) for a period of up to 18 months or for as long as the job the employee was removed from lasts if less than 18 months. This economic protection will maximize meaningful worker participation in the medical surveillance program, and is appropriate as part of the employer's overall obligation to provide a safe and healthful workplace. The provisions of MRP benefits during the employee's removal period may, however, be conditioned upon participation in medical surveillance.

The lead standard provides for a multiple physician review in cases where the employee wishes a second opinion concerning potential lead poisoning or toxicity. If an employee wishes a second opinion, he or she can make an appointment with a physician of his or her choice. This second physician will review the findings, recommendations or determinations of the first physician and conduct any examinations, consultations or tests deemed necessary in an attempt to make a final medical determination. If the first and second physicians do not agree in their assessment they must try to resolve their differences. If they cannot reach an agreement then they must designate a third physician to resolve the dispute.

The employer must provide examining and consulting physicians with the following specific information: A copy of the lead regulations and all appendices, a description of the employee's duties as related to exposure, the exposure level or anticipated level to lead and any other toxic substances (if applicable), a description of personal protective equipment used, blood lead levels, and all prior written medical opinions regarding the employee in the employer's possession or control. The employer must also obtain from the physician and provide the employee with a written medical opinion containing blood lead levels, the physician's opinion as to whether the employee is at risk of material impairment to health, any recommended protective measures for the employee if further exposure is permitted, as well as any recommended limitations upon an employee's use of respirators.

Employers must instruct each physician not to reveal to the employer in writing or in any other way his or her findings, laboratory results, or diagnoses which are felt to be unrelated to occupational lead exposure. They must also instruct each physician to advise the employee of any occupationally or non-occupationally related medical condition requiring further treatment or evaluation.

The standard provides for the use of respirators where engineering and other primary controls are not effective. However, the use of respirator protection shall not be used in lieu of temporary medical removal due to elevated blood lead levels or findings that an employee is at risk of material health impairment. This is based on the numerous inadequacies of respirators including skin rash where the facepiece makes contact with the skin, unacceptable stress to breathing in some workers with underlying cardiopulmonary impairment, difficulty in providing adequate fit, the tendency for respirators to create additional hazards by interfering with vision, hearing, and mobility, and the difficulties of assuring the maximum effectiveness of a complicated work practice program involving respirators. Respirators do, however, serve a useful function where engineering and work practice controls are inadequate by providing supplementary, interim, or short-term protection, provided they are properly selected for the environment in which the employee will be working, properly fitted to the employee, maintained and cleaned periodically, and worn by the employee when required.

In its interim final standard on occupational exposure to inorganic lead in the construction industry, OSHA has prohibited prophylactic chelation. Diagnostic and therapeutic chelation are permitted only under the supervision of a licensed physician with appropriate medical monitoring in an acceptable clinical setting. The decision to initiate chelation therapy must be made on an individual basis and take into account the severity of symptoms felt to be a result of lead toxicity along with blood lead levels, ZPP levels, and other laboratory tests as appropriate. EDTA and penicillamine which are the primary chelating agents used in the therapy of occupational lead poisoning have significant potential side effects and their use must be justified on the basis of expected benefits to the worker. Unless frank and severe symptoms are present, therapeutic chelation is not recommended, given the opportunity to remove a worker from exposure and allow the body to naturally excrete accumulated lead. As a diagnostic aid, the chelation mobilization test using CA-EDTA has limited applicability. According to some investigators, the test can differentiate between lead-induced and other nephropathies. The test may also provide an estimation of the mobile fraction of the total body lead burden.

Employers are required to assure that accurate records are maintained on exposure assessment, including environmental monitoring, medical surveillance, and medical removal for each employee. Exposure assessment records must be kept for at least 30 years. Medical surveillance records must be kept for the duration of employment plus 30 years except in cases where the employment was less than one year. If duration of employment is less than one year, the employer need not retain this record beyond the term of employment if the record is provided to the employee upon termination of employment. Medical removal records also must be maintained for the duration of employment. All records required under the standard must be made available upon request to the Assistant Secretary of Labor for Occupational Safety and Health and the Director of the National Institute for Occupational Safety and Health. Employers must also make environmental and biological monitoring and medical removal records available to affected employees and to former employees or their authorized employee representatives. Employees or their specifically designated representatives have access to their entire medical surveillance records.

In addition, the standard requires that the employer inform all workers exposed to lead at or above  $30 \text{ mg/m}^3$  of the provisions of the standard and all its appendices, the purpose and description of medical surveillance and provisions for medical removal protection if temporary removal is required. An understanding of the potential health effects of lead exposure by all exposed employees along with full understanding of their rights under the lead standard is essential for an effective monitoring program.

## II. Adverse Health Effects of Inorganic Lead

Although the toxicity of lead has been known for 2,000 years, the knowledge of the complex relationship between lead exposure and human response is still being refined. Significant research into the toxic properties of lead continues throughout the world, and it should be anticipated that our understanding of thresholds of effects and margins of safety will be improved in future years. The provisions of the lead standard are founded on two prime medical judgments: First, the prevention of adverse health effects from exposure to lead throughout a working lifetime requires that worker blood lead levels be maintained at or below  $40 \text{ } \mu\text{g/dl}$  and second, the blood lead levels of workers, male or female, who intend to parent in the near future should be maintained below  $30 \text{ } \mu\text{g/dl}$  to minimize adverse reproductive health effects to the parents and developing fetus. The adverse effects of lead on reproduction are being actively researched and OSHA encourages the physician to remain abreast of recent developments in the area to best advise pregnant workers or workers planning to conceive children.

The spectrum of health effects caused by lead exposure can be subdivided into five developmental stages: Normal, physiological changes of uncertain significance, pathophysiological changes, overt symptoms (morbidity), and mortality. Within this process there are no sharp distinctions, but rather a continuum of effects. Boundaries between categories overlap due to the wide variation of individual responses and exposures in the working population. OSHA's development of the lead standard focused on pathophysiological changes as well as later stages of disease.

### 1. Heme Synthesis Inhibition.

The earliest demonstrated effect of lead involves its ability to inhibit at least two enzymes of the heme synthesis pathway at very low blood levels. Inhibition of delta aminolevulinic acid dehydrase (ALA-D) which catalyzes the conversion of delta-aminolevulinic acid (ALA) to protoporphyrin is observed at a blood lead level below 20 µg/dl. At a blood lead level of 40 µg/dl, more than 20% of the population would have 70% inhibition of ALA-D. There is an exponential increase in ALA excretion at blood lead levels greater than 40 µg/dl.

Another enzyme, ferrochelatase, is also inhibited at low blood lead levels. Inhibition of ferrochelatase leads to increased free erythrocyte protoporphyrin (FEP) in the blood which can then bind to zinc to yield zinc protoporphyrin. At a blood lead level of 50 µg/dl or greater, nearly 100% of the population will have an increase in FEP. There is also an exponential relationship between blood lead levels greater than 40 µg/dl and the associated ZPP level, which has led to the development of the ZPP screening test for lead exposure.

While the significance of these effects is subject to debate, it is OSHA's position that these enzyme disturbances are early stages of a disease process which may eventually result in the clinical symptoms of lead poisoning. Whether or not the effects do progress to the later stages of clinical disease, disruption of these enzyme processes over a working lifetime is considered to be a material impairment of health.

One the eventual results of lead-induced inhibition of enzymes in the heme synthesis pathway is anemia which can be asymptomatic if mild but associated with a wide array of symptoms including dizziness, fatigue, and tachycardia when more severe. Studies have indicated that lead levels as low as 50 µg/dl can be associated with a definite decreased hemoglobin, although most cases of lead-induced anemia, as well as shortened red-cell survival times, occur at lead levels exceeding 80 µg/dl. Inhibited hemoglobin synthesis is more common in chronic cases whereas shortened erythrocyte life span is more common in acute cases.

In lead-induced anemias, there is usually a reticulocytosis along with the presence of basophilic stippling, and ringed sideroblasts, although none of the above are pathognomonic for lead-induced anemia.

## 2. Neurological Effects.

Inorganic lead has been found to have toxic effects on both the central and peripheral nervous systems. The earliest stages of lead-induced central nervous system effects first manifest themselves in the form of behavioral disturbances and central nervous system symptoms including irritability, restlessness, insomnia and other sleep disturbances, fatigue, vertigo, headache, poor memory, tremor, depression, and apathy. With more severe exposure, symptoms can progress to drowsiness, stupor, hallucinations, delirium, convulsions and coma.

The most severe and acute form of lead poisoning which usually follows ingestion or inhalation of large amounts of lead is acute encephalopathy which may arise precipitously with the onset of intractable seizures, coma, cardio-respiratory arrest, and death within 48 hours.

While there is disagreement about what exposure levels are needed to produce the earliest symptoms, most experts agree that symptoms definitely can occur at blood lead levels of 60 µg/dl whole blood and therefore recommend a 40 µg/dl maximum. The central nervous system effects frequently are not reversible following discontinued exposure or chelation therapy and when improvement does occur, it is almost always only partial.

The peripheral neuropathy resulting from lead exposure characteristically involves only motor function with minimal sensory damage and has a marked predilection for the extensor muscles of the most active extremity. The peripheral neuropathy can occur with varying degrees of severity. The earliest and mildest form which can be detected in workers with blood lead levels as low as 50 µg/dl is manifested by slowing of motor nerve conduction velocity often without clinical symptoms. With progression of the neuropathy there is development of painless extensor muscle weakness usually involving the extensor muscles of the fingers and hand in the most active upper extremity, followed in severe cases by wrist drop or, much less commonly, foot drop.

In addition to slowing of nerve conduction, electromyographical studies in patients with blood lead levels greater than 50 µg/dl have demonstrated a decrease in the number of acting motor unit potentials, an increase in the duration of motor unit potentials, and spontaneous pathological activity including fibrillations and fasciculations. Whether these effects occur at levels of 40 µg/dl is undetermined.

While the peripheral neuropathies can occasionally be reversed with therapy, again such recovery is not assured particularly in the more severe neuropathies and often improvement is only partial. The lack of reversibility is felt to be due in part to segmental demyelination.

### 3. Gastrointestinal.

Lead may also affect the gastrointestinal system producing abdominal colic or diffuse abdominal pain, constipation, obstipation, diarrhea, anorexia, nausea and vomiting. Lead colic rarely develops at blood lead levels below 80 µg/dl.

4. Renal. Renal toxicity represents one of the most serious health effects of lead poisoning. In the early stages of disease nuclear inclusion bodies can frequently be identified in proximal renal tubular cells. Renal function remains normal and the changes in this stage are probably reversible. With more advanced disease there is progressive interstitial fibrosis and impaired renal function. Eventually extensive interstitial fibrosis ensues with sclerotic glomeruli and dilated and atrophied proximal tubules; all represent end stage kidney disease. Azotemia can be progressive, eventually resulting in frank uremia necessitating dialysis. There is occasionally associated hypertension and hyperuricemia with or without gout.

Early kidney disease is difficult to detect. The urinalysis is normal in early lead nephropathy and the blood urea nitrogen and serum creatinine increase only when two-thirds of kidney function is lost. Measurement of creatinine clearance can often detect earlier disease as can other methods of measurement of glomerular filtration rate. An abnormal Ca-EDTA mobilization test has been used to differentiate between lead-induced and other nephropathies, but this procedure is not widely accepted. A form of Fanconi syndrome with aminoaciduria, glycosuria, and hyper-phosphaturia indicating severe injury to the proximal renal tubules is occasionally seen in children.

5. Reproductive effects. Exposure to lead can have serious effects on reproductive function in both males and females. In male workers exposed to lead there can be a decrease in sexual drive, impotence, decreased ability to produce healthy sperm, and sterility. Malformed sperm (teratospermia), decreased number of sperm (hypospermia), and sperm with decreased motility (asthenospermia) can all occur. Teratospermia has been noted at mean blood lead levels of 53 µg/dl and hypospermia and asthenospermia at 41 µg/dl. Furthermore, there appears to be a dose-response relationship for teratospermia in lead exposed workers.

Women exposed to lead may experience menstrual disturbances including dysmenorrhea, menorrhagia and amenorrhea. Following exposure to lead, women have a higher frequency of sterility, premature births, spontaneous miscarriages, and stillbirths.

Germ cells can be affected by lead and cause genetic damage in the egg or sperm cells before conception and result in failure to implant, miscarriage, stillbirth, or birth defects.

Infants of mothers with lead poisoning have a higher mortality during the first year and suffer from lowered birth weights, slower growth, and nervous system disorders.

Lead can pass through the placental barrier and lead levels in the mother's blood are comparable to concentrations of lead in the umbilical cord at birth. Transplacental passage becomes detectable at 12-14 weeks of gestation and increases until birth.

There is little direct data on damage to the fetus from exposure to lead but it is generally assumed that the fetus and newborn would be at least as susceptible to neurological damage as young children. Blood lead levels of 50-60 µg/dl in children can cause significant neurobehavioral impairments and there is evidence of hyperactivity at blood levels as low as 25 µg/dl. Given the overall body of literature concerning the adverse health effects of lead in children, OSHA feels that the blood lead level in children should be maintained below 30 µg/dl with a population mean of 15 µg/dl. Blood lead levels in the fetus and newborn likewise should not exceed 30 µg/dl.

Because of lead's ability to pass through the placental barrier and also because of the demonstrated adverse effects of lead on reproductive function in both the male and female as well as the risk of genetic damage of lead on both the ovum and sperm, OSHA recommends a 30 µg/dl maximum permissible blood lead level in both males and females who wish to bear children.

6. Other toxic effects. Debate and research continue on the effects of lead on the human body. Hypertension has frequently been noted in occupationally exposed individuals although it is difficult to assess whether this is due to lead's adverse effects on the kidney or if some other mechanism is involved. Vascular and electrocardiographic changes have been detected but have not been well characterized. Lead is thought to impair thyroid function and interfere with the pituitary-adrenal axis, but again these effects have not been well defined.

### III. Medical Evaluation

The most important principle in evaluating a worker for any occupational disease including lead poisoning is a high index of suspicion on the part of the examining physician. As discussed in Section 2, lead can affect numerous organ systems and produce a wide array of signs and symptoms, most of which are non-specific and subtle in nature at least in the early stages of disease. Unless serious concern for lead toxicity is present, many of the early clues to diagnosis may easily be overlooked.

The crucial initial step in the medical evaluation is recognizing that a worker's employment can result in exposure to lead. The worker will frequently be able to define exposures to lead and lead containing materials but often will not volunteer this information unless specifically asked. In other situations the worker may not know of any exposures to lead but the suspicion might be raised on the part of the physician because of the industry or occupation of the worker. Potential occupational exposure to lead and its compounds occur in many occupations in the construction industry, including demolition and salvaging operations, removal or encapsulation of materials containing lead, construction, alteration, repair or renovation of structures containing lead, transportation, disposal, storage or containment of lead or lead-containing materials on construction sites, and maintenance operations associated with construction activities.

Once the possibility for lead exposure is raised, the focus can then be directed toward eliciting information from the medical history, physical exam, and finally from laboratory data to evaluate the worker for potential lead toxicity.

A complete and detailed work history is important in the initial evaluation. A listing of all previous employment with information on job description, exposure to fumes or dust, known exposures to lead or other toxic substances, a description of any personal protective equipment used, and previous medical surveillance should all be included in the worker's record. Where exposure to lead is suspected, information concerning on-the-job personal hygiene, smoking or eating habits in work areas, laundry procedures, and use of any protective clothing or respiratory protection equipment should be noted. A complete work history is essential in the medical evaluation of a worker with suspected lead toxicity, especially when long term effects such as neurotoxicity and nephrotoxicity are considered.

The medical history is also of fundamental importance and should include a listing of all past and current medical conditions, current medications including proprietary drug intake, previous surgeries and hospitalizations, allergies, smoking history, alcohol consumption, and also non-occupational lead exposures such as hobbies (hunting, riflery). Also known childhood exposures should be elicited. Any previous history of hematological, neurological, gastrointestinal, renal, psychological, gynecological, genetic, or reproductive problems should be specifically noted.

A careful and complete review of systems must be performed to assess both recognized complaints and subtle or slowly acquired symptoms which the worker might not appreciate as being significant. The review of symptoms should include the following:

1. General – weight loss, fatigue, decreased appetite.

2. Head, Eyes, Ears, Nose, Throat (HEENT) – headaches, visual disturbances or decreased visual acuity, hearing deficits or tinnitus, pigmentation of the oral mucosa, or metallic taste in mouth.
3. Cardiopulmonary – shortness of breath, cough, chest pains, palpitations, or orthopnea.
4. Gastrointestinal – nausea, vomiting, heartburn, abdominal pain, constipation or diarrhea.
5. Neurologic – irritability, insomnia, weakness (fatigue), dizziness, loss of memory, confusion, hallucinations, incoordination, ataxia, decreased strength in hands or feet, disturbances in gait, difficulty in climbing stairs, or seizures.
6. Hematologic – pallor, easy fatigability, abnormal blood loss, melena.
7. Reproductive (male and female and spouse where relevant) – history of infertility, impotence, loss of libido, abnormal menstrual periods, history of miscarriages, stillbirths, or children with birth defects.
8. Musculoskeletal – muscle and joint pains.

The physical examination should emphasize the neurological, gastrointestinal, and cardiovascular systems. The worker's weight and blood pressure should be recorded and the oral mucosa checked for pigmentation characteristic of a possible Burtonian or lead line on the gingiva. It should be noted, however, that the lead line may not be present even in severe lead poisoning if good oral hygiene is practiced.

The presence of pallor on skin examination may indicate an anemia which, if severe, might also be associated with a tachycardia. If an anemia is suspected, an active search for blood loss should be undertaken including potential blood loss through the gastrointestinal tract.

A complete neurological examination should include an adequate mental status evaluation including a search for behavioral and psychological disturbances, memory testing, evaluation for irritability, insomnia, hallucinations, and mental clouding. Gait and coordination should be examined along with close observation for tremor. A detailed evaluation of peripheral nerve function including careful sensory and motor function testing is warranted. Strength testing particularly of extensor muscle groups of all extremities is of fundamental importance.

Cranial nerve evaluation should also be included in the routine examination.

The abdominal examination should include auscultation for bowel sounds and abdominal bruits and palpation for organomegaly, masses, and diffuse abdominal tenderness.

Cardiovascular examination should evaluate possible early signs of congestive heart failure. Pulmonary status should be addressed particularly if respirator protection is contemplated.

As part of the medical evaluation, the interim lead standard requires the following laboratory studies:

1. Blood lead level
2. Hemoglobin and hematocrit determinations, red cell indices, and examination of the peripheral blood smear to evaluate red blood cell morphology
3. Blood urea nitrogen
4. Serum creatinine
5. Routine urinalysis with microscopic examination
6. A zinc protoporphyrin level.

In addition to the above, the physician is authorized to order any further laboratory or other tests which he or she deems necessary in accordance with sound medical practice. The evaluation must also include pregnancy testing or laboratory evaluation of male fertility if requested by the employee. Additional tests which are probably not warranted on a routine basis but may be appropriate when blood lead and ZPP levels are equivocal include delta aminolevulinic acid and coproporphyrin concentrations in the urine, and dark-field illumination for detection of basophilic stippling in red blood cells.

If an anemia is detected further studies including a careful examination of the peripheral smear, reticulocyte count, stool for occult blood, serum iron, total iron binding capacity, bilirubin, and, if appropriate, vitamin B12 and folate may be of value in attempting to identify the cause of the anemia.

If a peripheral neuropathy is suspected, nerve conduction studies are warranted both for diagnosis and as a basis to monitor any therapy.

If renal disease is questioned, a 24 hour urine collection for creatinine clearance, protein, and electrolytes may be indicated. Elevated uric acid levels may result from lead-induced renal disease and a serum uric acid level might be performed.

An electrocardiogram and chest x-ray may be obtained as deemed appropriate.

Sophisticated and highly specialized testing should not be done routinely and where indicated should be under the direction of a specialist.

#### IV. Laboratory Evaluation

The blood lead level at present remains the single most important test to monitor lead exposure and is the test used in the medical surveillance program under the lead standard to guide employee medical removal. The ZPP has several advantages over the blood lead level. Because of its relatively recent development and the lack of extensive data concerning its interpretation, the ZPP currently remains an ancillary test.

This section will discuss the blood lead level and ZPP in detail and will outline their relative advantages and disadvantages. Other blood tests currently available to evaluate lead exposure will also be reviewed.

The blood lead level is a good index of current or recent lead absorption when there is no anemia present and when the worker has not taken any chelating agents. However, blood lead levels along with urinary lead levels do not necessarily indicate the total body burden of lead and are not adequate measures of past exposure. One reason for this is that lead has a high affinity for bone and up to 90% of the body's total lead is deposited there. A very important component of the total lead body burden is lead in soft tissue (liver, kidney, and brain). This fraction of the lead body burden, the biologically active lead, is not entirely reflected by blood lead levels since it is a function of the dynamics of lead absorption, distribution, deposition in bone and excretion. Following discontinuation of exposure to lead, the excess body burden is only slowly mobilized from bone and other relatively stable body stores and excreted. Consequently, a high blood lead level may only represent recent heavy exposure to lead without a significant total body excess and likewise a low blood lead level does not exclude an elevated total body burden of lead.

Also due to its correlation with recent exposures, the blood lead level may vary considerably over short time intervals.

To minimize laboratory error and erroneous results due to contamination, blood specimens must be carefully collected after thorough cleaning of the skin with appropriate methods using lead-free blood containers and analyzed by a reliable laboratory. Under the standard, samples must be analyzed in laboratories which are approved by OSHA. Analysis is to be made using atomic absorption spectrophotometry, anodic stripping voltammetry or any method which meets the accuracy requirements set forth by the standard.

The determination of lead in urine is generally considered a less reliable monitoring technique than analysis of whole blood primarily due to individual variability in urinary excretion capacity as well as the technical difficulty of obtaining accurate 24 hour urine collections. In addition, workers with renal insufficiency, whether due to lead or some other cause, may have decreased lead clearance and consequently urine lead levels may under-estimate the true lead burden. Therefore, urine lead levels should not be used as a routine test.

The zinc protoporphyrin test, unlike the blood lead determination, measures an adverse metabolic effect of lead and as such is a better indicator of lead toxicity than the level of blood lead itself. The level of ZPP reflects lead absorption over the preceding 3 to 4 months, and therefore is a better indicator of lead body burden. The ZPP requires more time than the blood lead to read significantly elevated levels; the return to normal after discontinuing lead exposure is also slower. Furthermore, the ZPP test is simpler, faster, and less expensive to perform and no contamination is possible. Many investigators believe it is the most reliable means of monitoring chronic lead absorption.

Zinc protoporphyrin results from the inhibition of the enzyme ferrochelatase which catalyzes the insertion of an iron molecule into the protoporphyrin molecule, which then becomes heme. If iron is not inserted into the molecule then zinc, having a greater affinity for protoporphyrin, takes the place of the iron, forming ZPP.

An elevation in the level of circulating ZPP may occur at blood lead levels as low as 20-30  $\mu\text{g}/\text{dl}$  in some workers. Once the blood lead level has reached 40  $\mu\text{g}/\text{dl}$  there is more marked rise in the ZPP value from its normal range of less than 100  $\mu\text{g}/\text{dl}$  100 ml. Increases in blood lead levels beyond 40  $\mu\text{g}/100\text{ g}$  are associated with exponential increases in ZPP.

Whereas blood lead levels fluctuate over short time spans, ZPP levels remain relatively stable. ZPP is measured directly in red blood cells and is present for the cell's entire 120 day life-span. Therefore, the ZPP level in blood reflects the average ZPP production over the previous 3-4 months and consequently the average lead exposure during that time interval.

It is recommended that a hematocrit be determined whenever a confirmed ZPP of 50  $\mu\text{g}/100\text{ ml}$  whole blood is obtained to rule out a significant underlying anemia. If the ZPP is in excess of 100  $\mu\text{g}/100\text{ ml}$  and not associated with abnormal elevations in blood lead levels, the laboratory should be checked to be sure that blood leads were determined using atomic absorption spectrophotometry anodic stripping voltammetry, or any method which meets the accuracy requirements set forth by the standard by an OSHA approved laboratory which is experienced in lead level determinations. Repeat periodic blood lead studies should be obtained in all individuals with elevated ZPP levels to be certain that an associated elevated blood lead level has not been missed due to transient fluctuations in blood leads.

ZPP has a characteristic fluorescence spectrum with a peak at 594 nm which is detectable with a hematofluorimeter. The hematofluorimeter is accurate and portable and can provide on-site, instantaneous results for workers who can be frequently tested via a finger prick.

However, careful attention must be given to calibration and quality control procedures. Limited data on blood lead-ZPP correlations and the ZPP levels which are associated with the adverse health effects discussed in Section 2 are the major limitations of the test. Also it is difficult to correlate ZPP levels with environmental exposure and there is some variation of response with age and sex. Nevertheless, the ZPP promises to be an important diagnostic test for the early detection of lead toxicity and its value will increase as more data is collected regarding its relationship to other manifestations of lead poisoning.

Levels of delta-aminolevulinic acid (ALA) in the urine are also used as a measure of lead exposure. Increasing concentrations of ALA are believed to result from the inhibition of the enzyme delta-aminolevulinic acid dehydrase (ALA-D). Although the test is relatively easy to perform, inexpensive, and rapid, the disadvantages include variability in results, the necessity to collect a complete 24 hour urine sample which has a specific gravity greater than 1.010, and also the fact that ALA decomposes in the presence of light.

The pattern of porphyrin excretion in the urine can also be helpful in identifying lead intoxication. With lead poisoning, the urine concentrations of coproporphyrins I and II, porphobilinogen and uroporphyrin I rise. The most important increase, however, is that of coproporphyrin III; levels may exceed 5,000 µg/l in the urine in lead poisoned individuals, but its correlation with blood lead levels and ZPP are not as good as those of ALA. Increases in urinary porphyrins are not diagnostic of lead toxicity and may be seen in porphyria, some liver diseases, and in patients with high reticulocyte counts.

Summary. The Occupational Safety and Health Administration's interim standard for inorganic lead in the construction industry places significant emphasis on the medical surveillance of all workers exposed to levels of inorganic lead above 30 µg/m<sup>3</sup> TWA. The physician has a fundamental role in this surveillance program, and in the operation of the medical removal protection program.

Even with adequate worker education on the adverse health effects of lead and appropriate training in work practices, personal hygiene and other control measures, the physician has a primary responsibility for evaluating potential lead toxicity in the worker. It is only through a careful and detailed medical and work history, a complete physical examination and appropriate laboratory testing that an accurate assessment can be made.

Many of the adverse health effects of lead toxicity are either irreversible or only partially reversible and therefore early detection of disease is very important.

This document outlines the medical monitoring program as defined by the occupational safety and health standard for inorganic lead. It reviews the adverse health effects of lead poisoning and describes the important elements of the history and physical examinations as they relate to these adverse effects. Finally, the appropriate laboratory testing for evaluating lead exposure and toxicity is presented.

It is hoped that this review and discussion will give the physician a better understanding of the OSHA standard with the ultimate goal of protecting the health and well-being of the worker exposed to lead under his or her care.

## **1926.64 Process Safety Management of Highly Hazardous Chemicals**

**Note:** Division 2/H, 1910.119, Process Safety Management of Highly Hazardous Chemicals applies to Construction.

## 1926.65 Hazardous Waste Operations and Emergency Response

**Note:** Division 2/H, 1910.120, Hazardous Waste Operations and Emergency Response applies to Construction.

## Historical Notes for Subdivision 3D

**Note:** The Accident Prevention Division adopted Division 3, Construction federal standard 29 CFR 1926 by reference on a temporary basis effective May 1, 1989. It contained new and revised federal occupational safety and health rules for the Construction industry. APD is now announcing that these same rules have been duly filed for permanent adoption, effective July 1, 1989. Division 3, Construction, includes new federal rules which cover masonry and concrete construction standards, and limits the use of construction cranes and derricks as personnel hoists, and revised federal rules and reduce occupational exposures to asbestos, tremolite, anthophyllite, and actinolite. Hazard communication rules for construction are also now included in Division 3.

Division 3, Construction, replaces Oregon codes, Division 83, construction, and Division 84, Electrical transmission and distribution facilities. However, some individual rules from each of these divisions have been retained and adopted into the new Division 3, construction, as Oregon-initiated rules.

This is Oregon OSHA administrative order 8-1989, adopted and effective July 7, 1989.

**Note:** Federal OSHA adopted two new sets of standards: Methylenedianiline (MDA), and Cadmium in 1992. The MDA standards were adopted for general industry and construction, cadmium was adopted for general industry, construction, and maritime. Oregon OSHA has adopted these new federal standards by reference, which establishes an occupational exposure level for MDA that is limited to 10 parts per billion (ppb) for an 8-hour time weighted average (TWA) and a short-term exposure limit (STEL) of 100 ppb. There are associated provisions for medical surveillance, medical monitoring, hygiene facilities, engineering controls, proper respirator use, and recordkeeping. Certain of these provisions would not apply if exposure levels are below the action level of 5 ppb.

For cadmium, the new standard establishes a single 8 hour TWA exposure limit of 5 micrograms per cubic meter of air for all cadmium compounds, including dust and fumes. Employers are required to comply with this limit primarily by means of engineering and work practice controls. This standard also establishes an 8-hour TWA action level of 2.5 micrograms per cubic meter of air. Employers are required to implement medical surveillance for employees exposed above the action level. Generally, for construction, the new standards require employers to provide engineering and other controls once an employee is exposed above the PEL for a total of 30 or more working days a year. If exposures are maintained below the regulatory limit, employers can use a mix of controls, including respirators. Construction operations much have a competent person to identify and control cadmium exposure in the workplace, and written compliance programs are required within 90 days of the standard's effective date.

This is Oregon OSHA administrative order 1-1993, adopted and effective January 22, 1993.

**Note:** In May 1993, federal OSHA adopted an interim final standard on lead for the construction industry, in order to protect more than 900,000 construction workers nationwide against the hazards of exposure to lead. This interim standard makes the permissible exposure limit (PEL) for lead in construction the same as is currently in effect for general industry, which is 50 micrograms or lead per cubic meter of air. This new standard's purpose is to reduce the incidence of acute lead poisoning and the adverse neurological and biochemical effects of it. Also, long-term benefits will include reduced cases of lead-induced hypertension, heart attacks, strokes, renal disease, and reproductive disorders.

The following is an overview of those parts of the standard that are changed from the general industry requirements:

Initial determination exposure assessment required.

General industry contingent on 30 days of exposure for engineering and work practice controls, whereas construction is not tied to 30 days of exposure.

Compliance program must be in writing prior to the start of each job, including frequent and regular jobsite inspections.

Description of arrangements with contractors.

Evaluation of effectiveness of mechanical ventilation.

Employer must ensure employees are following good work practices, and provide initial medical surveillance to employees who are exposed on any day.

Biological monitoring required every two months for the first six months, and notify each employee in writing of their blood lead level I.

Employers required to provide initial training prior to job assignment on hazards to fetus, and to maintain a record of objective data.

This is Oregon OSHA administrative order 16-1993, adopted and effective November 1, 1993.

**Note:** The 1993 Oregon legislature, with the passage of HB 3114, changed the minimum estimated cost of construction projects which trigger the requirement for onsite toilet facilities from \$500,000 to \$1,000,000. This required the amendment of OAR 437-003-0020(1) in division 3 construction, to reflect the increase in minimum estimated cost. A note has been added for clarification for the applicability of this rule. Also, an incorrect internal reference to "subparagraph (2) of 1926.51(c)" has been corrected to read "subparagraph (1) of 1926.51(c)."

Concurrently, three rules (OARs 437-003-0050, 0055, and 0060) have been repealed from division 3 construction because they were duplicative of federal rules which were adopted by reference in subdivision X, ladders, in division 3.

This is Oregon OSHA administrative order 1-1994, adopted and effective April 27, 1994.

**Note:** On July 19, 1994, federal OSHA published in the Federal Register their adoption of rules on retention of DOT markings, placards, and labels. These rules require employers receiving hazardous material shipments to retain markings, placards, and labels on the package, transport vehicle, freight container, motor vehicle, or rail freight car. The markings or other warning materials generally must be retained on packages "until the packaging is sufficiently cleaned of residue and purged of vapors to remove any potential hazards...". For other transport containers, such as vehicles, freight containers, motor vehicles, or rail freight cars, markings must be retained until the hazardous material is removed.

Oregon OSHA has adopted by reference this federal standard for retention of DOT markings, placards, and labels as amendments to divisions 2, 3, and 5. This rule also affects the agriculture industry, which is covered through amended rules in the division 2, general occupational safety and health rules.

This is Oregon OSHA administrative order 1-1995, adopted and effective January 19, 1995.

**Note:** Oregon OSHA adopted by reference corrections and technical amendments issued by federal OSHA, published in the Federal Register. Also, placement of certain general industry standards into the construction division rules as published in the Federal Register on June 30, 1993, are adopted. Federal OSHA made simple corrections, deleted redundant provisions, and clarified and reorganized various other provisions throughout the standards. These changes affect Oregon's division 2, general industry, division 3, construction, and division 5, maritime activities.

Thirteen similar standards for carcinogenic chemicals are consolidated under one single rule in general industry and maritime activities. This consolidation as well as the other amendments, do not change the substantive requirements of the standards.

This is Oregon OSHA administrative order 4-1997, adopted and effective April 2, 1997.

**Note:** Federal OSHA published in the Federal Register the new respiratory protection standard. The new standard replaces respiratory protection standards that were adopted in 1971 by OSHA. The new respiratory protection text is in general industry 29 CFR 1910.134. The text previously in 1910.134 has been redesignated as 1910.139. Four subdivisions in the construction standard have also been amended.

this new standard requires employers to establish or maintain a respiratory protection program to protect workers that wear respirators. Other provisions include requirements for program administration; work site-specific procedures; respirator selection; employee training; fit testing; medical evaluation; respirator use; and respirator cleaning, maintenance, and repair. Addressed for the first time are atmospheres that are Immediately Dangerous to Life and Health, including interior structural firefighting. The standard also simplifies and updates previous respiratory protection requirements.

This is Oregon OSHA Administrative Order 3-1998, Adopted and effective July 7, 1998.

**Note:** Federal OSHA made amendments in general industry and construction in both safety and health standards that will revise or eliminate duplicative, inconsistent, or unnecessary regulatory requirements without diminishing employee protections. Changes being made to health standards include reducing the frequency of required chest x-rays and eliminating sputum-cytology examinations for workers covered by the coke over and inorganic arsenic standards, and changing the emergency response provisions of the vinyl chloride standard.

Changes being made to safety standards include eliminating the public safety provisions of the temporary labor camp standard, eliminating unnecessary cross-references in the textile industry standards, and others. OSHA estimates that these changes will result in annualized savings for employers nationally of over \$9,600,000 and in reducing paperwork burden of 6600 hours annually.

This is Oregon OSHA administrative order 4-1999, adopted and effective April 30, 1999.

**Note:** On June 30, 1993, federal OSHA incorporated a large number of its 1910 general industry standards into its 1926 construction standard in order to consolidate all standards actually applicable to the construction industry in one place. This was done at the request of both employers and employees in construction work in order to facilitate compliance with all the applicable standards from general industry. Oregon OSHA proposes to adopt most of the applicable general industry standards into division 3, construction. This helps achieve more uniform reporting information and compliance, with a safer work environment for construction workers.

1926.501(b)(13), which was originally adopted from the federal construction standard, is being repealed because of confusion between the rule for residential construction and the other fall protection rules governing specific activities such as roofing or leading edge work. The more specific standards in 1926.501 will now be used for all industries. The current residential exceptions will be retained.

There should be no additional financial impact generated by the incorporation of applicable general industry standards into construction because the construction industry has been subject to these standards for a number of years. This action is to better provide access to all standards applicable to the construction industry.

This is Oregon OSHA administrative order 3-2000, adopted and effective February 8, 2000.

**Note:** Federal OSHA published in the January 5, 2005 Federal Register amendments to remove and revise provisions of its standards that are outdated, duplicative, unnecessary, inconsistent, or can be clarified or simplified by being written in plain language. Most of these changes are in the health standards in general industry, construction, and shipyard employment. The December 6, 2004 Federal Register makes a correction to a cross reference in Methylenedianiline in construction. We also repealed an Oregon-initiated rule that has effective dates that have passed a number of years ago and is no longer necessary. A nonmandatory appendix to OAR 437-002-0161, Medical and First Aid, was added.

This is Oregon OSHA Administrative Order 1-2005, Adopted and effective April 12, 2005.

**Note:** Oregon OSHA adopted federal OSHA changes as they appear in the April 3, 2006 Federal Register. These revisions include updating references and removing obsolete effective dates and startup dates from existing rules in general industry, construction, and maritime activities. Two changes federal OSHA made that we do not include in this rulemaking are to remove effective dates in 1910.266 and 1926.1092, neither of which Oregon OSHA has adopted before.

This is Oregon Administrative Order 4-2006, Adopted and effective July 24, 2006.

**Note:** Oregon OSHA adopts the federal OSHA changes as they appear in the August 24, 2006 Federal Register. These changes revise the existing rules on respiratory protection, adding definitions and new language that establishes Assigned Protection Factors (APFs) and Maximum Use Concentrations (MUCs) for respirator use. The revisions also supersede the respirator selection provisions of existing substance-specific standards with these new APFs (except for the respirator selection provisions of the 1,3-Butadiene Standard).

Federal OSHA developed the final APFs after thoroughly reviewing the available literature, including chamber-simulation studies and workplace protection factor studies, comments submitted to the record, and hearing testimony. The final APFs provide employers with critical information to use when selecting respirators for employees exposed to atmospheric contaminants found in general industry, construction, shipyards, longshoring, and marine terminal workplaces. Oregon OSHA also adopts these changes into Division 4, Agriculture. Proper respirator selection using APFs is an important component of an effective respiratory protection program. Accordingly, federal OSHA concludes that the final APFs are necessary to protect employees who must use respirators to protect them from airborne contaminants.

This is Oregon Administrative Order 10-2006, Adopted and effective November 30, 2006.

**Note:** In this rulemaking, Oregon OSHA is amending its standards to add language clarifying that the personal protective equipment (PPE) and training requirements impose a compliance duty to each and every employee covered by the standards, and that noncompliance may expose the employer to liability on a per-employee basis. The amendments consist of new paragraphs added to the introductory sections of the affected rules and changes to the language of some existing respirator and training requirements. These federal OSHA changes are in general industry, construction, and maritime and were published in the December 12, 2008 Federal Register.

This is Oregon OSHA Administrative Order 5-2009, adopted and effective May 29, 2009.

**Note:** Oregon OSHA adopted changes to rules in general industry, construction, agriculture, and maritime. Federal OSHA published a number of rule changes in these industries in the June 8, 2011 Federal Register. This is Phase III of the Standards Improvement Project (SIP III), the third in a series of rulemaking by Federal OSHA to improve and streamline the standards. This removes or revises individual requirements within rules that are confusing, outdated, duplicative, or inconsistent.

Oregon OSHA adopted the majority of the federal changes that include:

Personal Protective Equipment – Division 2/I, remove requirements that employers prepare and maintain written training certification records.

Respiratory Protection – revise requirements for breathing-gas containers.

Material Handling/Slings – revise standards in general industry, construction, and maritime standards.

Commercial Division Operations – Division 2/T, remove two obsolete recordkeeping requirements.

General industry and construction – remove requirements in numerous standards for employers to transfer specific records to the National Institute for Occupational Safety and Health (NIOSH).

Lead – amend trigger levels in general industry and construction.

In connection with rule changes in the SIP III rulemaking process, Oregon OSHA adopted additional changes to the subdivisions and rules opened during this rulemaking activity. We also made reference changes to Underground Installations in Division 3/P.

Oregon OSHA repealed all of Division 2/I rules with the exception of 1910.134 Respiratory Protection, 1910.137 Electrical Protective Equipment, 437-002-0138 Additional Oregon Rule for Electrical Protective Equipment, 437-002-0139 Working Underway on Water, and 437-002-1139 Working Over or In Water.

To replace them, we adopted new Oregon-initiated rule, 437-002-0134 Personal Protective Equipment, that includes sections covering scope/application, hazard assessment, equipment, training, payment, fall protection, clothing, high visibility garments, eye, head, foot, leg, hand and skin protection.

The change in format simplifies the existing text while making little change to the overall rule requirements with the following exceptions:

Modifies the hazard assessment requirement to clarify that employers must identify hazards to the entire body, including the torso and extremities, when performing the assessment. The assessment is currently limited to head, hands, eyes and face and foot protection. Note: The assessment for eyes, face, head, hands, and feet are currently in effect. The torso and extremities (e.g. arms and legs) element of the body assessment will not be enforced until July 1, 2012.

Change the fall protection component criteria to align with the systems criteria found in 1926.502 of the construction standards. The training requirement in this rule would also cover those parts not previously covered, such as fall protection.

Definition of “potable water”:

Previously, Oregon OSHA did not adopt 1910.141(a)(1), so the SIP-III changes to the definition of potable water must be addressed through Oregon-initiated rules. We will maintain the current definition of potable water in Division 2/J, 437-002-0141(1)(a), Sanitation and Division 4/J, 437-004-1105(1)(b), Sanitation. However, for consistency, we changed the definition of potable water in Division 4/J, 437-004-1110, Field Sanitation for Hand Labor Work, and Division 3/D, 437-003-0015 Drinking Water to the same definition.

MOCA -- 4,4'-Methylene bis (2-chloroaniline):

As a logical extension of the Federal OSHA SIP-III changes to 29 CFR 1910.1003, 13 Carcinogens, we amended the Oregon Rules for MOCA (4,4'-Methylene bis (2-chloroaniline)) at Division 2/Z, 437-002-0364. The requirements for respiratory protection are updated and the requirements for transfer of records is simplified. Most transfer of medical records to NIOSH is eliminated with the SIP III rulemaking. The employer is required to follow the requirements of the Respiratory Protection rule and select appropriate respirators based on the selection criteria in 1910.134(d). (The type of respirator to use is no longer specified.) We will also remove and reserve 437-002-0364(6)(a) which had a reporting requirement end date of December 1974.

This is Oregon OSHA Administrative Order 4-2011, adopted and effective December 8, 2011.

**Note:** Oregon OSHA adopted changes to rules in general industry and construction. Federal OSHA published a number of rule changes in these industries in the June 8, 2011 Federal Register. This is Phase III of the Standards Improvement Project (SIP III), the third in a series of rulemaking by Federal OSHA to improve and streamline the standards. This removes or revises individual requirements within rules that are confusing, outdated, duplicative, or inconsistent.

In connection with rule changes in the SIP III rulemaking process, Oregon OSHA adopted additional changes to the subdivisions and rules opened during this rulemaking activity.

For Substance-specific rules:

We adopted new Oregon-initiated rules in Divisions 2/Z, 3/D, and 3/Z, that replace the respiratory protection program paragraphs in the 1910 and 1926 substance specific rules referencing 1910.134 Respiratory Protection. The new rules expand the 1910.134 reference to include paragraphs (e) Medical Evaluation, and (o) Appendices. Also, notes are added following each of these new rules to clarify that these requirements are in addition to other medical evaluation and respiratory-protection-related requirements in each rule.

In most instances, the change in the requirement for a respirator medical evaluation (1910.134(e)) is a change in timing. Employers in many instances are already required to provide respirator medical evaluations based on contaminant exposure and required use of a respirator. Employers subject to the substance-specific rules would be required to provide a respirator medical evaluation to determine the employee's ability to wear a respirator without adverse health effects before the employee is fit tested or required to use a respirator in the workplace.

By adding section (o) of 1910.134, the new rules specify that all the Appendices to 1910.134 apply, providing approved procedures and respirator protocols to employers. These include Appendix A, Fit Testing Procedures; Appendix B-1, User Seal Check Procedures; Appendix B-2, Respirator Cleaning Procedures; Appendix C, OSHA Respirator Medical Evaluation Questionnaire; and Appendix D, Information for Employees Using Respirators When Not Required under the Standard.

This is Oregon OSHA Administrative Order 5-2011, adopted December 8, 2011, and effective July 1, 2012.

**Note:** This rulemaking is to keep Oregon OSHA in harmony with recent changes to federal OSHA's standards. Federal OSHA published in the December 27, 2011 Federal Register corrections of typographical errors and non-substantive technical amendments to a number of standards in general industry, construction, and shipyard employment. The technical amendments include updating or revising cross-references. These revisions do not affect the substantive requirements of coverage of those standards, do not modify or revoke existing rights or obligations, and do not establish new rights or obligations.

Oregon OSHA adopts these corrections and amendments to the standards Oregon has adopted previous to reflect federal OSHA's changes. We are also making rule reference changes in a number of standards to reflect the newly adopted OAR 437-002-0134, Personal Protective Equipment.

This is Oregon OSHA administrative order 1-2012, adopted and effective April 10, 2012.

**Note:** Federal OSHA modified its Hazard Communication Standard (HCS) to conform to the United Nations' Globally Harmonized System of Classification and Labelling of Chemicals (GHS). OSHA determined that the modifications will significantly reduce costs and burdens while also improving the quality and consistency of information provided to employers and employees regarding chemical hazards and associated protective measures. OSHA concluded this improved information will enhance the effectiveness of the HCS in ensuring that employees are apprised of the chemical hazards to which they may be exposed, and in reducing the incidence of chemical-related occupational illnesses and injuries.

The modifications to the standard include revised criteria for classification of chemical hazards; revised labeling provisions that include requirements for use of standardized signal words, pictograms, hazard statements, and precautionary statements; a specified format for safety data sheets; and related revisions to definitions of terms used in the standard, and requirements for employee training on labels and safety data sheets. OSHA and Oregon OSHA are also modifying provisions of other standards, including standards for flammable and combustible liquids, spray finishing, reinforced plastics, dipping and coating, welding, cutting, and brazing, hazardous waste operations and emergency response, process safety management, pipe labeling, and most substance specific health standards, to ensure consistency with the modified HCS requirements. The consequences of these modifications will be to improve safety, to facilitate global harmonization of standards, and to produce hundreds of millions of dollars in annual savings nationally.

This rulemaking also repeals three Oregon-initiated rules: OAR 437-002-0289 Precautionary Labels, general requirements in Division 2/Q; 437-002-0361, regarding certain compliance dates for the Ethylene Oxide rule in Division 2/Z; and 437-003-0035 additional rules in hazard communication in Division 3/D. All three rules repealed are obsolete and unnecessary. The text of 1926.59 Hazard Communication in Division 3/D is repealed and a note added to refer the reader to 1910.1200 Hazard Communication in Division 2/Z (same as federal OSHA).

This is Oregon OSHA Administrative Order 5-2012, adopted and effective September 25, 2012.

**Note:** Oregon OSHA is adopting changes to our administrative (recordkeeping), general industry, and construction standards, and updating references in the maritime activity standards in response to federal OSHA's adoption of final rules published in the May 14, 2019 Federal Register. This is Phase IV of federal OSHA's Standards Improvement Project (SIP-IV), the fourth in a series of rulemakings to improve and streamline workplace safety and health standards. Oregon's response removes or revises rules or requirements within our corresponding rules that are outdated, duplicative, or inconsistent. This rulemaking is anticipated to reduce regulatory burden and compliance costs while maintaining or enhancing worker safety and health as well as worker privacy protections.

In Division 3D, Oregon OSHA adopted updates to 1926.50(f), Medical Services and First Aid, and removed requirements for recording employee social security numbers in substance specific rules.

This is Oregon OSHA Administrative Order 3-2019, filed and effective October 29, 2019

Oregon Administrative Rules  
Chapter 437

Division 3  
Construction

---

Personal Protective & Life  
Saving Equipment

Subdivision

**E**

Administrative  
Order 1-2023

In accordance with **Oregon Revised Statutes (ORS) 654**, The Oregon Safe Employment Act (OSEAct), Oregon Department of Consumer and Business Services, Occupational Safety and Health Division (Oregon OSHA), adopted these rules.

The Secretary of State designated Oregon Administrative Rules Chapter 437 as the Oregon Occupational Safety and Health Division Rules. Six subject areas are designated as “Divisions” of these rules.

- **Division 1** Administration of the Oregon Safe Employment Act
- **Division 2** General Occupational Safety and Health Rules
- **Division 3** Construction
- **Division 4** Agriculture
- **Division 5** Maritime Activities
- **Division 7** Forest Activities

Oregon-initiated rules are numbered in a uniform system developed by the Secretary of State. This system does not number the rules in sequence (001, 002, 003, etc.). Omitted numbers may be assigned to new rules at the time of their adoption.

**Oregon-initiated rules** are arranged in the following codification structure prescribed by the Secretary of State for Oregon Administrative Rules (OAR):

Chapter	Division	Subdivision	Rule	Section	Paragraphs
437	003	N	0221	(1)	(a)(A)(i)(I)

Cite as 437-003-0221(1)(a)

Many of the Oregon OSHA rules are adopted by reference from the Code of Federal Regulations (CFR), and are arranged in the following federal numbering system:

Part	Subpart (Subdivision)	Section	Paragraphs
1926	N	.176	(a)(1)(i)(A)(1)(i)

Cite as 1926.176(a)(1)

When both Federal and Oregon-initiated rules are in the same Division or Subdivision, the Oregon-initiated rules are displayed in *italics*. The terms “subdivision” and “subpart” are synonymous within OAR 437, Oregon Occupational Safety and Health rules.

---

These rules are available for viewing in the Office of the Secretary of State, Oregon State Archives Building, Salem, Oregon.

These rules are available in electronic and printable formats at [osha.oregon.gov](http://osha.oregon.gov).

Printed copies of these rules are available at:

**437-003-0001 Adoption by Reference**

*In addition to, and not in lieu of, any other safety and health codes contained in OAR Chapter 437, the Department adopts by reference the following federal regulations printed as part of the Code of Federal Regulations, in the Federal Register:*

(5) Subdivision E – Personal Protective and Life Saving Equipment.

- (a) 29 CFR 1926.95 Criteria for personal protective equipment. REPEALED with Oregon OSHA Admin. Order 2-2013, filed 2/15/13, effective 4/1/13. In Oregon, OAR 437-003-0134 applies.
  - (b) 29 CFR 1926.97 Electrical protective equipment, published 4/11/14, FR vol. 79, p. 20316.
  - (c) 29 CFR 1926.100 Head protection. REPEALED with Oregon OSHA Admin. Order 2-2013, filed 2/15/13, effective 4/1/13. In Oregon, OAR 437-003-0134 applies.
  - (d) 29 CFR 1926.101 Hearing protection. REPEALED with Oregon OSHA Admin. Order 2-2013, filed 2/15/13, effective 4/1/13. In Oregon, OAR 437-003-0134 applies.
  - (e) 29 CFR 1926.102 Eye and face protection. REPEALED with Oregon OSHA Admin. Order 2-2013, filed 2/15/13, effective 4/1/13. In Oregon, OAR 437-003-0134 applies.
  - (f) 29 CFR 1926.103 Respiratory protection, published 1/8/98, FR vol. 63, no. 5, p. 1297.
- Note:** 29 CFR 1926.104 Removed, 8/9/94, FR vol. 59, no. 152, p. 40729.
- (g) 29 CFR 1926.105 Reserved, 8/9/94, FR vol. 59, no. 152, p. 40729.
  - (h) 29 CFR 1926.106 Working over or near water, published 4/6/79, FR vol. 44, p. 20940.
  - (i) 29 CFR 1926.107 Definitions applicable to this subpart, published 8/9/94, FR vol. 59, no. 152, p. 40729.

*These standards are available at the Oregon Occupational Safety and Health Division, Oregon Department of Consumer and Business Services, and the United States Government Printing Office.*

 OSHA Administrative Order 7-2014, filed 11/7/14, effective 11/9/14.  
 OSHA Administrative Order 3-2015, filed 10/19/15, effective 1/1/1

Authority: Sec. 107, Contract Work Hours and Safety Standards Act (Construction Safety Act) (40 U.S.C. 333); Sections 4, 6, and 8 of the Occupational Safety and Health Act of 1970 (29 U.S.C. 653, 655, 657); Secretary of Labor's Order No. 12-71 (36 FR 8754), 8-76 (41 FR 25059), 9-83 (48 FR 35736), 1-90 (55 FR 9033), 1-90 (55 FR 9033), 6-96 (62 FR 111), 5-2002 (67 FR 65008), or 5-2007 (72 FR 31160), as applicable; and 29 CFR part 1911.

### **437-003-0134 Personal Protective Equipment**

*Application. This rule applies to personal protective equipment and other protective equipment for the eyes, face, head, extremities and torso to include protective clothing, respiratory devices, and protective shields and barriers, wherever employees encounter hazardous processes or environments, chemical hazards, radiological hazards, or mechanical irritants that are capable of causing injury or impairment in the function of any part of the body through absorption, inhalation or physical contact.*

#### **(1) Hazard assessment and equipment selection.**

- (a) *The employer must assess the workplace to determine if hazards are present, or are likely to be present, which necessitate the use of personal protective equipment (PPE) or other protective equipment. If such hazards are present, or likely to be present, the employer must:*
  - (A) *Select, and have each affected employee use, the types of PPE that will protect the affected employee from the hazards identified in the hazard assessment;*
    - (i) *All protective equipment must be of safe design and construction for the work to be performed.*
    - (ii) *Protective equipment must be worn and used in a manner which will make full use of its protective properties.*
  - (B) *Communicate selection decisions to each affected employee; and,*
  - (C) *Select PPE that properly fits each affected employee.*

**Note:** *Non-mandatory Appendix B to Subdivision 2/I, contains an example of procedures that would comply with the requirement for a hazard assessment.*

(2) *Equipment.*

- (a) *Where employees provide their own protective equipment, the employer is responsible to assure its adequacy, including proper maintenance, and sanitation of such equipment.*
- (b) *All personal protective equipment must be provided, used, and maintained in a sanitary and reliable condition.*
- (c) *Defective or damaged personal protective equipment must not be used.*
- (d) *Each employer must maintain a regular system of inspection and maintenance of personal protective equipment furnished to workers.*

(3) *Training.*

- (a) *The employer must provide training to each employee who is required by this section to use PPE and each employee that is provided training must know at least the following:*
  - (A) *When PPE is necessary;*
  - (B) *What PPE is necessary;*
  - (C) *How to properly don, doff, adjust, and wear PPE;*
  - (D) *The limitations of the PPE; and,*
  - (E) *The proper care, maintenance, useful life and disposal of the PPE.*

- (b) Each affected employee must demonstrate an understanding of the training specified in paragraph (3)(a) of this section, and the ability to use PPE properly, before being allowed to perform work requiring the use of PPE.*
- (c) When the employer has reason to believe that any affected employee who has already been trained does not have the understanding and skill required by paragraph (3)(b) of this section, the employer must retrain each such employee. Circumstances where retraining is required include, but are not limited to situations where:
  - (A) Changes in the workplace render previous training obsolete; or*
  - (B) Changes in the types of PPE to be used render previous training obsolete; or*
  - (C) Inadequacies in an affected employee's knowledge or use of assigned PPE indicate that the employee has not retained the requisite understanding or skill.**
- (4) Payment for protective equipment.*
  - (a) Except as provided by paragraphs (4)(b) through (4)(f) of this section, the protective equipment, including personal protective equipment (PPE), used to comply with this part, must be provided by the employer at no cost to employees.*
  - (b) The employer is not required to pay for non-specialty safety-toe protective footwear (including steel-toe shoes or steel-toe boots) and non-specialty prescription safety eyewear, provided that the employer permits such items to be worn off the job-site.*
  - (c) When the employer provides metatarsal guards and allows the employee, at his or her request, to use shoes or boots with built-in metatarsal protection, the employer is not required to reimburse the employee for the shoes or boots.*
  - (d) The employer is not required to pay for:
    - (A) The logging boots required by OAR 437-007-0330 in Division 7.*
    - (B) Everyday clothing, such as long-sleeve shirts, long pants, street shoes, and normal work boots; or*
    - (C) Ordinary clothing, skin creams, or other items, used solely for protection from weather, such as winter coats, jackets, gloves, parkas, rubber boots, hats, raincoats, ordinary sunglasses, and sunscreen.**
  - (e) The employer must pay for replacement PPE, except when the employee has lost or intentionally damaged the PPE.*

- (f) *Where an employee provides adequate protective equipment he or she owns pursuant to paragraph (2)(a) of this section, the employer may allow the employee to use it and is not required to reimburse the employee for that equipment. The employer must not require an employee to provide or pay for his or her own PPE, unless the PPE is excepted by paragraphs (4)(b) through (4)(e) of this section.*
- (5) *Fall Protection. When fall protection systems are required by another standard, the employer must ensure that fall protection systems are provided, installed, and implemented according to the criteria in 1926.502, 437-003-0502, 437-003-1502, and 437-003-2502 in Division 3/M, Fall Protection.*
- (6) *Work Clothing.*
- (a) *Clothing must be worn which is appropriate to the work performed and conditions encountered.*
- (b) *Appropriate high temperature protective clothing must be worn by workers who are exposed to possible contact with molten metals or other substances that can cause burns.*
- (c) *Loose sleeves, ties, lapels, cuffs, or other loose clothing must not be worn near moving machinery.*
- (d) *Clothing saturated or impregnated with flammable liquids, corrosive or toxic substances, irritants, or oxidizing agents must be removed immediately and not worn again until properly cleaned.*
- (e) *Rings, wristwatches, earrings, bracelets, and other jewelry which might contact power driven machinery or electric circuitry, must not be worn.*
- (f) *Allow employees to wear a face covering if they so choose, unless doing so creates or otherwise exposes the employee to a hazard. Employers must supply these items at no cost to employees when the employer requires their use.*

**Note:** *For purposes of this rule, employers are not required to allow voluntary use of respirators if an employee requests to use one in lieu of a face covering.*

- (7) *High Visibility Garments.*
- (a) *Employees exposed to hazards caused by on highway type moving vehicles in construction zones and street/highway traffic must wear highly visible upper body garments. The colors must contrast with other colors in the area sufficiently to make the worker stand out. Colors equivalent to strong red, strong orange, strong yellow, strong yellow-green or fluorescent versions of these colors are acceptable. During hours of darkness, the garments must also have reflective material visible from all sides for 1000 feet.*
- (8) *Eye And Face Protection.*

- (a) *The employer must ensure that each affected employee uses appropriate eye or face protection when exposed to eye or face hazards from flying particles, molten metal, liquid chemicals, acids or caustic liquids, chemical gases or vapors, or potentially injurious light radiation.*
- (b) *The employer must ensure that each affected employee uses eye protection that provides side protection when there is a hazard from flying objects. Detachable side protectors (e.g., clip-on or slide-on side shields) meeting the pertinent requirements of this section are acceptable.*
- (c) *The employer must ensure that each affected employee who wears prescription lenses while engaged in operations that involve eye hazards wears eye protection that incorporates the prescription in its design, or shall wear eye protection that can be worn over the prescription lenses without disturbing the proper position of the prescription lenses or the protective lenses.*
- (d) *Eye and face PPE must be distinctly marked to facilitate identification of the manufacturer.*
- (e) *The employer must ensure that each affected employee uses equipment with filter lenses that have a shade number appropriate for the work being performed for protection from injurious light radiation.*

**Table 1 - Filter Lenses for Protection Against Radiant Energy**

<b>Operations</b>	<b>Electrode Size 1/32 in.</b>	<b>Arc Current (amps)</b>	<b>Minimum* Protective Shade</b>
<i>Shielded metal arc welding</i>	<i>Less than 3</i>	<i>Less than 60</i>	<i>7</i>
	<i>3-5</i>	<i>60-160</i>	<i>8</i>
	<i>5-8</i>	<i>160-250</i>	<i>10</i>
	<i>More than 8</i>	<i>250-550</i>	<i>11</i>
<i>Gas metal arc welding and flux cored arc welding</i>		<i>Less than 60</i>	<i>7</i>
		<i>60-160</i>	<i>10</i>
		<i>160-250</i>	<i>10</i>
		<i>250-500</i>	<i>10</i>
<i>Gas Tungsten arc welding</i>		<i>Less than 50</i>	<i>8</i>
		<i>50-150</i>	<i>8</i>
		<i>150-500</i>	<i>10</i>
<i>Air carbon</i>	<i>(Light)</i>	<i>Less than 500</i>	<i>10</i>
<i>Arc cutting</i>	<i>(Heavy)</i>	<i>500-1000</i>	<i>11</i>

<b>Operations</b>	<b>Electrode Size 1/32 in.</b>	<b>Arc Current (amps)</b>	<b>Minimum* Protective Shade</b>
<i>Plasma arc welding</i>		<i>Less than 20</i>	<i>6</i>
		<i>20-100</i>	<i>8</i>
		<i>100-400</i>	<i>10</i>
		<i>400-800</i>	<i>11</i>
<i>Plasma arc cutting</i>	<i>(Light) **</i>	<i>Less than 300</i>	<i>8</i>
	<i>(Medium) **</i>	<i>300-400</i>	<i>9</i>
	<i>(Heavy) **</i>	<i>400-800</i>	<i>10</i>
<i>Torch brazing</i>			<i>3</i>
<i>Torch soldering</i>			<i>2</i>
<i>Carbon arc welding</i>			<i>14</i>

\* As a rule of thumb, start with a shade that is too dark to see the weld zone. Then go to a lighter shade which gives sufficient view of the weld zone without going below the minimum. In oxyfuel gas welding or cutting where the torch produces a high yellow light, it is desirable to use a filter lens that absorbs the yellow or sodium line in the visible light of the (spectrum) operation.

\*\* These values apply where the actual arc is clearly seen. Experience has shown that lighter filters may be used when the arc is hidden by the work piece.

**Table 2 - Filter Lenses for Protection Against Radiant Energy**

<b>Operations</b>		<b>Plate thickness – inches</b>	<b>Plate thickness – mm</b>	<b>Minimum* Protective Shade</b>
<i>Gas Welding:</i>	<i>Light</i>	<i>Under 1/8</i>	<i>Under 3.2</i>	<i>4</i>
	<i>Medium</i>	<i>1/8 to 1/2</i>	<i>3.2 to 12.7</i>	<i>5</i>
	<i>Heavy</i>	<i>Over 1/2</i>	<i>Over 12.7</i>	<i>6</i>
<i>Oxygen Cutting:</i>	<i>Light</i>	<i>Under 1</i>	<i>Under 25</i>	<i>3</i>
	<i>Medium</i>	<i>1 to 6</i>	<i>25 to 150</i>	<i>4</i>
	<i>Heavy</i>	<i>Over 6</i>	<i>Over 150</i>	<i>5</i>

\* As a rule of thumb, start with a shade that is too dark to see the weld zone. Then go to a lighter shade which gives sufficient view of the weld zone without going below the minimum. In oxyfuel gas welding or cutting where the torch produces a high yellow light, it is desirable to use a filter lens that absorbs the yellow or sodium line in the visible light of the (spectrum) operation.

\*\* These values apply where the actual arc is clearly seen. Experience has shown that lighter filters may be used when the arc is hidden by the work piece.

- (f) *Protective eye and face protection devices must comply with any of the following consensus Standards.*

- (A) *ANSI Z87.1-2003, American National Standard Practice for Occupational and Educational Eye and Face Protection, which is incorporated by reference in 1910.6;*
  - (B) *ANSI Z87.1-1989 (R-1998), American National Standard Practice for Occupational and Educational Eye and Face Protection, which is incorporated by reference in 1910.6; or*
  - (C) *ANSI Z87.1-1989, American National Standard Practice for Occupational and Educational Eye and Face Protection, which is incorporated by reference in 1910.6.*
- (g) *Protective eye and face protection devices that the employer demonstrates are at least as effective as protective eye and face protection devices that are constructed in accordance with one of the above consensus standards will be deemed to be in compliance with the requirements of this section.*
- (h) *Employees whose occupation or assignment requires exposure to laser beams shall be furnished laser safety goggles as required by Occupational Health Regulations which will protect for the specific wavelength of the laser and be of optical density adequate for the energy involved.*
- (9) *Head Protection.*
- (a) *The employer must ensure that each affected employee wears a protective helmet when working in areas where there is a potential for injury to the head from falling or flying objects.*
  - (b) *The employer must ensure that a protective helmet designed to reduce electrical shock hazard is worn by each such affected employee when near exposed electrical conductors which could contact the head.*
  - (c) *Head protection must comply with any of the following consensus standards:*
    - (A) *ANSI Z89.1-2009, American National Standard for Industrial Head Protection, which is incorporated by reference in 1910.6;*
    - (B) *ANSI Z89.1-2003, American National Standard for Industrial Head Protection, which is incorporated by reference in 1910.6;*
    - (C) *ANSI Z89.1-1997, American National Standard for Industrial Head Protection, which is incorporated by reference in 1910.6; or*
  - (d) *Head protection devices that the employer demonstrates are at least as effective as head protection devices that are constructed in accordance with one of the above consensus standards will be deemed to be in compliance with the requirements of this section.*

- (e) *Employees who are exposed to power-driven machinery or to sources of ignition shall wear caps or other head covering which completely covers the hair.*

(10) *Foot Protection.*

- (a) *The employer must ensure that each affected employee use protective footwear when working in areas where there is a danger of foot injuries due to falling or rolling objects, or objects piercing the sole, and where such employee's feet are exposed to electrical hazards.*
- (b) *Protective footwear must comply with any of the following consensus standards:*
  - (A) *ASTM F-2412-2005, Standard Test Methods for Foot Protection, and ASTM F-2413-2005, Standard Specification for Performance Requirements for Protective Footwear, which are incorporated by reference in 1910.6;*
  - (B) *ANSI Z41-1999, American National Standard for Personal Protection – Protective Footwear, which is incorporated by reference in 1910.6; or*
  - (C) *ANSI Z41-1991, American National Standard for Personal Protection – Protective Footwear, which is incorporated by reference in §1910.6.*
- (c) *Protective footwear that the employer demonstrates is at least as effective as protective footwear that is constructed in accordance with one of the above consensus standards will be deemed to be in compliance with the requirements of this section.*
- (d) *Special types or designs of shoes or foot guards are required where conditions exist that make their use necessary for the safety of workers.*

(11) *Leg protection.*

- (a) *Leggings or high boots of leather, rubber, or other suitable material must be worn by persons exposed to hot substances or dangerous chemical spills.*
- (b) *Employees using chain saws must wear chaps or leg protectors that cover the leg from the upper thigh to mid-calf. The protector must be material designed to resist cuts from the chain saw. Employers must provide this protection at no cost to the employee.*

(12) *Hand Protection.*

- (a) *Employers must select and require employees to use appropriate hand protection when employees' hands are exposed to hazards such as those from skin absorption of harmful substances; severe cuts or lacerations; severe abrasions; punctures; chemical burns; thermal burns; and harmful temperature extremes.*

- (b) Employers must base the selection of the appropriate hand protection on an evaluation of the performance characteristics of the hand protection relative to the task(s) to be performed, conditions present, duration of use, and the hazards and potential hazards identified.*
  - (c) Gloves must not be worn by persons whose hands are exposed to moving parts in which they could be caught.*
- (13) Skin protection.*
- (a) Where the need for their use is necessary, protective covering, ointments, gloves, or other effective protection must be provided for and used by persons exposed to materials which are hazardous to the skin.*

Statutory Authority: ORS 654.025(2) and 656.726(4).

Statutes Implemented: ORS 654.001 through 654.295.

History: OSHA Administrative Order 2-2013, filed 2/15/13, effective 4/1/13.

OSHA Administrative Order 1-2016, filed 3/1/16, effective 1/1/17.

OSHA Temporary Administrative Order 1-2023, filed 3/30/23, effective 4/3/23.

## **1926.97 Electrical Protective Equipment**

- (a) Design requirements for specific types of electrical protective equipment. Rubber insulating blankets, rubber insulating matting, rubber insulating covers, rubber insulating line hose, rubber insulating gloves, and rubber insulating sleeves shall meet the following requirements:
  - (1) Manufacture and marking of rubber insulating equipment.
    - (i) Blankets, gloves, and sleeves shall be produced by a seamless process
    - (ii) Each item shall be clearly marked as follows
      - (A) Class 00 equipment shall be marked Class 00
      - (B) Class 0 equipment shall be marked Class 0
      - (C) Class 1 equipment shall be marked Class 1.
      - (D) Class 2 equipment shall be marked Class 2.
      - (E) Class 3 equipment shall be marked Class 3.
      - (F) Class 4 equipment shall be marked Class 4.
      - (G) Non-ozone-resistant equipment shall be marked Type I.
      - (H) Ozone-resistant equipment shall be marked Type II.
      - (I) Other relevant markings, such as the manufacturer's identification and the size of the equipment, may also be provided.

- (iii) Markings shall be non-conducting and shall be applied in such a manner as not to impair the insulating qualities of the equipment.
- (iv) Markings on gloves shall be confined to the cuff portion of the glove.
- (2) Electrical requirements.
  - (i) Equipment shall be capable of withstanding the ac proof-test voltage specified in Table E-1 or the dc proof-test voltage specified in Table E-2.
    - (A) The proof-test shall reliably indicate that the equipment can withstand the voltage involved.
    - (B) The test voltage shall be applied continuously for 3 minutes for equipment other than matting and shall be applied continuously for 1 minute for matting.
    - (C) Gloves shall also be capable of separately withstanding the ac proof-test voltage specified in Table E-1 after a 16-hour water soak. (See the note following paragraph (a)(3)(ii)(B) of this section.)
  - (ii) When the ac proof-test is used on gloves, the 60-hertz proof-test current may not exceed the values specified in Table E-1 at any time during the test period.
    - (A) If the ac proof-test is made at a frequency other than 60 hertz, the permissible proof-test current shall be computed from the direct ratio of the frequencies.
    - (B) For the test, gloves (right side out) shall be filled with tap water and immersed in water to a depth that is in accordance with Table E-3. Water shall be added to or removed from the glove, as necessary, so that the water level is the same inside and outside the glove.
    - (C) After the 16-hour water soak specified in paragraph (a)(2)(i)(C) of this section, the 60-hertz proof-test current may not exceed the values given in Table E-1 by more than 2 milliamperes.
  - (iii) Equipment that has been subjected to a minimum breakdown voltage test may not be used for electrical protection. (See the note following paragraph (a)(3)(ii)(B) of this section.)

- (iv) Material used for Type II insulating equipment shall be capable of withstanding an ozone test, with no visible effects. The ozone test shall reliably indicate that the material will resist ozone exposure in actual use. Any visible signs of ozone deterioration of the material, such as checking, cracking, breaks, or pitting, is evidence of failure to meet the requirements for ozone-resistant material. (See the note following paragraph (a)(3)(ii)(B) of this section.)
- (3) Workmanship and finish.
- (i) Equipment shall be free of physical irregularities that can adversely affect the insulating properties of the equipment and that can be detected by the tests or inspections required under this section.
  - (ii) Surface irregularities that may be present on all rubber goods (because of imperfections on forms or molds or because of inherent difficulties in the manufacturing process) and that may appear as indentations, protuberances, or imbedded foreign material are acceptable under the following conditions:
    - (A) The indentation or protuberance blends into a smooth slope when the material is stretched.
    - (B) Foreign material remains in place when the insulating material is folded and stretches with the insulating material surrounding it.

**Note to paragraph (a):** Rubber insulating equipment meeting the following national consensus standards is deemed to be in compliance with the performance requirements of paragraph (a) of this section:

American Society for Testing and Materials (ASTM) D120-09, Standard Specification for Rubber Insulating Gloves.

ASTM D178-01 (2010), Standard Specification for Rubber Insulating Matting.

ASTM D1048-12, Standard Specification for Rubber Insulating Blankets.

ASTM D1049-98 (2010), Standard Specification for Rubber Insulating Covers.

ASTM D1050-05 (2011), Standard Specification for Rubber Insulating Line Hose.

ASTM D1051-08, Standard Specification for Rubber Insulating Sleeves.

The preceding standards also contain specifications for conducting the various tests required in paragraph (a) of this section. For example, the ac and dc proof tests, the breakdown test, the water-soak procedure, and the ozone test mentioned in this paragraph are described in detail in these ASTM standards.

ASTM F1236-96 (2012), Standard Guide for Visual Inspection of Electrical Protective Rubber Products, presents methods and techniques for the visual inspection of electrical protective equipment made of rubber. This guide also contains descriptions and photographs of irregularities that can be found in this equipment.

ASTM F819-10, Standard Terminology Relating to Electrical Protective Equipment for Workers, includes definitions of terms relating to the electrical protective equipment covered under this section.

- (b) Design requirements for other types of electrical protective equipment. The following requirements apply to the design and manufacture of electrical protective equipment that is not covered by paragraph (a) of this section:
- (1) Voltage withstand. Insulating equipment used for the protection of employees shall be capable of withstanding, without failure, the voltages that may be imposed upon it.

**Note to paragraph (b)(1):** These voltages include transient overvoltages, such as switching surges, as well as nominal line voltage. See Appendix B to Division 2/RR for a discussion of transient overvoltages on electric power transmission and distribution systems. See IEEE Std 516-2009, IEEE Guide for Maintenance Methods on Energized Power Lines, for methods of determining the magnitude of transient overvoltages on an electrical system and for a discussion comparing the ability of insulation equipment to withstand a transient overvoltage based on its ability to withstand ac voltage testing.
  - (2) Equipment current.
    - (i) Protective equipment used for the primary insulation of employees from energized circuit parts shall be capable of passing a current test when subjected to the highest nominal voltage on which the equipment is to be used.
    - (ii) When insulating equipment is tested in accordance with paragraph (b)(2)(i) of this section, the equipment current may not exceed 1 microampere per kilovolt of phase-to-phase applied voltage.

**Note 1 to paragraph (b)(2):** This paragraph applies to equipment that provides primary insulation of employees from energized parts. It does not apply to equipment used for secondary insulation or equipment used for brush contact only.

**Note 2 to paragraph (b)(2):** For ac excitation, this current consists of three components: Capacitive current because of the dielectric properties of the insulating material itself, conduction current through the volume of the insulating equipment, and leakage current along the surface of the tool or equipment. The conduction current is normally negligible. For clean, dry insulating equipment, the leakage current is small, and the capacitive current predominates.
- Note to paragraph (b):** Plastic guard equipment is deemed to conform to the performance requirements of paragraph (b) of this section if it meets, and is used in accordance with, ASTM F712-06 (2011), Standard Test Methods and Specifications for Electrically Insulating Plastic Guard Equipment for Protection of Workers.
- (c) In-service care and use of electrical protective equipment.
- (1) General. Electrical protective equipment shall be maintained in a safe, reliable condition.

(2) Specific requirements. The following specific requirements apply to rubber insulating blankets, rubber insulating covers, rubber insulating line hose, rubber insulating gloves, and rubber insulating sleeves:

- (i) Maximum use voltages shall conform to those listed in Table E-4.
- (ii) Insulating equipment shall be inspected for damage before each day's use and immediately following any incident that can reasonably be suspected of causing damage. Insulating gloves shall be given an air test, along with the inspection.

**Note to paragraph (c)(2)(ii):** ASTM F1236-96 (2012), Standard Guide for Visual Inspection of Electrical Protective Rubber Products, presents methods and techniques for the visual inspection of electrical protective equipment made of rubber. This guide also contains descriptions and photographs of irregularities that can be found in this equipment.

- (iii) Insulating equipment with any of the following defects may not be used:
  - (A) A hole, tear, puncture, or cut;
  - (B) Ozone cutting or ozone checking (that is, a series of interlacing cracks produced by ozone on rubber under mechanical stress);
  - (C) An embedded foreign object;
  - (D) Any of the following texture changes: Swelling, softening, hardening, or becoming sticky or inelastic.
  - (E) Any other defect that damages the insulating properties.
- (iv) Insulating equipment found to have other defects that might affect its insulating properties shall be removed from service and returned for testing under paragraphs (c)(2)(viii) and (c)(2)(ix) of this section.
- (v) Insulating equipment shall be cleaned as needed to remove foreign substances.
- (vi) Insulating equipment shall be stored in such a location and in such a manner as to protect it from light, temperature extremes, excessive humidity, ozone, and other damaging substances and conditions.
- (vii) Protector gloves shall be worn over insulating gloves, except as follows:
  - (A) Protector gloves need not be used with Class 0 gloves, under limited-use conditions, when small equipment and parts manipulation necessitate unusually high finger dexterity.

**Note to paragraph (c)(2)(vii)(A):** Persons inspecting rubber insulating gloves used under these conditions need to take extra care in visually examining them. Employees using rubber insulating gloves under these conditions need to take extra care to avoid handling sharp objects.

(B) If the voltage does not exceed 250 volts, ac, or 375 volts, dc, protector gloves need not be used with Class 00 gloves, under limited-use conditions, when small equipment and parts manipulation necessitate unusually high finger dexterity.

**Note to paragraph (c)(2)(vii)(B):** Persons inspecting rubber insulating gloves used under these conditions need to take extra care in visually examining them. Employees using rubber insulating gloves under these conditions need to take extra care to avoid handling sharp objects.

(C) Any other class of glove may be used without protector gloves, under limited-use conditions, when small equipment and parts manipulation necessitate unusually high finger dexterity but only if the employer can demonstrate that the possibility of physical damage to the gloves is small and if the class of glove is one class higher than that required for the voltage involved.

(D) Insulating gloves that have been used without protector gloves may not be reused until they have been tested under the provisions of paragraphs (c)(2)(viii) and (c)(2)(ix) of this section.

- (viii) Electrical protective equipment shall be subjected to periodic electrical tests. Test voltages and the maximum intervals between tests shall be in accordance with Table E-4 and Table E-5.
- (ix) The test method used under paragraphs (c)(2)(viii) and (c)(2)(xi) of this section shall reliably indicate whether the insulating equipment can withstand the voltages involved.

**Note to paragraph (c)(2)(ix):** Standard electrical test methods considered as meeting this paragraph are given in the following national consensus standards:

ASTM D120-09, Standard Specification for Rubber Insulating Gloves.

ASTM D178-01 (2010), Standard Specification for Rubber Insulating Matting.

ASTM D1048-12, Standard Specification for Rubber Insulating Blankets.

ASTM D1049-98 (2010), Standard Specification for Rubber Insulating Covers.

ASTM D1050-05 (2011), Standard Specification for Rubber Insulating Line Hose.

ASTM D1051-08, Standard Specification for Rubber Insulating Sleeves.

ASTM F478-09, Standard Specification for In-Service Care of Insulating Line Hose and covers.

ASTM F479-06 (2011), Standard Specification for In-Service Care of Insulating Blankets.

ASTM F496-08, Standard Specification for In-Service Care of Insulating Gloves and sleeves.

- (x) Insulating equipment failing to pass inspections or electrical tests may not be used by employees, except as follows:
  - (A) Rubber insulating line hose may be used in shorter lengths with the defective portion cut off.
  - (B) Rubber insulating blankets may be salvaged by severing the defective area from the undamaged portion of the blanket. The resulting undamaged area may not be smaller than 560 millimeters by 560 millimeters (22 inches by 22 inches) for Class 1, 2, 3, and 4 blankets.
  - (C) Rubber insulating blankets may be repaired using a compatible patch that results in physical and electrical properties equal to those of the blanket.
  - (D) Rubber insulating gloves and sleeves with minor physical defects, such as small cuts, tears, or punctures, may be repaired by the application of a compatible patch. Also, rubber insulating gloves and sleeves with minor surface blemishes may be repaired with a compatible liquid compound. The repaired area shall have electrical and physical properties equal to those of the surrounding material. Repairs to gloves are permitted only in the area between the wrist and the reinforced edge of the opening.
- (xi) Repaired insulating equipment shall be retested before it may be used by employees.
- (xii) The employer shall certify that equipment has been tested in accordance with the requirements of paragraphs (c)(2)(iv), (c)(2)(vii)(D), (c)(2)(viii), (c)(2)(ix), and (c)(2)(xi) of this section. The certification shall identify the equipment that passed the test and the date it was tested and shall be made available upon request to the Assistant Secretary for Occupational Safety and Health and to employees or their authorized representatives.

**Note to paragraph (c)(2)(xii):** Marking equipment with, and entering onto logs, the results of the tests and the dates of testing are two acceptable means of meeting the certification requirement.

Table 1 - AC Proof-Test Requirements

Class of equipment	Proof-test voltage rms V	Maximum proof-test current, mA (gloves only)			
		280-mm (11-in) glove	360-mm (14-in) glove	410-mm (16-in) glove	460-mm (18-in) glove
00	2,500	8	12		
0	5,000	8	12	14	16
1	10,000		14	16	18
2	20,000		16	18	20
3	30,000		18	20	22
4	40,000			22	24

Table 2 - DC Proof Test Requirements

Class of equipment	Proof-test voltage
00	10,000
0	20,000
1	40,000
2	50,000
3	60,000
4	70,000

**Note:** The dc voltages listed in this table are not appropriate for proof testing rubber insulating line hose or covers. For this equipment, dc proof tests shall use a voltage high enough to indicate that the equipment can be safely used at the voltages listed in Table E-4. See ASTM D1050-05 (2011) and ASTM D1049-98 (2010) for further information on proof tests for rubber insulating line hose and covers, respectively.

Table 3 - Glove Tests-Water Level <sup>1 2</sup>

Class of glove	AC proof test		DC proof test	
	mm	in	mm	in
00	38	1.5	38	1.5
0	38	1.5	38	1.5
1	38	1.5	51	2.0
2	64	2.5	76	3.0
3	89	3.5	102	4.0
4	127	5.0	153	6.0

<sup>1</sup> The water level is given as the clearance from the reinforced edge of the glove to the water line, with a tolerance of ±13 mm. (±0.5 in.).

<sup>2</sup> If atmospheric conditions make the specified clearances impractical, the clearances may be increased by a maximum of 25 mm. (1 in.).

**Table 4 - Rubber Insulating Equipment, Voltage Requirements**

<b>Class of equipment</b>	<b>Maximum use voltage 1 AC rms</b>	<b>Retest voltage 2 AC rms</b>	<b>Retest voltage 2 DC avg</b>
00	500	2,500	10,000
0	1,000	5,000	20,000
1	7,500	10,000	40,000
2	17,000	20,000	50,000
3	26,500	30,000	60,000
4	36,000	40,000	70,000

**Table 5 - Rubber Insulating Equipment Test Intervals**

<b>Type of equipment</b>	<b>When to test</b>
Rubber insulating line hose	Upon indication that insulating value is suspect and after repair.
Rubber insulating covers	Upon indication that insulating value is suspect and after repair.
Rubber insulating blankets	Before first issue and every 12 months thereafter; <sup>5</sup> upon indication that insulating value is suspect; and after repair.
Rubber insulating gloves	Before first issue and every 6 months thereafter; <sup>1</sup> upon indication that insulating value is suspect; after repair; and after use without protectors.
Rubber insulating sleeves	Before first issue and every 12 months thereafter; <sup>1</sup> upon indication that insulating value is suspect; and after repair.

Statutory Authority: ORS 654.025(2) and 656.726(4)  
 Statutes Implemented: ORS 654.001 through 654.295.  
 History.: OSHA Administrative Order 3-2015, filed 10/9/15, effective 1/1/16.

<sup>1</sup> The maximum use voltage is the ac voltage (rms) classification of the protective equipment that designates the maximum nominal design voltage of the energized system that may be safely worked. The nominal design voltage is equal to the phase-to-phase voltage on multiphase circuits. However, the phase-to-ground potential is considered to be the nominal design voltage if:

- (1) There is no multiphase exposure in a system area and the voltage exposure is limited to the phase-to-ground potential, or
- (2) The electric equipment and devices are insulated or isolated or both so that the multiphase exposure on a grounded wye circuit is removed.

<sup>2</sup> The proof-test voltage shall be applied continuously for at least 1 minute, but no more than 3 minutes.

<sup>5</sup> If the insulating equipment has been electrically tested but not issued for service, the insulating equipment may not be placed into service unless it has been electrically tested within the previous 12 months.

## 1926.103 Respiratory Protection

**Note:** The requirements applicable to construction work under this section are identical to those in 29 CFR 1910.134, located in Oregon OSHA's standards in Division 2, Subdivision I, Personal Protective Equipment.

## 1926.106 Working Over or Near Water

- (a) Employees working over or near water, where the danger of drowning exists, shall be provided with U.S. Coast Guard-approved life jacket or buoyant work vests.
- (b) Prior to and after each use, the buoyant work vests or life preservers shall be inspected for defects which would alter their strength or buoyancy. Defective units shall not be used.
- (c) Ring buoys with at least 90 feet of line shall be provided and readily available for emergency rescue operations. Distance between ring buoys shall not exceed 200 feet.
- (d) At least one lifesaving skiff shall be immediately available at locations where employees are working over or adjacent to water.

Statutory Authority: ORS 654.025(2) and 656.726(4).  
Statutes Implemented: ORS 654.001 through 654.295.  
History: APD Admin. Order 8-1989, filed 7/7/89, effective 7/7/89.

## 1926.107 Definitions Applicable to this Subdivision

- (a) Contaminant means any material which by reason of its action upon, within, or to a person is likely to cause physical harm.
- (b) O.D. means optical density and refers to the light refractive characteristics of a lens.
- (c) Radiant energy means energy that travels outward in all directions from its sources.

Statutory Authority: ORS 654.025(2) and 656.726(4).  
Statutes Implemented: ORS 654.001 through 654.295.  
History: APD Admin. Order 8-1989, filed 7/7/89, effective 7/7/89.  
OSHA Administrative Order 6-1995, filed 4/18/95, effective 6/1/95.

## Historical Notes for Subdivision E

**Note:** In November 2014, Oregon OSHA proposed to adopt Federal OSHA final rules for Electric Power Generation, Transmission, and Distribution, that were published in the April 11, 2014 Federal Register. The proposal included Oregon-initiated changes to the federal rule. Three public hearings were held during November and December of 2014 resulting in several written comments and oral testimony before the comment period closed on December 12, 2014. Most of the comments received concerned the two worker rule exceptions. As a result of the comments received, Oregon OSHA decided not to adopt the rule as proposed in 2014, but to consider an alternative approach.

Two stakeholder meetings were conducted in the first half of 2015 to discuss comments along with potential changes to the 2014 proposal. Oregon OSHA received input and support from stakeholders to combine the Electric Power Generation, Transmission, and Distribution standards in Divisions 2/R and 3/V into one rule. Oregon OSHA merged 1910.269, in Division 2/R General Industry, and Division 3/V in Construction, standards into the new Division 2/RR. Unifying language and Oregon-unique rules for Power Generation, Transmission and Distribution for General Industry and Construction were incorporated into one standard.

In July, 2015 Oregon OSHA reposed rules for Electric Power Generation, Transmission, and Distribution. Three public hearings were held during August and September 2015. Most of the oral and written comments received concerned: the duties of a Safety Watch, the exception to the two-worker rule, and helicopters. Changes to the final rule include:

**Safety Watch:** Safety Watch text was added to the final rule 437-002-2311(13).

**Operating switches:** 437-002-2311(2)(b)(B) was changed to clarify that 437-002-2311(2)(b)(E) must be followed for routine switching of load break elbows.

**Helicopters:** Paragraphs were removed which were already addressed by, or were in conflict with, other regulatory agencies; or were unnecessarily restrictive based upon accepted industry practices.

On October 5, 2015 Federal OSHA published in the Federal Register, minor language clarifications in rules related to Line Clearance Tree Trimming as well as correcting errors in Table R-6 (Alternative Minimum Approach Distances.) The note for enclosed spaces was removed from Appendix A-3 and placed in Appendix A-5. These corrections have been incorporated in Oregon OSHA's final rules.

This is Oregon OSHA Administrative Order 3-2015, adopted October 9, 2015, and effective January 1, 2016.

**Note:** In November of 2015, Oregon OSHA proposed to revise the general fall protection requirements covered under Division 3 (Construction Industry), Subdivisions 3/M (Fall Protection) and 3/E (Personal Protective and Life Saving Equipment), as requested by federal OSHA. Federal OSHA's request was not based on data related to enforcement, but on the effectiveness of the rule itself, presuming it is followed. The proposed revisions to Subdivision 3/M and Subdivision 3/E, includes amending the 10-foot general trigger height for fall protection to 6 feet, and repealing 437-003-0134(5)(a), which has a 10-foot general fall protection trigger height requirement, due to redundancy.

Five public hearings were held during January of 2016. Oregon OSHA received oral testimony in addition to written comments. Several comments received opposed lowering the 10-foot general trigger height for fall protection to 6 feet. Reasons for the opposing comments included, but were not limited to; the belief that the hazard associated with a 6-foot fall is not an “extreme difference” than that of a 10-foot fall; employers’ difficulty of ensuring employees follow company policy to use personal fall protection systems; additional costs incurred by employers and homeowners for increased use of fall protection systems, in lieu of slide guards; lack of data that supports the need to lower the current 10-foot trigger height.

Oregon OSHA considered all comments received. However, since federal OSHA’s request was not based on data related to enforcement, but rather on the literal effectiveness of the rule itself, presuming it is followed, Oregon OSHA must comply with federal OSHA’s request.

This is Oregon OSHA Administrative Order 1-2016, adopted March 1, 2016, and effective January 1, 2017.

**OREGON OCCUPATIONAL  
SAFETY AND HEALTH STANDARDS**

Oregon Administrative Rules, Chapter 437

**DIVISION 3 (29 CFR 1926)  
CONSTRUCTION**

**CONSTRUCTION**

**Subdivision F**

**Fire Protection and Prevention**

Oregon Occupational Safety and Health Division (Oregon OSHA)  
Department of Consumer and Business Services  
Salem, Oregon 97301-3882

AO 5-2012

The Oregon Department of Consumer and Business Services adopted these rules pursuant to ORS 654.025(2).

The Secretary of State Designated OAR Chapter 437 as the "Oregon Occupational Safety and Health Code." Six general subject areas within this code are designated as "Divisions."

- **Division 1** General Administrative Rules
- **Division 2** General Occupational Safety and Health Rules
- **Division 3** Construction
- **Division 4** Agriculture
- **Division 5** Maritime Activities
- **Division 7** Forest Activities
- **Oregon Revised Statutes (ORS) 654** The Oregon Safe Employment Act (OSEAct)

Oregon-initiated rules in this division of the Oregon Occupational Safety and Health Code are numbered in a uniform system developed by the Secretary of State. This system does not number the rules in sequence (001, 002, 003, etc.). Omitted numbers may be assigned to new rules at the time of their adoption.

**Oregon-initiated rules** are arranged in the following Basic Codification Structure adopted by the Secretary of State for Oregon Administrative Rules (OAR):

Chapter	Division	Rule	Section	Subsection	Paragraphs
437	003	1760	(1)	(a)	(A)(i)(I)

The majority of Oregon OSHA codes are adopted by reference from the Code of Federal Regulations (CFR), and are arranged in the following basic federal numbering system:

Chapter	Division	Part	Subpart (Subdivision)	Section	Paragraphs
437	003	1926	M	.502	(a)

The terms "subdivision" and "subpart" are synonymous within OAR 437, Oregon Occupational Safety and Health Code.

---

To obtain an order form or copies of these codes, address:

**Department of Consumer & Business Services  
Oregon Occupational Safety & Health Division (Oregon OSHA)  
350 Winter St. NE, Room 430  
Salem, OR 97301-3882**

Or call the Oregon OSHA Resource Library at 503-378-3272

The rules referenced in this division are available for viewing in the Office of the Secretary of State, Administrative Rules and Office Document Section, Oregon State Archives Building, Salem, Oregon 97310, or the Central Office, Oregon Occupational Safety and Health Division of the Department of Consumer and Business Services, Room 430, 350 Winter St. NE Salem, OR 97301-3882. ## OAR 437, DIVISION 3

### CONSTRUCTION

#### SUBDIVISION F – FIRE PROTECTION AND PREVENTION

**437-003-0001 Adoption by Reference.** *In addition to, and not in lieu of, any other safety and health codes contained in OAR Chapter 437, the Department adopts by reference the following federal regulations printed as part of the Code of Federal Regulations, in the Federal Register:*

**(6) Subdivision F – Fire Protection and Prevention.**

- (a)** 29 CFR 1926.150 **Fire protection**, published 4/6/79, FR vol. 44, p. 20940.
- (b)** 29 CFR 1926.151 **Fire prevention**, published 7/11/86, FR vol. 51, p. 25318.
- (c)** 29 CFR 1926.152 **Flammable liquids**, published 3/26/12, FR vol. 77, no. 58, p. 17574.
- (d)** 29 CFR 1926.153 **Liquefied petroleum gas (LP-Gas)**, published 6/30/93, FR vol. 58, no. 124, p. 35170.
- (e)** 29 CFR 1926.154 **Temporary heating devices**, published 4/6/79, FR vol. 44, p. 20940.
- (f)** 29 CFR 1926.155 **Definitions applicable to this subpart**, published 3/26/12, FR vol. 77, no. 58, p. 17574.

*These standards are available at the Oregon Occupational Safety and Health Division, Oregon Department of Consumer and Business Services, and the United States Government Printing Office.*

**Stat. Auth.:** ORS 654.025(2) and 656.726(4).

**Stats. Implemented:** ORS 654.001 through 654.295.

## SUBDIVISION F

### FIRE PROTECTION AND PREVENTION

**Authority:** Section 107 of the Contract Work Hours and Safety Standards Act (40 U.S.C. 3704); Sections 4, 6, and 8 of the Occupational Safety and Health Act of 1970 (29 U.S.C. 653, 655, 657); Secretary of Labor's Order No. 12-71 (36 FR 8754), 8-76 (41 FR 25059), 9-83 (48 FR 35736), 1-90 (55 FR 9033), 6-96 (62 FR 111), 3-2000 (62 FR 50017), 5-2002 (67 FR 650008), 5-2007 (72 FR 31159), 4-2010 (75 FR 55355), or 1-2012 (77 FR 3912), as applicable; and 29 CFR part 1911.

#### **§1926.150 Fire Protection.**

##### **(a) General requirements.**

- (1) The employer shall be responsible for the development of a fire protection program to be followed throughout all phases of the construction and demolition work, and he shall provide for the firefighting equipment as specified in this subpart. As fire hazards occur, there shall be no delay in providing the necessary equipment.
- (2) Access to all available firefighting equipment shall be maintained at all times.
- (3) All firefighting equipment, provided by the employer, shall be conspicuously located.
- (4) All firefighting equipment shall be periodically inspected and maintained in operating condition. Defective equipment shall be immediately replaced.
- (5) As warranted by the project, the employer shall provide a trained and equipped firefighting organization (Fire Brigade) to assure adequate protection to life.

##### **(b) Water supply.**

- (1) A temporary or permanent water supply, of sufficient volume, duration, and pressure, required to properly operate the firefighting equipment shall be made available as soon as combustible materials accumulate.
- (2) Where underground water mains are to be provided, they shall be installed, completed, and made available for use as soon as practicable.

##### **(c) Portable firefighting equipment.**

###### **(1) Fire extinguishers and small hose lines.**

- (i) A fire extinguisher, rated not less than 2A, shall be provided for each 3,000 square feet of the protected building area, or major fraction thereof. Travel distance from any point of the protected area to the nearest fire extinguisher shall not exceed 100 feet.

# F

## FIRE PROTECTION

- (ii) One 55-gallon open drum of water with two fire pails may be substituted for a fire extinguisher having a 2A rating.
- (iii) A 1/2-inch diameter garden-type hose line, not to exceed 100 feet in length and equipped with a nozzle, may be substituted for a 2A-rated fire extinguisher, providing it is capable of discharging a minimum of 5 gallons per minute with a minimum hose stream range of 30 feet horizontally. The garden-type hose lines shall be mounted on conventional racks or reels. The number and location of hose racks or reels shall be such that at least one hose stream can be applied to all points in the area.
- (iv) One or more fire extinguishers, rated not less than 2A, shall be provided on each floor. In multistory buildings, at least one fire extinguisher shall be located adjacent to stairway.
- (v) Extinguishers and water drums, subject to freezing, shall be protected from freezing.
- (vi) A fire extinguisher, rated not less than 10B, shall be provided within 50 feet of wherever more than 5 gallons of flammable or combustible liquids or 5 pounds of flammable gas are being used on the jobsite. This requirement does not apply to the integral fuel tanks of motor vehicles.
- (vii) Carbon tetrachloride and other toxic vaporizing liquid fire extinguishers are prohibited.
- (viii) Portable fire extinguishers shall be inspected periodically and maintained in accordance with Maintenance and Use of Portable Fire Extinguishers, NFPA No. 10A-1970.
- (ix) Fire extinguishers which have been listed or approved by a nationally recognized testing laboratory, shall be used to meet the requirements of this subpart.
- (x) Table F-1 may be used as a guide for selecting the appropriate portable fire extinguishers.

Table F-1 - Fire Extinguishers Data

MAINTENANCE										

**(2) Fire hose and connections.**

- (i) One hundred feet, or less, of 1-1/2-inch hose, with a nozzle capable of discharging water at 25 gallons or more per minute, may be substituted for a fire extinguisher rated not more than 2A in the designated area provided that the hose line can reach all points in the area.
- (ii) If fire hose connections are not compatible with local firefighting equipment, the contractor shall provide adapters, or equivalent, to permit connections.
- (iii) During demolition involving combustible materials, charged hose lines, supplied by hydrants, water tank trucks with pumps, or equivalent, shall be made available.

**(d) Fixed firefighting equipment.****(1) Sprinkler protection.**

- (i) If the facility being constructed includes the installation of automatic sprinkler protection, the installation shall closely follow the construction and be placed in service as soon as applicable laws permit following completion of each story.
- (ii) During demolition or alterations, existing automatic sprinkler installations shall be retained in service as long as reasonable. The operation of sprinkler control valves shall be permitted only by properly authorized persons. Modification of sprinkler systems to permit alterations or additional demolition should be expedited so that the automatic protection may be returned to service as quickly as possible. Sprinkler control valves shall be checked daily at close of work to ascertain that the protection is in service.

**(2) Standpipes.** In all structures in which standpipes are required, or where standpipes exist in structures being altered, they shall be brought up as soon as applicable laws permit, and shall be maintained as construction progresses in such a manner that they are always ready for fire protection use. The standpipes shall be provided with Siamese fire department connections on the outside of the structure, at the street level, which shall be conspicuously marked. There shall be at least one standard hose outlet at each floor.

**(e) Fire alarm devices.**

- (1) An alarm system, e.g., telephone system, siren, etc., shall be established by the employer whereby employees on the site and the local fire department can be alerted for an emergency.
- (2) The alarm code and reporting instructions shall be conspicuously posted at phones and at employee entrances.

## **(f) Fire cutoffs.**

(1) Fire walls and exit stairways, required for the completed buildings, shall be given construction priority. Fire doors, with automatic closing devices, shall be hung on openings as soon as practicable.

(2) Fire cutoffs shall be retained in buildings undergoing alterations or demolition until operations necessitate their removal.

**Stat. Auth.:** ORS 654.025(2) and 656.726(4).

**Stats. Implemented:** ORS 654.001 through 654.295.

**Hist:** APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89.

## **§1926.151 Fire Prevention.**

### **(a) Ignition hazards.**

(1) Electrical wiring and equipment for light, heat, or power purposes shall be installed in compliance with the requirements of Subpart K of this part.

(2) Internal combustion engine powered equipment shall be so located that the exhausts are well away from combustible materials. When the exhausts are piped to outside the building under construction, a clearance of at least 6 inches shall be maintained between such piping and combustible material.

(3) Smoking shall be prohibited at or in the vicinity of operations which constitute a fire hazard, and shall be conspicuously posted: "No Smoking or Open Flame."

(4) Portable battery powered lighting equipment, used in connection with the storage, handling, or use of flammable gases or liquids, shall be of the type approved for the hazardous locations.

(5) The nozzle of air, inert gas, and steam lines or hoses, when used in the cleaning or ventilation of tanks and vessels that contain hazardous concentrations of flammable gases or vapors, shall be bonded to the tank or vessel shell. Bonding devices shall not be attached or detached in hazardous concentrations of flammable gases or vapors.

### **(b) Temporary buildings.**

(1) No temporary building shall be erected where it will adversely affect any means of exit.

(2) Temporary buildings, when located within another building or structure, shall be of either noncombustible construction or of combustible construction having a fire resistance of not less than 1 hour.

(3) Temporary buildings, located other than inside another building and not used for the storage, handling, or use of flammable or combustible liquids, flammable gases, explosives, or blasting agents, or similar hazardous occupancies, shall be located at a distance of not less than 10 feet from another building or structure. Groups of temporary buildings, not exceeding 2,000 square feet in aggregate, shall, for the purposes of this part, be considered a single temporary building.

**(c) Open yard storage.**

(1) Combustible materials shall be piled with due regard to the stability of piles and in no case higher than 20 feet.

(2) Driveways between and around combustible storage piles shall be at least 15 feet wide and maintained free from accumulation of rubbish, equipment, or other articles or materials. Driveways shall be so spaced that a maximum grid system unit of 50 feet by 150 feet is produced.

(3) The entire storage site shall be kept free from accumulation of unnecessary combustible materials. Weeds and grass shall be kept down and a regular procedure provided for the periodic cleanup of the entire area.

(4) When there is a danger of an underground fire, that land shall not be used for combustible or flammable storage.

(5) Method of piling shall be solid wherever possible and in orderly and regular piles. No combustible material shall be stored outdoors within 10 feet of a building or structure.

(6) Portable fire extinguishing equipment, suitable for the fire hazard involved, shall be provided at convenient, conspicuously accessible locations in the yard area. Portable fire extinguishers, rated not less than 2A, shall be placed so that maximum travel distance to the nearest unit shall not exceed 100 feet.

**(d) Indoor storage.**

(1) Storage shall not obstruct, or adversely affect, means of exit.

(2) All materials shall be stored, handled, and piled with due regard to their fire characteristics.

(3) Noncompatible materials, which may create a fire hazard, shall be segregated by a barrier having a fire resistance of at least 1 hour.

(4) Material shall be piled to minimize the spread of fire internally and to permit convenient access for firefighting. Stable piling shall be maintained at all times. Aisle space shall be maintained to safely accommodate the widest vehicle that may be used within the building for firefighting purposes.

(5) Clearance of at least 36 inches shall be maintained between the top level of the stored material and the sprinkler deflectors.

(6) Clearance shall be maintained around lights and heating units to prevent ignition of combustible materials.

(7) A clearance of 24 inches shall be maintained around the path of travel of fire doors unless a barricade is provided, in which case no clearance is needed. Material shall not be stored within 36 inches of a fire door opening.

(44 FR 8577, Feb. 9, 1979; 44 FR 20940, Apr. 6, 1979, as amended at 51 FR 25318, July 11, 1986)

**Stat. Auth.:** ORS 654.025(2) and 656.726(4).

**Stats. Implemented:** ORS 654.001 through 654.295.

**Hist:** APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89.

## §1926.152 Flammable Liquids.

### (a) General requirements.

(1) Only approved containers and portable tanks shall be used for storage and handling of flammable liquids. Approved safety cans or Department of Transportation approved containers shall be used for the handling and use of flammable liquids in quantities of 5 gallons or less, except that this shall not apply to those flammable liquid materials which are highly viscid (extremely hard to pour), which may be used and handled in original shipping containers. For quantities of one gallon or less, the original container may be used, for storage, use and handling of flammable liquids.

(2) Flammable liquids shall not be stored in areas used for exits, stairways, or normally used for the safe passage of people.

### (b) Indoor storage of flammable liquids.

(1) No more than 25 gallons of flammable liquids shall be stored in a room outside of an approved storage cabinet. For storage of liquefied petroleum gas, see §1926.153.

(2) Quantities of flammable liquid in excess of 25 gallons shall be stored in an acceptable or approved cabinet meeting the following requirements:

(i) Acceptable wooden storage cabinets shall be constructed in the following manner, or equivalent: The bottom, sides, and top shall be constructed of an exterior grade of plywood at least 1 inch in thickness, which shall not break down or delaminate under standard fire test conditions. All joints shall be rabbeted and shall be fastened in two directions with flathead wood screws. When more than one door is used, there shall be a rabbeted overlap of not less than 1 inch. Steel hinges shall be mounted in such a manner as to not lose their holding capacity due to loosening or burning out of the screws when subjected to fire. Such cabinets shall be painted inside and out with fire retardant paint.

# F

## FLAMMABLE LIQUIDS

(ii) Approved metal storage cabinets will be acceptable.

(iii) Cabinets shall be labeled in conspicuous lettering, “**Flammable – Keep Away from Open Flames**”.

(3) Not more than 60 gallons of Category 1, 2 and/or 3 flammable liquids or 120 gallons of Category 4 flammable liquids shall be stored in any one storage cabinet. Not more than three such cabinets may be located in a single storage area. Quantities in excess of this shall be stored in an inside storage room.

(4)

(i) Inside storage rooms shall be constructed to meet the required fire-resistive rating for their use. Such construction shall comply with the test specifications set forth in Standard Methods of Fire Test of Building Construction and Material, NFPA 251-1969.

(ii) Where an automatic extinguishing system is provided, the system shall be designed and installed in an approved manner. Openings to other rooms or buildings shall be provided with noncombustible liquid-tight raised sills or ramps at least 4 inches in height, or the floor in the storage area shall be at least 4 inches below the surrounding floor. Openings shall be provided with approved self-closing fire doors. The room shall be liquid-tight where the walls join the floor. A permissible alternate to the sill or ramp is an open-grated trench, inside of the room, which drains to a safe location. Where other portions of the building or other buildings are exposed, windows shall be protected as set forth in the Standard for Fire Doors and Windows, NFPA No. 80-1970, for Class E or F openings. Wood of at least 1-inch nominal thickness may be used for shelving, racks, dunnage, scuffboards, floor overlay, and similar installations.

(iii) Materials which will react with water and create a fire hazard shall not be stored in the same room with flammable liquids.

(iv) Storage in inside storage rooms shall comply with Table F-2 following:

Table F-2

Fire protection provided	Fire resistance	Maximum size	Total allowable quantities gals./sq. ft./floor area
Yes	2 hrs.	500 sq. ft.	10
No	2 hrs.	500 sq. ft.	4
Yes	1 hr.	150 sq. ft.	5
No	1 hr.	150 sq. ft.	2

**Note:** Fire protection system shall be sprinkler, water spray, carbon dioxide or other system approved by a nationally recognized testing laboratory for this purpose.

(v) Electrical wiring and equipment located in inside storage rooms shall be approved for Class I, Division 1, Hazardous Locations. For definition of Class I, Division 1, Hazardous Locations, see §1926.449.

(vi) Every inside storage room shall be provided with either a gravity or a mechanical exhausting system. Such system shall commence not more than 12 inches above the floor and be designed to provide for a complete change of air within the room at least 6 times per hour. If a mechanical exhausting system is used, it shall be controlled by a switch located outside of the door. The ventilating equipment and any lighting fixtures shall be operated by the same switch. An electric pilot light shall be installed adjacent to the switch if Category 1, 2 or 3 flammable liquids are dispensed within the room. Where gravity ventilation is provided, the fresh air intake, as well as the exhausting outlet from the room, shall be on the exterior of the building in which the room is located.

(vii) In every inside storage room there shall be maintained one clear aisle at least 3 feet wide. Containers over 30 gallons capacity shall not be stacked one upon the other.

(viii) Flammable liquids in excess of that permitted in inside storage rooms shall be stored outside of buildings in accordance with paragraph (c) of this section.

(5) “Quantity.” The quantity of flammable liquids kept in the vicinity of spraying operations shall be the minimum required for operations and should ordinarily not exceed a supply for 1 day or one shift. Bulk storage of portable containers of flammable or combustible liquids shall be in a separate, constructed building detached from other important buildings or cut off in a standard manner.

**(c) Storage outside buildings.**

(1) Storage of containers (not more than 60 gallons each) shall not exceed 1,100 gallons in any one pile or area. Piles or groups of containers shall be separated by a 5-foot clearance. Piles or groups of containers shall not be nearer than 20 feet to a building.

(2) Within 200 feet of each pile of containers, there shall be a 12-foot-wide access way to permit approach of fire control apparatus.

(3) The storage area shall be graded in a manner to divert possible spills away from buildings or other exposures, or shall be surrounded by a curb or earth dike at least 12 inches high. When curbs or dikes are used, provisions shall be made for draining off accumulations of ground or rain water, or spills of flammable liquids. Drains shall terminate at a safe location and shall be accessible to operation under fire conditions.

**(4) Outdoor portable tank storage:**

(i) Portable tanks shall not be nearer than 20 feet from any building. Two or more portable tanks, grouped together, having a combined capacity in excess of 2,200 gallons, shall be separated by a 5-foot-clear area. Individual portable tanks exceeding 1,100 gallons shall be separated by a 5-foot-clear area.

(ii) Within 200 feet of each portable tank, there shall be a 12-foot-wide access way to permit approach of fire control apparatus.

(5) Storage areas shall be kept free of weeds, debris, and other combustible material not necessary to the storage.

(6) Portable tanks, not exceeding 660 gallons, shall be provided with emergency venting and other devices, as required by chapters III and IV of NFPA 30-1969, The Flammable and Combustible Liquids Code.

(7) Portable tanks, in excess of 660 gallons, shall have emergency venting and other devices, as required by chapters II and III of The Flammable and Combustible Liquids Code, NFPA 30-1969.

**(d) Fire control for flammable liquid storage.**

(1) At least one portable fire extinguisher, having a rating of not less than 20-B units, shall be located outside of, but not more than 10 feet from, the door opening into any room used for storage of more than 60 gallons of flammable liquids.

(2) At least one portable fire extinguisher having a rating of not less than 20-B units shall be located not less than 25 feet, nor more than 75 feet, from any flammable liquid storage area located outside.

(3) When sprinklers are provided, they shall be installed in accordance with the Standard for the Installation of Sprinkler Systems, NFPA 13-1969.

(4) At least one portable fire extinguisher having a rating of not less than 20-B:C units shall be provided on all tank trucks or other vehicles used for transporting and/or dispensing flammable liquids.

**(e) Dispensing liquids.**

(1) Areas in which flammable liquids are transferred at one time, in quantities greater than 5 gallons from one tank or container to another tank or container, shall be separated from other operations by 25-foot distance or by construction having a fire resistance of at least 1 hour. Drainage or other means shall be provided to control spills. Adequate natural or mechanical ventilation shall be provided to maintain the concentration of flammable vapor at or below 10 percent of the lower flammable limit.

(2) Transfer of Category 1, 2 or 3 flammable liquids from one container to another shall be done only when containers are electrically interconnected (bonded).

(3) Flammable liquids shall be drawn from or transferred into vessels, containers, or tanks within a building or outside only through a closed piping system, from safety cans, by means of a device drawing through the top, or from a container, or portable tanks, by gravity or pump, through an approved self-closing valve. Transferring by means of air pressure on the container or portable tanks is prohibited.

(4) The dispensing units shall be protected against collision damage.

(5) Dispensing devices and nozzles for Category 1, 2 or 3 flammable liquids shall be of an approved type.

**(f) Handling liquids at point of final use.**

(1) Category 1, 2 or 3 flammable liquids shall be kept in closed containers when not actually in use.

(2) Leakage or spillage of Category 1, 2 or 3 flammable liquids shall be disposed of promptly and safely.

(3) Flammable liquids may be used only where there are no open flames or other sources of ignition within 50 feet of the operation, unless conditions warrant greater clearance.

**(g) Service and refueling areas.**

(1) Flammable liquids shall be stored in approved closed containers, in tanks located underground, or in aboveground portable tanks.

(2) The tank trucks shall comply with the requirements covered in the Standard for Tank Vehicles for Flammable and Combustible Liquids, NFPA No. 385-1966.

(3) The dispensing hose shall be an approved type.

(4) The dispensing nozzle shall be an approved automatic-closing type without a latch-open device.

(5) Underground tanks shall not be abandoned.

(6) Clearly identified and easily accessible switch(es) shall be provided at a location remote from dispensing devices to shut off the power to all dispensing devices in the event of an emergency.

(7)

(i) Heating equipment of an approved type may be installed in the lubrication or service area where there is no dispensing or transferring of Category 1, 2 or 3 flammable liquids, provided the bottom of the heating unit is at least 18 inches above the floor and is protected from physical damage.

(ii) Heating equipment installed in lubrication or service areas, where Category 1, 2 or 3 flammable liquids are dispensed, shall be of an approved type for garages, and shall be installed at least 8 feet above the floor.

(8) There shall be no smoking or open flames in the areas used for fueling, servicing fuel systems for internal combustion engines, receiving or dispensing of flammable liquids.

(9) Conspicuous and legible signs prohibiting smoking shall be posted.

(10) The motors of all equipment being fueled shall be shut off during the fueling operation.

(11) Each service or fueling area shall be provided with at least one fire extinguisher having a rating of not less than 20-B:C located so that an extinguisher will be within 75 feet of each pump, dispenser, underground fill pipe opening, and lubrication or service area.

(44 FR 8577, Feb. 9, 1979; 44 FR 20940, Apr. 6, 1979, as amended at 51 FR 25318, July 11, 1986)

## **§1926.153 Liquefied Petroleum Gas (LP-Gas).**

### **(a) Approval of equipment and systems.**

(1) Each system shall have containers, valves, connectors, manifold valve assemblies, and regulators of an approved type.

(2) All cylinders shall meet the Department of Transportation specification identification requirements published in 49 CFR Part 178, Shipping Container Specifications.

(3) **Definition.** As used in this section, "Containers" – All vessels, such as tanks, cylinders, or drums, used for transportation or storing liquefied petroleum gases.

**(b) Welding on LP-Gas containers.** Welding is prohibited on containers.

**(c) Container valves and container accessories.**

(1) Valves, fittings, and accessories connected directly to the container, including primary shut off valves, shall have a rated working pressure of at least 250 p.s.i.g. and shall be of material and design suitable for LP-Gas service.

(2) Connections to containers, except safety relief connections, liquid level gauging devices, and plugged openings, shall have shutoff valves located as close to the container as practicable.

**(d) Safety devices.**

(1) Every container and every vaporizer shall be provided with one or more approved safety relief valves or devices. These valves shall be arranged to afford free vent to the outer air with discharge not less than 5 feet horizontally away from any opening into a building which is below such discharge.

(2) Shutoff valves shall not be installed between the safety relief device and the container, or the equipment or piping to which the safety relief device is connected, except that a shutoff valve may be used where the arrangement of this valve is such that full required capacity flow through the safety relief device is always afforded.

(3) Container safety relief devices and regulator relief vents shall be located not less than 5 feet in any direction from air openings into sealed combustion system appliances or mechanical ventilation air intakes.

**(e) Dispensing.**

(1) Filling of fuel containers for trucks or motor vehicles from bulk storage containers shall be performed not less than 10 feet from the nearest masonry-walled building, or not less than 25 feet from the nearest building or other construction and, in any event, not less than 25 feet from any building opening.

(2) Filling of portable containers or containers mounted on skids from storage containers shall be performed not less than 50 feet from the nearest building.

**(f) Requirements for appliances.**

(1) LP-Gas consuming appliances shall be approved types.

(2) Any appliance that was originally manufactured for operation with a gaseous fuel other than LP-Gas, and is in good condition, may be used with LP-Gas only after it is properly converted, adapted, and tested for performance with LP-Gas before the appliance is placed in use.

**(g) Containers and regulating equipment installed outside of buildings or structures.**

Containers shall be upright upon firm foundations or otherwise firmly secured. The possible effect on the outlet piping of settling shall be guarded against by a flexible connection or special fitting.

**(h) Containers and equipment used inside of buildings or structures.**

(1) When operational requirements make portable use of containers necessary, and their location outside of buildings or structures is impracticable, containers and equipment shall be permitted to be used inside of buildings or structures in accordance with paragraphs (h)(2) through (11) of this section.

(2) "Containers in use" means connected for use.

(3) Systems utilizing containers having a water capacity greater than 2-1/2 pounds (nominal 1 pound LP-Gas capacity) shall be equipped with excess flow valves. Such excess flow valves shall be either integral with the container valves or in the connections to the container valve outlets.

(4) Regulators shall be either directly connected to the container valves or to manifolds connected to the container valves. The regulator shall be suitable for use with LP-Gas. Manifolds and fittings connecting containers to pressure regulator inlets shall be designed for at least 250 p.s.i.g. service pressure.

(5) Valves on containers having water capacity greater than 50 pounds (nominal 20 pounds LP-Gas capacity) shall be protected from damage while in use or storage.

(6) Aluminum piping or tubing shall not be used.

(7) Hose shall be designed for a working pressure of at least 250 p.s.i.g. Design, construction, and performance of hose, and hose connections shall have their suitability determined by listing by a nationally recognized testing agency. The hose length shall be as short as practicable. Hoses shall be long enough to permit compliance with spacing provisions of paragraphs (h)(1) through (13) of this section, without kinking or straining, or causing hose to be so close to a burner as to be damaged by heat.

(8) Portable heaters, including salamanders, shall be equipped with an approved automatic device to shut off the flow of gas to the main burner, and pilot if used, in the event of flame failure. Such heaters, having inputs above 50,000 B.t.u. per hour, shall be equipped with either a pilot, which must be lighted and proved before the main burner can be turned on, or an electrical ignition system.

**Note:** The provisions of this subparagraph do not apply to portable heaters under 7,500 B.t.u. per hour input when used with containers having a maximum water capacity of 2-1/2 pounds.

(9) Container valves, connectors, regulators, manifolds, piping, and tubing shall not be used as structural supports for heaters.

(10) Containers, regulating equipment, manifolds, pipe, tubing, and hose shall be located to minimize exposure to high temperatures or physical damage.

(11) Containers having a water capacity greater than 2-1/2 pounds (nominal 1 pound LP-Gas capacity) connected for use shall stand on a firm and substantially level surface and, when necessary, shall be secured in an upright position.

(12) The maximum water capacity of individual containers shall be 245 pounds (nominal 100 pounds LP-Gas capacity).

(13) For temporary heating, heaters (other than integral heater-container units) shall be located at least 6 feet from any LP-Gas container. This shall not prohibit the use of heaters specifically designed for attachment to the container or to a supporting standard, provided they are designed and installed so as to prevent direct or radiant heat application from the heater onto the containers. Blower and radiant type heaters shall not be directed toward any LP-Gas container within 20 feet.

(14) If two or more heater-container units, of either the integral or nonintegral type, are located in an unpartitioned area on the same floor, the container or containers of each unit shall be separated from the container or containers of any other unit by at least 20 feet.

(15) When heaters are connected to containers for use in an unpartitioned area on the same floor, the total water capacity of containers, manifolded together for connection to a heater or heaters, shall not be greater than 735 pounds (nominal 300 pounds LP-Gas capacity). Such manifolds shall be separated by at least 20 feet.

(16) Storage of containers awaiting use shall be in accordance with paragraphs (j) and (k) of this section.

**(i) Multiple container systems.**

(1) Valves in the assembly of multiple container systems shall be arranged so that replacement of containers can be made without shutting off the flow of gas in the system. This provision is not to be construed as requiring an automatic change-over device.

(2) Heaters shall be equipped with an approved regulator in the supply line between the fuel cylinder and the heater unit. Cylinder connectors shall be provided with an excess flow valve to minimize the flow of gas in the event the fuel line becomes ruptured.

(3) Regulators and low-pressure relief devices shall be rigidly attached to the cylinder valves, cylinders, supporting standards, the building walls, or otherwise rigidly secured, and shall be so installed or protected from the elements.

# F LIQUIFIED PETROLEUM GAS

(j) **Storage of LPG containers.** Storage of LPG within buildings is prohibited.

(k) **Storage outside of buildings.**

(1) Storage outside of buildings, for containers awaiting use, shall be located from the nearest building or group of buildings, in accordance with the following:

**Table F-3**

Quantity of LP Gas Stored:	Distance (feet)
500 lbs. or less .....	0
501 to 6,000 lbs. ....	10
6,001 to 10,000 lbs. ....	20
Over 10,000 lbs. ....	25

(2) Containers shall be in a suitable ventilated enclosure or otherwise protected against tampering.

(l) **Fire protection.** Storage locations shall be provided with at least one approved portable fire extinguisher having a rating of not less than 20-B:C.

(m) **Systems utilizing containers other than DOT containers.**

(1) **Application.** This paragraph applies specifically to systems utilizing storage containers other than those constructed in accordance with DOT specifications. Paragraph (b) of this section applies to this paragraph unless otherwise noted in paragraph (b) of this section.

(2) **Design pressure and classification of storage containers.** Storage containers shall be designed and classified in accordance with Table F-31.

**Table F-31**

Container type	For gases with vapor press. Not to exceed lb. per sq. in. gage at 100° F. (37.8° C.)	Minimum design pressure of container, lb. per sq. in. gage	
		1949 and earlier editions of ASME Code (Par. U-68, U-69)	1949 edition of ASME Code (Par. U-200, U-201); 1950, 1952, 1956, 1959, 1962, 1965, and 1968 (Division 1) editions of ASME Code; All editions of API-ASME Code <sup>3</sup>
80 <sup>1</sup>	80 <sup>1</sup>	80 <sup>1</sup>	100 <sup>1</sup>
100	100	100	125
125	125	125	156
150	150	150	187
175	175	175	219
200 <sup>2</sup>	215	200	250

<sup>1</sup> New storage containers of the 80 type have not been authorized since Dec. 31, 1947.

<sup>2</sup> Container type may be increased by increments of 25. The minimum design pressure of containers shall be 100 percent of the container type designation when constructed under 1949 or earlier editions of the ASME Code (Par. U-68 and U-69). The minimum design pressure of containers shall be 125 percent of the container type designation when constructed under: (1) the 1949 ASME Code (Par. U-200 and U-201), (2) 1950, 1952, 1956, 1959, 1962, 1965, and 1968 (Division 1) editions of the ASME Code, and (3) all editions of the API-ASME Code.

<sup>3</sup> Construction of containers under the API-ASME Code is not authorized after July 1, 1961.

**(3)** Containers with foundations attached (portable or semiportable b containers with suitable steel “runners” or “skids” and popularly known in the industry as “skid tanks”) shall be designed, installed, and used in accordance with these rules subject to the following provisions:

**(i)** If they are to be used at a given general location for a temporary period not to exceed 6 months they need not have fire-resisting foundations or saddles but shall have adequate ferrous metal supports.

**(ii)** They shall not be located with the outside bottom of the container shell more than 5 feet (1.52 m) above the surface of the ground unless fire-resisting supports are provided.

**(iii)** The bottom of the skids shall not be less than 2 inches (5.08 cm) or more than 12 inches (30.48 cm) below the outside bottom of the container shell.

**(iv)** Flanges, nozzles, valves, fittings, and the like, having communication with the interior of the container, shall be protected against physical damage.

**(v)** When not permanently located on fire-resisting foundations, piping connections shall be sufficiently flexible to minimize the possibility of breakage or leakage of connections if the container settles, moves, or is otherwise displaced.

**(vi)** Skids, or lugs for attachment of skids, shall be secured to the container in accordance with the code or rules under which the container is designed and built (with a minimum factor of safety of four) to withstand loading in any direction equal to four times the weight of the container and attachments when filled to the maximum permissible loaded weight.

**(4)** Field welding where necessary shall be made only on saddle plates or brackets which were applied by the manufacturer of the tank.

**(n)** When LP-Gas and one or more other gases are stored or used in the same area, the containers shall be marked to identify their content. Marking shall be in compliance with American National Standard Z48.1-1954, “Method of Marking Portable Compressed Gas Containers To Identify the Material Contained.”

**(o) Damage from vehicles.** When damage to LP-Gas systems from vehicular traffic is a possibility, precautions against such damage shall be taken.

**Stat. Auth.:** ORS 654.025(2) and 656.726(4).

**Stats. Implemented:** ORS 654.001 through 654.295.

**Hist:** APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89.

OR-OSHA Admin. Order 3-2000, f. 2/8/00, ef. 2/8/00.

# F TEMPORARY HEATING DEVICES

## §1926.154 Temporary Heating Devices.

### (a) Ventilation.

(1) Fresh air shall be supplied in sufficient quantities to maintain the health and safety of workmen. Where natural means of fresh air supply is inadequate, mechanical ventilation shall be provided.

(2) When heaters are used in confined spaces, special care shall be taken to provide sufficient ventilation in order to ensure proper combustion, maintain the health and safety of workers, and limit temperature rise in the area.

### (b) Clearance and mounting.

(1) Temporary heating devices shall be installed to provide clearance to combustible material not less than the amount shown in Table F-4.

(2) Temporary heating devices, which are listed for installation with lesser clearances than specified in Table F-4, may be installed in accordance with their approval.

Table F-4

Heating appliances	Minimum clearance, (inches)		
	Sides	Rear	Chimney connector
Room heater, circulating type .....	12	12	18
Room heater, radiant type .....	36	36	18

(3) Heaters not suitable for use on wood floors shall not be set directly upon them or other combustible materials. When such heaters are used, they shall rest on suitable heat insulating material or at least 1-inch concrete, or equivalent. The insulating material shall extend beyond the heater 2 feet or more in all directions.

(4) Heaters used in the vicinity of combustible tarpaulins, canvas, or similar coverings shall be located at least 10 feet from the coverings. The coverings shall be securely fastened to prevent ignition or upsetting of the heater due to wind action on the covering or other material.

(c) **Stability.** Heaters, when in use, shall be set horizontally level, unless otherwise permitted by the manufacturer's markings.

(d) **Solid fuel salamanders.** Solid fuel salamanders are prohibited in buildings and on scaffolds.

## TEMPORARY HEATING DEVICES/ DEFINITIONS APPLICABLE TO THIS SUBDIVISION

**F**

### **(e) Oil-fired heaters.**

(1) Flammable liquid-fired heaters shall be equipped with a primary safety control to stop the flow of fuel in the event of flame failure. Barometric or gravity oil feed shall not be considered a primary safety control.

(2) Heaters designed for barometric or gravity oil feed shall be used only with the integral tanks.

### **(3) (Reserved)**

(4) Heaters specifically designed and approved for use with separate supply tanks may be directly connected for gravity feed, or an automatic pump, from a supply tank.

**Stat. Auth.:** ORS 654.025(2) and 656.726(4).  
**Stats. Implemented:** ORS 654.001 through 654.295.  
**Hist:** APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89.

### **§1926.155 Definitions Applicable to this Subdivision.**

(a) **Approved**, for the purpose of this subpart, means equipment that has been listed or approved by a nationally recognized testing laboratory such as Factory Mutual Engineering Corp., or Underwriters' Laboratories, Inc., or Federal agencies such as Bureau of Mines, or U.S. Coast Guard, which issue approvals for such equipment.

(b) **Closed container** means a container so sealed by means of a lid or other device that neither liquid nor vapor will escape from it at ordinary temperatures.

(c) **Reserved.**

(d) **Combustion** means any chemical process that involves oxidation sufficient to produce light or heat.

(e) **Fire brigade** means an organized group of employees that are knowledgeable, trained, and skilled in the safe evacuation of employees during emergency situations and in assisting in fire fighting operations.

(f) **Fire resistance** means so resistant to fire that, for specified time and under conditions of a standard heat intensity, it will not fail structurally and will not permit the side away from the fire to become hotter than a specified temperature. For purposes of this part, fire resistance shall be determined by the Standard Methods of Fire Tests of Building Construction and Materials, NFPA 251-1969.

(g) **Flammable** means capable of being easily ignited, burning intensely, or having a rapid rate of flame spread.

**(h) Flammable liquid** means any liquid having a vapor pressure not exceeding 40 pounds per square inch (absolute) at 100 degrees F (37.8 degrees C) and having a flashpoint at or below 199.4 degrees F (93 degrees C). Flammable liquids are divided into four categories as follows:

**(1)** Category 1 shall include liquids having flashpoints below 73.4 degrees F (23 degrees C) and having a boiling point at or below 95 degrees F (35 degrees C).

**(2)** Category 2 shall include liquids having flashpoints below 73.4 degrees F (23 degrees C) and having a boiling point above 95 degrees F (35 degrees C).

**(3)** Category 3 shall include liquids having flashpoints at or above 73.4 degrees F (23 degrees C) and at or below 140 degrees F (60 degrees C).

**(4)** Category 4 shall include liquids having flashpoints above 140 degrees F (60 degrees C) and at or below 199.4 degrees F (93 degrees C).

**(i) Flash point** of the liquid means the temperature at which it gives off vapor sufficient to form an ignitable mixture with the air near the surface of the liquid or within the vessel used as determined by appropriate test procedure and apparatus as specified below.

**(1)** The flashpoint of liquids having a viscosity less than 45 Saybolt Universal Second(s) at 100 degrees F (37.8 degrees C) and a flashpoint below 175 degrees F (79.4 degrees C) shall be determined in accordance with the Standard Method of Test for Flash Point by the Tag Closed Tester, ASTM D-56-69 (incorporated by reference; See § 1926.6), or an equivalent method as defined by § 1910.1200 Appendix B.

**(2)** The flashpoints of liquids having a viscosity of 45 Saybolt Universal Second(s) or more at 175 degrees F (79.4 degrees C) or higher shall be determined in accordance with the Standard Method of Test for Flash Point by the Pensky Martens Closed Tester, ASTM D-93-69 (incorporated by reference; See § 1926.6), or an equivalent method as defined by § 1910.1200 Appendix B.

**(j) Liquefied petroleum gases, LPG and LP Gas** mean and include any material which is composed predominantly of any of the following hydrocarbons, or mixtures of them, such as propane, propylene, butane (normal butane or iso-butane), and butylenes.

**(k) Portable tank** means a closed container having a liquid capacity more than 60 U.S. gallons, and not intended for fixed installation.

**(l) Safety can** means an approved closed container, of not more than 5 gallons capacity, having a flash-arresting screen, spring-closing lid and spout cover and so designed that it will safely relieve internal pressure when subjected to fire exposure.

## DEFINITIONS APPLICABLE TO THIS SUBDIVISION

---

**F**

**(m) Vapor pressure** means the pressure, measured in pounds per square inch (absolute), exerted by a volatile liquid as determined by the "Standard Method of Test for Vapor Pressure of Petroleum Products (Reid Method)." (ASTM D-323-58).

**Stat. Auth.:** ORS 654.025(2) and 656.726(4).

**Stats. Implemented:** ORS 654.001 through 654.295.

**Hist:** APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89.

OR-OSHA Admin. Order 5-2012, f. 9/25/12, ef. 9/25/12.

-- END OF DOCUMENT --

Oregon Administrative Rules  
Chapter 437

Division 3  
Construction

---

Signs, Signals and  
Barricades

Subdivision

**G**

Administrative  
Order 3-2019

The Oregon Department of Consumer and Business Services adopted these rules pursuant to ORS 654.025(2).

The Secretary of State designated OAR Chapter 437 as the “Oregon Occupational Safety and Health Code.” Six general subject areas within this code are designated as “Divisions.”

- **Division 1** General Administrative Rules
- **Division 2** General Occupational Safety and Health Rules
- **Division 3** Construction
- **Division 4** Agriculture
- **Division 5** Maritime Activities
- **Division 7** Forest Activities
- **Oregon Revised Statutes (ORS) 654** The Oregon Safe Employment Act (OSEAct)

Oregon-initiated rules in this division of the Oregon Occupational Safety and Health Code are numbered in a uniform system developed by the Secretary of State. This system does not number the rules in sequence (001, 002, 003, etc.). Omitted numbers may be assigned to new rules at the time of their adoption.

**Oregon-initiated rules** are arranged in the following Basic Codification Structure adopted by the Secretary of State for Oregon Administrative Rules (OAR):

Chapter	Division	Rule	Section	Subsection	Paragraphs
437	002	0322	(1)	(a)	(A)(i)(I)

The majority of Oregon OSHA rules are adopted by reference from the Code of Federal Regulations (CFR), and are arranged in the following basic federal numbering system:

Chapter	Division	Part	Subpart (Subdivision)	Section	Paragraphs
437	002	1910	G	.303	(a)(1)(i)(A)(1)

The terms “subdivision” and “subpart” are synonymous within OAR 437, Oregon Occupational Safety and Health Code.

---

To obtain an order form or copies of these codes, address:

**Department of Consumer & Business Services**  
**Oregon Occupational Safety & Health Division (Oregon OSHA)**  
350 Winter St. NE  
Salem, OR 97301-3882

Or call the Oregon OSHA Resource Library at 503-378-3272

The rules referenced in this division are available for viewing in the Office of the Secretary of State, Oregon State Archives Building, Salem, Oregon, or the Central Office, Oregon Occupational Safety and Health Division of the Department of Consumer and Business Services, 350 Winter St. NE, Salem, Oregon, and on our website at [osha.oregon.gov](http://osha.oregon.gov).

**437-003-0001 Adoption by Reference**

*In addition to, and not in lieu of, any other safety and health codes contained in OAR Chapter 437, the Department adopts by reference the following federal regulations printed as part of the Code of Federal Regulations, in the Federal Register:*

## (7) Subdivision G – Signs, Signals, and Barricades.

- (a) 29 CFR 1926.200 Accident prevention signs and tags, published 6/13/13, FR vol. 78, no. 114, p. 35559; 11/6/13, FR vol. 78, no. 215, p. 66641, amended 5/14/19 FR vol. 84, no. 93. p. 21576.
- (b) 29 CFR 1926.201 Signaling, REPEALED with OR-OSHA Admin. Order 2-2003, f. 1/30/03, ef. 1/30/03.
- (c) 29 CFR 1926.202 Barricades, REPEALED with OR-OSHA Admin. Order 2-2003, f. 1/30/03, ef. 1/30/03.
- (d) 29 CFR 1926.203 Definitions applicable to this subpart, published 4/6/79, FR vol. 44, p. 20940; amended with OR-OSHA Admin. Order 2-2003, f. 1/30/03, ef. 1/30/03, Repealed 5/14/19, FR vol. 84, no. 93, p. 21576.

*These standards are available at the Oregon Occupational Safety and Health Division, Oregon Department of Consumer and Business Services, and the United States Government Printing Office.*

## 1926.200 Accident Prevention Signs and Tags

- (a) General. Signs and symbols required by this Subpart shall be visible at all times when work is being performed, and shall be removed or covered promptly when the hazards no longer exist.
- (b) Danger signs.
- (1) Danger signs shall be used only where an immediate hazard exists, and shall follow the specifications illustrated in Figure 1 of ANSI Z35.1-1968 or in Figures 1 to 13 of ANSI Z535.2-2011, incorporated by reference in 1926.6.

Figure G-1

(2) Danger signs shall have red as the predominating color for the upper panel; black outline on the borders; and a white lower panel for additional sign wording.

(c) Caution signs.

(1) Caution signs shall be used only to warn against potential hazards or to caution against unsafe practices, and shall follow the specifications illustrated in Figure 4 of ANSI Z35.1-1968 or in Figures 1 to 13 of ANSI Z535.2-2011, incorporated by reference in 1926.6.

Figure G-2

(2) Caution signs shall have yellow as the predominating color; black upper panel and borders: yellow lettering of “caution” on the black panel; and the lower yellow panel for additional sign wording. Black lettering shall be used for additional wording.

(3) The standard color of the background shall be yellow; and the panel, black with yellow letters. Any letters used against the yellow background shall be black. The colors shall be those of opaque glossy samples as specified in Table 1 of ANSI Z53.1-1967 or in Table 1 of ANSI Z535.1-2006(R2011), incorporated by reference in 1926.6.

(d) Exit signs. Exit signs, when required, shall be lettered in legible red letters, not less than 6 inches high, on a white field and the principal stroke of the letters shall be at least three-fourths inch in width.

- (e) Safety instruction signs. Safety instruction signs, when used, shall be white with green upper panel with white letters to convey the principal message. Any additional wording on the sign shall be black letters on the white background.
- (f) Directional signs. Directional signs, other than automotive traffic signs specified in paragraph (g) of this section, shall be white with a black panel and a white directional symbol. Any additional wording on the sign shall be black letters on the white background.
- (g) Traffic control signs and devices.
- (1) At points of hazards, construction areas shall be posted with legible traffic control signs and protected by traffic control devices.

**Note:** In Oregon, 437-003-0420 applies instead of 1926.200(g)(2), 1926.201, 1926.202, and 1926.203.

### **437-003-0420 Traffic Control**

**Note:** 1926.201, 1926.202, and 1926.203 were repealed by Oregon OSHA. In Oregon, 437-003-0420 applies.

- (1) *Adequate and appropriate traffic control devices, including signs, signals, markings, and other devices must be provided and used for the protection of workers for all operations on or adjacent to a highway, street, or roadway. The traffic control devices' design and use must conform to the Manual of Uniform Traffic Control Devices (MUTCD), incorporated by reference in 1926.6.*
- (2) *Signaling by flaggers and the use of flaggers, including warning garments worn by flaggers, must conform to the Manual of Uniform Traffic Control Devices (MUTCD), incorporated by reference in 1926.6.*
- (3) *The design and use of barricades for the protection of employees must conform to the Manual of Uniform Traffic Control Devices (MUTCD), incorporated by reference in 1926.6.*

**Note:** The MUTCD is available electronically at [mutcd.fhwa.dot.gov](http://mutcd.fhwa.dot.gov), or printed copies are available to purchase from The American Traffic Safety Services Association, 1-800-231-3475, [www.atssa.com](http://www.atssa.com); the Institute of Transportation Engineers, 202-785-0060, [www.ite.org](http://www.ite.org); or the American Association of State Highway and Transportation Officials, 1-800-231-3475, [store.transportation.org](http://store.transportation.org).

**Note:** A copy of the MUTCD is available to read in the Oregon OSHA Resource Center, 350 Winter Street NE, Salem, Oregon 97301.

**Note:** Employers who follow the most current edition of the Oregon Department of Transportation's Temporary Traffic Control Handbook are considered to be in compliance with this requirement.

## 1926.200 (h) Accident prevention tags.

- (1) Accident prevention tags shall be used as a temporary means of warning employees of an existing hazard, such as defective tools, equipment, etc. They shall not be used in place of, or as a substitute for, accident prevention signs.
- (2) For accident prevention tags, employers shall follow specifications that are similar to those in Figures 1 to 4 of ANSI Z35.2-1968 or Figures 1 to 8 of ANSI Z535.5-2011, incorporated by reference in Sec. 1926.6.
  - (i) Additional rules. ANSI Z35.1-1968, ANSI Z535.2-2011, ANSI Z35.2-1968, and ANSI Z535.5-2011, incorporated by reference in Sec. 1926.6, contain rules in addition to those specifically prescribed in this subpart. The employer shall comply with ANSI Z35.1-1968 or ANSI Z535.2-2011, and ANSI Z35.2-1968 or Z535.5-2011, with respect to such additional rules.

[44 FR 8577, Feb. 9, 1979; 44 FR 20940, Apr. 6, 1979, as amended at 58 FR 35173, June 30, 1993; 67 FR 57736, Sept. 12, 2002; 78 FR 35567, June 13, 2013; 78 FR 66642, November 6, 2013; 84 FR 21416, May 14, 2019]

OR-OSHA Admin. Order 3-2019, f. 10/29/19, ef. 10/29/19

## Historical Notes for Subdivision G

**Note:** Federal OSHA revised charts referred to in 1910.177, Servicing Multi-Piece and Single Piece Rim Wheels. This rulemaking amended the rules to indicate the availability of these revised charts. The current requirement for charts or rim manuals to be available in the workplace was not changed. Oregon OSHA continued the process of adopting federal rules by reference, and with the adoption of 1910.177, equivalent state rules in Division 56, Vehicles, were repealed.

This is Oregon OSHA Administrative Order 2-1989, filed and effective March 1, 1989.

**Note:** The Accident Prevention Division adopted Division 3, Construction on a temporary basis effective May 1, 1989. It contained new and revised federal occupational safety and health rules for the Construction industry. APD is now announcing that these same rules have been duly filed for permanent adoption. Division 3, Construction replaced Oregon codes Division 83 and 84. Some individual rules from each of these divisions have been retained and adopted into the new Division 3 as Oregon initiated rules.

This is Oregon OSHA Administrative Order 8-1989, filed and effective July 7, 1989.

**Note:** On June 30, 1993, Federal OSHA incorporated a large number of its 1910 General Industry standards into its 1926 Construction standard in order to consolidate all standards actually applicable to the construction industry in one place. This was done at the request of both employers and employees in construction work in order to facilitate compliance with all the applicable standards from general industry. Oregon OSHA adopted most of the applicable general industry standards into Division 3, Construction. This will help achieve more uniform reporting information and compliance, with a safer work environment for construction workers.

1926.501(b)(13), which was originally adopted from the federal construction standard, is being repealed because of confusion between this rule for residential construction and the other fall protection rules governing specific activities such as roofing or leading edge work. The more specific standards in 1926.501 will now be used for all industries. The current residential exceptions will be retained.

This is Oregon OSHA Administrative Order 3-2000, filed and effective February 8, 2000.

**Note:** In response to revisions made by federal OSHA involving traffic control in construction (published in the September 12, 2002 Federal Register), Oregon OSHA has made changes to portions of Division 3/G, Construction- Signs, Signals, and Barricades, and OAR 437-003-0420, Traffic Control. 1926.200(g), 1926.201, and 1926.202 were not adopted. In their place, Oregon amended 437-003-0420, which provides rules for signaling and the use of flaggers, and for using barricades for protection of workers. The amendment to 437-003-0420 reflects the adoption of the December, 2000 edition of the Manual of Uniform Traffic Control Devices (MUTCD), and provides guidance for the use of short term traffic control procedures. These changes become effective immediately upon adoption.

This is Oregon OSHA Administrative Order 7-2013, filed and effective January 30, 2003.

**Note:** Oregon OSHA is adopting changes to our administrative (recordkeeping), general industry, and construction standards, and updating references in the maritime activity standards in response to federal OSHA's adoption of final rules published in the May 14, 2019 Federal Register. This is Phase IV of federal OSHA's Standards Improvement Project (SIP-IV), the fourth in a series of rulemakings to improve and streamline workplace safety and health standards. Oregon's response removes or revises rules or requirements within our corresponding rules that are outdated, duplicative, or inconsistent. This rulemaking is anticipated to reduce regulatory burden and compliance costs while maintaining or enhancing worker safety and health as well as worker privacy protections.

In Division 3G, Oregon OSHA adopted updates to 1926.200(g) and 437-003-0420 to allow for use of the 2009 edition of the Manual of Uniform Traffic Control Devices (MUTCD).

This is Oregon OSHA Administrative Order 3-2019, filed and effective October 29, 2019.

Materials Handling,  
Storage, Use, and Disposal

Subdivision

**H**

Administrative  
Order 3-2019

The Oregon Department of Consumer and Business Services adopted these rules pursuant to ORS 654.025(2).

The Secretary of State designated OAR Chapter 437 as the “Oregon Occupational Safety and Health Code.” Six general subject areas within this code are designated as “Divisions.”

- **Division 1** General Administrative Rules
- **Division 2** General Occupational Safety and Health Rules
- **Division 3** Construction
- **Division 4** Agriculture
- **Division 5** Maritime Activities
- **Division 7** Forest Activities
- **Oregon Revised Statutes (ORS) 654** The Oregon Safe Employment Act (OSEAct)

Oregon-initiated rules in this division of the Oregon Occupational Safety and Health Code are numbered in a uniform system developed by the Secretary of State. This system does not number the rules in sequence (001, 002, 003, etc.). Omitted numbers may be assigned to new rules at the time of their adoption.

**Oregon-initiated rules** are arranged in the following Basic Codification Structure adopted by the Secretary of State for Oregon Administrative Rules (OAR):

Chapter	Division	Rule	Section	Subsection	Paragraphs
437	002	0322	(1)	(a)	(A)(i)(I)

The majority of Oregon OSHA rules are adopted by reference from the Code of Federal Regulations (CFR), and are arranged in the following basic federal numbering system:

Chapter	Division	Part	Subpart (Subdivision)	Section	Paragraphs
437	002	1910	G	.303	(a)(1)(i)(A)(1)

The terms “subdivision” and “subpart” are synonymous within OAR 437, Oregon Occupational Safety and Health Code.

---

To obtain an order form or copies of these codes, address:

**Department of Consumer & Business Services**  
**Oregon Occupational Safety & Health Division (Oregon OSHA)**  
350 Winter St. NE  
Salem, OR 97301-3882

Or call the Oregon OSHA Resource Library at 503-378-3272

The rules referenced in this division are available for viewing in the Office of the Secretary of State, Oregon State Archives Building, Salem, Oregon, or the Central Office, Oregon Occupational Safety and Health Division of the Department of Consumer and Business Services, 350 Winter St. NE, Salem, Oregon, and on our website at [osha.oregon.gov](http://osha.oregon.gov).

## 1926.250 General Requirements for Storage

### (a) General.

- (1) All materials stored in tiers shall be stacked, racked, blocked, interlocked, or otherwise secured to prevent sliding, falling or collapse.
- (2)
  - (i) The weight of stored material on floors within buildings and structures, in pounds per square foot, shall not exceed maximum safe load limits.
  - (ii) Employers shall conspicuously post maximum safe load limits of floors within buildings and structures, in pounds per square foot, in all storage areas, except when the storage area is on a floor or slab on grade. Posting is not required for storage areas in all single-family residential structures and wood-framed multi-family residential structures.

- (3) Aisles and passageways shall be kept clear to provide for the free and safe movement of material handling equipment or employees. Such areas shall be kept in good repair.
- (4) When a difference in road or working levels exist, means such as ramps, blocking, or grading shall be used to ensure the safe movement of vehicles between the two levels.

(b) Material storage.

- (1) Material stored inside buildings under construction shall not be placed within 6 feet of any hoistway or inside floor openings, nor within 10 feet of an exterior wall which does not extend above the top of the material stored.
- (2) Each employee required to work on stored material in silos, hoppers, tanks, and similar storage areas shall be equipped with personal fall arrest equipment meeting the requirements of Subpart M of this part.
- (3) Noncompatible materials shall be segregated in storage.
- (4) Bagged materials shall be stacked by stepping back the layers and cross-keying the bags at least every 10 bags high.
- (5) Materials shall not be stored on scaffolds or runways in excess of supplies needed for immediate operations.
- (6) Brick stacks shall not be more than 7 feet in height. When a loose brick stack reaches a height of 4 feet, it shall be tapered back 2 inches in every foot of height above the 4-foot level.
- (7) When masonry blocks are stacked higher than 6 feet, the stack shall be tapered back one-half block per tier above the 6-foot level.
- (8) Lumber:
  - (i) Used lumber shall have all nails withdrawn before stacking.
  - (ii) Lumber shall be stacked on level and solidly supported sills.
  - (iii) Lumber shall be so stacked as to be stable and self-supporting.
  - (iv) Lumber piles shall not exceed 20 feet in height provided that lumber to be handled manually shall not be stacked more than 16 feet high.
- (9) Structural steel, poles, pipe, bar stock, and other cylindrical materials, unless racked, shall be stacked and blocked so as to prevent spreading or tilting.

- (c) Housekeeping. Storage areas shall be kept free from accumulation of materials that constitute hazards from tripping, fire, explosion, or pest harborage. Vegetation control will be exercised when necessary.
- (d) Dockboards (bridge plates).
- (1) Portable and powered dockboards shall be strong enough to carry the load imposed on them.
  - (2) Portable dockboards shall be secured in position, either by being anchored or equipped with devices which will prevent their slipping.
  - (3) Handholds, or other effective means, shall be provided on portable dockboards to permit safe handling.
  - (4) Positive protection shall be provided to prevent railroad cars from being moved while dockboards or bridge plates are in position.

## 1926.251 Rigging Equipment for Material Handling

### (a) General.

- (1) Rigging equipment for material handling shall be inspected prior to use on each shift and as necessary during its use to ensure that it is safe. Defective rigging equipment shall be removed from service.
- (2) Employers must ensure that rigging equipment:
  - (i) Has permanently affixed and legible identification markings as prescribed by the manufacturer that indicate the recommended safe working load;
  - (ii) Not be loaded in excess of its recommended safe working load as prescribed on the identification markings by the manufacturer; and
  - (iii) Not be used without affixed, legible identification markings, required by paragraph (a)(2)(i) of this section.
- (3) Rigging equipment, when not in use, shall be removed from the immediate work area so as not to present a hazard to employees.

- (4) Special custom design grabs, hooks, clamps, or other lifting accessories, for such units as modular panels, prefabricated structures and similar materials, shall be marked to indicate the safe working loads and shall be proof-tested prior to use to 125 percent of their rated load.
  - (5) Scope. This section applies to slings used in conjunction with other material handling equipment for the movement of material by hoisting, in employments covered by this part. The types of slings covered are those made from alloy steel chain, wire rope, metal mesh, natural or synthetic fiber rope (conventional three strand construction), and synthetic web (nylon, polyester, and polypropylene).
  - (6) Inspections. Each day before being used, the sling and all fastenings and attachments shall be inspected for damage or defects by a competent person designated by the employer. Additional inspections shall be performed during sling use, where service conditions warrant. Damaged or defective slings shall be immediately removed from service.
- (b) Alloy steel chains.
- (1) Welded alloy steel chain slings shall have permanently affixed durable identification stating size, grade, rated capacity, and sling manufacturer.
  - (2) Hooks, rings, oblong links, pear-shaped links, welded or mechanical coupling links, or other attachments, when used with alloy steel chains, shall have a rated capacity at least equal to that of the chain.
  - (3) Job or shop hooks and links, or makeshift fasteners, formed from bolts, rods, etc., or other such attachments, shall not be used.
  - (4) Employers must not use alloy steel-chain slings with loads in excess of the rated capacities (i.e., working load limits) indicated on the sling by permanently affixed and legible identification markings prescribed by the manufacturer.
  - (5) Whenever wear at any point of any chain link exceeds that shown in Table H-1, the assembly shall be removed from service.
  - (6) Inspections.
    - (i) In addition to the inspection required by other paragraphs of this section, a thorough periodic inspection of alloy steel chain slings in use shall be made on a regular basis, to be determined on the basis of (A) frequency of sling use; (B) severity of service conditions; (C) nature of lifts being made; and (D) experience gained on the service life of slings used in similar circumstances. Such inspections shall in no event be at intervals greater than once every 12 months.

- (ii) The employer shall make and maintain a record of the most recent month in which each alloy steel chain sling was thoroughly inspected, and shall make such record available for examination.

(c) Wire rope.

- (1) Employers must not use improved plow-steel wire rope and wire-rope slings with loads in excess of the rated capacities (i.e., working load limits) indicated on the sling by permanently affixed and legible identification markings prescribed by the manufacturer.
- (2) Protruding ends of strands in splices on slings and bridles shall be covered or blunted.
- (3) Wire rope shall not be secured by knots, except on haul back lines on scrapers.
- (4) The following limitations shall apply to the use of wire rope:
  - (i) An eye splice made in any wire rope shall have not less than three full tucks. However, this requirement shall not operate to preclude the use of another form of splice or connection which can be shown to be as efficient and which is not otherwise prohibited.
  - (ii) Except for eye splices in the ends of wires and for endless rope slings, each wire rope used in hoisting or lowering, or in pulling loads, shall consist of one continuous piece without knot or splice.
  - (iii) Eyes in wire rope bridles, slings, or bull wires shall not be formed by wire rope clips or knots.
  - (iv) Wire rope shall not be used if, in any length of eight diameters, the total number of visible broken wires exceeds 10 percent of the total number of wires, or if the rope shows other signs of excessive wear, corrosion, or defect.
- (5) When U-bolt wire rope clips are used to form eyes, Table H-2 shall be used to determine the number and spacing of clips.
  - (i) When used for eye splices, the U-bolt shall be applied so that the "U" section is in contact with the dead end of the rope.
  - (ii) Reserved
- (6) Slings shall not be shortened with knots or bolts or other makeshift devices.
- (7) Sling legs shall not be kinked.

- (8) Slings used in a basket hitch shall have the loads balanced to prevent slippage.
  - (9) Slings shall be padded or protected from the sharp edges of their loads.
  - (10) Hands or fingers shall not be placed between the sling and its load while the sling is being tightened around the load.
  - (11) Shock loading is prohibited.
  - (12) A sling shall not be pulled from under a load when the load is resting on the sling.
  - (13) Minimum sling lengths.
    - (i) Cable laid and 6 X 19 and 6 X 37 slings shall have minimum clear length of wire rope 10 times the component rope diameter between splices, sleeves or end fittings.
    - (ii) Braided slings shall have a minimum clear length of wire rope 40 times the component rope diameter between the loops or end fittings.
    - (iii) Cable laid grommets, strand laid grommets and endless slings shall have a minimum circumferential length of 96 times their body diameter.
  - (14) Safe operating temperatures. Fiber core wire rope slings of all grades shall be permanently removed from service if they are exposed to temperatures in excess of 200° F (93.33° C). When nonfiber core wire rope slings of any grade are used at temperatures above 400° F (204.44° C) or below minus 60° F (15.55° C), recommendations of the sling manufacturer regarding use at that temperature shall be followed.
  - (15) End attachments.
    - (i) Welding of end attachments, except covers to thimbles, shall be performed prior to the assembly of the sling.
    - (ii) All welded end attachments shall not be used unless proof tested by the manufacturer or equivalent entity at twice their rated capacity prior to initial use. The employer shall retain a certificate of proof test, and make it available for examination.
  - (16) Wire rope slings shall have permanently affixed, legible identification markings stating size, rated capacity for the type(s) of hitch(es) used and the angle upon which it is based, and the number of legs if more than one.
- (d) Natural rope, and synthetic fiber.

- (1) Employers must not use natural- and synthetic-fiber rope slings with loads in excess of the rated capacities (i.e., working load limits) indicated on the sling by permanently affixed and legible identification markings prescribed by the manufacturer.
- (2) All splices in rope slings provided by the employer shall be made in accordance with fiber rope manufacturers recommendations.
  - (i) In manila rope, eye splices shall contain at least three full tucks, and short splices shall contain at least six full tucks (three on each side of the centerline of the splice).
  - (ii) In layed synthetic fiber rope, eye splices shall contain at least four full tucks, and short splices shall contain at least eight full tucks (four on each side of the centerline of the splice).
  - (iii) Strand end tails shall not be trimmed short (flush with the surface of the rope) immediately adjacent to the full tucks. This precaution applies to both eye and short splices and all types of fiber rope. For fiber ropes under 1-inch diameter, the tails shall project at least six rope diameters beyond the last full tuck. For fiber ropes 1 inch diameter and larger, the tails shall project at least 6 inches beyond the last full tuck. In applications where the projecting tails may be objectionable, the tails shall be tapered and spliced into the body of the rope using at least two additional tucks (which will require a tail length of approximately six rope diameters beyond the last full tuck).
  - (iv) For all eye splices, the eye shall be sufficiently large to provide an included angle of not greater than 60° at the splice when the eye is placed over the load or support.
  - (v) Knots shall not be used in lieu of splices.
- (3) Safe operating temperatures. Natural and synthetic fiber rope slings, except for wet frozen slings, may be used in a temperature range from minus 20° F (-28.88° C) to plus 180° F (82.2° C) without decreasing the working load limit. For operations outside this temperature range and for wet frozen slings, the sling manufacturer's recommendations shall be followed.
- (4) Splicing. Spliced fiber rope slings shall not be used unless they have been spliced in accordance with the following minimum requirements and in accordance with any additional recommendations of the manufacturer:
  - (i) In manila rope, eye splices shall consist of at least three full tucks, and short splices shall consist of at least six full tucks, three on each side of the splice center line.

- (ii) In synthetic fiber rope, eye splices shall consist of at least four full tucks, and short splices shall consist of at least eight full tucks, four on each side of the center line.
  - (iii) Strand end tails shall not be trimmed flush with the surface of the rope immediately adjacent to the full tucks. This applies to all types of fiber rope and both eye and short splices. For fiber rope under 1 inch (2.54 cm) in diameter, the tail shall project at least six rope diameters beyond the last full tuck. For fiber rope 1 inch (2.54 cm) in diameter and larger, the tail shall project at least 6 inches (15.24 cm) beyond the last full tuck. Where a projecting tail interferes with the use of the sling, the tail shall be tapered and spliced into the body of the rope using at least two additional tucks (which will require a tail length of approximately six rope diameters beyond the last full tuck).
  - (iv) Fiber rope slings shall have a minimum clear length of rope between eye splices equal to 10 times the rope diameter.
  - (v) Knots shall not be used in lieu of splices.
  - (vi) Clamps not designed specifically for fiber ropes shall not be used for splicing.
  - (vii) For all eye splices, the eye shall be of such size to provide an included angle of not greater than 60° at the splice when the eye is placed over the load or support.
- (5) End attachments. Fiber rope slings shall not be used if end attachments in contact with the rope have sharp edges or projections.
- (6) Removal from service. Natural and synthetic fiber rope slings shall be immediately removed from service if any of the following conditions are present:
- (i) Abnormal wear.
  - (ii) Powdered fiber between strands.
  - (iii) Broken or cut fibers.
  - (iv) Variations in the size or roundness of strands.
  - (v) Discoloration or rotting.
  - (vi) Distortion of hardware in the sling.

- (7) Employers must use natural- and synthetic-fiber rope slings that have permanently affixed and legible identification markings that state the rated capacity for the type(s) of hitch(es) used and the angle upon which it is based, type of fiber material, and the number of legs if more than one.
- (e) Synthetic webbing (nylon, polyester, and polypropylene).
- (1) The employer shall have each synthetic web sling marked or coded to show:
- (i) Name or trademark of manufacturer.
  - (ii) Rated capacities for the type of hitch.
  - (iii) Type of material.
- (2) Rated capacity shall not be exceeded.
- (3) Webbing. Synthetic webbing shall be of uniform thickness and width and selvage edges shall not be split from the webbing's width.
- (4) Fittings. Fittings shall be:
- (i) Of a minimum breaking strength equal to that of the sling; and
  - (ii) Free of all sharp edges that could in any way damage the webbing.
- (5) Attachment of end fittings to webbing and formation of eyes. Stitching shall be the only method used to attach end fittings to webbing and to form eyes. The thread shall be in an even pattern and contain a sufficient number of stitches to develop the full breaking strength of the sling.
- (6) Environmental conditions. When synthetic web slings are used, the following precautions shall be taken:
- (i) Nylon web slings shall not be used where fumes, vapors, sprays, mists or liquids of acids or phenolics are present.
  - (ii) Polyester and polypropylene web slings shall not be used where fumes, vapors, sprays, mists or liquids of caustics are present.
  - (iii) Web slings with aluminum fittings shall not be used where fumes, vapors, sprays, mists or liquids of caustics are present.
- (7) Safe operating temperatures. Synthetic web slings of polyester and nylon shall not be used at temperatures in excess of 180° F (82.2° C). Polypropylene web slings shall not be used at temperatures in excess of 200° F (93.33° C).
- (8) Removal from service. Synthetic web slings shall be immediately removed from service if any of the following conditions are present:

- (i) Acid or caustic burns;
  - (ii) Melting or charring of any part of the sling surface;
  - (iii) Snags, punctures, tears or cuts;
  - (iv) Broken or worn stitches; or
  - (v) Distortion of fittings.
- (f) Shackles and hooks.
- (1) Employers must not use shackles with loads in excess of the rated capacities (i.e., working load limits) indicated on the shackle by permanently affixed and legible identification markings prescribed by the manufacturer.
  - (2) The manufacturer's recommendations shall be followed in determining the safe working loads of the various sizes and types of specific and identifiable hooks. All hooks for which no applicable manufacturer's recommendations are available shall be tested to twice the intended safe working load before they are initially put into use. The employer shall maintain a record of the dates and results of such tests.

Table H-1 - Maximum Allowable Wear at any Point of Link

Chain size (inches)	Maximum allowable wear (inch)	Chain size (inches)	Maximum allowable wear (inch)
1/4	3/64	1	3/16
3/8	5/64	1 1/8	7/32
1/2	7/64	1 1/4	1/4
5/8	9/64	1 3/8	9/32
3/4	5/32	1 1/2	5/16
7/8	11/64	1 3/4	11/32

Table H-2 - Number and Spacing of U-Bolt Wire Rope Clips

Improved plow steel, rope diameter (inches)	Number of clips		Minimum spacing (inches)
	Drop forged	Other material	
1/2	3	4	3
5/8	3	4	3 3/4
3/4	4	5	4 1/2
7/8	4	5	5 1/4
1	5	6	6
1 1/8	6	6	6 3/4
1 1/4	6	7	7 1/2
1 3/8	7	7	8 1/4
1 1/2	7	8	9

OR-OSHA Admin. Order 3-2012, f. 8/20/12, ef. 8/20/12.

## 1926.252 Disposal of Waste Materials

- (a) Whenever materials are dropped more than 20 feet to any point lying outside the exterior walls of the building, an enclosed chute of wood, or equivalent material, shall be used. For the purpose of this paragraph, an enclosed chute is a slide, closed in on all sides, through which material is moved from a high place to a lower one.
- (b) When debris is dropped through holes in the floor without the use of chutes, the area onto which the material is dropped shall be completely enclosed with barricades not less than 42 inches high and not less than 6 feet back from the projected edge of the opening above. Signs warning of the hazard of falling materials shall be posted at each level. Removal shall not be permitted in this lower area until debris handling ceases above.
- (c) All scrap lumber, waste material, and rubbish shall be removed from the immediate work area as the work progresses.
- (d) Disposal of waste material or debris by burning shall comply with local fire regulations.

- (e) All solvent waste, oily rags, and flammable liquids shall be kept in fire resistant covered containers until removed from worksite.

Stat. Auth.: ORS 654.025(2) and 656.726(3).  
Hist: APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89.

## Historical Notes for Subdivision H

**Note:** The Accident Prevention Division adopted Division 3, Construction on a temporary basis effective May 1, 1989. It contained new and revised federal occupational safety and health rules for the Construction industry. APD is now announcing that these same rules have been duly filed for permanent adoption. Division 3, Construction replaced Oregon codes Division 83 and 84. Some individual rules from each of these divisions have been retained and adopted into the new Division 3 as Oregon initiated rules.

This is Oregon OSHA Administrative Order 8-1989, filed and effective July 7, 1989.

**Note:** Federal OSHA revised the construction industry safety standards that regulate fall protection systems and procedures. These systems and procedures are intended to prevent employees from falling off, onto or through working levels and to protect employees from falling objects.

This final rule corrects problems which have arisen during enforcement of the existing standards. This revised standard also consolidates and simplifies many existing provisions. One change was made in Division 2/R, Special Industries referring to a requirement for personal fall arrest equipment. The repeal of Oregon-initiated rule 437-03-075 is necessary to avoid duplicate language. These amendments were published in the Federal Register on August 9, 1994.

This is Oregon OSHA Administrative Order 6-1995, filed April 18, 1995, effective June 1, 1995.

**Note:** Oregon OSHA amended two federal OSHA rules in Subdivision 3/H. The rule segments were previously omitted when many general industry standards were brought into construction. One paragraph on housekeeping was added to 1926.250, General Requirements for Storage. In 1926.251, Rigging Equipment for Material Handling, paragraphs were added concerning slings.

This is Oregon OSHA Administrative Order 6-1998, filed and effective October 15, 1998.

**Note:** On June 30, 1993, federal OSHA incorporated a large number of its 1910 General Industry standards into its 1926 Construction standard in order to consolidate all standards actually applicable to the construction industry in one place. This was done at the request of both employers and employees in construction work in order to facilitate compliance with all the applicable standards from general industry. Oregon OSHA adopted most of the applicable general industry standards into Division 3, Construction. This will help achieve more uniform reporting information and compliance, with a safer work environment for construction workers.

1926.501(b)(13), which was originally adopted from the federal construction standard is being repealed because of confusion between this rule for residential construction and the other fall protection rules governing specific activities such as roofing or leading edge work. The more specific standards in 1926.501 will now be used for all industries. The current residential exceptions will be retained.

This is Oregon OSHA Administrative Order 3-2000, filed and effective February 8, 2000.

**Note:** Oregon OSHA adopted changes to rules in general industry, construction, agriculture, and maritime. Federal OSHA published a number of rule changes in these industries in the June 8, 2011 Federal Register. This is Phase III of the standards improvement project (SIP III). This is the third in a series of rulemaking by federal OSHA to improve and streamline the standards. This removes or revises individual requirement within rules that are confusing, outdated, duplicative, or inconsistent.

This is Oregon OSHA Administrative Order 4-2011, filed and effective December 8, 2011.

**Note:** This rulemaking is to keep Oregon OSHA in harmony with recent changes to federal OSHA's standards. Federal OSHA corrected the sling standard for construction titled Rigging Equipment for Material Handling, by removing outdated rated capacity tables, re designating the remaining two tables, and amending the rule text to reflect the correct table numbers. These changes were published in the April 18, 2012 Federal Register. Oregon OSHA also adopted these corrections and amendments to 1926.251 in Division 3/H.

This is Oregon OSHA Administrative Order 3-2012, filed and effective August 20, 2012.

**Note:** Oregon OSHA is adopting changes to their administrative (recordkeeping), general industry, and construction standards, and updating references in the maritime activity standards in response to federal OSHA's adoption of final rules published in the May 14, 2019 Federal Register. This is Phase IV of federal OSHA's Standards Improvement Project (SIP-IV), the fourth in a series of rulemakings to improve and streamline workplace safety and health standards. Oregon's response removes or revises rules or requirements within our corresponding rules that are outdated, duplicative, or inconsistent. This rulemaking is anticipated to reduce regulatory burden and compliance costs while maintaining or enhancing worker safety and health as well as worker privacy protections.

In Division 3H, Oregon OSHA adopted updates to the general requirements for storage, 1926.250.

This is Oregon OSHA Administrative Order 3-2019, filed and effective October 29, 2019.

Oregon Administrative Rules  
Chapter 437

Division 3  
Construction

---

# Tools - Hand and Power

Subdivision

**I**

AO 3-2000

The Oregon Department of Consumer and Business Services adopted these rules pursuant to ORS 654.025(2).

The Secretary of State designated OAR Chapter 437 as the "Oregon Occupational Safety and Health Code." Six general subject areas within this code are designated as "Divisions."

- **Division 1** General Administrative Rules
- **Division 2** General Occupational Safety and Health Rules
- **Division 3** Construction
- **Division 4** Agriculture
- **Division 5** Maritime Activities
- **Division 7** Forest Activities
- **Oregon Revised Statutes (ORS) 654** The Oregon Safe Employment Act (OSEAct)

Oregon-initiated rules in this division of the Oregon Occupational Safety and Health Code are numbered in a uniform system developed by the Secretary of State. This system does not number the rules in sequence (001, 002, 003, etc.). Omitted numbers may be assigned to new rules at the time of their adoption.

**Oregon-initiated rules** are arranged in the following Basic Codification Structure adopted by the Secretary of State for Oregon Administrative Rules (OAR):

Chapter	Division	Rule	Section	Subsection	Paragraphs
<i>437</i>	<i>003</i>	<i>1760</i>	<i>(1)</i>	<i>(a)</i>	<i>(A)(i)(I)</i>

The majority of Oregon OSHA rules are adopted by reference from the Code of Federal Regulations (CFR), and are arranged in the following basic federal numbering system:

Chapter	Division	Part	Subpart (Subdivision)	Section	Paragraphs
437	003	1926	I	.502	(a)

The terms "subdivision" and "subpart" are synonymous within OAR 437, Oregon Occupational Safety and Health Code.

---

To obtain an order form or copies of these codes, address:

**Department of Consumer & Business Services**  
**Oregon Occupational Safety & Health Division (Oregon OSHA)**  
350 Winter St. NE, 3<sup>rd</sup> Floor  
Salem, OR 97301-3882

Or call the Oregon OSHA Resource Library at 503-378-3272

The rules referenced in this division are available for viewing in the Office of the Secretary of State, Oregon State Archives Building, Salem, Oregon, or the Central Office, Oregon Occupational Safety and Health Division of the Department of Consumer and Business Services, 350 Winter St. NE, Salem, Oregon, and on our web site at [osha.oregon.gov](http://osha.oregon.gov).

**437-003-0001 Adoption by Reference**

*In addition to, and not in lieu of, any other safety and health codes contained in OAR Chapter 437, the Department adopts by reference the following federal regulations printed as part of the Code of Federal Regulations, in the Federal Register:*

(9) Subdivision I – Tools – Hand and Power.

(a) 29 CFR 1926.300 General requirements, published 3/7/96, FR vol. 61, no. 46, p. 9250.

(b) 29 CFR 1926.301 Hand tools, published 4/6/79, FR vol. 44, p. 20940.

(c) 29 CFR 1926.302 Power operated hand tools, published 6/30/93, FR vol. 58, no. 124, p. 35175.

(d) 29 CFR 1926.303 Abrasive wheels and tools, published 6/30/93, FR vol. 58, no. 124, p. 35175.

(e) 29 CFR 1926.304 Woodworking tools, published 3/7/96, FR vol. 61, no. 46, p. 9251.

(f) 29 CFR 1926.305 Jacks - lever and ratchet, screw, and hydraulic, published Federal Register vol. 58, no. 124, p. 35176.

*These standards are available at the Oregon Occupational Safety and Health Division, Oregon Department of Consumer and Business Services, and the United States Government Printing Office.*

Authority: Sec. 107, Contract Work Hours and Safety Standards Act (Construction Safety Act) (40 U.S.C. 333); secs. 4, 6, 8, Occupational Safety and Health Act of 1970 (29 U.S.C. 653, 655, 657); Secretary of Labor's Order No. 12-71 (36 FR 8754), 8-76 (41 FR 25059), or 9-83 (48 FR 35736), or 1-90 (55 FR 9033), as applicable; and 29 CFR part 1911.

## 1926.300 General Requirements

- (a) Condition of tools. All hand and power tools and similar equipment, whether furnished by the employer or the employee, shall be maintained in a safe condition.
- (b) Guarding.
- (1) When power operated tools are designed to accommodate guards, they shall be equipped with such guards when in use.
  - (2) Belts, gears, shafts, pulleys, sprockets, spindles, drums, fly wheels, chains, or other reciprocating, rotating or moving parts of equipment shall be guarded if such parts are exposed to contact by employees or otherwise create a hazard. Guarding shall meet the requirements as set forth in American National Standards Institute, B15.1-1953 (R1958), Safety Code for Mechanical Power-Transmission Apparatus.
  - (3) Types of guarding. One or more methods of machine guarding shall be provided to protect the operator and other employees in the machine area from hazards such as those created by point of operation, ingoing nip points, rotating parts, flying chips and sparks. Examples of guarding methods are – barrier guards, two-hand tripping devices, electronic safety devices, etc.
  - (4) Point of operation guarding.
    - (i) Point of operation is the area on a machine where work is actually performed upon the material being processed.
    - (ii) The point of operation of machines whose operation exposes an employee to injury, shall be guarded. The guarding device shall be in conformity with any appropriate standards therefor, or, in the absence of applicable specific standards, shall be so designed and constructed as to prevent the operator from having any part of his body in the danger zone during the operating cycle.

- (iii) Special handtools for placing and removing material shall be such as to permit easy handling of material without the operator placing a hand in the danger zone. Such tools shall not be in lieu of other guarding required by this section, but can only be used to supplement protection provided.
- (iv) The following are some of the machines which usually require point of operation guarding:
  - (A) Guillotine cutters.
  - (B) Shears.
  - (C) Alligator shears.
  - (D) Power presses.
  - (E) Milling machines.
  - (F) Power saws.
  - (G) Jointers.
  - (H) Portable power tools.
  - (I) Forming rolls and calenders.
- (5) Exposure of blades. When the periphery of the blades of a fan is less than 7 feet (2.128 m) above the floor or working level, the blades shall be guarded. The guard shall have openings no larger than 1/2 inch (1.27 cm).
- (6) Anchoring fixed machinery. Machines designed for a fixed location shall be securely anchored to prevent walking or moving.
- (7) Guarding of abrasive wheel machinery – exposure adjustment. Safety guards of the types described in paragraphs (b)(8) and (9) of this section, where the operator stands in front of the opening, shall be constructed so that the peripheral protecting member can be adjusted to the constantly decreasing diameter of the wheel. The maximum angular exposure above the horizontal plane of the wheel spindle as specified in paragraphs (b)(8) and (9) of this section shall never be exceeded, and the distance between the wheel periphery and the adjustable tongue or the end of the peripheral member at the top shall never exceed 1/4 inch (0.635 cm). (See [Figure I - 1](#) through [Figure I - 6](#).)

Figure I - 1

Correct

Showing adjustable tongue giving required angle protection for all sizes of wheel used.

Figure I - 2

Figure I - 3

Correct

Showing movable guard with opening small enough to give required protection for the smallest size wheel used.

Figure I - 4

Figure I - 5

Incorrect

Showing movable guard with size of opening correct for full size wheel but too large for smaller wheel.

Figure I - 6

- (8) Bench and floor stands. The angular exposure of the grinding wheel periphery and sides for safety guards used on machines known as bench and floor stands should not exceed 90° or one-fourth of the periphery. This exposure shall begin at a point not more than 65° above the horizontal plane of the wheel spindle. (See [Figure I - 7](#) and [Figure I - 8](#) and paragraph (b)(7) of this section.)

Figure I - 7

Figure I - 8

Wherever the nature of the work requires contact with the wheel below the horizontal plane of the spindle, the exposure shall not exceed 125° (See [Figure I - 9](#) and [Figure I - 10](#).)

Figure I - 9

Figure I - 10

- (9) Cylindrical grinders. The maximum angular exposure of the grinding wheel periphery and sides for safety guards used on cylindrical grinding machines shall not exceed 180°. This exposure shall begin at a point not more than 65° above the horizontal plane of the wheel spindle. (See [Figure I - 11](#) and [Figure I - 12](#) and paragraph (b)(7) of this section.)

Figure I - 11

Figure I - 12

- (c) Personal protective equipment. Employees using hand and power tools and exposed to the hazard of falling, flying, abrasive, and splashing objects, or exposed to harmful dusts, fumes, mists, vapors, or gases shall be provided with the particular personal protective equipment necessary to protect them from the hazard. All personal protective equipment shall meet the requirements and be maintained according to Subparts D and E of this part.

- (d) Switches.

- (1) All hand-held powered platen sanders, grinders with wheels 2-inch diameter or less, routers, planers, laminate trimmers, nibblers, shears, scroll saws, and jigsaws with blade shanks one-fourth of an inch wide or less may be equipped with only a positive "on-off" control.
- (2) All hand-held powered drills, tappers, fastener drivers, horizontal, vertical, and angle grinders with wheels greater than 2 inches in diameter, disc sanders, belt sanders, reciprocating saws, saber saws, and other similar operating powered tools shall be equipped with a momentary contact "on-off" control and may have a lock-on control provided that turnoff can be accomplished by a single motion of the same finger or fingers that turn it on.
- (3) All other hand-held powered tools, such as circular saws, chain saws, and percussion tools without positive accessory holding means, shall be equipped with a constant pressure switch that will shut off the power when the pressure is released.
- (4) The requirements of this paragraph shall become effective on July 15, 1972.
- (5) Exception: This paragraph does not apply to concrete vibrators, concrete breakers, powered tampers, jack hammers, rock drills, and similar hand operated power tools.

Stat. Auth.: ORS 654.025(2) and 656.726(3).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).  
OR-OSHA Admin. Order 4-1997, f. 4/2/97, ef. 4/2/97.

### 1926.301 Hand Tools

- (a) Employers shall not issue or permit the use of unsafe hand tools.
- (b) Wrenches, including adjustable, pipe, end, and socket wrenches shall not be used when jaws are sprung to the point that slippage occurs.
- (c) Impact tools, such as drift pins, wedges, and chisels, shall be kept free of mushroomed heads.
- (d) The wooden handles of tools shall be kept free of splinters or cracks and shall be kept tight in the tool.

Stat. Auth.: ORS 654.025(2) and 656.726(3).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89.

### 1926.302 Power-operated Hand Tools

- (a) Electric power-operated tools.
  - (1) Electric power operated tools shall either be of the approved double-insulated type or grounded in accordance with Subpart K of this part.
  - (2) The use of electric cords for hoisting or lowering tools shall not be permitted.
- (b) Pneumatic power tools.
  - (1) Pneumatic power tools shall be secured to the hose or whip by some positive means to prevent the tool from becoming accidentally disconnected.
  - (2) Safety clips or retainers shall be securely installed and maintained on pneumatic impact (percussion) tools to prevent attachments from being accidentally expelled.
  - (3) All pneumatically driven nailers, staplers, and other similar equipment provided with automatic fastener feed, which operate at more than 100 p.s.i. pressure at the tool shall have a safety device on the muzzle to prevent the tool from ejecting fasteners, unless the muzzle is in contact with the work surface.

- (4) Compressed air shall not be used for cleaning purposes except where reduced to less than 30 p.s.i. and then only with effective chip guarding and personal protective equipment which meets the requirements of Subpart E of this part. The 30 p.s.i. requirement does not apply for concrete form, mill scale and similar cleaning purposes.
  - (5) The manufacturer's safe operating pressure for hoses, pipes, valves, filters, and other fittings shall not be exceeded,
  - (6) The use of hoses for hoisting or lowering tools shall not be permitted.
  - (7) All hoses exceeding 1/2 inch inside diameter shall have a safety device at the source of supply or branch line to reduce pressure in case of hose failure.
  - (8) Airless spray guns of the type which atomize paints and fluids at high pressures (1,000 pounds or more per square inch) shall be equipped with automatic or visible manual safety devices which will prevent pulling of the trigger to prevent release of the paint or fluid until the safety device is manually released.
  - (9) In lieu of the above, a diffuser nut which will prevent high pressure, high velocity release, while the nozzle tip is removed, plus a nozzle tip guard which will prevent the tip from coming into contact with the operator, or other equivalent protection, shall be provided.
  - (10) Abrasive blast cleaning nozzles. The blast cleaning nozzles shall be equipped with an operating valve which must be held open manually. A support shall be provided on which the nozzle may be mounted when it is not in use.
- (c) Fuel powered tools.
- (1) All fuel powered tools shall be stopped while being refueled, serviced, or maintained, and fuel shall be transported, handled, and stored in accordance with Subpart F of this part.
  - (2) When fuel powered tools are used in enclosed spaces, the applicable requirements for concentrations of toxic gases and use of personal protective equipment, as outlined in Subparts D and E of this part, shall apply.
- (d) Hydraulic power tools.

- (1) The fluid used in hydraulic powered tools shall be fire-resistant fluids approved under Schedule 30 of the U.S. Bureau of Mines, Department of the Interior, and shall retain its operating characteristics at the most extreme temperatures to which it will be exposed.
  - (2) The manufacturer's safe operating pressures for hoses, valves, pipes, filters, and other fittings shall not be exceeded.
- (e) Powder-actuated tools.
- (1) Only employees who have been trained in the operation of the particular tool in use shall be allowed to operate a powder-actuated tool.
  - (2) The tool shall be tested each day before loading to see that safety devices are in proper working condition. The method of testing shall be in accordance with the manufacturer's recommended procedure.
  - (3) Any tool found not in proper working order, or that develops a defect during use, shall be immediately removed from service and not used until properly repaired.
  - (4) Personal protective equipment shall be in accordance with Subpart E of this part.
  - (5) Tools shall not be loaded until just prior to the intended firing time. Neither loaded nor empty tools are to be pointed at any employees. Hands shall be kept clear of the open barrel end.
  - (6) Loaded tools shall not be left unattended.
  - (7) Fasteners shall not be driven into very hard or brittle materials including, but not limited to, cast iron, glazed tile, surface-hardened steel, glass block, live rock, face brick, or hollow tile.
  - (8) Driving into materials easily penetrated shall be avoided unless such materials are backed by a substance that will prevent the pin or fastener from passing completely through and creating a flying missile hazard on the other side.
  - (9) No fastener shall be driven into a spalled area caused by an unsatisfactory fastening.
  - (10) Tools shall not be used in an explosive or flammable atmosphere.
  - (11) All tools shall be used with the correct shield, guard, or attachment recommended by the manufacturer.

(12) NOTE: This rule was NOT adopted by OR-OSHA. In Oregon, OAR 437-003-0925 applies:

Stat. Auth.: ORS 654.025(2) and 656.726(3).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89.

### ***437-003-0925 Powder-Actuated Tools***

*Powder-actuated tools used by employees shall meet all other applicable requirements of American National Standards Institute, ANSI A10.3-1985, Safety Requirements for Powder-Actuated Fastening Systems.*

Stat. Auth.: ORS 654.025(2) and 656.726(3).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 8-1990, f. 3/30/90, ef. 9/1/90.

OR-OSHA Admin. Order 3-2000, f. 2/8/00, ef. 2/8/00.

**1926.303 Abrasive Wheels and Tools**

- (a) Power. All grinding machines shall be supplied with sufficient power to maintain the spindle speed at safe levels under all conditions of normal operation.
- (b) Guarding.
- (1) Grinding machines shall be equipped with safety guards in conformance with the requirements of American National Standards Institute, B7.1-1970, Safety Code for the Use, Care and Protection of Abrasive Wheels, and paragraph (d) of this section.
  - (2) Guarding design. The safety guard shall cover the spindle end, nut, and flange projections. The safety guard shall be mounted so as to maintain proper alignment with the wheel, and the strength of the fastenings shall exceed the strength of the guard, except:
    - (i) Safety guards on all operations where the work provides a suitable measure of protection to the operator, may be so constructed that the spindle end, nut, and outer flange are exposed; and where the nature of the work is such as to entirely cover the side of the wheel, the side covers of the guard may be omitted; and
    - (ii) The spindle end, nut, and outer flange may be exposed on machines designed as portable saws.
- (c) Use of abrasive wheels.
- (1) Floor stand and bench mounted abrasive wheels, used for external grinding, shall be provided with safety guards (protection hoods). The maximum angular exposure of the grinding wheel periphery and sides shall be not more than 90°, except that when work requires contact with the wheel below the horizontal plane of the spindle, the angular exposure shall not exceed 125°. In either case, the exposure shall begin not more than 65° above the horizontal plane of the spindle. Safety guards shall be strong enough to withstand the effect of a bursting wheel.
  - (2) Floor and bench-mounted grinders shall be provided with work rests which are rigidly supported and readily adjustable. Such work rests shall be kept at a distance not to exceed one-eighth inch from the surface of the wheel.

- (3) Cup type wheels used for external grinding shall be protected by either a revolving cup guard or a band type guard in accordance with the provisions of the American National Standards Institute, B7.1-1970 Safety Code for the Use, Care, and Protection of Abrasive Wheels. All other portable abrasive wheels used for external grinding, shall be provided with safety guards (protection hoods) meeting the requirements of paragraph (c)(5) of this section, except as follows:
  - (i) When the work location makes it impossible, a wheel equipped with safety flanges, as described in paragraph (c)(6) of this section, shall be used;
  - (ii) When wheels 2 inches or less in diameter which are securely mounted on the end of a steel mandrel are used.
- (4) Portable abrasive wheels used for internal grinding shall be provided with safety flanges (protection flanges) meeting the requirements of paragraph (c)(6) of this section, except as follows:
  - (i) When wheels 2 inches or less in diameter which are securely mounted on the end of a steel mandrel are used;
  - (ii) If the wheel is entirely within the work being ground while in use.
- (5) When safety guards are required, they shall be so mounted as to maintain proper alignment with the wheel, and the guard and its fastenings shall be of sufficient strength to retain fragments of the wheel in case of accidental breakage. The maximum angular exposure of the grinding wheel periphery and sides shall not exceed 180°.
- (6) When safety flanges are required, they shall be used only with wheels designed to fit the flanges. Only safety flanges, of a type and design and properly assembled so as to ensure that the pieces of the wheel will be retained in case of accidental breakage, shall be used.
- (7) All abrasive wheels shall be closely inspected and ring-tested before mounting to ensure that they are free from cracks or defects.
- (8) Grinding wheels shall fit freely on the spindle and shall not be forced on. The spindle nut shall be tightened only enough to hold the wheel in place.
- (9) All employees using abrasive wheels shall be protected by eye protection equipment in accordance with the requirements of Subpart E of this part, except when adequate eye protection is afforded by eye shields which are permanently attached to the bench or floor stand.

- (d) Other requirements. All abrasive wheels and tools used by employees shall meet other applicable requirements of American National Standards Institute, B7.1-1970, Safety Code for the Use, Care and Protection of Abrasive Wheels.
- (e) Work rests. On offhand grinding machines, work rests shall be used to support the work. They shall be of rigid construction and designed to be adjustable to compensate for wheel wear. Work rests shall be kept adjusted closely to the wheel with a maximum opening of 1/8 inch (0.3175 cm) to prevent the work from being jammed between the wheel and the rest, which may cause wheel breakage. The work rest shall be securely clamped after each adjustment. The adjustment shall not be made with the wheel in motion.

Stats. Implemented: ORS 654.001 through 654.295.  
Hist: APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89.  
OR-OSHA Admin. Order 3-2000, f. 2/8/00, ef. 2/8/00.

## 1926.304 Woodworking Tools

- (a) Disconnect switches. All fixed power driven woodworking tools shall be provided with a disconnect switch that can either be locked or tagged in the off position.
- (b) Speeds. The operating speed shall be etched or otherwise permanently marked on all circular saws over 20 inches in diameter or operating at over 10,000 peripheral feet per minute. Any saw so marked shall not be operated at a speed other than that marked on the blade. When a marked saw is retensioned for a different speed, the marking shall be corrected to show the new speed.
- (c) Self-feed. Automatic feeding devices shall be installed on machines whenever the nature of the work will permit. Feeder attachments shall have the feed rolls or other moving parts covered or guarded so as to protect the operator from hazardous points.
- (d) Guarding. All portable, power-driven circular saws shall be equipped with guards above and below the base plate or shoe. The upper guard shall cover the saw to the depth of the teeth, except for the minimum arc required to permit the base to be tilted for bevel cuts. The lower guard shall cover the saw to the depth of the teeth, except for the minimum arc required to allow proper retraction and contact with the work. When the tool is withdrawn from the work, the lower guard shall automatically and instantly return to the covering position.

- (e) Personal protective equipment. All personal protective equipment provided for use shall conform to Subpart E of this part.
- (f) Other requirements. All woodworking tools and machinery shall meet other applicable requirements of American National Standards Institute, 01.1-1961, Safety Code for Woodworking Machinery.
- (g) Radial saws.
- (1) The upper hood shall completely enclose the upper portion of the blade down to a point that will include the end of the saw arbor. The upper hood shall be constructed in such a manner and of such material that it will protect the operator from flying splinters, broken saw teeth, etc., and will deflect sawdust away from the operator. The sides of the lower exposed portion of the blade shall be guarded to the full diameter of the blade by a device that will automatically adjust itself to the thickness of the stock and remain in contact with stock being cut to give maximum protection possible for the operation being performed.
- (h) Hand-fed crosscut table saws.
- (1) Each circular crosscut table saw shall be guarded by a hood which shall meet all the requirements of paragraph (i)(1) of this section for hoods for circular ripsaws.
- (i) Hand-fed ripsaws.
- (1) Each circular hand-fed ripsaw shall be guarded by a hood which shall completely enclose that portion of the saw above the table and that portion of the saw above the material being cut. The hood and mounting shall be arranged so that the hood will automatically adjust itself to the thickness of and remain in contact with the material being cut but it shall not offer any considerable resistance to insertion of material to saw or to passage of the material being sawed. The hood shall be made of adequate strength to resist blows and strains incidental to reasonable operation, adjusting, and handling, and shall be so designed as to protect the operator from flying splinters and broken saw teeth. It shall be made of material that is soft enough so that it will be unlikely to cause tooth breakage. The hood shall be so mounted as to insure that its operation will be positive, reliable, and in true alignment with the saw; and the mounting shall be adequate in strength to resist any reasonable side thrust or other force tending to throw it out of line.

## 1926.305 Jacks – Lever and Ratchet, Screw, and Hydraulic

### (a) General requirements.

- (1) The manufacturer's rated capacity shall be legibly marked on all jacks and shall not be exceeded.
- (2) All jacks shall have a positive stop to prevent overtravel.

### (b) (Reserved)

- (c) Blocking. When it is necessary to provide a firm foundation, the base of the jack shall be blocked or cribbed. Where there is a possibility of slippage of the metal cap of the jack, a wood block shall be placed between the cap and the load.

### (d)

#### (1) Operation and maintenance.

- (i) After the load has been raised, it shall be cribbed, blocked, or otherwise secured at once.
- (ii) Hydraulic jacks exposed to freezing temperatures shall be supplied with an adequate antifreeze liquid.
- (iii) All jacks shall be properly lubricated at regular intervals.
- (iv) Each jack shall be thoroughly inspected at times which depend upon the service conditions. Inspections shall be not less frequent than the following:
  - (a) For constant or intermittent use at one locality, once every 6 months,
  - (b) For jacks sent out of shop for special work, when sent out and when returned,
  - (c) For a jack subjected to abnormal load or shock, immediately before and immediately thereafter.
- (v) Repair or replacement parts shall be examined for possible defects.
- (vi) Jacks which are out of order shall be tagged accordingly, and shall not be used until repairs are made.

**OREGON OCCUPATIONAL  
SAFETY AND HEALTH STANDARDS**

Oregon Administrative Rules, Chapter 437

**DIVISION 3 (29 CFR 1926)  
CONSTRUCTION**

**CONSTRUCTION**

**Subdivision J  
Welding and Cutting**

Oregon Occupational Safety and Health Division (Oregon OSHA)  
Department of Consumer and Business Services  
Salem, Oregon 97301-3882

AO 6-2014

The Oregon Department of Consumer and Business Services adopted these rules pursuant to ORS 654.025(2).

The Secretary of State Designated OAR Chapter 437 as the “Oregon Occupational Safety and Health Code.” Six general subject areas within this code are designated as “Divisions.”

- **Division 1** General Administrative Rules
- **Division 2** General Occupational Safety and Health Rules
- **Division 3** Construction
- **Division 4** Agriculture
- **Division 5** Maritime Activities
- **Division 7** Forest Activities
- **Oregon Revised Statutes (ORS) 654** The Oregon Safe Employment Act (OSEAct)

Oregon-initiated rules in this division of the Oregon Occupational Safety and Health Code are numbered in a uniform system developed by the Secretary of State. This system does not number the rules in sequence (001, 002, 003, etc.). Omitted numbers may be assigned to new rules at the time of their adoption.

**Oregon-initiated rules** are arranged in the following Basic Codification Structure adopted by the Secretary of State for Oregon Administrative Rules (OAR):

Chapter	Division	Rule	Section	Subsection	Paragraphs
437	003	1760	(1)	(a)	(A)(i)(I)

The majority of Oregon OSHA codes are adopted by reference from the Code of Federal Regulations (CFR), and are arranged in the following basic federal numbering system:

Chapter	Division	Part	Subpart (Subdivision)	Section	Paragraphs
437	003	1926	M	.502	(a)

The terms “subdivision” and “subpart” are synonymous within OAR 437, Oregon Occupational Safety and Health Code.

---

To obtain an order form or copies of these codes, address:

**Department of Consumer & Business Services  
Oregon Occupational Safety & Health Division (Oregon OSHA)  
350 Winter St. NE, Room 430  
Salem, OR 97301-3882**

Or call the Oregon OSHA Resource Library at 503-378-3272

The rules referenced in this division are available for viewing in the Office of the Secretary of State, Administrative Rules and Office Document Section, Oregon State Archives Building, Salem, Oregon 97310, or the Central Office, Oregon Occupational Safety and Health Division of the Department of Consumer and Business Services, Room 430, 350 Winter St. NE Salem, OR 97301-3882. ## OAR 437, DIVISION 3

### CONSTRUCTION

#### SUBDIVISION J – WELDING AND CUTTING

**437-003-0001 Adoption by Reference.** *In addition to, and not in lieu of, any other safety and health codes contained in OAR Chapter 437, the Department adopts by reference the following federal regulations printed as part of the Code of Federal Regulations, in the Federal Register:*

**(10) Subdivision J – Cutting and Welding.**

- (a)** 29 CFR 1926.350 **Gas welding and cutting.** Repealed. Oregon OSHA Admin. Order 6-2014, f. 10/28/14, ef. 5/1/15. In Oregon, OAR 437-002-2253 applies.
- (b)** 29 CFR 1926.351 **Arc welding and cutting,** published 7/11/86, FR vol. 51, p. 25318.
- (c)** 29 CFR 1926.352 **Fire prevention,** published 4/6/79, FR vol. 44, p. 20940.
- (d)** 29 CFR 1926.353 **Ventilation and protection in welding, cutting, and heating,** published 6/30/93, FR vol. 58, no. 124, p. 35179.
- (e)** 29 CFR 1926.354 **Welding, cutting, and heating in way of preservative coatings,** published 4/6/79, FR vol. 44, p. 20940.

*These standards are available at the Oregon Occupational Safety and Health Division, Oregon Department of Consumer and Business Services, and the United States Government Printing Office.*

**Stat. Auth.:** ORS 654.025(2) and 656.726(4).

**Stats. Implemented:** ORS 654.001 through 654.295.

**SUBDIVISION J**

**WELDING AND CUTTING**

**Authority:** Sec. 107, Contract Work Hours and Safety Standards Act (Construction Safety Act) (40 U.S.C. 333); secs. 4, 6, 8, Occupational Safety and Health Act of 1970 (29 U.S.C. 653, 655, 657); Secretary of Labor's Order No. 12-71 (36 FR 8754), 8-76 (41 FR 25059), or 9-83 (48 FR 35736), as applicable.

**§1926.350 Repealed.**

**\*\*1926.350 was repealed. In Oregon, 437-002-2253 Oxygen-fuel gas welding and cutting applies (437-002-2253 is reprinted here from Division 2/Q.)\*\***

***437-002-2253 Oxygen-fuel gas welding and cutting.***

***(1) Scope and Application.*** *These rules apply to safe practices for users of oxy-fuel gas for welding, cutting, soldering, brazing, flame coating (thermal spraying), related materials and equipment, in general industry and construction. This rule does not apply to agriculture, forest activities, or maritime industries.*

***(2) Definitions.***

***Apparatus*** – *Includes regulators, hoses, connections (fittings), torches, manifolds and safety devices.*

***Approved*** – *Means listed or approved by a nationally recognized testing laboratory. Refer to 1910.7 for definitions and requirements for a nationally recognized testing laboratory.*

***Attended*** – *When a trained employee or qualified person is within sight of and can maintain control of the torch.*

***Brazing*** – *Is a metal joining process where filler metal is heated to join two or more close-fitting metal parts. It is similar to soldering but the temperatures used to melt the filler metal at or above 800°F.*

***Burners*** – *A type of torch system usually designed for stationary use at the bench or lathe. The material being worked, such as glass, is moved into and around the flame. Flame size is determined by valves that adjust the flow and mix of fuel gas and oxygen.*

***Check valve (reverse flow check valve)*** – *A device designed to prevent the unintentional backflow of gases.*

***NOTE:*** *Reverse flow check valves alone will not stop a flashback in the system.*

***Compartment (inside)*** – *Is within an enclosed vehicle and opens to the inside.*

**Compartment (outside)** – Is recessed or built into an enclosed vehicle but opens to the outside of the enclosed vehicle. This compartment seals the compressed gases from entering the vehicle compartment and is vented to the outside of the vehicle.

**Competent person** – one who is capable of identifying existing and predictable hazards in the surroundings or working conditions which are unsanitary, hazardous, or dangerous to employees, and who has authorization to take prompt corrective measures to eliminate them.

**Confined space:** A space that meets all of the following:

- Large enough and so configured that an employee can fully enter the space and perform work.
- Has limited or restricted means for entry or exit.
- Is not designed for continuous human occupancy.

**Containers (compressed, liquefied and dissolved gas)** – Cylinders, portable tanks, non-refillable cylinders, or stationary tanks, consisting of various shapes and sizes that are designed and constructed to meet ASME, TC or DOT specification.

**Crack (Cracking)** – Opening a cylinder valve slightly and immediately closing it prior to attaching a pressure reducing regulator. This is an approved process that applies only to oxygen cylinders.

**Cutting (oxy-fuel cutting)** – A process where a cutting torch is used to heat metal to kindling temperature. A stream of oxygen is then trained on the metal, and metal burns in that oxygen and then flows out of the cut.

**Cylinder(s)** – An approved DOT portable container used for transportation and storage of compressed gas. Generally a cylinder is a compressed gas container having a maximum water capacity of 454 kg (1000 lbs).

**Drop Test** – A method using compressed gas cylinder (container) pressure to test connected regulators, hoses, torch and connections for leaks.

**Enclosed space** – Spaces that are surrounded by something and the only openings are access openings, for example, drawers, closets, unventilated cabinets, automobile trunks, unventilated cylinder compartments or toolboxes.

**Enclosed vehicle** – Includes but is not limited to the interior of automobiles, automobile trunks, vans, or in any enclosed truck or trailer.

**Flame coating (thermal spraying)** – The use of oxygen and fuel gases to apply fine metallic or nonmetallic materials in a molten or semi-molten condition to form a coating. The coating material may be in the form of powder, ceramic-rod, wire, or molten materials.

**Flashback (flame) arrestor** – A device that prevents the propagation of a flame upstream.

**Fuel Gas** – A flammable product or mixture of products used in welding, cutting and heating processes. Commonly used fuel gases are available in compressed gases, liquefied and liquefied mixtures, acetylene dissolved, and gasoline.

**Handling** – Moving, connecting, or disconnecting oxygen and fuel gas containers under normal conditions.

## **OXYGEN-FUEL GAS WELDING AND CUTTING**

# **J**

**Leak test** – The application of a liquid solution, or the use of other methods, to verify that oxygen and fuel gas cylinders and apparatus do not leak. Solutions must be compatible with the gas being used.

**Manifold** – An apparatus designed to connect two or more cylinders for use. In construction this may mean that two cylinders or more are connected by pigtails to form a manifold.

**Moving cylinders** – The movement of a cylinder(s) from one location to another at the worksite or place of business.

**Periodic Inspection** – An inspection that is made at least once per quarter.

**Portable Cylinder banks** – Multiple cylinders manifolded together on a portable frame.

**PSIG (Gauge Pressure)** – Pressure above or below local atmospheric pressure displayed as pounds per square inch.

**Secure** – Arrange to prevent movement (including lashing and chaining), or a minimum of three points of contact with other cylinders or walls.

**Special truck** – A vehicle or cart that is designed for the specific purpose of moving compressed, dissolved and liquefied gas cylinders in a stable manner.

**Stored** – Cylinders without attached regulators, cylinders not secured to a workstation, or cylinders that have not been used for 24 hours or more will be considered stored. This does not include cylinders secured on a cart.

**NOTE 1:** No more than one additional set of cylinders may be secured to a workstation.

**NOTE 2:** Cylinders, with or without regulators, kept in or on vehicles due to their frequency of use will not be considered as stored when a leak test is performed at the end of the day. When cylinders are used during multiple shifts, they must be leak tested at the end of each shift.

**Soldering** – Is a metal joining process where filler metal is heated to join two or more close-fitting metal parts. It is similar to brazing but the temperatures used to melt the filler metal are below 800°F.

**Supervisory personnel (supervisor)** – An agent of the employer such as a manager, superintendent, foreperson, or person in charge of all or part of the place of employment who directs the work activities of one or more employees.

### **Torches:**

(Pre-mix) – Oxygen and fuel gases are mixed in a chamber within the torch body.

(Surface-mix) – Oxygen and fuel gases are mixed at the torch tip.

**Transporting cylinders** – Any cylinder movement by a vehicle to a worksite or place of business.

**NOTE 1:** A cylinder(s) loaded into a vehicle for movement to a worksite or place of business is not in storage.

**NOTE 2:** Requirements for the separation of oxidizers and fuel gases do not apply when cylinders are being transported to a work site or place of business.

*Use* – *Withdrawing and using the gas in a non-recoverable manner for applications other than manufacturing or repackaging of compressed gasses.*

*Valve end up* – *The tops of all acetylene cylinders are elevated so that the cylinders are inclined at an angle of not less than 30 degrees from horizontal (to protect against loss of acetone).*

*Welder and welding operator* – *One who operates electric or gas welding and cutting equipment.*

*Welding (oxy-fuel welding)* – *A process using fuel gases and oxygen to weld metals. Welded metal occurs when two pieces are heated to a temperature that produces a shared pool of molten metal. The molten pool is generally supplied with additional metal called filler. Filler material depends upon the metals to be welded.*

### **(3) Training and Evaluation.**

*(a) You must provide training by a competent person that covers:*

*(A) Procedures, practices and requirements for representative tasks employees are expected to perform.*

*(B) Instructions for safe use, operation and maintenance of tools, equipment and machinery.*

*(C) Manufacturer's operating and maintenance instructions, warnings and precautions.*

*(D) Work performance expectations in a language or manner that employees are able to understand.*

*(E) Hazards associated with expected tasks.*

*(F) Ways to prevent or control identified hazards.*

*NOTE: A new employee does not need to be retrained in all of (3)(a)(A)-(F) if you are able to determine through discussion and observations that they received adequate training prior to employment with you. Retraining is required if the employee fails to demonstrate the knowledge and experience to safely perform the expected tasks.*

*(b) You must evaluate employee's ability to adequately perform the expected tasks prior to allowing them to work independently.*

### **(4) General Requirements.**

*(a) You must:*

*(A) Guard against mixtures of fuel gases and air or oxygen that may be explosive.*

*(i) Use approved apparatus such as torches, regulators, or pressure reducing valves, hoses and connections, protective equipment, acetylene generators, and manifolds.*

*(ii) Install and use reverse flow check valves and flashback arrestors according to torch manufacturers' recommendations unless they are not required by the manufacturer.*

## **OXYGEN-FUEL GAS WELDING AND CUTTING**

**J**

**(B)** Use cylinders that meet the Department of Transportation requirements published in 49 CFR Part 178.

**(C)** Use portable cylinders for the storage and shipment of compressed gases that are constructed and maintained in accordance with the U.S. Department of Transportation regulations, 49 CFR Parts 171-179.

**(D)** Use compressed gas cylinders equipped with connections complying with Compressed Gas Association (CGA) Pamphlet V-1 1994, 7<sup>th</sup> Edition, Standard for Compressed Gas Cylinder Valve Outlet and Inlet Connections.

**(E)** Use compressed gas cylinders whose contents are legibly marked with:

**(i)** The chemical or trade name of the gas in conformance with Compressed Gas Association (CGA) Pamphlet C-7 2011, 9<sup>th</sup> Edition, Guide to Preparation of Precautionary Labeling and Marking of Compressed Gas Containers, and

**(ii)** Stenciling, stamping, or labeling that is not readily removable.

**(F)** Protect against oil and grease hazards.

**(i)** Keep cylinders, cylinder valves, couplings, regulators, hose, and apparatus free from oily or greasy substances.

**(ii)** Keep oxygen cylinders away from contacting oil and grease.

**(G)** Follow the requirements of OAR 437-002-2253(13) Service Piping, OAR 437-002-2253 (14) Acetylene Generators, OAR 437-002-2253 (15) Calcium Carbide Storage when generating acetylene for immediate use at the work location.

**(H)** Make readily available the rules and instructions covering the operation and maintenance of oxygen or fuel-gas supply equipment including generators, and oxygen or fuel-gas distribution piping systems.

**(b)** You must not:

**(A)** Remove any product or shipping hazard labels.

**(B)** Deface any product or shipping hazard labels.

**(C)** Use liquid acetylene.

**(D)** Generate acetylene at a pressure in excess of 15 psig (30 psia).

**(E)** Pipe or use acetylene at a pressure in excess of 15 psig unless it is in an approved manifold.

**NOTE 1:** This requirement does not apply to storage of acetylene dissolved in a suitable solvent in cylinders manufactured and maintained according to U.S. Department of Transportation requirements, or to acetylene for chemical use.

**NOTE 2:** Due to the instability of acetylene, the 15 psig (30 psia) limit is intended to prevent unsafe use of acetylene in pressurized chambers such as caissons, underground excavations, or tunnel construction.

**(F)** Use any device or attachment facilitating or permitting mixtures of air or oxygen with flammable gases prior to consumption, except at the burner or in a standard torch, unless approved for the purpose.

**(G)** Attempt to mix gases in a cylinder unless you are a gas supplier.

**(H)** Refill a cylinder unless you are:

**(i)** The owner of the cylinder, or

**(ii)** Authorized by the owner of the cylinder.

**(I)** Use a cylinder's contents for purposes other than those intended by the supplier.

**(J)** Use a damaged cylinder.

**(K)** Repair or alter cylinders or valves.

**(L)** Tamper with the numbers and markings stamped into cylinders.

**(M)** Handle oxygen cylinders, cylinder caps and valves, couplings, regulators, hoses, and apparatus with oily hands or gloves.

**(N)** Permit a jet of oxygen to:

**(i)** Strike an oily surface.

**(ii)** Strike greasy clothes.

**(iii)** Enter a fuel oil or other storage tank.

**(O)** Blow off clothing with oxygen.

**(P)** Use oxygen in pneumatic tools, in oil preheating burners, to start internal-combustion engines, to blow out pipelines, to create pressure, or for ventilation.

**(5) Transportation of Compressed, Liquefied and Dissolved Gas Cylinders.**

**(a)** When transporting cylinders in vehicles you must:

**(A)** Secure cylinders from moving.

**(B)** Keep valve protection caps in place on cylinders when regulators are not attached.

**NOTE:** This applies to cylinders designed to accept valve caps.

**(C)** Protect cylinder valves and regulators when regulators are attached.

## **OXYGEN-FUEL GAS WELDING AND CUTTING**

**J**

**(D)** Keep acetylene gas cylinders with valve(s) end up.

**(E)** Keep liquid cylinder valve(s) vertical.

**(F)** Keep oil residue from contacting oxygen cylinders.

**(b)** When transporting cylinders in enclosed vehicle(s) you must:

**NOTE:** This rule does not apply to cylinders transported in an unoccupied enclosed truck or trailer compartment with a shippers' certificate meeting the code for Hazardous Materials Regulations CFR 49 part 172.204.

**(A)** Ensure that cylinders are leak checked prior to each placement into the vehicle. Cylinders left in vehicles overnight must be leak checked at the end of the day and again prior to transporting.

**(B)** Cap cylinders.

**(C)** Secure cylinders from movement.

**(D)** Isolate fuel gas cylinders from sources of ignition.

**(E)** Maintain vehicle temperatures below 125 degrees.

**Note:** Temperatures in vehicles can exceed 125 F during sunny or warm weather. This may affect your decision to leave cylinders in vehicles for periods of time when temperatures may climb.

**(F)** Remove cylinders from the "inside vehicle compartment" to the outside of the vehicle prior to use.

**(G)** Open "outside vehicle compartment" doors when withdrawing product from cylinders.

**(H)** Ensure that all outside cylinder compartment(s) are sealed to prevent leakage to the inside of the vehicle. Outside compartment doors must open to the outside of the vehicle.

**(I)** Ensure the interior of any cylinder compartment containing oxidizers does not contain petroleum products or materials that have contacted petroleum products.

**(c)** When transporting cylinders in vehicles you must not put them in the trunks of passenger vehicles.

**(6) Storage of Oxygen and Fuel Gas Cylinders.**

**(a)** You must store oxygen and fuel gas cylinders in locations:

**(A)** Specifically assigned.

**(B)** Well ventilated.

**(C)** That avoids prolonged exposure to damp environments.

- (D) Away from heat sources.*
- (E) Posted with signs prohibiting smoking and open flame within 20 feet.*
- (F) Where the temperature does not exceed 125°F (52°C).*
- (G) Where sparks, hot slag, or flame will not reach them.*
- (H) Where they will not contact electrical welding equipment or electrical circuits.*

*NOTE: All high and low pressure cylinders in contact with or secured to a conductive table or column without being isolated from electrical current can become part of an electrical circuit.*

- (I) Where they are protected from corrosion.*
- (J) Where they cannot be knocked over.*
- (K) Where they cannot be damaged by passing or falling objects.*
- (L) Where they will not be tampered with by unauthorized persons.*
- (M) Where they will not be struck by heavy objects.*
- (N) Away from inside or outside exit routes or other areas normally used or intended for safe travel of personnel.*
- (O) Where they will not be subject to unventilated enclosed spaces.*
- (P) That are not identified as confined spaces.*
- (Q) With prominent signs posted identifying the names of the gasses stored.*

*(b) You must store cylinders in the following manner:*

- (A) With valve caps in place.*
- (B) Valve end up and secured from movement.*
- (C) Liquefied gas cylinders and acetylene cylinders with valve end up.*

*NOTE: Liquefied petroleum gas cylinders used on forklifts may be stored either horizontally or vertically.*

- (D) Refrigerated liquid cylinders in a vertical position.*
- (E) With all individual oxygen and flammable gas cylinder valves on portable cylinder banks closed.*

## **OXYGEN-FUEL GAS WELDING AND CUTTING**

**J**

**(c)** You must separate oxygen cylinders from fuel-gas cylinders or combustible materials (especially oil or grease) and any other substance likely to cause or accelerate fire by:

**(A)** A minimum distance of 20 feet, or

**(B)** A noncombustible barrier that:

**(i)** Vertically extends 18 inches above the tallest cylinder(s) and is at least 5 feet high.

**(ii)** Laterally extends 18 inches beyond the sides of the cylinders.

**(iii)** Has a fire-resistance rating of at least one-half hour.

**(d)** You must separate oxygen and fuel gas cylinders secured on a cart from assigned cylinder storage areas by a minimum of 20 feet or a non combustible barrier.

**NOTE 1:** Single cylinders of oxygen and fuel gas can be secured on a cart or used adjacent to each other without being separated by a partition.

**NOTE 2:** An additional set of cylinders secured at a workstation without attached pressure reducing regulators will be considered in use and not in storage.

**(e)** You must limit cylinders, except those in actual use or attached ready for use, stored inside buildings to a total gas capacity of 2,000 cubic feet or 300 pounds of liquefied petroleum gas.

**(f)** Store cylinders of fuel gases in excess of 2,000 cubic feet total gas capacity or 300 pounds of liquefied petroleum gas (LPG), or any LPG mixture where LPG is the primary gas, (this does not apply to cylinders in actual use or attached ready for use) in the following manner:

**(A)** Outside, or

**(B)** In a separate room, compartment or special building with interior walls, partitions, floors, and ceilings that:

**(i)** Are constructed with noncombustible material having a fire-resistance floor to ceiling

**(ii)** Are securely anchored

**(iii)** Have at least one wall of the room that is an exterior wall

**(C)** The room must have a swinging type, self-closing fire door for a Class B opening and have a rating of at least 1 hour if there are openings to other parts of the building.

**(D)** The room must have wired glass windows mounted with approved metal frames and fixed sashes where windows are used. They must be installed in accordance with the Standard for the Installation of Fire Doors and Windows, NFPA 80-1970.

**(g)** You must comply with the provisions of the Compressed Gases and Cryogenic Fluid Code, NFPA No. 55-2010 when a liquid oxygen system is to be used to supply gaseous oxygen that has a storage capacity of more than 20,000 cubic feet of oxygen (measured at 14.7 psia (101 kPa) and 70° F (21.1° C)), connected in service or ready for service, or unconnected reserves on site.

**(h)** The handling, storage, and utilization of all compressed gases in cylinders, portable tanks, rail tank cars, or motor vehicle cargo tanks must be in accordance with Compressed Gas Association (CGA) Pamphlet P-1 2008, 11<sup>th</sup> Edition, Safe Handling of Compressed Gases in Containers.

**(7) Handling of Oxygen and Fuel Gas Cylinders.**

**(a)** When handling or moving cylinders you must:

**(A)** Provide adequate access for cylinder handling.

**(B)** Remove regulators and ensure any required valve protection is in place before moving unsecured cylinders.

**(C)** Move cylinders using a special truck, a cylinder hand truck, a cart or cylinder pallet.

**NOTE:** This rule does not apply to acetylene manufacturers, cylinder fill plants and distributors of compressed gases and acetylene. (7)(a)(C) does not apply to the movement of individual fuel gas cylinders of 40 cubic feet (b-tank) or less.

**(D)** Leave the valve protection cap and valve seal outlet in place until the cylinder has been secured in place and is ready to be connected to a regulator or manifold.

**NOTE:** This does not apply to manufacturers and distributors of compressed gases and acetylene plants where cylinders are connected and disconnected to cylinder manifolds.

**(E)** Use warm, not boiling, water to thaw frozen cylinders loose from the ground or if otherwise fixed.

**(b)** When moving cylinders by a crane or derrick you must:

**(A)** Use a cradle, boat, or suitable platform that secures cylinders.

**(B)** Install valve-protection caps on cylinders, including those cylinders with a water weight capacity of over 30 lbs., designed to accept a cap.

**(C)** Not use slings or electric magnets for this purpose.

**(c)** Before moving a portable bank or cylinder cradles you must:

**(A)** Close all individual oxygen and flammable gas cylinder valves on portable cylinder banks when in storage.

**(B)** Restrict manual movement of portable cylinder banks to clean, smooth, level stationary surfaces.

**(C)** Stay out of the portable-bank's travel path when moving manually.

## **OXYGEN-FUEL GAS WELDING AND CUTTING**

# **J**

*(d) When moving a portable bank or cylinder cradles with a forklift you must secure them to the forklift.*

*(e) When moving a portable bank or cylinder cradles with a crane you must use the lifting hook attached to the cradles or other appropriate moving equipment.*

*(f) When lifting liquid cylinders you must:*

*(A) Lift by using the cylinder lift eyes.*

*(B) Use a lifting device designed for the lift and rated for the weight.*

*(g) Before moving cylinders to storage you must:*

*(A) Close the cylinder valve.*

*(B) Replace and secure any valve outlet seals.*

*(C) Properly install the cylinder cap.*

*(h) When handling or moving cylinders you must not:*

*(A) Repair or alter cylinders or valves.*

*(B) Place bars under valves or valve protection caps to pry cylinders loose when frozen to the ground or otherwise fixed.*

*(C) Use valve protection caps for lifting or lowering cylinders manually or with a crane from one position or location to another.*

*(D) Drag or slide cylinders.*

*(E) Lift liquid cylinders by the cylinder grab ring.*

*(F) Drop cylinders or permit them to strike each other violently.*

*(G) Subject any cylinder to mechanical shocks that may damage the valve.*

*(H) Use cylinders as rollers for moving material or other equipment.*

*(I) Permit oil, grease or other combustible substances to contact cylinders, valves, or other apparatus.*

*(J) Attempt to catch a falling cylinder.*

*(K) Place cylinders where they can become part of an electrical circuit.*

**NOTE:** *All pressurized cylinders in contact with or secured to a conductive table or column without being isolated from electrical current can become part of an electrical circuit.*

*(i) When connecting cylinders for use you must:*

*(A) Use a pressure-reducing regulator or separate control valve to discharge gas from a cylinder.*

*(B) Use regulators approved for the specific gas.*

*(C) Loosen the valve outlet seal slowly when preparing to connect a cylinder.*

*(D) Back out the regulator adjusting screws before opening cylinder valves.*

*(E) Open oxygen cylinder valves slowly and slightly (called cracking) for an instant and then close before attaching a regulator. Stand with the cylinder valve between you and the valve outlet connection so the outlet connection is facing away from your body when cracking an oxygen cylinder.*

*NOTE: Cracking is an approved process that applies only to oxygen cylinders.*

*(F) Open acetylene cylinder valves no more than one and one half turns.*

*NOTE: It is preferable to open the acetylene valve no more than three-fourths of a turn.*

*(G) Return cylinders with contaminated valves (mud, oil, grease, and similar material) to the supplier.*

*(H) Use acetylene tank keys or wrenches designed to open acetylene stem type valves.*

*(I) Notify the supplier if cylinder valves cannot be opened by hand.*

*(J) Stand with the cylinder valve between you and the regulator so your body, the cylinder valve, and regulator form a straight line when opening the cylinder valve.*

*(K) Open cylinder valves slowly and carefully after the cylinder has been connected to the process.*

*(L) Ensure that cylinder valves, pressure-reducing regulators, hoses, torches and all connections do not leak.*

*(i) Perform a drop test*

- Ensure that both the oxygen and fuel control valves on the torch handle are closed.*
- With the oxygen cylinder valve open, adjust the oxygen regulator to deliver a minimum of 20 PSIG (10kPa).*
- With the fuel cylinder valve open, adjust the fuel regulator to deliver a minimum of 10 PSIG (70kPa).*
- Close both the oxygen and fuel cylinder valves.*
- Turn the adjusting screws counterclockwise to relieve regulator pressure.*
- Observe the gauges on both regulators for a minimum of five minutes. If the gauge readings do not change, then the system is leak tight. If there is a leak, use an approved leak detection method to locate it.*

## **OXYGEN-FUEL GAS WELDING AND CUTTING**

# **J**

*(ii) If the pressure drops during the drop test, perform a leak test to identify all leaks.*

*(iii) Use industry approved oil free leak detection solution.*

*(iv) Perform a leak test on cylinder pressure relief and safety devices, valves and regulator connections after the cylinder valve is open and connected to the pressure reducing regulator.*

*(v) Remove from service any cylinder that leaks at the valve, safety device or fittings that cannot be stopped by closing the valve. Isolate the cylinder away from ignition sources.*

***NOTE:** Remove leaking cylinders to a safe outside location whenever possible. A warning should be placed near cylinders with leaking fuse plugs or other leaking safety devices not to approach them with a lighted cigarette or other source of ignition.*

*(vi) Promptly notify the supplier of any leaking cylinder or trouble with any cylinder valve and follow their instructions.*

*(vii) Tag cylinders having leaking fuse plugs or other leaking safety devices.*

*(M) Keep the cylinder key used for opening stem type cylinder valves on the valve spindle.*

*(N) Allow each gas to flow through its respective hose for a few seconds to purge the hose of any mixture of gases:*

*(i) After connecting welding, cutting or heating apparatus to oxygen and fuel-gas cylinders.*

*(ii) When starting to reuse the apparatus after an interval of a half hour or more.*

*(j) When connecting cylinders you must not:*

*(A) Open cylinder valves (other than cracking oxygen) until a regulator has been attached.*

*(B) Stand or have any body part in front or behind the pressure reducing regulator when opening cylinder valves.*

*(C) Use a hammer or wrench to open hand wheel cylinder valves.*

*(k) When removing regulators from cylinders you must:*

*(A) Ensure that oxygen and fuel gas cylinder valves are closed.*

*(B) Visually check the low pressure delivery gauges and high pressure supply gauge to ensure there is no pressure remaining in the system.*

*(C) Use the appropriate wrench to disconnect the regulator.*

*(D) Place disconnected regulators, hoses, and torches where they will not come into contact with dust and oily or greasy substances.*

**(8) Use of Oxygen and Fuel Gas Cylinders.**

**(a)** When using cylinders you must:

**(A)** Secure from movement with valve end up.

**(B)** Perform a drop test as defined in (7)(i)(L)(i) at the beginning of each shift to verify no leaks exist.

**(C)** Close cylinder or manifold valves:

**(i)** Before moving cylinders.

**(ii)** At the end of the shift or when work is finished.

**(iii)** When cylinders are empty.

**(D)** Place cylinders far enough away from the actual welding or cutting operation to:

**(i)** Ensure sparks, hot slag, or flame will not reach them, or

**(ii)** Protect them with fire resistant shields.

**(E)** Keep cylinders away from radiators, piping systems, layout tables, etc., that may be used for grounding electric circuits such as for arc welding machines.

**(F)** Keep keys, handles or nonadjustable wrenches on valve stems of cylinders not having fixed hand wheel while these cylinders are in service.

**(G)** Keep one key or handle on valve stems for each in service manifold in multiple cylinder installations.

**(H)** Allow each gas to flow through its respective hose for a few seconds to purge the hose of any mixture of gases before using a torch assembly that has been shutdown for an interval of one half hour or more.

**(I)** Follow the apparatus manufacturer's operating sequence when lighting, adjusting, and extinguishing torch flames.

**(J)** Close the torch handle valves on oxygen and/or fuel gas when the welding and cutting equipment is unattended for only a few minutes.

*Note: This does not apply to jeweler's torches or other torches similar in size when placed in proper holders.*

**(K)** Completely shut down a torch system (refer to (8)(a)(C)) in the following order:

**(i)** Close and drain the oxygen system before the closing and draining of the fuel gas system.

## **OXYGEN-FUEL GAS WELDING AND CUTTING**

# **J**

*(ii) Open the torch valves momentarily after closing the cylinder valves to release all gas pressure from the hoses and regulators; then close the torch valves.*

*(iii) Turn the regulator pressure adjusting screws counter clockwise to release all spring pressure.*

*(iv) Visually check the low pressure delivery gauge and high pressure supply gauge to ensure there is no pressure remaining in the system.*

**(b)** *When using cylinders you must not:*

**(A)** *Place a cylinder where it might become part of an electric circuit.*

**(B)** *Tap an electrode against a cylinder to strike an arc.*

**(C)** *Use a cylinder as a roller or support.*

**(D)** *Attempt to mix gases in a cylinder unless you are the gas supplier.*

**(E)** *Refill a cylinder unless you are the owner of the cylinder or a person authorized by the owner.*

**(F)** *Use a cylinder's contents for purposes other than those intended by the supplier.*

**(G)** *Tamper with safety devices on cylinders or valves.*

**(H)** *Drop or handle cylinders roughly.*

**(I)** *Put down a lighted torch unless the torch or torch assembly is placed in a holder and secured from unintended movement.*

**(J)** *Use the regulator adjusting screw as a shut-off mechanism.*

**(K)** *Place anything on top of any cylinder when in use which may damage the safety device or interfere with the quick closing of the valve.*

**(L)** *Take cylinders containing oxygen or acetylene or other fuel gas into confined spaces.*

### **(9) Pressure Reducing Regulators.**

**(a)** *When using pressure reducing regulators you must:*

**(A)** *Use them with cylinder and piping outlets to ensure suitable working pressure for fuel gas and oxygen-fuel gas applications.*

**(B)** *Use them for the gas and pressures for which they are intended.*

**(C)** Ensure that regulator inlet connections are marked with an identifying Compressed Gas Association (CGA) number.

**NOTE:** The CGA numbers identify the cylinder valve and gas service for which an inlet connection is designed.

**(D)** Ensure that inlet connections of regulators intended for attachment to gas storage cylinders comply with the requirements of Compressed Gas Association (CGA) Pamphlet V-1 1994, 7<sup>th</sup> Edition, Standard for Compressed Gas Cylinder Valve Outlet and Inlet Connections and Compressed Gas Association (CGA) Pamphlet V-7 2009, 5<sup>th</sup> Edition, Standard Method of Determining Cylinder Valve Outlet Connections for Industrial Gas Mixtures.

**(E)** Ensure that regulators or parts of regulators, including gauges, are repaired only by skilled mechanics who have been properly instructed.

**(F)** Use oxygen regulators that are marked with "USE NO OIL."

**(G)** Use acetylene regulator with a delivery pressure gauge that graphically indicates the maximum 15 psig working pressure.

**(H)** Inspect regulator union nuts and connections to detect faulty seats before the regulators are attached to the cylinder valves.

**(I)** Fully turn the regulator pressure-adjusting screw counter clockwise before slowly opening the cylinder valve.

**(J)** Keep pressure-reducing regulators in good repair.

**(K)** Replace cracked, broken or otherwise defective parts (including gauge glasses).

**(b)** When using pressure reducing regulators you must not:

**(A)** Use the regulator adjusting screw as a "shut-off" mechanism.

**(B)** Use oxygen and/or fuel gases from cylinders, piping, or manifolds through torches or other devices equipped with shutoff valves without using a pressure reducing regulator.

**(10) Hose and Hose Connections.**

**(a)** When using fuel gas and oxygen hoses you must:

**(A)** Use hoses that comply with the Compressed Gas Association (CGA) Pamphlet E-1 2009, 6<sup>th</sup> Edition, Standard for Rubber Welding Hose and Hose Connections for Gas Welding, Cutting, and Allied Processes and Association for Rubber Products Manufacturers (ARPM) Publication IP-7 2011, 10<sup>th</sup> Edition.

**NOTE:** This standard does not apply to liquefied petroleum gas hose covered under NFPA 58, Liquefied Petroleum Gas Code applicable to the propane industry.

## **OXYGEN-FUEL GAS WELDING AND CUTTING**

**J**

**(B)** Use fuel gas and oxygen hoses that are easily distinguishable from each other.

**NOTE:** The contrast may be made by different colors or by surface characteristics readily distinguishable by the sense of touch. Use red for fuel gases, green for oxygen, and black for inert gas.

**(C)** Use "Grade T" hose for most fuel gases to include acetylene.

**Note:** Grade R or RM hose may only be used with acetylene. Do not use with any other fuel gas.

**(D)** Use oil free air or an oil free inert gas to test hoses.

**(E)** Keep hoses and couplings (connectors) free from oily or greasy substances.

**(F)** Visually inspect each hose for leaks, burns, worn places, bulges, cracks, crimps, multiple splices, cuts, oil and grease, damaged or worn fittings, and other defects rendering it unfit for service:

**(i)** At the beginning of each task, the portion of hose intended for use, or

**(ii)** At the end of each working shift, the portion of hose used before storing it on a cart or hose reel.

**(G)** Perform inspections on hoses and hose connections following any failed drop test to determine the cause of the failure.

**(H)** Test hose to twice the normal pressure it will be subjected to but in no case less than 300 psi. when it:

**(i)** Has been subject to flashback, or

**(ii)** Shows evidence of severe wear or damage.

**(I)** Repair or replace hoses that have defects rendering them unfit for service.

**(J)** Protect hoses from damage by physical hazards, hot objects, or kinking.

**(K)** Keep hoses, cables, and other equipment clear of passageways, ladders and stairs.

**(L)** Use manifold hose connections, including both ends of the supply hose that lead to the manifold, with hose that cannot be interchanged between fuel gas and oxygen manifolds and supply header connections. You must not use adapters to permit the interchange of hose.

**(M)** Cap manifold and header hose connections when not in use.

**(N)** Store gas hoses in ventilated boxes.

**(b)** When using fuel gas and oxygen hoses you must not:

**(A)** Route in such a manner that severely bends the hose at the hose coupling (connector).

- (B) Pull or drag welding equipment with the hose assembly.*
- (C) Drag or rest hoses on materials that are not fully cooled.*
- (D) Drag hoses across potential puncture or abrading points.*
- (E) Handle oxygen hoses with oily hands or oily gloves.*
- (F) Tape together more than 4 inches out of 12 inches of parallel sections of oxygen and fuel gas hose.*
- (G) Use a single hose having more than one gas passage.*
- (H) Repair damaged hoses with tape.*
- (I) Use a defective hose.*

*(c) Hose connections must:*

- (A) Comply with Compressed Gas Association (CGA) Pamphlet E-1 2009, 6<sup>th</sup> Edition, Standard for Rubber Welding Hose and Hose Connections for Gas Welding, Cutting, and Allied Processes, (3) Connections.*
  - (B) Clamp or securely fasten in a manner that will withstand twice the pressure to which they are normally subjected, and in no case less than a pressure of 300 psi, for one (1) minute, without leakage.*
  - (C) Use oxygen and fuel gas connection fittings that are different in size and prevent the intermixing of connections, or*
  - (D) Be marked in a manner to identify the oxygen and fuel gas hose.*
  - (E) Use hose couplings that cannot be unlocked or disconnected by means of a straight pull without rotary motion.*
- (d) When using hose connections you must not use adaptors that permit the interchange of manifold hose connections.*

**(11) Torches used with Oxygen and Fuel Gas.**

*(a) When using oxygen and fuel gas torches you must:*

- (A) Follow the manufacturer's recommendation for the use of torch handles with internal check valves and flashback arrestors.*
- (B) Keep torches free from oily or greasy substances.*
- (C) Clean clogged torch tip openings with suitable:
  - (i) Cleaning wires.**

*(ii) Drills.*

*(iii) Devices designed for such purposes.*

**(D)** *Inspect torches following any failed drop test to determine the cause of the failure prior to using. Check:*

*(i) Shut-off valves.*

*(ii) Hose couplings.*

*(iii) Tip connections.*

**(E)** *Only light torches with friction lighters, stationary pilot flames or other approved devices.*

**(b)** *You must not:*

**(A)** *Use defective torches.*

**(B)** *Light a torch:*

*(i) With matches.*

*(ii) From hot work.*

*(iii) With other hand held open flame.*

**(12) Manifolds with Oxygen and Fuel Gas.**

**(a)** *When working with oxygen and fuel gas manifolds you must:*

**(A)** *Label each manifold with the name of the product they contain in letters at least 1-inch high:*

*(i) Use permanent signage, or*

*(ii) Use painted letters.*

**(B)** *Place oxygen and fuel gas manifolds in safe, well ventilated and accessible locations.*

**(C)** *Use manifolds that are either approved separately for each component part or as an approved assembled unit.*

**(D)** *Limit the total capacity of fuel-gas cylinders connected to one manifold inside a building. The total capacity must not exceed 300 pounds (135.9 kg) of liquefied petroleum gas or 3,000 cubic feet (m<sup>3</sup>) of other fuel-gas, except as provided for in paragraph (a)(F).*

**(E)** *Separate more than one manifold connected to cylinders located in the same room by:*

- (i) At least 50 feet, or*
  - (ii) A noncombustible partition that:*
    - (I) Extends at least 18 inches above the tallest container and is not less than 5 feet high.*
    - (II) Extends laterally at least 18 inches beyond the sides of the containers.*
    - (III) Has a fire-resistance rating of at least one-half hour.*
- (F) Locate fuel-gas cylinders connected to one manifold having an aggregate capacity exceeding 300 pounds of liquefied petroleum gas or 3,000 cubic feet of other fuel-gas:*
- (i) Outdoors, or*
  - (ii) In a separate building or room constructed in accordance with the rules on acetylene generators (14)(d)(H)(i), (d)(H)(ii), and (d)(H)(iii) and (14)(d)(I)(i), (d)(I)(ii), and (d)(I)(iii).*
- (G) Ensure that separate manifold buildings or rooms used for storage of calcium carbide and cylinders containing fuel gases:*
- (i) Are well-ventilated.*
  - (ii) Do not have open flames for heat or lighting.*
  - (iii) Are in compliance with Storage (6)(f)(B) when cylinders exceed 2000 cubic feet or 300 pounds of liquefied petroleum gas.*
- (H) Use approved pressure regulating devices on high-pressure fuel-gas manifolds.*
- (I) Use manifold hose connections that are not interchangeable on all ends of the supply hose that leads to the manifold.*
- (J) Keep hose connections free of grease and oil.*
- (K) Cap manifold and header hose connections when not in use.*
- (b) When working with oxygen and fuel gas manifolds you must not:*
- (A) Locate oxygen and fuel gas manifolds in enclosed or confined spaces.*
  - (B) Use adaptors that permit the interchange of manifold hose connections.*
  - (C) Place anything on top of a manifold when in use which will:*
    - (i) Damage the manifold*
    - (ii) Interfere with the quick closing of the manifold valve(s).*

## **OXYGEN-FUEL GAS WELDING AND CUTTING**

# **J**

**(c)** *When using high-pressure oxygen manifolds (for use with cylinders having a Department of Transportation service pressure above 200 psig (1.36 MPa)) you must:*

**(A)** *Use manifolds that are either approved separately for each component part or approved as an assembled unit.*

**(B)** *Separate oxygen manifolds from fuel-gas cylinders or combustible materials (especially oil or grease) by a:*

**(i)** *Minimum distance of 20 feet, or*

**(ii)** *Noncombustible partition that complies with Compressed Gas Association (CGA) Pamphlet P-1 2008, 11th Edition, Safe Handling of Compressed Gases in Containers:*

**(I)** *Extends at least 18 inches above the tallest container and is not less than 5 feet high.*

**(II)** *Extends laterally at least 18 inches beyond the sides of the containers.*

**(III)** *Has a fire-resistance rating of at least one-half hour.*

**(C)** *Limit oxygen cylinders connected to one manifold to a total gas capacity of 6,000 cubic feet except as provided in paragraph (c)(E).*

**(D)** *Separate manifolds by:*

**(i)** *At least 50 feet, or*

**(ii)** *A noncombustible partition that complies with Compressed Gas Association (CGA) Pamphlet P-1 2008, 11th Edition, Safe Handling of Compressed Gases in Containers:*

**(I)** *Extends at least 18 inches above the tallest container and not less than 5 feet high.*

**(II)** *Extends laterally at least 18 inches beyond the sides of the containers.*

**(III)** *Has a fire-resistance rating of at least one-half hour.*

**NOTE 1:** *If you have a preexisting noncombustible barrier used to separate oxygen from combustible materials or fuel gases other than acetylene, the barrier must be a minimum of 5 feet high and have a minimum fire resistance rating of one-half hour. Noncombustible barriers built on, or modified after, May 1, 2015 must comply with the 18 inch dimensions found in 437-002-2253(12)(c)(D)(ii)(I) and (II).*

**NOTE 2:** *437-002-2102 Acetylene requires noncombustible partitions used for oxygen and acetylene separation to extend 18 inches horizontally and vertically.*

**(E)** *Locate an oxygen manifold inside a building having other occupancy, with an aggregate cylinder capacity of more than 6,000 cubic feet of oxygen, in a separate room that is:*

- (i) Of noncombustible construction having a fire-resistance rating of at least one-half hour, or*
- (ii) A noncombustible partition that complies with Compressed Gas Association (CGA) Pamphlet P-1 2008, 11th Edition, Safe Handling of Compressed Gases in Containers:*
- (I) Extends at least 18 inches above the tallest container and is not less than 5 feet high.*
  - (II) Extends laterally at least 18 inches beyond the sides of the containers.*
  - (III) Has a fire-resistance rating of at least one-half hour.*
- (F) Comply with NFPA 55, 2010 Edition, Compressed Gases and Cryogenic Fluid Code, when an oxygen manifold or oxygen bulk supply system has more than 20,000 cubic feet of oxygen (measured at 14.7 psia (101 kPa) and 70<sup>0</sup> F (21.1°C)), connected in service, ready for service, or unconnected reserves on hand at the site.*
- (G) Use approved pressure regulating devices on high-pressure oxygen manifolds.*
- (d) When using high pressure oxygen manifolds you must not locate them in an acetylene generator room.*
- (e) When using low-pressure oxygen manifolds with cylinders having a Department of Transportation service pressure not exceeding 200 psig (1.36 Mpa) you must:*
- (A) Use manifolds that:*
    - (i) Are constructed for use with oxygen at a pressure of 250 psig.*
    - (ii) Have a minimum bursting pressure of 1,000 psig.*
    - (iii) Are protected by a safety relief device that will relieve at a maximum pressure of 500 psig.*
- NOTE: DOT-4L200 cylinders safety device relieve at a maximum pressure of 250 psig, or 235 psig if vacuum insulation is used.*
- (B) Use hose and hose connections subject to cylinder pressure that have a bursting pressure of 1,000 psig.*
  - (C) Test and prove manifolds are gas-tight at a pressure of 300 psig.*
  - (D) Use oil-free non-combustible fluid for testing oxygen manifolds.*
  - (E) Locate manifolds to comply with paragraphs (c)(B), (C), (D), (E), and (F) and all their parts.*

## **OXYGEN-FUEL GAS WELDING AND CUTTING**

**J**

**(F)** Post the following sign at each manifold:

*Low-Pressure Manifold  
Do Not Connect High-Pressure Cylinders  
Maximum Pressure – 250 psig*

**(f)** When using portable outlet headers you must:

**(A)** Equip each outlet on the service piping from which oxygen or fuel-gas is withdrawn, to supply a portable outlet header, with a readily accessible shutoff valve.

**(B)** Use hose and hose connections that comply with paragraph (a)(I) of this section when connecting the portable outlet header to the service piping.

**(C)** Provide master shutoff valves for both oxygen and fuel-gas at the entry end of the portable outlet header.

**(D)** Provide a hydraulic back-pressure valve, installed at the inlet and preceding the service outlets, on portable fuel-gas service outlet headers unless one of the following is installed at each outlet and approved for use:

**(i)** Pressure-reducing regulator,

**(ii)** Back-flow check valve, or

**(iii)** Hydraulic back-pressure valve.

**(E)** Provide oxygen service header outlets with pressure reducing regulators or direct hose connections.

**(F)** Provide each valve assembly with a detachable outlet seal cap, chained or otherwise attached to the body of the valve on the portable header service outlet.

**(G)** Use materials and fabrication procedures for portable outlet headers that comply with the rule on Service Piping Systems paragraphs (13)(a)(A-L), (13)(b)(A-E), and (13)(f)(A-C).

**(H)** Provide frames for portable outlet headers that will:

**(i)** Secure the equipment in the correct operating position.

**(ii)** Protect them from damage during handling and operation.

**(g)** When using portable outlet headers you must not use them indoors except for temporary service when a direct supply outlet located on the service piping system cannot be accessed.

**(h)** To comply with manifold operation procedures you must:

**(A)** Ensure that cylinder manifolds are installed under the supervision of someone familiar with the proper practices with reference to their construction and use.

**(B)** Ensure all manifolds and parts used in methods of manifolding are used only for the gas or gases for which they are approved.

**(C)** Install approved flash arresters between each acetylene cylinder and the coupler block.

**NOTE:** For outdoor use only, and when the number of cylinders coupled does not exceed three, one flash arrester installed between the coupler block and regulator is acceptable.

**(D)** Install manifold acetylene and liquefied fuel-gas cylinders in a vertical position.

**(E)** Maintain approximately equal pressure in the gas cylinders connected to and discharged simultaneously through a common manifold.

**(i)** To comply with manifold operation procedures you must not connect more than 3,000 cubic feet of aggregate capacity of fuel-gas cylinders to a portable manifold inside a building.

**(13) Service piping systems materials and designs.**

**(a)** Service piping systems must use:

**(A)** Piping and fittings that comply with section 2, *Industrial Gas and Air Piping Systems*, of the American National Standard Code for Power Piping ASME B31.1 2010.

**(B)** At least Schedule 40 pipe and use fittings that are at least standard weight in sizes up to and including 6-inch nominal.

**(C)** Copper tubing that is Type K or L and complies with the Standard Specification for Seamless Copper Water Tube, ASTM B88-66a.

**(D)** Steel, wrought iron, brass or copper pipe, or seamless copper, brass or stainless steel tubing, except when stated otherwise.

**(E)** Stainless steel or copper alloys for oxygen piping and fittings when pressures exceed 700 psi.

**(F)** Hose connections and hose to connect the outlet of a manifold pressure regulator to piping, provided that the working pressure of the piping is 250 psi or less and they comply with the rules for hose and hose connections found in paragraphs (10) (a)(A), (10) (a)(K), (10) (b)(G), (10)(c)(A), and (10)(c)(B).

**(G)** Hose(s) that do not exceed 5 feet in length to connect manifold pressure regulators to piping.

**(H)** Hose that has a minimum bursting pressure of 1,000 psig (6.8 MPa).

**(I)** A piping system with a minimum design pressure of 250 psig when oxygen is supplied from a low-pressure oxygen manifold without an intervening pressure regulating device.

**(J)** Pressure regulating devices at each station outlet when the connected equipment is for use at pressures less than 250 psig (1.7 MPa).

## **OXYGEN-FUEL GAS WELDING AND CUTTING**

**J**

**(K)** *Steel or wrought iron piping for acetylene or acetylenic compounds.*

**(L)** *Unalloyed copper for acetylene or acetylenic compounds only with equipment listed as appropriate for its use.*

**(b)** *Piping joints must be treated as follows. You must:*

**(A)** *Weld, thread or flange joints in steel or wrought iron piping.*

**NOTE:** *Fittings, such as ells, tees, couplings, and unions, may be rolled, forged or cast steel, malleable iron or nodular iron.*

**(B)** *Weld, braze, thread, or flange brass or copper pipe joints.*

**(C)** *Braze socket type joints with silver-brazing alloy or similar high melting point (not less than 800° F (427° C)) filler metal.*

**(D)** *Braze joints or use approved gas tubing fittings in seamless copper, brass, or stainless steel tubing.*

**(E)** *Prohibit the use of gray or white cast iron fittings on piping joints.*

**(c)** *When installing piping systems you must:*

**(A)** *Internally examine and remove scale and dirt from fittings and lengths of pipe before assembly.*

**(B)** *Wash out oxygen pipe and fittings with a suitable solution which will effectively remove grease and dirt but will not react with oxygen.*

**NOTE:** *Hot water solutions of caustic soda or trisodium phosphate are effective cleaning agents for this purpose. Rinse and dry piping thoroughly after cleaning.*

**(C)** *Install and maintain distribution lines in a safe operating condition.*

**(D)** *Run all piping as directly as practicable.*

**(E)** *Protect piping against physical damage.*

**(F)** *Make allowances for piping expansion, contraction, jarring and vibration.*

**(G)** *Locate pipe laid underground below the frost line.*

**(H)** *Protect against corrosion.*

**(I)** *Weld or braze piping that is installed in tunnels, trenches or ducts.*

**(J)** *Install shutoff valves outside of tunnels, trenches or ducts.*

**(K)** Provide good natural or forced ventilation when oxygen piping is installed in the same tunnel, trench or duct with fuel-gas pipelines.

**(L)** Drain low points in piping that carries moist gas into drip pots, constructed to permit pumping or draining out the condensate, at necessary intervals.

**(M)** Install drain valves having outlets normally closed with screw caps or plugs for draining low points in piping systems.

**(N)** Case or jacket pipes leading to the surface of the ground where necessary to prevent loosening or breaking.

**(O)** Install gas cocks or valves for all buildings at points where they will be readily accessible for shutting off the gas supply to these buildings in an emergency.

**(P)** Install a shutoff valve in the discharge line from the generator, gas holder, manifold or other source of supply.

**(Q)** Thoroughly blow out assembled piping with air, nitrogen or carbon dioxide to remove foreign materials.

**(R)** Blowout oxygen piping using oil-free air, oil-free nitrogen, or oil-free carbon dioxide:

**NOTE:** Air or inert gas may be used with other piping.

**(S)** Purge oxygen lines, using oil-free air, oil-free nitrogen, or oil-free carbon dioxide.

**(T)** Use pressure relief devices set to function at not more than the design pressure of the systems and that discharge upwards to a safe location.

**(d)** When installing piping systems you must not:

**(A)** Install shutoff valves in safety relief lines in such a manner that the safety relief device can be rendered ineffective.

**(B)** Have uncapped openings of flammable gas lines or other parts of equipment being purged of air or gas near open lights or other sources of ignition.

**(C)** Use open end valves or petcocks except when drips are located outdoors, underground, and not readily accessible.

**(D)** Use valves outdoors, underground or in areas not readily accessible unless they are equipped with a means to secure them in the closed position.

**(E)** Weld or cut an acetylene or oxygen pipeline, including the attachment of hangers or supports, until the line has been purged.

**(e)** When painting and marking piping systems you must ensure that:

**(A)** Underground pipe and tubing and outdoor ferrous pipe and tubing is covered or painted with a suitable material for protection against corrosion.

# OXYGEN-FUEL GAS WELDING AND CUTTING

# J

**(B)** Aboveground piping systems are marked in accordance with the American National Standard Scheme for the Identification of Piping Systems, ASME A13.1 2007.

**(C)** Station outlets are marked with the name of the gas.

**(f)** When testing piping systems you must:

**(A)** Test and prove they are gas-tight at 1-1/2 times their maximum operating pressure.

**(B)** Thoroughly purge them of air before placing them in service.

**(C)** Use oil free and noncombustible material to test oxygen lines.

**(g)** When testing piping systems you must not:

**(A)** Use flames to detect leaks.

**(B)** Purge flammable gas lines or other parts of equipment of air or gas when uncapped openings are near sources of ignition.

**(h)** When installing protective equipment, hose and regulators in service piping systems you must:

**(A)** Install and use equipment in the service for which it was approved and as recommended by the manufacturer.

**(B)** Install the protective equipment shown in Figures Q-1, Q-2, and Q-3 in portable outlet headers and fuel-gas and oxygen piping systems to prevent:

**NOTE:** When only a portion of a fuel-gas system is to be used with oxygen, only that portion need comply with paragraph (h)(A).

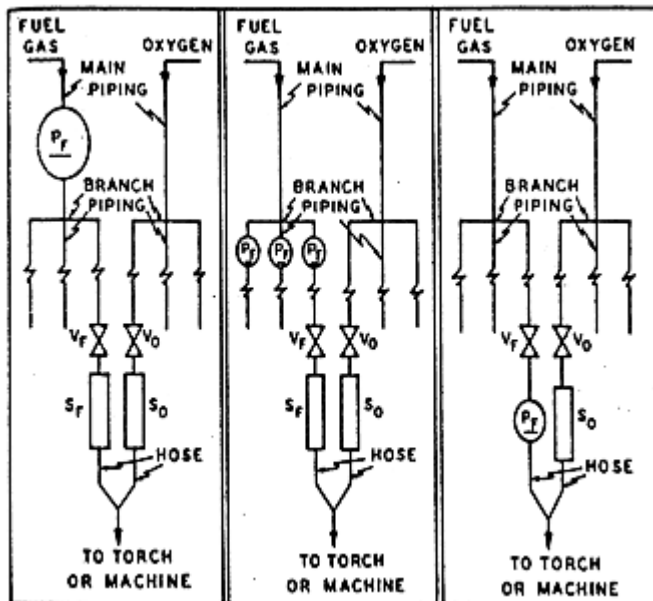

Fig. Q-1

Fig. Q-2

Fig. Q-3

**LEGEND**

- PF — Protective equipment in fuel gas piping  
SF — Backflow prevention device(s) at fuel gas station outlet  
SO — Backflow prevention device(s) at oxygen  
VF — Fuel gas station outlet valve  
VO — Oxygen station outlet valve station outlet

- (i) Backflow of oxygen into the fuel-gas supply system.*
- (ii) Passage of a flash back into the fuel-gas supply system.*
- (iii) Excessive back pressure of oxygen in the fuel-gas supply system.*

**NOTE:** The three functions of the protective equipment may be combined in one device or may be provided by separate devices.

**(C) Locate protective equipment:**

- (i) As in Figure Q-1 In the main supply line, Figure Q-1, or*
- (ii) As in Figure Q-2 at the head of each branch line, or*
- (iii) As in Figure Q-3 at each location where fuel-gas is withdrawn.*
- (iv) As in Figure Q-2 or Figure Q-3 where branch lines are of 2 inch pipe size or larger or of substantial length.*

**(D) Install flash-back protection that will prevent flame from passing into the fuel-gas system.**

**(E) Provide an approved back-pressure relief device set at a pressure not greater than the pressure rating of the backflow or the flashback protection device, whichever is lower.**

**(F) Locate pressure-relief devices on the downstream side of backflow and flashback protection devices.**

**(G) Install pressure-relief device vents that are at least as large as the relief device inlet.****(H) Install pressure-relief vents without low points that may collect moisture.**

**(I) Install drip pots with drains closed with screw plugs or caps at the low points if low points are unavoidable.**

**(J) Install the vent end so it:**

- (i) Does not endanger personnel or property through gas discharge.*
- (ii) Is located away from ignition sources.*
- (iii) Terminates in a hood or bend.*

## **OXYGEN-FUEL GAS WELDING AND CUTTING**

**J**

**(K)** *Maintain liquid levels when using a liquid in the pipeline protective equipment.*

**NOTE:** *Suitable antifreeze may be used to prevent freezing.*

**(L)** *Withdraw fuel-gas for use with equipment not requiring oxygen upstream of the piping protective devices.*

**(i)** *Station outlet protective equipment must:*

**(A)** *Have a check valve, pressure regulator, hydraulic seal, or combination of these devices at each station outlet, including those on portable headers.*

**(B)** *Have these devices as shown in Figures Q-1, Q-2, and Q-3 and designated as SF and SO.*

**(C)** *Use approved pipeline protective equipment (designated PF) located at the station outlet as in Figure Q-3, or an additional check valve, pressure regulator, or hydraulic seal is required.*

**(D)** *Have a shutoff valve (designated VF and VO) installed at each station outlet.*

**(E)** *Have a shutoff valve located on the upstream side of other station outlet equipment.*

**(F)** *Terminate the station outlet in a union connection that complies with the Compressed Gas Association (CGA) Pamphlet E-1 2009, 6<sup>th</sup> Edition, Standard for Rubber Welding Hose and Hose Connections for Gas Welding, Cutting, and Allied Processes and Compressed Gas Association (CGA) Pamphlet E-4 2010, 6<sup>th</sup> Edition, Standard for Gas Pressure Regulators if the outlet is equipped with a detachable regulator.*

**(G)** *Terminate in a union connection complying with the Compressed Gas Association (CGA) Pamphlet E-1 2009, 6<sup>th</sup> Edition, Standard for Rubber Welding Hose and Hose Connections for Gas Welding, Cutting, and Allied Processes if it is connected directly to a hose.*

**(H)** *Terminate in pipe threads to which permanent connections are to be made, such as to a machine.*

**(I)** *Have station outlets equipped with a detachable outlet seal cap secured in place.*

**(J)** *Use this cap to seal the outlet except when a hose, a regulator, or piping is attached.*

**(K)** *Be equipped with station outlets with approved backflow and flash-back protective devices when four or less torches are supplied from one station outlet through rigid piping provided:*

**(i)** *Each outlet from this piping is equipped with a shutoff valve, and*

**(ii)** *The fuel-gas capacity of any one torch does not exceed 15 cubic feet (0.42m<sup>3</sup>) per hour.*

**(14) Acetylene generators**

**(a)** When using acetylene generators you must:

**(A)** Use those that are of approved construction.

**(B)** Ensure they are plainly marked with:

**(i)** Maximum weight and size of carbide necessary for a single charge.

**(ii)** Manufacturer's name and address.

**(iii)** Name or number of the type of generator.

**(iv)** Size of the carbide to be used on the generator nameplate.

**(v)** Rating and pressure limitations.

**(C)** Limit the total hourly output rate for which it is approved and marked. Unless specifically approved for higher ratings, carbide-feed generators must be rated at 1 cubic foot (0.028 m<sup>3</sup>) per hour per pound of carbide required for a single complete charge.

**(D)** Require regular operating of relief valves.

**(E)** Set relief valves to open at a pressure not in excess of 15 psig.

**(F)** Set hydraulic back pressure valves to open at a pressure not in excess of 20 psig.

**(G)** Locate the generator where the operator can maintain ample free, unobstructed operation and maintenance space around the generator to permit ready adjustment and charging.

**(H)** Ensure that all non-automatic generator water overflows are visible.

**(I)** Ensure that non-automatic generators are not used to generate acetylene at pressures exceeding 1 psig.

**(b)** When using stationary acetylene generators (automatic and non-automatic) you must:

**(A)** Place on a foundation where:

**(i)** The generator(s) is level.

**(ii)** No excessive strain will be placed on the generator or its connections.

**(B)** Ensure the generator(s) is grounded.

**(C)** Place generators where water will not freeze.

## **OXYGEN-FUEL GAS WELDING AND CUTTING**

# **J**

**(D)** Ensure there are no prohibited sources of ignition in outside generator houses or inside generator rooms unless the generators are prepared in accordance with paragraph (h)(H)(i) through (iv) of this section:

**(E)** Ensure that when a non-continuous connection to the water supply is used the supply line must terminate at a point not less than 2 inches above the regularly provided opening for filling so that the water can be observed as it enters the generator.

**(F)** Discharge generators through an open connection into a suitably vented outdoor receptacle or residue pit.

**NOTE:** An open connection for the sludge draw off is desirable to enable the generator operator to observe leakage of generator water from the drain valve or sludge cock.

**(G)** Provide a vent pipe for each generator.

**(H)** Rigidly install the escape or relief pipe:

**(i)** Without traps.

**(ii)** So condensation will drain back to the generator.

**(I)** Carry the full size escape or relief pipe to a suitable point outside the building.

**(J)** Terminate the escape or relief pipe in a hood or bend located at least 12 feet (3.7m) above the ground.

**NOTE:** It is preferable to terminate the escape or relief pipe above the roof, and as far away as practicable from windows or other openings into buildings and as far away as practicable from sources of ignition such as flues or chimneys and tracks used by locomotives.

**(K)** Route the generating chamber relief pipes separately to the outside so they are unobstructed by rain, snow, ice, insects, or birds.

**(L)** Locate the end of the relief pipes at least 3 feet (0.9 m) from combustible construction.

**(M)** Use gas holders constructed on the gasometer principle that has the bell suitably guided.

**(N)** Ensure the gas bell moves freely without tendency to bind and it has at least 2 inches (5 cm) clearance from the shell.

**(O)** Provide a compressor or booster cutoff at a point 12 inches (0.3 m) or more above the landing point of the bell.

**(P)** Ventilate the room in accordance with paragraph (d)(J) of this section when the gas holder is located indoors.

**(Q)** Heat and light the room in accordance with paragraphs (d)(K) and (d)(L), (M), (N), (O), and (P) of this section when the gas holder is located indoors.

**(R)** Protect gas holder seals against freezing when the gas holder is not located within a heated building.

**(S)** Provide means to stop the generator-feeding mechanism before the gas holder reaches the upper limit of its travel.

**(T)** Ensure that the gas capacity of the gas holder is not less than one-third of the hourly rating of the generator when the holder is connected to only one generator.

**(U)** Ensure if acetylene is used from the gas holder without increase in pressure at some points, but with increase in pressure by a compressor or booster pump at other points, then you must:

**(i)** Install approved piping protective devices in each supply line.

**(ii)** Locate a low-pressure protective device between the gas holder and the shop piping.

**(iii)** Locate the medium-pressure protective device between the compressor or booster pump and the shop piping (see Figure 1).

**NOTE 1:** Approved protective equipment (designated  $P_f$ ) is used to prevent backflow of oxygen into the fuel-gas supply system, passage of a flashback into the fuel-gas supply system; and excessive back pressure of oxygen in the fuel-gas supply system.

**NOTE 2:** The three functions of the protective equipment may be combined in one device or may be provided by separate devices.

**Figure 1**

**(V)** Use approved compressor or booster systems only.

**(W)** Ensure that wiring and electrical equipment in compressor or booster pump rooms or enclosures conform to the provisions of Subdivision S, Electrical, Class I, Division 2.

**(X)** Locate compressors and booster pump equipment:

**(i)** In well-ventilated areas and

**(ii)** Away from ignition sources including, but not limited to, open flames, electrical or mechanical sparks.

## **OXYGEN-FUEL GAS WELDING AND CUTTING**

# **J**

- (Y)** Provide compressor or booster pumps with pressure relief valves which will relieve pressure exceeding 15 psig:
- (i)** To a safe outdoor location as provided in paragraph (b)(G), (H), (I), (J), (K), and (L) of this section, or
  - (ii)** By returning the gas to the inlet side or to the gas supply source.
- (Z)** Provide compressor or booster pump discharge outlets with approved protective equipment. (See Service Piping Systems (h) and (i)).
- (c)** When using stationary acetylene generators (automatic and non-automatic) you must not:
- (A)** Use common salt (sodium chloride) or other corrosive chemicals for protection against freezing.
  - (B)** Supply water through a continuous connection to the generator unless the generator is provided with an:
    - (i)** Adequate open overflow, or
    - (ii)** Automatic water shutoff which will effectively prevent overfilling the generator.
  - (C)** Fit generators with continuous drain connections leading to sewers unless otherwise specifically approved.
  - (D)** Interconnect generating chamber relief pipes.
- (d)** When outside generator houses and inside generator rooms for stationary acetylene generators are used, you must.
- (A)** Ensure that the walls, floors, and roofs of outside generator houses are of noncombustible construction.
  - (B)** Separate the storage or manifolding of oxygen cylinders from the generator or carbide storage section by partition walls continuous from floor to roof or ceiling, of the type of construction stated in paragraph (d)(H)(i) thru (iii) of this section.
  - (C)** Ensure that separation walls are:
    - (i)** Without openings.
    - (ii)** Joined to the floor, other walls and ceiling or roof in a manner to create a permanent gastight joint.
  - (D)** Locate exit doors so they are readily accessible in case of emergency.

**(E)** Provide explosion venting:

**(i)** For outside generator houses and inside generator rooms in exterior walls or roofs.

**(ii)** In areas equal to not less than 1 square foot (0.09 m<sup>2</sup>) per 50 cubic feet (1.4 m<sup>3</sup>) of room volume.

**(iii)** That consists of one or any combination of the following:

**(I)** Walls of light, noncombustible material preferably single-thickness,

**(II)** Single-strength glass;

**(III)** Lightly fastened hatch covers;

**(IV)** Lightly fastened swinging doors in exterior walls opening outward;

**(V)** Lightly fastened walls or roof designed to relieve at a maximum pressure of 25 pounds per square foot (0.001 MPa).

**(F)** Restrict the installation of acetylene generators inside buildings to buildings not exceeding one story in height.

**NOTE:** This does not prohibit such installation on the roof or top floor of a building exceeding such height.

**(G)** Enclose generators installed inside a building in a separate room.

**(H)** Ensure that the walls, partitions, floors, and ceilings of inside generator rooms:

**(i)** Are constructed from noncombustible materials having a fire-resistance rating of at least 1 hour floor to ceiling.

**(ii)** Are securely anchored.

**(iii)** Have at least one wall of the room be an exterior wall.

**(I)** Protect openings from an inside generator room to other parts of the building:

**(i)** By a swinging type, self-closing fire door for a Class B opening and having a rating of at least 1 hour.

**(ii)** With wired glass windows in partitions that are in approved metal frames with fixed sash.

**(iii)** By completing Installation in accordance with the Standard for the Installation of Fire Doors and Windows, NFPA 80-1970.

**NOTE:** Inside generator rooms built after July 1, 2014 must comply with NFPA 80-2013.

## **OXYGEN-FUEL GAS WELDING AND CUTTING**

# **J**

- (J)** *Ventilate inside generator rooms or outside generator houses with vents located at floor and ceiling levels.*
- (K)** *Heat by steam, hot water, enclosed electrically heated elements or other indirect means.*
- (L)** *Ensure that generator houses or rooms have natural light during daylight hours.*
- (M)** *Restrict installation of electric lamps to fixed position where artificial lighting is necessary.*
- (N)** *Provide lamps with enclosures of glass or other noncombustible material so designed and constructed to prevent gas vapors from reaching the lamp or socket and to resist breakage.*
- (O)** *Use rigid conduit with threaded connections.*
- (P)** *Install lamps outside of wired-glass panels in gas-tight frames in the exterior walls or roof of the generator house or room.*
- (Q)** *Locate electric switches, telephones, and all other electrical apparatus which may cause a spark, outside the generator house or in a room or space separated from the generator room by a gas-tight partition, except:*
- (i)** *If they are specifically approved for use inside acetylene generator room.*
  - (ii)** *Where the generator system is designed so that no carbide fill opening or other part of the generator is open to the generator house or room during the operation of the generator, and*
  - (iii)** *When residue is carried in closed piping from the residue discharge valve to a point outside the generator house or room, and*
  - (iv)** *Where electrical equipment in the generator house or room must conform to the provisions of Subpart S for Class I, Division 2 locations.*
- (R)** *Ensure that unauthorized persons do not enter outside generator houses or inside generator rooms.*
- (e)** *When outside generator houses and inside generator rooms for stationary acetylene generators are used, you must not:*
- (A)** *Locate openings in any outside generator house within 5 feet (1.5m) of any opening in another building.*
  - (B)** *Use flames or fire to heat outside generator houses or inside generator rooms, or in any enclosure communicating with them.*
- (f)** *When using portable acetylene generators you must:*
- (A)** *Use those that are approved for portable use.*

- (B)** Use them further than 10 feet (3m) from combustible materials other than the floor.
- (C)** Protect them against freezing.
- (D)** Clean and recharge them and blow off the air mixture outside of buildings.
- (E)** Anchor them to the vehicles they are to be transported and used on.
- (F)** Turn off the vehicle motor during charging, cleaning, and generating processes.
- (G)** Locate portable generators at a safe distance from the welding position so they will not be exposed to sparks, slag, and misdirection of the torch flame or over heating from hot materials or processes.
- (g)** When using portable acetylene generators you must not:
- (A)** Use them in rooms with:
- (i)** A total volume less than the total gas-generating capacity per charge of all generators in the room (to obtain the gas-generating capacity in cubic feet per charge, multiply the pounds of carbide per charge by 4.5).
  - (ii)** A ceiling height less than 10 feet (3 m).
- (B)** Use salt or other corrosive chemical to prevent freezing.
- (C)** Move those charged with carbide by crane or derrick.
- (D)** Store those not in use in rooms where open flames are used unless the:
- (i)** Generator contains no carbide.
  - (ii)** Generator has been thoroughly purged of acetylene.
  - (iii)** Rooms are well ventilated.
- (h)** When providing maintenance and operating acetylene generators you must:
- (A)** Post operating instructions in a conspicuous place near the generator or keep those in a suitable place available for ready reference.
- (B)** Follow the order of operations specified in the manufacturer instructions when recharging generators.
- (C)** Flush out batch-type generators with water:
- (i)** When the charge of carbide is exhausted.
  - (ii)** Before additional carbide is added to the generating chamber, and

## **OXYGEN-FUEL GAS WELDING AND CUTTING**

# **J**

**(D)** Renew the water supply according to instruction card furnished by the manufacturer.

**(E)** Add enough carbide each time the generator is recharged to refill the space provided for carbide without ramming the charge.

**(F)** Keep the generator water chambers filled to the proper level at all times except while draining during the recharging operation.

**(G)** Fill the water chamber to the proper level whenever:

**(i)** Repairs are to be made.

**(ii)** The generator is to be charged.

**(iii)** Carbide is to be removed.

**(H)** Do the following before making repairs involving welding, soldering, or other hot work or other operations which produce a source of ignition:

**(i)** Completely remove the carbide charge and feed mechanism.

**(ii)** Expel all acetylene by completely flooding the generator shell with water.

**(iii)** Disconnect the generator from the piping system.

**(iv)** Keep the generator filled with water, if possible, or positioned to hold as much water as possible.

**(i)** When maintaining or operating acetylene generators you must not:

**(A)** Discharge water-carbide residue from the generator:

**(i)** Into sewer pipes, or

**(ii)** Store in areas near open flames.

**NOTE:** Clear water from residue settling pits may be discharged into sewer pipes.

**(B)** Use steel or ferrous tools while distributing the charge.

**(C)** Make hot repairs in a room where there are other generators unless all the generators and piping have been purged of acetylene.

### **(15) Storing of calcium carbide.**

**(a)** Packaging of calcium carbide must:

**(A)** Be in containers that are:

**(i)** Constructed from metal having sufficient strength to prevent rupture.

- (ii) Equipped with a screw top or equivalent.*
  - (iii) Constructed to be water-and-air-tight.*
  - (iv) Soldered in a manner that the package will not fail if exposed to fire.*
- (B)** *Ensure that the packages are conspicuously marked “Calcium Carbide – Dangerous If Not Kept Dry” or with equivalent warning.*
- (C)** *Make known this caution: “Metal tools, even the so-called spark resistant type may cause ignition of an acetylene and air mixture when opening carbide containers”.*
- (b)** *When storing calcium carbide indoors you must:*
- (A)** *Store in dry, waterproof, well-ventilated locations when quantities of 600 pounds or less are being stored.*
  - (B)** *Keep packages of calcium carbide sealed, except one of each size may be open.*
  - (C)** *Store calcium carbide exceeding 600 pounds (272.2 kg) but not exceeding 5,000 pounds (2,268 kg):*
    - (i)** *In accordance with paragraph (b)(D)(i), (ii), (I) through (III) of this section;*
    - (ii)** *In an inside generator room or outside generator house; or*
    - (iii)** *In a separate room in a one-story building which may contain other occupancies, but without cellar or basement beneath the carbide storage section. Such rooms must be constructed in accordance with paragraphs (d)(H)(i) through (iii) and (d)(I)(i) and (ii) of this section and ventilated in accordance with paragraph (d)(J) of this section. These rooms must be used for no other purpose.*
  - (D)** *Store calcium carbide in excess of 5,000 pounds (2,268 kg) in:*
    - (i)** *An outside generator houses, or*
    - (ii)** *A one story building without cellar or basement and used for no other purpose:*
      - (I)** *If the storage building is of noncombustible construction, it may adjoin other one-story buildings if they are separated by unpierced firewalls.*
      - (II)** *If the storage building is detached and less than 10 feet (3 m) from a building or buildings, there must not be an opening in any of the mutually exposing sides of such buildings within 10 feet (3 m).*
      - (III)** *If the storage building is of combustible construction, it must be at least 30 feet (9.1 m) from any other building exceeding two stories.*

*(c) When storing calcium carbide indoors you must not:*

*(A) Store more than 600 pounds of calcium carbide in the same room with fuel-gas cylinders.*

*(B) Break the seals when there is carbide in excess of 1 pound (0.5 kg) in any other unsealed package of the same size of carbide in the room.*

*(C) Store in rooms with sprinkler systems.*

*(d) When storing calcium carbide outdoors you must:*

*(A) Examine carbide containers to make sure they are in good condition.*

*(B) Place the bottom tier of each row on wooden planking or equivalent so containers will not contact the ground or ground water.*

*(C) Periodically re-examine carbide containers for rusting or other damage that might affect its water or air tightness.*

*(D) Ensure the carbide containers that are stored the longest are used first.*

*(E) Only store in unopened air and water tight metal containers.*

*(F) Store only those containers that are unopened.*

**Stat. Auth.:** ORS 654.025(2) and ORS 656.726(4).

**Stats. Implemented:** ORS 654.001 to 654.295.

**Hist:** OR-OSHA Admin. Order 6-2014, f. 10/28/14, ef. 5/1/15.

## **§1926.351 Arc Welding and Cutting.**

### **(a) Manual electrode holders.**

(1) Only manual electrode holders which are specifically designed for arc welding and cutting, and are of a capacity capable of safely handling the maximum rated current required by the electrodes, shall be used.

(2) Any current-carrying parts passing through the portion of the holder which the arc welder or cutter grips in his hand, and the outer surfaces of the jaws of the holder, shall be fully insulated against the maximum voltage encountered to ground.

### **(b) Welding cables and connectors.**

(1) All arc welding and cutting cables shall be of the completely insulated, flexible type, capable of handling the maximum current requirements of the work in progress, taking into account the duty cycle under which the arc welder or cutter is working.

(2) Only cable free from repair or splices for a minimum distance of 10 feet from the cable end to which the electrode holder is connected shall be used, except that cables with standard insulated connectors or with splices whose insulating quality is equal to that of the cable are permitted.

(3) When it becomes necessary to connect or splice lengths of cable one to another, substantial insulated connectors of a capacity at least equivalent to that of the cable shall be used. If connections are effected by means of cable lugs, they shall be securely fastened together to give good electrical contact, and the exposed metal parts of the lugs shall be completely insulated.

(4) Cables in need of repair shall not be used. When a cable, other than the cable lead referred to in paragraph (b)(2) of this section, becomes worn to the extent of exposing bare conductors, the portion thus exposed shall be protected by means of rubber and friction tape or other equivalent insulation.

### **(c) Ground returns and machine grounding.**

(1) A ground return cable shall have a safe current carrying capacity equal to or exceeding the specified maximum output capacity of the arc welding or cutting unit which it services. When a single ground return cable services more than one unit, its safe current-carrying capacity shall equal or exceed the total specified maximum output capacities of all the units which it services.

(2) Pipelines containing gases or flammable liquids, or conduits containing electrical circuits, shall not be used as a ground return. For welding on natural gas pipelines, the technical portions of regulations issued by the Department of Transportation, Office of Pipeline Safety, 49 CFR Part 192, Minimum Federal Safety Standards for Gas Pipelines, shall apply.

(3) When a structure or pipeline is employed as a ground return circuit, it shall be determined that the required electrical contact exists at all joints. The generation of an arc, sparks, or heat at any point shall cause rejection of the structures as a ground circuit.

(4) When a structure or pipeline is continuously employed as a ground return circuit, all joints shall be bonded, and periodic inspections shall be conducted to ensure that no condition of electrolysis or fire hazard exists by virtue of such use.

(5) The frames of all arc welding and cutting machines shall be grounded either through a third wire in the cable containing the circuit conductor or through a separate wire which is grounded at the source of the current. Grounding circuits, other than by means of the structure, shall be checked to ensure that the circuit between the ground and the grounded power conductor has resistance low enough to permit sufficient current to flow to cause the fuse or circuit breaker to interrupt the current.

(6) All ground connections shall be inspected to ensure that they are mechanically strong and electrically adequate for the required current.

**(d) Operating instructions.** Employers shall instruct employees in the safe means of arc welding and cutting as follows:

(1) When electrode holders are to be left unattended, the electrodes shall be removed and the holders shall be so placed or protected that they cannot make electrical contact with employees or conducting objects.

(2) Hot electrode holders shall not be dipped in water; to do so may expose the arc welder or cutter to electric shock.

(3) When the arc welder or cutter has occasion to leave his work or to stop work for any appreciable length of time, or when the arc welding or cutting machine is to be moved, the power supply switch to the equipment shall be opened.

(4) Any faulty or defective equipment shall be reported to the supervisor.

(5) See §1926.406(c) for additional requirements.

**(e) Shielding.** Whenever practicable, all arc welding and cutting operations shall be shielded by non-combustible or flameproof screens which will protect employees and other persons working in the vicinity from the direct rays of the arc.

(44 FR 8577, Feb. 9, 1979; 44 FR 20940, Apr. 6, 1979, as amended at 51 FR 25318, July 11, 1986)

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Stats. Implemented:** ORS 654.001 through 654.295.

**Hist:** APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89.

## **§1926.352 Fire Prevention.**

**(a)** When practical, objects to be welded, cut, or heated shall be moved to a designated safe location or, if the objects to be welded, cut, or heated cannot be readily moved, all movable fire hazards in the vicinity shall be taken to a safe place, or otherwise protected.

**(b)** If the object to be welded, cut, or heated cannot be moved and if all the fire hazards cannot be removed, positive means shall be taken to confine the heat, sparks, and slag, and to protect the immovable fire hazards from them.

**(c)** No welding, cutting, or heating shall be done where the application of flammable paints, or the presence of other flammable compounds, or heavy dust concentrations creates a hazard.

**(d)** Suitable fire extinguishing equipment shall be immediately available in the work area and shall be maintained in a state of readiness for instant use.

**(e)** When the welding, cutting, or heating operation is such that normal fire prevention precautions are not sufficient, additional personnel shall be assigned to guard against fire while the actual welding, cutting, or heating operation is being performed, and for a sufficient period of time after completion of the work to ensure that no possibility of fire exists. Such personnel shall be instructed as to the specific anticipated fire hazards and how the firefighting equipment provided is to be used.

**(f)** When welding, cutting, or heating is performed on walls, floors, and ceilings, since direct penetration of sparks or heat transfer may introduce a fire hazard to an adjacent area, the same precautions shall be taken on the opposite side as are taken on the side on which the welding is being performed.

**(g)** For the elimination of possible fire in enclosed spaces as a result of gas escaping through leaking or improperly closed torch valves, the gas supply to the torch shall be positively shut off at some point outside the enclosed space whenever the torch is not to be used or whenever the torch is left unattended for a substantial period of time, such as during the lunch period. Overnight and at the change of shifts, the torch and hose shall be removed from the confined space. Open end fuel gas and oxygen hoses shall be immediately removed from enclosed spaces when they are disconnected from the torch or other gas-consuming device.

**(h)** Except when the contents are being removed or transferred, drums, pails, and other containers which contain or have contained flammable liquids shall be kept closed. Empty containers shall be removed to a safe area apart from hot work operations or open flames.

# J FIRE PREVENTION

---

**(i)** Drums containers, or hollow structures which have contained toxic or flammable substances shall, before welding, cutting, or heating is undertaken on them, either be filled with water or thoroughly cleaned of such substances and ventilated and tested. For welding, cutting and heating on steel pipelines containing natural gas, the pertinent portions of regulations issued by the Department of Transportation, Office of Pipeline Safety, 49 CFR Part 192, Minimum Federal Safety Standards for Gas Pipelines, shall apply.

**(j)** Before heat is applied to a drum, container, or hollow structure, a vent or opening shall be provided for the release of any built-up pressure during the application of heat.

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Stats. Implemented:** ORS 654.001 through 654.295.

**Hist:** APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89.

# VENTILATION & PROTECTION IN WELDING, CUTTING, & HEATING

J

---

## §1926.353 Ventilation and Protection in Welding, Cutting, and Heating.

**(a) Mechanical ventilation.** For purposes of this section, mechanical ventilation shall meet the following requirements:

- (1) Mechanical ventilation shall consist of either general mechanical ventilation systems or local exhaust systems.
- (2) General mechanical ventilation shall be of sufficient capacity and so arranged as to produce the number of air changes necessary to maintain welding fumes and smoke within safe limits, as defined in Subpart D of this part.
- (3) Local exhaust ventilation shall consist of freely movable hoods intended to be placed by the welder or burner as close as practicable to the work. This system shall be of sufficient capacity and so arranged as to remove fumes and smoke at the source and keep the concentration of them in the breathing zone within safe limits as defined in Subpart D of this part.
- (4) Contaminated air exhausted from a working space shall be discharged into the open air or otherwise clear of the source of intake air.
- (5) All air replacing that withdrawn shall be clean and respirable.
- (6) Oxygen shall not be used for ventilation purposes, comfort cooling, blowing dust from clothing, or for cleaning the work area.

**(b) Welding, cutting, and heating in confined spaces.**

- (1) Except as provided in paragraph (b)(2) of this section, and paragraph (c)(2) of this section, either general mechanical or local exhaust ventilation meeting the requirements of paragraph (a) of this section shall be provided whenever welding, cutting, or heating is performed in a confined space.
- (2) When sufficient ventilation cannot be obtained without blocking the means of access, employees in the confined space shall be protected by air line respirators in accordance with the requirements of Subpart E of this part, and an employee on the outside of such a confined space shall be assigned to maintain communication with those working within it and to aid them in an emergency.
- (3) **Lifelines.** Where a welder must enter a confined space through a manhole or other small opening, means shall be provided for quickly removing him in case of emergency. When safety belts and lifelines are used for this purpose they shall be so attached to the welder's body that his body cannot be jammed in a small exit opening. An attendant with a pre-planned rescue procedure shall be stationed outside to observe the welder at all times and be capable of putting rescue operations into effect.

# **J VENTILATION & PROTECTION IN WELDING, CUTTING, & HEATING**

## **(c) Welding, cutting, or heating of metals of toxic significance.**

(1) Welding, cutting, or heating in any enclosed spaces involving the metals specified in this subparagraph shall be performed with either general mechanical or local exhaust ventilation meeting the requirements of paragraph (a) of this section:

- (i) Zinc-bearing base or filler metals or metals coated with zinc-bearing materials;
- (ii) Lead base metals;
- (iii) Cadmium-bearing filler materials;
- (iv) Chromium-bearing metals or metals coated with chromium-bearing materials.

(2) Welding, cutting, or heating in any enclosed spaces involving the metals specified in this subparagraph shall be performed with local exhaust ventilation in accordance with the requirements of paragraph (a) of this section, or employees shall be protected by air line respirators in accordance with the requirements of Subpart E of this part:

- (i) Metals containing lead, other than as an impurity, or metals coated with lead-bearing materials;
- (ii) Cadmium-bearing or cadmium-coated base metals;
- (iii) Metals coated with mercury-bearing metals;
- (iv) Beryllium-containing base or filler metals. Because of its high toxicity, work involving beryllium shall be done with both local exhaust ventilation and air line respirators.

(3) Employees performing such operations in the open air shall be protected by filter-type respirators in accordance with the requirements of Subpart E of this part, except that employees performing such operations on beryllium-containing base or filler metals shall be protected by air line respirators in accordance with the requirements of Subpart E of this part.

(4) Other employees exposed to the same atmosphere as the welders or burners shall be protected in the same manner as the welder or burner.

## **(d) Inert-gas metal-arc welding.**

(1) Since the inert-gas metal-arc welding process involves the production of ultra-violet radiation of intensities of 5 to 30 times that produced during shielded metal-arc welding, the decomposition of chlorinated solvents by ultraviolet rays, and the liberation of toxic fumes and gases, employees shall not be permitted to engage in, or be exposed to the process until the following special precautions have been taken:

# VENTILATION & PROTECTION IN WELDING, CUTTING, & HEATING

J

- (i) The use of chlorinated solvents shall be kept at least 200 feet, unless shielded, from the exposed arc, and surfaces prepared with chlorinated solvents shall be thoroughly dry before welding is permitted on such surfaces.
- (ii) Employees in the area not protected from the arc by screening shall be protected by filter lenses meeting the requirements of Subpart E of this part. When two or more welders are exposed to each other's arc, filter lens goggles of a suitable type, meeting the requirements of Subpart E of this part, shall be worn under welding helmets. Hand shields to protect the welder against flashes and radiant energy shall be used when either the helmet is lifted or the shield is removed.
- (iii) Welders and other employees who are exposed to radiation shall be suitably protected so that the skin is covered completely to prevent burns and other damage by ultraviolet rays. Welding helmets and hand shields shall be free of leaks and openings, and free of highly reflective surfaces.
- (iv) When inert-gas metal-arc welding is being performed on stainless steel, the requirements of paragraph (c)(2) of this section shall be met to protect against dangerous concentrations of nitrogen dioxide.
- (e) General welding, cutting, and heating.**
- (1) Welding, cutting, and heating, not involving conditions or materials described in paragraph (b), (c), or (d) of this section, may normally be done without mechanical ventilation or respiratory protective equipment, but where, because of unusual physical or atmospheric conditions, an unsafe accumulation of contaminants exists, suitable mechanical ventilation or respiratory protective equipment shall be provided.
- (2) Employees performing any type of welding, cutting, or heating shall be protected by suitable eye protective equipment in accordance with the requirements of Subpart E of this part.

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Stats. Implemented:** ORS 654.001 through 654.295.

**Hist:** APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89.

OR-OSHA Admin. Order 3-2000, f. 2/8/00 ef. 2/8/00.

# WELDING, CUTTING, AND HEATING IN WAY OF PRESERVATIVE COATINGS

J

## §1926.354 Welding, Cutting, and Heating in Way of Preservative Coatings.

(a) Before welding, cutting, or heating is commenced on any surface covered by a preservative coating whose flammability is not known, a test shall be made by a competent person to determine its flammability. Preservative coatings shall be considered to be highly flammable when scrapings burn with extreme rapidity.

(b) Precautions shall be taken to prevent ignition of highly flammable hardened preservative coatings. When coatings are determined to be highly flammable, they shall be stripped from the area to be heated to prevent ignition.

### (c) Protection against toxic preservative coatings:

(1) In enclosed spaces, all surfaces covered with toxic preservatives shall be stripped of all toxic coatings for a distance of at least 4 inches from the area of heat application, or the employees shall be protected by air line respirators, meeting the requirements of Subpart E of this part.

(2) In the open air, employees shall be protected by a respirator, in accordance with requirements of Subpart E of this part.

(d) The preservative coatings shall be removed a sufficient distance from the area to be heated to ensure that the temperature of the unstripped metal will not be appreciably raised. Artificial cooling of the metal surrounding the heating area may be used to limit the size of the area required to be cleaned.

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Hist:** APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89.

– END OF DOCUMENT –

**OREGON OCCUPATIONAL  
SAFETY AND HEALTH STANDARDS**

Oregon Administrative Rules, Chapter 437

**DIVISION 3 (29 CFR 1926)  
CONSTRUCTION**

Oregon Occupational Safety and Health Division (Oregon OSHA)  
Department of Consumer and Business Services  
Salem, Oregon 97301-3882

AO 2-2007

The Oregon Department of Consumer and Business Services adopted these rules pursuant to ORS 654.025(2).

The Secretary of State Designated OAR Chapter 437 as the “Oregon Occupational Safety and Health Code.” Six general subject areas within this code are designated as “Divisions.”

- **Division 1** General Administrative Rules
- **Division 2** General Occupational Safety and Health Rules
- **Division 3** Construction
- **Division 4** Agriculture
- **Division 5** Maritime Activities
- **Division 7** Forest Activities
- **Oregon Revised Statutes (ORS) 654** The Oregon Safe Employment Act (OSEAct)

Oregon-initiated rules in this division of the Oregon Occupational Safety and Health Code are numbered in a uniform system developed by the Secretary of State. This system does not number the rules in sequence (001, 002, 003, etc.). Omitted numbers may be assigned to new rules at the time of their adoption.

**Oregon-initiated rules** are arranged in the following Basic Codification Structure adopted by the Secretary of State for Oregon Administrative Rules (OAR):

Chapter	Division	Rule	Section	Subsection	Paragraphs
437	003	1760	(1)	(a)	(A)(i)(I)

The majority of Oregon OSHA codes are adopted by reference from the Code of Federal Regulations (CFR), and are arranged in the following basic federal numbering system:

Chapter	Division	Part	Subpart (Subdivision)	Section	Paragraphs
437	003	1926	M	.502	(a)

The terms “subdivision” and “subpart” are synonymous within OAR 437, Oregon Occupational Safety and Health Code.

---

To obtain an order form or copies of these codes, address:

**Department of Consumer & Business Services  
Oregon Occupational Safety & Health Division (Oregon OSHA)  
350 Winter St. NE, Room 430  
Salem, OR 97301-3882**

Or call the Oregon OSHA Resource Library at 503-378-3272

The rules referenced in this division are available for viewing in the Office of the Secretary of State, Administrative Rules and Office Document Section, Oregon State Archives Building, Salem, Oregon 97310, or the Central Office, Oregon Occupational Safety and Health Division of the Department of Consumer and Business Services, Room 430, 350 Winter St. NE Salem, OR 97301-3882. ## SUBDIVISION K

## ELECTRICAL

**Authority:** Secs. 6 and 8 of the Occupational Safety and Health Act (29 U.S.C. 655, 657); sec. 107, Contract Work Hours and Safety Standards Act (40 U.S.C. 333); Secretary of Labor's Order No. 9-83 (48 FR 35736) or 1-90 (55 FR 9033), as applicable; 29 CFR Part 1911.

**Source:** 51 FR 25318, July 11, 1986, unless otherwise noted.

### GENERAL

#### **§1926.400 Introduction.**

This subpart addresses electrical safety requirements that are necessary for the practical safeguarding of employees involved in construction work and is divided into four major divisions and applicable definitions as follows:

**(a) Installation safety requirements.** Installation safety requirements are contained in §§1926.402 through 1926.408. Included in this category are electric equipment and installations used to provide electric power and light on jobsites.

**(b) Safety-related work practices.** Safety-related work practices are contained in §§1926.416 and 1926.417. In addition to covering the hazards arising from the use of electricity at jobsites, these regulations also cover the hazards arising from the accidental contact, direct or indirect, by employees with all energized lines, above or below ground, passing through or near the jobsite.

**(c) Safety-related maintenance and environmental considerations.** Safety-related maintenance and environmental considerations are contained in §§1926.431 and 1926.432.

**(d) Safety requirements for special equipment.** Safety requirements for special equipment are contained in §1926.441.

**(e) Definitions.** Definitions applicable to this Subpart are contained in §1926.449.

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

#### **§1926.401 (Reserved)**

# APPLICABILITY / GENERAL REQUIREMENTS

# K

## INSTALLATION SAFETY REQUIREMENTS

### §1926.402 Applicability.

**(a) Covered.** Sections 1926.402 through 1926.408 contain installation safety requirements for electrical equipment and installations used to provide electric power and light at the jobsite. These sections apply to installations, both temporary and permanent, used on the jobsite; but these sections do not apply to existing permanent installations that were in place before the construction activity commenced.

**Note:** If the electrical installation is made in accordance with the National Electrical Code ANSI/NFPA 70-1984, exclusive of Formal Interpretations and Tentative Interim Amendments, it will be deemed to be in compliance with §§1926.403 through 1926.408, except for §§1926.404(b)(1) and 1926.405(a)(2)(ii)(E), (F), (G), and (J).

**(b) Not covered.** Sections 1926.402 through 1926.408 do not cover installations used for the generation, transmission, and distribution of electric energy, including related communication, metering, control, and transformation installations. (However, these regulations do cover portable and vehicle-mounted generators used to provide power for equipment used at the jobsite.) See Subpart V of this Part for the construction of power distribution and transmission lines.

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

### §1926.403 General Requirements.

**(a) Approval.** All electrical conductors and equipment shall be approved.

#### **(b) Examination, installation, and use of equipment.**

**(1) Examination.** The employer shall ensure that electrical equipment is free from recognized hazards that are likely to cause death or serious physical harm to employees. Safety of equipment shall be determined on the basis of the following considerations:

**(i)** Suitability for installation and use in conformity with the provisions of this subpart. Suitability of equipment for an identified purpose may be evidenced by listing, labeling, or certification for that identified purpose.

**(ii)** Mechanical strength and durability, including, for parts designed to enclose and protect other equipment, the adequacy of the protection thus provided.

**(iii)** Electrical insulation.

# K GENERAL REQUIREMENTS

(iv) Heating effects under conditions of use.

(v) Arcing effects.

(vi) Classification by type, size, voltage, current capacity, specific use.

(vii) Other factors which contribute to the practical safeguarding of employees using or likely to come in contact with the equipment.

**(2) Installation and use.** Listed, labeled, or certified equipment shall be installed and used in accordance with instructions included in the listing, labeling, or certification.

**(c) Interrupting rating.** Equipment intended to break current shall have an interrupting rating at system voltage sufficient for the current that must be interrupted.

**(d) Mounting and cooling of equipment.**

**(1) Mounting.** Electric equipment shall be firmly secured to the surface on which it is mounted. Wooden plugs driven into holes in masonry, concrete, plaster, or similar materials shall not be used.

**(2) Cooling.** Electrical equipment which depends upon the natural circulation of air and convection principles for cooling of exposed surfaces shall be installed so that room air flow over such surfaces is not prevented by walls or by adjacent installed equipment. For equipment designed for floor mounting, clearance between top surfaces and adjacent surfaces shall be provided to dissipate rising warm air. Electrical equipment provided with ventilating openings shall be installed so that walls or other obstructions do not prevent the free circulation of air through the equipment.

**(e) Splices.** Conductors shall be spliced or joined with splicing devices designed for the use or by brazing, welding, or soldering with a fusible metal or alloy. Soldered splices shall first be so spliced or joined as to be mechanically and electrically secure without solder and then soldered. All splices and joints and the free ends of conductors shall be covered with an insulation equivalent to that of the conductors or with an insulating device designed for the purpose.

**(f) Arcing parts.** Parts of electric equipment which in ordinary operation produce arcs, sparks, flames, or molten metal shall be enclosed or separated and isolated from all combustible material.

**(g) Marking.** Electrical equipment shall not be used unless the manufacturer's name, trademark, or other descriptive marking by which the organization responsible for the product may be identified is placed on the equipment and unless other markings are provided giving voltage, current, wattage, or other ratings as necessary. The marking shall be of sufficient durability to withstand the environment involved.

# GENERAL REQUIREMENTS **K**

**(h) Identification of disconnecting means and circuits.** Each disconnecting means required by this subpart for motors and appliances shall be legibly marked to indicate its purpose, unless located and arranged so the purpose is evident. Each service, feeder, and branch circuit, at its disconnecting means or overcurrent device, shall be legibly marked to indicate its purpose, unless located and arranged so the purpose is evident. These markings shall be of sufficient durability to withstand the environment involved.

**(i) 600 Volts, nominal, or less.** This paragraph applies to equipment operating at 600 volts, nominal, or less.

**(1) Working space about electric equipment.** Sufficient access and working space shall be provided and maintained about all electric equipment to permit ready and safe operation and maintenance of such equipment.

**(i) Working clearances.** Except as required or permitted elsewhere in this subpart, the dimension of the working space in the direction of access to live parts operating at 600 volts or less and likely to require examination, adjustment, servicing, or maintenance while alive shall not be less than indicated in Table K-1. In addition to the dimensions shown in Table K-1, workspace shall not be less than 30 inches (762 mm) wide in front of the electric equipment. Distances shall be measured from the live parts if they are exposed, or from the enclosure front or opening if the live parts are enclosed. Walls constructed of concrete, brick, or tile are considered to be grounded. Working space is not required in back of assemblies such as dead-front switchboards or motor control centers where there are no renewable or adjustable parts such as fuses or switches on the back and where all connections are accessible from locations other than the back.

**Table K-1 – Working Clearances**

Nominal voltage to ground	Minimum clear distance for conditions <sup>1</sup>		
	(a)	(b)	(c)
	Feet <sup>2</sup>	Feet <sup>2</sup>	Feet <sup>2</sup>
0 – 150 .....	3	3	3
151 – 600 .....	3	3-1/2	4

<sup>1</sup> Conditions (a), (b), and (c) are as follows: (a) Exposed live parts on one side and no live or grounded parts on the other side of the working space, or exposed live parts on both sides effectively guarded by insulating material. Insulated wire or insulated busbars operating at not over 300 volts are not considered live parts. (b) Exposed live parts on one side and grounded parts on the other side. (c) Exposed live parts on both sides of the workspace (not guarded as provided in Condition (a)) with the operator between.

<sup>2</sup> **NOTE:** For International System of Units (SI): one foot = 0.3048 m.

**(ii) Clear spaces.** Working space required by this subpart shall not be used for storage. When normally enclosed live parts are exposed for inspection or servicing, the working space, if in a passageway or general open space, shall be guarded.

**(iii) Access and entrance to working space.** At least one entrance shall be provided to give access to the working space about electric equipment.

# K GENERAL REQUIREMENTS

**(iv) Front working space.** Where there are live parts normally exposed on the front of switchboards or motor control centers, the working space in front of such equipment shall not be less than 3 feet (914 mm).

**(v) Headroom.** The minimum headroom of working spaces about service equipment, switchboards, panelboards, or motor control centers shall be 6 feet 3 inches (1.91 m).

## **(2) Guarding of live parts.**

**(i)** Except as required or permitted elsewhere in this subpart, live parts of electric equipment operating at 50 volts or more shall be guarded against accidental contact by cabinets or other forms of enclosures, or by any of the following means:

**(A)** By location in a room, vault, or similar enclosure that is accessible only to qualified persons.

**(B)** By partitions or screens so arranged that only qualified persons will have access to the space within reach of the live parts. Any openings in such partitions or screens shall be so sized and located that persons are not likely to come into accidental contact with the live parts or to bring conducting objects into contact with them.

**(C)** By location on a balcony, gallery, or platform so elevated and arranged as to exclude unqualified persons.

**(D)** By elevation of 8 feet (2.44 m) or more above the floor or other working surface and so installed as to exclude unqualified persons.

**(ii)** In locations where electric equipment would be exposed to physical damage, enclosures or guards shall be so arranged and of such strength as to prevent such damage.

**(iii)** Entrances to rooms and other guarded locations containing exposed live parts shall be marked with conspicuous warning signs forbidding unqualified persons to enter.

## **(j) Over 600 volts, nominal.**

**(1) General.** Conductors and equipment used on circuits exceeding 600 volts, nominal, shall comply with all applicable provisions of paragraphs (a) through (g) of this section and with the following provisions which supplement or modify those requirements. The provisions of paragraphs (j)(2), (j)(3), and (j)(4) of this section do not apply to equipment on the supply side of the service conductors.

**(2) Enclosure for electrical installations.** Electrical installations in a vault, room, closet or in an area surrounded by a wall, screen, or fence, access to which is controlled by lock and key or other equivalent means, are considered to be accessible to qualified persons only. A wall, screen, or fence less than 8 feet (2.44 m) in height is not considered adequate to prevent access unless it has other features that provide a degree of isolation equivalent to an 8-foot (2.44-m) fence. The entrances to all buildings, rooms or enclosures containing exposed live parts or exposed conductors operating at over 600 volts, nominal, shall be kept locked or shall be under the observation of a qualified person at all times.

**(i) Installations accessible to qualified persons only.** Electrical installations having exposed live parts shall be accessible to qualified persons only and shall comply with the applicable provisions of paragraph (j)(3) of this section.

**(ii) Installations accessible to unqualified persons.** Electrical installations that are open to unqualified persons shall be made with metal-enclosed equipment or shall be enclosed in a vault or in an area, access to which is controlled by a lock. Metal-enclosed switch-gear, unit substations, transformers, pull boxes, connection boxes, and other similar associated equipment shall be marked with appropriate caution signs. If equipment is exposed to physical damage from vehicular traffic, guards shall be provided to prevent such damage. Ventilating or similar openings in metal-enclosed equipment shall be designed so that foreign objects inserted through these openings will be deflected from energized parts.

**(3) Workspace about equipment.** Sufficient space shall be provided and maintained about electric equipment to permit ready and safe operation and maintenance of such equipment. Where energized parts are exposed, the minimum clear workspace shall not be less than 6 feet 6 inches (1.98 m) high (measured vertically from the floor or platform), or less than 3 feet (914 mm) wide (measured parallel to the equipment). The depth shall be as required in Table K-2. The workspace shall be adequate to permit at least a 90-degree opening of doors or hinged panels.

**(i) Working space.** The minimum clear working space in front of electric equipment such as switchboards, control panels, switches, circuit breakers, motor controllers, relays, and similar equipment shall not be less than specified in Table K-2 unless otherwise specified in this subpart. Distances shall be measured from the live parts if they are exposed, or from the enclosure front or opening if the live parts are enclosed. However, working space is not required in back of equipment such as deadfront switchboards or control assemblies where there are no renewable or adjustable parts (such as fuses or switches) on the back and where all connections are accessible from locations other than the back. Where rear access is required to work on de-energized parts on the back of enclosed equipment, a minimum working space of 30 inches (762 mm) horizontally shall be provided.

# K GENERAL REQUIREMENTS

**Table K-2**  
**Minimum Depth of Clear Working Space in Front of Electric Equipment**

Nominal voltage to ground	Conditions <sup>1</sup>		
	(a)	(b)	(c)
	Feet <sup>2</sup>	Feet <sup>2</sup>	Feet <sup>2</sup>
601 to 2,500 .....	3	4	5
2,501 to 9,000 .....	4	5	6
9,001 to 25,000 .....	5	6	9
25,001 to 75 kV .....	6	8	10
Above 75 kV .....	8	10	12

<sup>1</sup> Conditions (a), (b), and (c) are as follows: (a) Exposed live parts on one side and no live or grounded parts on the other side of the working space, or exposed live parts on both sides effectively guarded by insulating material. Insulated wire or insulated busbars operating at not over 300 volts are not considered live parts. (b) Exposed live parts on one side and grounded parts on the other side. Walls constructed of concrete, brick or tile are considered to be grounded surfaces. (c) Exposed live parts on both sides of the workspace (not guarded as provided in Condition (a)) with the operator between.

<sup>2</sup> **NOTE:** For SI units: one foot = 0.3048 m.

**(ii) Lighting outlets and points of control.** The lighting outlets shall be so arranged that persons changing lamps or making repairs on the lighting system will not be endangered by live parts or other equipment. The points of control shall be so located that persons are not likely to come in contact with any live part or moving part of the equipment while turning on the lights.

**(iii) Elevation of unguarded live parts.** Unguarded live parts above working space shall be maintained at elevations not less than specified in Table K-3.

**Table K-3**  
**Elevation of Unguarded Energized Parts Above Working Space**

Normal voltage between phases	Minimum elevation
601 - 7,500 .....	8 feet 6 inches <sup>1</sup>
7,501 - 35,000 .....	9 feet
Over 35 kV .....	9 feet + 0.37 inches per kV above 35 kV

<sup>1</sup> **NOTE:** For SI units: one inch = 25.4 mm; one foot = 0.3048 m.

**(4) Entrance and access to workspace.** At least one entrance not less than 24 inches (610 mm) wide and 6 feet 6 inches (1.98 m) high shall be provided to give access to the working space about electric equipment. On switchboard and control panels exceeding 48 inches (1.22 m) in width, there shall be one entrance at each end of such board where practicable. Where bare energized parts at any voltage or insulated energized parts above 600 volts are located adjacent to such entrance, they shall be guarded.

(Information collection requirements contained in paragraphs (g) and (h) were approved by the Office of Management and Budget under control number 1218-0130)

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).

APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

**§1926.404 Wiring Design and Protection.**

**(a) Use and identification of grounded and grounding conductors.**

**(1) Identification of conductors.** A conductor used as a grounded conductor shall be identifiable and distinguishable from all other conductors. A conductor used as an equipment grounding conductor shall be identifiable and distinguishable from all other conductors.

**(2) Polarity of connections.** No grounded conductor shall be attached to any terminal or lead so as to reverse designated polarity.

**(3) Use of grounding terminals and devices.** A grounding terminal or grounding-type device on a receptacle, cord connector, or attachment plug shall not be used for purposes other than grounding.

**(b) Branch circuits.**

**NOTE:** Effective October 1, 2003, §1926.404(b)(1) is REPEALED and 437-003-0404 is IN EFFECT.

**437-003-0404 Branch circuits.**

**(1) General.** *Use ground fault circuit interrupters specified in (2) below or an assured equipment grounding conductor program as in (3) below. These requirements are in addition to any other requirements for equipment grounding conductors.*

**(2)** *All 125-volt, single-phase, 15-, 20-, and 30-ampere receptacles on construction sites, that are for temporary power and are available for use by employees, must have approved ground-fault circuit interrupters.*

**(a)** *GFI protection must be at the outlet end of the circuit. Extension cords or other devices with listed ground-fault circuit interrupter protection for personnel identified for portable are acceptable.*

**(3) Assured equipment grounding conductor program:** *Receptacles more than 125-volt, single-phase, 30-amperes must have protection that complies with (2) above, or an assured equipment grounding conductor program that complies with the following:*

**(a)** *A written description of the program, including the employer's specific procedures. The program must be at the job site for inspection and copying by the Administrator and any affected employee.*

**(b)** *The employer must designate one or more competent persons (defined in §1926.32(f)) to implement the program.*

*(c) Before each day's use, visually inspect each extension cord, or other device, and any equipment connected by cord and plug, for external defects, such as deformed or missing pins or insulation damage, and for signs of possible internal damage. Extension cords, devices and receptacles not exposed to damage are exempt from this inspection. Do not use damaged or defective equipment.*

*(d) Do these tests on all extension cords, other devices and receptacles that are not part of the permanent wiring of the building or structure, and cord- and plug-connected equipment required to be grounded:*

*(A) Test all equipment grounding conductors for continuity.*

*(B) Test each receptacle or plug to assure the equipment grounding conductor is connected to its proper terminal.*

*(e) Do all required tests:*

*(A) Before first use;*

*(B) Before first use after repair;*

*(C) Before use after any incident that reasonably could cause damage (for example, when a cord set is run over); and*

*(D) At intervals not longer than 3 months. Inspect fixed extension cords, other devices and receptacles not exposed to damage at least every 6 months.*

*(f) Record all tests required in this paragraph. This test record must identify each receptacle, cord set, and cord- and plug-connected equipment that passed the test and indicate the last date of testing or the test interval. Keep this record by means of logs, color coding, or other effective means. Keep the record until replaced by a newer record. The record must be available on the job site for inspection by the Administrator and any affected employee.*

**Stat. Auth.:** ORS 654.025(2) and 656.726(4).

**Stats. Implemented:** ORS 654.001 through 654.295.

**Hist:** OR-OSHA Admin. Order 5-2002, f. 6/28/02, ef. 10/1/03.

**(2) Outlet devices.** Outlet devices shall have an ampere rating not less than the load to be served and shall comply with the following:

**(i) Single receptacles.** A single receptacle installed on an individual branch circuit shall have an ampere rating of not less than that of the branch circuit.

**(ii) Two or more receptacles.** Where connected to a branch circuit supplying two or more receptacles or outlets, receptacle ratings shall conform to the values listed in Table K-4.

# WIRING DESIGN & PROTECTION

# K

**(iii) Receptacles used for the connection of motors.** The rating of an attachment plug or receptacle used for cord- and plug-connection of a motor to a branch circuit shall not exceed 15 amperes at 125 volts or 10 amperes at 250 volts if individual overload protection is omitted.

**Table K-4 – Receptacle Ratings for Various Size Circuits**

Circuit rating amperes	Receptacle rating amperes
15 .....	Not over 15
20 .....	15 or 20
30 .....	30
40 .....	40 or 50
50 .....	50

**(c) Outside conductors and lamps.**

**(1) 600 volts, nominal, or less.** Paragraphs (c)(1)(i) through (c)(1)(iv) of this section apply to branch circuit, feeder, and service conductors rated 600 volts, nominal, or less and run outdoors as open conductors.

**(i) Conductors on poles.** Conductors supported on poles shall provide a horizontal climbing space not less than the following:

**(A)** Power conductors below communication conductors – 30 inches (762 mm).

**(B)** Power conductors alone or above communication conductors: 300 volts or less – 24 inches (610 mm); more than 300 volts – 30 inches (762 mm).

**(C)** Communication conductors below power conductors: with power conductors 300 volts or less – 24 inches (610 mm); more than 300 volts – 30 inches (762 mm).

**(ii) Clearance from ground.** Open conductors shall conform to the following minimum clearances:

**(A)** 10 feet (3.05 m) – above finished grade, sidewalks, or from any platform or projection from which they might be reached.

**(B)** 12 feet (3.66 m) – over areas subject to vehicular traffic other than truck traffic.

**(C)** 15 feet (4.57 m) – over areas other than those specified in paragraph (c)(1)(ii)(D) of this section that are subject to truck traffic.

**(D)** 18 feet (5.49 m) – over public streets, alleys, roads, and driveways.

**(iii) Clearance from building openings.** Conductors shall have a clearance of at least 3 feet (914 mm) from windows, doors, fire escapes, or similar locations. Conductors run above the top level of a window are considered to be out of reach from that window and, therefore, do not have to be 3 feet (914 mm) away.

**(iv) Clearance over roofs.** Conductors above roof space accessible to employees on foot shall have a clearance from the highest point of the roof surface of not less than 8 feet (2.44 m) vertical clearance for insulated conductors, not less than 10 feet (3.05 m) vertical or diagonal clearance for covered conductors, and not less than 15 feet (4.57 m) for bare conductors, except that:

**(A)** Where the roof space is also accessible to vehicular traffic, the vertical clearance shall not be less than 18 feet (5.49 m), or

**(B)** Where the roof space is not normally accessible to employees on foot, fully insulated conductors shall have a vertical or diagonal clearance of not less than 3 feet (914 mm), or

**(C)** Where the voltage between conductors is 300 volts or less and the roof has a slope of not less than 4 inches (102 mm) in 12 inches (305 mm), the clearance from roofs shall be at least 3 feet (914 mm), or

**(D)** Where the voltage between conductors is 300 volts or less and the conductors do not pass over more than 4 feet (1.22 m) of the overhang portion of the roof and they are terminated at a through-the-roof raceway or support, the clearance from roofs shall be at least 18 inches (457 mm).

**(2) Location of outdoor lamps.** Lamps for outdoor lighting shall be located below all live conductors, transformers, or other electric equipment, unless such equipment is controlled by a disconnecting means that can be locked in the open position or unless adequate clearances or other safeguards are provided for relamping operations.

**(d) Services.**

**(1) Disconnecting means.**

**(i) General.** Means shall be provided to disconnect all conductors in a building or other structure from the service-entrance conductors. The disconnecting means shall plainly indicate whether it is in the open or closed position and shall be installed at a readily accessible location nearest the point of entrance of the service-entrance conductors.

**(ii) Simultaneous opening of poles.** Each service disconnecting means shall simultaneously disconnect all ungrounded conductors.

**(2) Services over 600 volts, nominal.** The following additional requirements apply to services over 600 volts, nominal.

# WIRING DESIGN & PROTECTION

# K

**(i) Guarding.** Service-entrance conductors installed as open wires shall be guarded to make them accessible only to qualified persons.

**(ii) Warning signs.** Signs warning of high voltage shall be posted where unauthorized employees might come in contact with live parts.

**(e) Overcurrent protection.**

**(1) 600 volts, nominal, or less.** The following requirements apply to overcurrent protection of circuits rated 600 volts, nominal, or less.

**(i) Protection of conductors and equipment.** Conductors and equipment shall be protected from overcurrent in accordance with their ability to safely conduct current. Conductors shall have sufficient ampacity to carry the load.

**(ii) Grounded conductors.** Except for motor-running overload protection, overcurrent devices shall not interrupt the continuity of the grounded conductor unless all conductors of the circuit are opened simultaneously.

**(iii) Disconnection of fuses and thermal cutouts.** Except for devices provided for current-limiting on the supply side of the service disconnecting means, all cartridge fuses which are accessible to other than qualified persons and all fuses and thermal cutouts on circuits over 150 volts to ground shall be provided with disconnecting means. This disconnecting means shall be installed so that the fuse or thermal cutout can be disconnected from its supply without disrupting service to equipment and circuits unrelated to those protected by the overcurrent device.

**(iv) Location in or on premises.** Overcurrent devices shall be readily accessible. Overcurrent devices shall not be located where they could create an employee safety hazard by being exposed to physical damage or located in the vicinity of easily ignitable material.

**(v) Arcing or suddenly moving parts.** Fuses and circuit breakers shall be so located or shielded that employees will not be burned or otherwise injured by their operation.

**(vi) Circuit breakers.**

**(A)** Circuit breakers shall clearly indicate whether they are in the open (off) or closed (on) position.

**(B)** Where circuit breaker handles on switchboards are operated vertically rather than horizontally or rotationally, the up position of the handle shall be the closed (on) position.

**(C)** If used as switches in 120-volt, fluorescent lighting circuits, circuit breakers shall be marked “**SWD.**”

# K

## WIRING DESIGN & PROTECTION

**(2) Over 600 volts, nominal.** Feeders and branch circuits over 600 volts, nominal, shall have short-circuit protection.

**(f) Grounding.** Paragraphs (f)(1) through (f)(11) of this section contain grounding requirements for systems, circuits, and equipment.

**(1) Systems to be grounded.** The following systems which supply premises wiring shall be grounded:

**(i) Three-wire DC systems.** All 3-wire DC systems shall have their neutral conductor grounded.

**(ii) Two-wire DC systems.** Two-wire DC systems operating at over 50 volts through 300 volts between conductors shall be grounded unless they are rectifier-derived from an AC system complying with paragraphs (f)(1)(iii), (f)(1)(iv), and (f)(1)(v) of this section.

**(iii) AC circuits, less than 50 volts.** AC circuits of less than 50 volts shall be grounded if they are installed as overhead conductors outside of buildings or if they are supplied by transformers and the transformer primary supply system is ungrounded or exceeds 150 volts to ground.

**(iv) AC systems, 50 volts to 1000 volts.** AC systems of 50 volts to 1000 volts shall be grounded under any of the following conditions, unless exempted by paragraph (f)(1)(v) of this section:

**(A)** If the system can be so grounded that the maximum voltage to ground on the ungrounded conductors does not exceed 150 volts;

**(B)** If the system is nominally rated 480Y/277 volt, 3-phase, 4-wire in which the neutral is used as a circuit conductor;

**(C)** If the system is nominally rated 240/120 volt, 3-phase, 4-wire in which the midpoint of one phase is used as a circuit conductor; or

**(D)** If a service conductor is uninsulated.

**(v) Exceptions.** AC systems of 50 volts to 1000 volts are not required to be grounded if the system is separately derived and is supplied by a transformer that has a primary voltage rating less than 1000 volts, provided all of the following conditions are met:

**(A)** The system is used exclusively for control circuits,

**(B)** The conditions of maintenance and supervision assure that only qualified persons will service the installation,

**(C)** Continuity of control power is required, and

# WIRING DESIGN & PROTECTION

# K

(D) Ground detectors are installed on the control system.

**(2) Separately derived systems.** Where paragraph (f)(1) of this section requires grounding of wiring systems whose power is derived from generator, transformer, or converter windings and has no direct electrical connection, including a solidly connected grounded circuit conductor, to supply conductors originating in another system, paragraph (f)(5) of this section shall also apply.

**(3) Portable and vehicle-mounted generators.**

**(i) Portable generators.** Under the following conditions, the frame of a portable generator need not be grounded and may serve as the grounding electrode for a system supplied by the generator:

**(A)** The generator supplies only equipment mounted on the generator and/or cord- and plug-connected equipment through receptacles mounted on the generator, and

**(B)** The noncurrent-carrying metal parts of equipment and the equipment grounding conductor terminals of the receptacles are bonded to the generator frame.

**(ii) Vehicle-mounted generators.** Under the following conditions the frame of a vehicle may serve as the grounding electrode for a system supplied by a generator located on the vehicle:

**(A)** The frame of the generator is bonded to the vehicle frame, and

**(B)** The generator supplies only equipment located on the vehicle and/or cord- and plug-connected equipment through receptacles mounted on the vehicle or on the generator, and

**(C)** The noncurrent-carrying metal parts of equipment and the equipment grounding conductor terminals of the receptacles are bonded to the generator frame, and

**(D)** The system complies with all other provisions of this section.

**(iii) Neutral conductor bonding.** A neutral conductor shall be bonded to the generator frame if the generator is a component of a separately derived system. No other conductor need be bonded to the generator frame.

**(4) Conductors to be grounded.** For AC premises wiring systems the identified conductor shall be grounded.

**(5) Grounding connections.**

**(i) Grounded system.** For a grounded system, a grounding electrode conductor shall be used to connect both the equipment grounding conductor and the grounded circuit conductor to the grounding electrode. Both the equipment grounding conductor and the grounding electrode conductor shall be connected to the grounded circuit conductor on the supply side of the service disconnecting means, or on the supply side of the system disconnecting means or over-current devices if the system is separately derived.

**(ii) Ungrounded systems.** For an ungrounded service-supplied system, the equipment grounding conductor shall be connected to the grounding electrode conductor at the service equipment. For an ungrounded separately derived system, the equipment grounding conductor shall be connected to the grounding electrode conductor at, or ahead of, the system disconnecting means or overcurrent devices.

**(6) Grounding path.** The path to ground from circuits, equipment, and enclosures shall be permanent and continuous.

**(7) Supports, enclosures, and equipment to be grounded.**

**(i) Supports and enclosures for conductors.** Metal cable trays, metal raceways, and metal enclosures for conductors shall be grounded, except that:

**(A)** Metal enclosures such as sleeves that are used to protect cable assemblies from physical damage need not be grounded; and

**(B)** Metal enclosures for conductors added to existing installations of open wire, knob-and-tube wiring, and non-metallic-sheathed cable need not be grounded if all of the following conditions are met:

(1) Runs are less than 25 feet (7.62 m);

(2) Enclosures are free from probable contact with ground, grounded metal, metal laths, or other conductive materials; and

(3) Enclosures are guarded against employee contact.

**(ii) Service equipment enclosures.** Metal enclosures for service equipment shall be grounded.

**(iii) Fixed equipment.** Exposed noncurrent-carrying metal parts of fixed equipment which may become energized shall be grounded under any of the following conditions:

**(A)** If within 8 feet (2.44 m) vertically or 5 feet (1.52 m) horizontally of ground or grounded metal objects and subject to employee contact.

**(B)** If located in a wet or damp location and subject to employee contact.

# WIRING DESIGN & PROTECTION

# K

- (C) If in electrical contact with metal.
- (D) If in a hazardous (classified) location.
- (E) If supplied by a metal-clad, metal-sheathed, or grounded metal raceway wiring method.
- (F) If equipment operates with any terminal at over 150 volts to ground; however, the following need not be grounded:
  - (1) Enclosures for switches or circuit breakers used for other than service equipment and accessible to qualified persons only;
  - (2) Metal frames of electrically heated appliances which are permanently and effectively insulated from ground; and
  - (3) The cases of distribution apparatus such as transformers and capacitors mounted on wooden poles at a height exceeding 8 feet (2.44 m) above ground or grade level.

**(iv) Equipment connected by cord and plug.** Under any of the conditions described in paragraphs (f)(7)(iv)(A) through (f)(7)(iv)(C) of this section, exposed noncurrent-carrying metal parts of cord- and plug-connected equipment which may become energized shall be grounded:

- (A) If in a hazardous (classified) location (see §1926.407).
- (B) If operated at over 150 volts to ground, except for guarded motors and metal frames of electrically heated appliances if the appliance frames are permanently and effectively insulated from ground.
- (C) If the equipment is one of the types listed in paragraphs (f)(7)(iv)(C)(1) through (f)(7)(iv)(C)(5) of this section. However, even though the equipment may be one of these types, it need not be grounded if it is exempted by paragraph (f)(7)(iv)(C)(6).
  - (1) Hand held motor-operated tools;
  - (2) Cord- and plug-connected equipment used in damp or wet locations or by employees standing on the ground or on metal floors or working inside of metal tanks or boilers;
  - (3) Portable and mobile X-ray and associated equipment;
  - (4) Tools likely to be used in wet and/or conductive locations; and
  - (5) Portable hand lamps.

(6) Tools likely to be used in wet and/or conductive locations need not be grounded if supplied through an isolating transformer with an ungrounded secondary of not over 50 volts. Listed or labeled portable tools and appliances protected by a system of double insulation, or its equivalent, need not be grounded. If such a system is employed, the equipment shall be distinctively marked to indicate that the tool or appliance utilizes a system of double insulation.

(v) **Nonelectrical equipment.** The metal parts of the following nonelectrical equipment shall be grounded: Frames and tracks of electrically operated cranes; frames of nonelectrically driven elevator cars to which electric conductors are attached; hand-operated metal shifting ropes or cables of electric elevators, and metal partitions, grill work, and similar metal enclosures around equipment of over 1kV between conductors.

**(8) Methods of grounding equipment.**

(i) **With circuit conductors.** Noncurrent-carrying metal parts of fixed equipment, if required to be grounded by this subpart, shall be grounded by an equipment grounding conductor which is contained within the same raceway, cable, or cord, or runs with or encloses the circuit conductors. For DC circuits only, the equipment grounding conductor may be run separately from the circuit conductors.

(ii) **Grounding conductor.** A conductor used for grounding fixed or movable equipment shall have capacity to conduct safely any fault current which may be imposed on it.

(iii) **Equipment considered effectively grounded.** Electric equipment is considered to be effectively grounded if it is secured to, and in electrical contact with, a metal rack or structure that is provided for its support and the metal rack or structure is grounded by the method specified for the noncurrent-carrying metal parts of fixed equipment in paragraph (f)(8)(i) of this section. Metal car frames supported by metal hoisting cables attached to or running over metal sheaves or drums of grounded elevator machines are also considered to be effectively grounded.

(9) **Bonding.** If bonding conductors are used to assure electrical continuity, they shall have the capacity to conduct any fault current which may be imposed.

(10) **Made electrodes.** If made electrodes are used, they shall be free from nonconductive coatings, such as paint or enamel; and, if practicable, they shall be embedded below permanent moisture level. A single electrode consisting of a rod, pipe or plate which has a resistance to ground greater than 25 ohms shall be augmented by one additional electrode installed no closer than 6 feet (1.83 m) to the first electrode.

## **(11) Grounding of systems and circuits of 1000 volts and over (high voltage).**

**(i) General.** If high voltage systems are grounded, they shall comply with all applicable provisions of paragraphs (f)(1) through (f)(10) of this section as supplemented and modified by this paragraph (f)(11).

**(ii) Grounding of systems supplying portable or mobile equipment.** Systems supplying portable or mobile high voltage equipment, other than substations installed on a temporary basis, shall comply with the following:

**(A)** Portable and mobile high voltage equipment shall be supplied from a system having its neutral grounded through an impedance. If a delta-connected high voltage system is used to supply the equipment, a system neutral shall be derived.

**(B)** Exposed noncurrent-carrying metal parts of portable and mobile equipment shall be connected by an equipment grounding conductor to the point at which the system neutral impedance is grounded.

**(C)** Ground-fault detection and relaying shall be provided to automatically de-energize any high voltage system component which has developed a ground fault. The continuity of the equipment grounding conductor shall be continuously monitored so as to de-energize automatically the high voltage feeder to the portable equipment upon loss of continuity of the equipment grounding conductor.

**(D)** The grounding electrode to which the portable or mobile equipment system neutral impedance is connected shall be isolated from and separated in the ground by at least 20 feet (6.1 m) from any other system or equipment grounding electrode, and there shall be no direct connection between the grounding electrodes, such as buried pipe, fence or like objects.

**(iii) Grounding of equipment.** All noncurrent-carrying metal parts of portable equipment and fixed equipment including their associated fences, housings, enclosures, and supporting structures shall be grounded. However, equipment which is guarded by location and isolated from ground need not be grounded. Additionally, pole-mounted distribution apparatus at a height exceeding 8 feet (2.44 m) above ground or grade level need not be grounded.

(Information collection requirements contained in paragraphs (b)(1)(iii)(A) and (b)(1)(iii)(G) were approved by the Office of Management and Budget under control number 1218-0062; information collection requirements contained in paragraph (f)(7)(iv)(C)(6) were approved by the Office of Management and Budget under control number: 1218-0130)

**Stat. Auth.:** ORS 654.025(2) and 656.726(4).

**Stats. Implemented:** ORS 654.001 through 654.295.

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).

APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

OR-OSHA Admin. Order 5-2002, f. 6/28/02, ef. 10/01/03.

**§1926.405 Wiring Methods, Components, and Equipment for General Use.**

**(a) Wiring methods.** The provisions of this paragraph do not apply to conductors which form an integral part of equipment such as motors, controllers, motor control centers and like equipment.

**(1) General requirements.**

**(i) Electrical continuity of metal raceways and enclosures.** Metal raceways, cable armor, and other metal enclosures for conductors shall be metallically joined together into a continuous electric conductor and shall be so connected to all boxes, fittings, and cabinets as to provide effective electrical continuity.

**(ii) Wiring in ducts.** No wiring systems of any type shall be installed in ducts used to transport dust, loose stock or flammable vapors. No wiring system of any type shall be installed in any duct used for vapor removal or in any shaft containing only such ducts.

**(2) Temporary wiring.**

**(i) Scope.** The provisions of paragraph (a)(2) of this section apply to temporary electrical power and lighting wiring methods which may be of a class less than would be required for a permanent installation. Except as specifically modified in paragraph (a)(2) of this section, all other requirements of this subpart for permanent wiring shall apply to temporary wiring installations. Temporary wiring shall be removed immediately upon completion of construction or the purpose for which the wiring was installed.

**(ii) General requirements for temporary wiring.**

**(A)** Feeders shall originate in a distribution center. The conductors shall be run as multiconductor cord or cable assemblies or within raceways; or, where not subject to physical damage, they may be run as open conductors on insulators not more than 10 feet (3.05 m) apart.

**(B)** Branch circuits shall originate in a power outlet or panelboard. Conductors shall be run as multiconductor cord or cable assemblies or open conductors, or shall be run in raceways. All conductors shall be protected by overcurrent devices at their ampacity. Runs of open conductors shall be located where the conductors will not be subject to physical damage, and the conductors shall be fastened at intervals not exceeding 10 feet (3.05 m). No branch-circuit conductors shall be laid on the floor. Each branch circuit that supplies receptacles or fixed equipment shall contain a separate equipment grounding conductor if the branch circuit is run as open conductors.

(C) Receptacles shall be of the grounding type. Unless installed in a complete metallic raceway, each branch circuit shall contain a separate equipment grounding conductor, and all receptacles shall be electrically connected to the grounding conductor. Receptacles for uses other than temporary lighting shall not be installed on branch circuits which supply temporary lighting. Receptacles shall not be connected to the same ungrounded conductor of multiwire circuits which supply temporary lighting.

(D) Disconnecting switches or plug connectors shall be installed to permit the disconnection of all ungrounded conductors of each temporary circuit.

(E) All lamps for general illumination shall be protected from accidental contact or breakage. Metal-case sockets shall be grounded.

(F) Temporary lights shall not be suspended by their electric cords unless cords and lights are designed for this means of suspension.

(G) Portable electric lighting used in wet and/or other conductive locations, as for example, drums, tanks, and vessels, shall be operated at 12 volts or less. However, 120-volt lights may be used if protected by a ground-fault circuit interrupter.

(H) A box shall be used wherever a change is made to a raceway system or a cable system which is metal clad or metal sheathed.

(I) Flexible cords and cables shall be protected from damage. Sharp corners and projections shall be avoided. Flexible cords and cables may pass through doorways or other pinch points, if protection is provided to avoid damage.

(J) Extension cord sets used with portable electric tools and appliances shall be of three-wire type and shall be designed for hard or extra-hard usage. Flexible cords used with temporary and portable lights shall be designed for hard or extra-hard usage.

**Note:** The National Electrical Code, ANSI/NFPA 70, in Article 400, Table 400-4, lists various types of flexible cords, some of which are noted as being designed for hard or extra-hard usage. Examples of these types of flexible cords include hard service cord (types S, ST, SO, STO) and junior hard service cord (types SJ, SJO, SJT, SJTO).

(iii) **Guarding.** For temporary wiring over 600 volts, nominal, fencing, barriers, or other effective means shall be provided to prevent access of other than authorized and qualified personnel.

**(b) Cabinets, boxes, and fittings.**

(1) **Conductors entering boxes, cabinets, or fittings.** Conductors entering boxes, cabinets, or fittings shall be protected from abrasion, and openings through which conductors enter shall be effectively closed. Unused openings in cabinets, boxes, and fittings shall also be effectively closed.

**(2) Covers and canopies.** All pull boxes, junction boxes, and fittings shall be provided with covers. If metal covers are used, they shall be grounded. In energized installations each outlet box shall have a cover, faceplate, or fixture canopy. Covers of outlet boxes having holes through which flexible cord pendants pass shall be provided with bushings designed for the purpose or shall have smooth, well-rounded surfaces on which the cords may bear.

**(3) Pull and junction boxes for systems over 600 volts, nominal.** In addition to other requirements in this section for pull and junction boxes, the following shall apply to these boxes for systems over 600 volts, nominal:

**(i) Complete enclosure.** Boxes shall provide a complete enclosure for the contained conductors or cables.

**(ii) Covers.** Boxes shall be closed by covers securely fastened in place. Underground box covers that weigh over 100 pounds (43.6 kg) meet this requirement. Covers for boxes shall be permanently marked "**HIGH VOLTAGE.**" The marking shall be on the outside of the box cover and shall be readily visible and legible.

**(c) Knife switches.** Single-throw knife switches shall be so connected that the blades are dead when the switch is in the open position. Single-throw knife switches shall be so placed that gravity will not tend to close them. Single-throw knife switches approved for use in the inverted position shall be provided with a locking device that will ensure that the blades remain in the open position when so set. Double-throw knife switches may be mounted so that the throw will be either vertical or horizontal. However, if the throw is vertical, a locking device shall be provided to ensure that the blades remain in the open position when so set.

**(d) Switchboards and panelboards.** Switchboards that have any exposed live parts shall be located in permanently dry locations and accessible only to qualified persons. Panelboards shall be mounted in cabinets, cutout boxes, or enclosures designed for the purpose and shall be dead front. However, panelboards other than the dead front externally-operable type are permitted where accessible only to qualified persons. Exposed blades of knife switches shall be dead when open.

**(e) Enclosures for damp or wet locations.**

**(1) Cabinets, fittings, and boxes.** Cabinets, cutout boxes, fittings, boxes, and panelboard enclosures in damp or wet locations shall be installed so as to prevent moisture or water from entering and accumulating within the enclosures. In wet locations the enclosures shall be weatherproof.

**(2) Switches and circuit breakers.** Switches, circuit breakers, and switchboards installed in wet locations shall be enclosed in weatherproof enclosures.

**(f) Conductors for general wiring.** All conductors used for general wiring shall be insulated unless otherwise permitted in this Subpart. The conductor insulation shall be of a type that is suitable for the voltage, operating temperature, and location of use. Insulated conductors shall be distinguishable by appropriate color or other means as being grounded conductors, ungrounded conductors, or equipment grounding conductors.

## (g) Flexible cords and cables.

### (1) Use of flexible cords and cables.

**(i) Permitted uses.** Flexible cords and cables shall be suitable for conditions of use and location. Flexible cords and cables shall be used only for:

- (A) Pendants;
- (B) Wiring of fixtures;
- (C) Connection of portable lamps or appliances;
- (D) Elevator cables;
- (E) Wiring of cranes and hoists;
- (F) Connection of stationary equipment to facilitate their frequent interchange;
- (G) Prevention of the transmission of noise or vibration; or
- (H) Appliances where the fastening means and mechanical connections are designed to permit removal for maintenance and repair.

**(ii) Attachment plugs for cords.** If used as permitted in paragraphs (g)(1)(i)(C), (g)(1)(i)(F), or (g)(1)(i)(H) of this section, the flexible cord shall be equipped with an attachment plug and shall be energized from a receptacle outlet.

**(iii) Prohibited uses.** Unless necessary for a use permitted in paragraph (g)(1)(i) of this section, flexible cords and cables shall not be used:

- (A) As a substitute for the fixed wiring of a structure;
- (B) Where run through holes in walls, ceilings, or floors;
- (C) Where run through doorways, windows, or similar openings, except as permitted in paragraph (a)(2)(ii)(A) of this section;
- (D) Where attached to building surfaces; or
- (E) Where concealed behind building walls, ceilings, or floors.

### (2) Identification, splices, and terminations.

**(i) Identification.** A conductor of a flexible cord or cable that is used as a grounded conductor or an equipment grounding conductor shall be distinguishable from other conductors.

**(ii) Marking.** Type SJ, SJO, SJT, SJTO, S, SO, ST, and STO cords shall not be used unless durably marked on the surface with the type designation, size, and number of conductors.

**(iii) Splices.** Flexible cords shall be used only in continuous lengths without splice or tap. Hard service flexible cords No. 12 or larger may be repaired if spliced so that the splice retains the insulation, outer sheath properties, and usage characteristics of the cord being spliced.

**(iv) Strain relief.** Flexible cords shall be connected to devices and fittings so that strain relief is provided which will prevent pull from being directly transmitted to joints or terminal screws.

**(v) Cords passing through holes.** Flexible cords and cables shall be protected by bushings or fittings where passing through holes in covers, outlet boxes, or similar enclosures.

**(h) Portable cables over 600 volts, nominal.** Multiconductor portable cable for use in supplying power to portable or mobile equipment at over 600 volts, nominal, shall consist of No. 8 or larger conductors employing flexible stranding. Cables operated at over 2000 volts shall be shielded for the purpose of confining the voltage stresses to the insulation. Grounding conductors shall be provided. Connectors for these cables shall be of a locking type with provisions to prevent their opening or closing while energized. Strain relief shall be provided at connections and terminations. Portable cables shall not be operated with splices unless the splices are of the permanent molded, vulcanized, or other equivalent type. Termination enclosures shall be marked with a high voltage hazard warning, and terminations shall be accessible only to authorized and qualified personnel.

**(i) Fixture wires.**

**(1) General.** Fixture wires shall be suitable for the voltage, temperature, and location of use. A fixture wire which is used as a grounded conductor shall be identified.

**(2) Uses permitted.** Fixture wires may be used:

**(i)** For installation in lighting, fixtures and in similar equipment where enclosed or protected and not subject to bending or twisting in use; or

**(ii)** For connecting lighting fixtures to the branch-circuit conductors supplying the fixtures.

**(3) Uses not permitted.** Fixture wires shall not be used as branch-circuit conductors except as permitted for Class 1 power-limited circuits.

## (j) Equipment for general use.

### (1) Lighting fixtures, lampholders, lamps, and receptacles.

**(i) Live parts.** Fixtures, lampholders, lamps, rosettes, and receptacles shall have no live parts normally exposed to employee contact. However, rosettes and cleat-type lampholders and receptacles located at least 8 feet (2.44 m) above the floor may have exposed parts.

**(ii) Support.** Fixtures, lampholders, rosettes, and receptacles shall be securely supported. A fixture that weighs more than 6 pounds (2.72 kg) or exceeds 16 inches (406 mm) in any dimension shall not be supported by the screw shell of a lampholder.

**(iii) Portable lamps.** Portable lamps shall be wired with flexible cord and an attachment plug of the polarized or grounding type. If the portable lamp uses an Edison-based lampholder, the grounded conductor shall be identified and attached to the screw shell and the identified blade of the attachment plug. In addition, portable handlamps shall comply with the following:

**(A)** Metal shell, paperlined lampholders shall not be used;

**(B)** Handlamps shall be equipped with a handle of molded composition or other insulating material;

**(C)** Handlamps shall be equipped with a substantial guard attached to the lampholder or handle;

**(D)** Metallic guards shall be grounded by the means of an equipment grounding conductor run within the power supply cord.

**(iv) Lampholders.** Lampholders of the screw-shell type shall be installed for use as lampholders only. Lampholders installed in wet or damp locations shall be of the weatherproof type.

**(v) Fixtures.** Fixtures installed in wet or damp locations shall be identified for the purpose and shall be installed so that water cannot enter or accumulate in wireways, lampholders, or other electrical parts.

### (2) Receptacles, cord connectors, and attachment plugs (caps).

**(i) Configuration.** Receptacles, cord connectors, and attachment plugs shall be constructed so that no receptacle or cord connector will accept an attachment plug with a different voltage or current rating than that for which the device is intended. However, a 20-ampere T-slot receptacle or cord connector may accept a 15-ampere attachment plug of the same voltage rating. Receptacles connected to circuits having different voltages, frequencies, or types of current (ac or dc) on the same premises shall be of such design that the attachment plugs used on these circuits are not interchangeable.

**(ii) Damp and wet locations.** A receptacle installed in a wet or damp location shall be designed for the location.

**(3) Appliances.**

**(i) Live parts.** Appliances, other than those in which the current-carrying parts at high temperatures are necessarily exposed, shall have no live parts normally exposed to employee contact.

**(ii) Disconnecting means.** A means shall be provided to disconnect each appliance.

**(iii) Rating.** Each appliance shall be marked with its rating in volts and amperes or volts and watts.

**(4) Motors.** This paragraph applies to motors, motor circuits, and controllers.

**(i) In sight from.** If specified that one piece of equipment shall be “in sight from” another piece of equipment, one shall be visible and not more than 50 feet (15.2 m) from the other.

**(ii) Disconnecting means.**

**(A)** A disconnecting means shall be located in sight from the controller location. The controller disconnecting means for motor branch circuits over 600 volts, nominal, may be out of sight of the controller, if the controller is marked with a warning label giving the location and identification of the disconnecting means which is to be locked in the open position.

**(B)** The disconnecting means shall disconnect the motor and the controller from all ungrounded supply conductors and shall be so designed that no pole can be operated independently.

**(C)** If a motor and the driven machinery are not in sight from the controller location, the installation shall comply with one of the following conditions:

**(1)** The controller disconnecting means shall be capable of being locked in the open position.

**(2)** A manually operable switch that will disconnect the motor from its source of supply shall be placed in sight from the motor location.

**(D)** The disconnecting means shall plainly indicate whether it is in the open (off) or closed (on) position.

**(E)** The disconnecting means shall be readily accessible. If more than one disconnect is provided for the same equipment, only one need be readily accessible.

(F) An individual disconnecting means shall be provided for each motor, but a single disconnecting means may be used for a group of motors under any one of the following conditions:

- (1) If a number of motors drive special parts of a single machine or piece of apparatus, such as a metal or woodworking machine, crane, or hoist;
- (2) If a group of motors is under the protection of one set of branch-circuit protective devices; or
- (3) If a group of motors is in a single room in sight from the location of the disconnecting means.

**(iii) Motor overload, short-circuit, and ground-fault protection.** Motors, motor-control apparatus, and motor branch-circuit conductors shall be protected against overheating due to motor overloads or failure to start, and against short-circuits or ground faults. These provisions do not require overload protection that will stop a motor where a shutdown is likely to introduce additional or increased hazards, as in the case of fire pumps, or where continued operation of a motor is necessary for a safe shutdown of equipment or process and motor overload sensing devices are connected to a supervised alarm.

**(iv) Protection of live parts – all voltages.**

**(A)** Stationary motors having commutators, collectors, and brush rigging located inside of motor end brackets and not conductively connected to supply circuits operating at more than 150 volts to ground need not have such parts guarded. Exposed live parts of motors and controllers operating at 50 volts or more between terminals shall be guarded against accidental contact by any of the following:

- (1) By installation in a room or enclosure that is accessible only to qualified persons;
- (2) By installation on a balcony, gallery, or platform, so elevated and arranged as to exclude unqualified persons; or
- (3) By elevation 8 feet (2.44 m) or more above the floor.

**(B)** Where live parts of motors or controllers operating at over 150 volts to ground are guarded against accidental contact only by location, and where adjustment or other attendance may be necessary during the operation of the apparatus, insulating mats or platforms shall be provided so that the attendant cannot readily touch live parts unless standing on the mats or platforms.

**(5) Transformers.**

**(i) Application.** The following paragraphs cover the installation of all transformers, except:

**(A)** Current transformers;

**(B)** Dry-type transformers installed as a component part of other apparatus;

**(C)** Transformers which are an integral part of an X-ray, high frequency, or electrostatic-coating apparatus;

**(D)** Transformers used with Class 2 and Class 3 circuits, sign and outline lighting, electric discharge lighting, and power-limited fire-protective signaling circuits.

**(ii) Operating voltage.** The operating voltage of exposed live parts of transformer installations shall be indicated by warning signs or visible markings on the equipment or structure.

**(iii) Transformers over 35 kV.** Dry-type, high fire point liquid-insulated, and askarel-insulated transformers installed indoors and rated over 35 kV shall be in a vault.

**(iv) Oil-insulated transformers.** If they present a fire hazard to employees, oil-insulated transformers installed indoors shall be in a vault.

**(v) Fire protection.** Combustible material, combustible buildings and parts of buildings, fire escapes, and door and window openings shall be safeguarded from fires which may originate in oil-insulated transformers attached to or adjacent to a building or combustible material.

**(vi) Transformer vaults.** Transformer vaults shall be constructed so as to contain fire and combustible liquids within the vault and to prevent unauthorized access. Locks and latches shall be so arranged that a vault door can be readily opened from the inside.

**(vii) Pipes and ducts.** Any pipe or duct system foreign to the vault installation shall not enter or pass through a transformer vault.

**(viii) Material storage.** Materials shall not be stored in transformer vaults.

# K WIRING METHODS, COMPONENTS, & EQUIPMENT FOR GENERAL USE

Oregon Administrative Rules  
Oregon Occupational Safety  
and Health Division

## (6) Capacitors.

**(i) Drainage of stored charge.** All capacitors, except surge capacitors or capacitors included as a component part of other apparatus, shall be provided with an automatic means of draining the stored charge and maintaining the discharged state after the capacitor is disconnected from its source of supply.

**(ii) Over 600 volts.** Capacitors rated over 600 volts, nominal, shall comply with the following additional requirements:

**(A)** Isolating or disconnecting switches (with no interrupting rating) shall be interlocked with the load interrupting device or shall be provided with prominently displayed caution signs to prevent switching load current.

**(B)** For series capacitors the proper switching shall be assured by use of at least one of the following:

- (1) Mechanically sequenced isolating and bypass switches,
- (2) Interlocks, or
- (3) Switching procedure prominently displayed at the switching location.

(Information collection requirements contained in paragraphs (g)(2)(ii), (j)(3)(iii), (j)(4)(ii)(A), (j)(5)(ii), and (j)(6)(ii)(B)(3) were approved by the Office of Management and Budget under control number 1218-0130)

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).

# SPECIFIC PURPOSE EQUIPMENT & INSTALLATIONS **K**

---

## **§1926.406 Specific Purpose Equipment and Installations.**

**(a) Cranes and hoists.** This paragraph applies to the installation of electric equipment and wiring used in connection with cranes, monorail hoists, hoists, and all runways.

**(1) Disconnecting means.**

**(i) Runway conductor disconnecting means.** A readily accessible disconnecting means shall be provided between the runway contact conductors and the power supply.

**(ii) Disconnecting means for cranes and monorail hoists.** A disconnecting means, capable of being locked in the open position, shall be provided in the leads from the runway contact conductors or other power supply on any crane or monorail hoist.

**(A)** If this additional disconnecting means is not readily accessible from the crane or monorail hoist operating station, means shall be provided at the operating station to open the power circuit to all motors of the crane or monorail hoist.

**(B)** The additional disconnect may be omitted if a monorail hoist or hand-propelled crane bridge installation meets all of the following:

- (1)** The unit is floor controlled;
- (2)** The unit is within view of the power supply disconnecting means; and
- (3)** No fixed work platform has been provided for servicing the unit.

**(2) Control.** A limit switch or other device shall be provided to prevent the load block from passing the safe upper limit of travel of any hoisting mechanism.

**(3) Clearance.** The dimension of the working space in the direction of access to live parts which may require examination, adjustment, servicing, or maintenance while alive shall be a minimum of 2 feet 6 inches (762 mm). Where controls are enclosed in cabinets, the door(s) shall open at least 90 degrees or be removable, or the installation shall provide equivalent access.

**(4) Grounding.** All exposed metal parts of cranes, monorail hoists, hoists and accessories including pendant controls shall be metallically joined together into a continuous electrical conductor so that the entire crane or hoist will be grounded in accordance with §1926.404(f). Moving parts, other than removable accessories or attachments, having metal-to-metal bearing surfaces shall be considered to be electrically connected to each other through the bearing surfaces for grounding purposes. The trolley frame and bridge frame shall be considered as electrically grounded through the bridge and trolley wheels and its respective tracks unless conditions such as paint or other insulating materials prevent reliable metal-to-metal contact. In this case a separate bonding conductor shall be provided.

# K SPECIFIC PURPOSE EQUIPMENT & INSTALLATIONS

---

## (b) Elevators, escalators, and moving walks.

(1) **Disconnecting means.** Elevators, escalators, and moving walks shall have a single means for disconnecting all ungrounded main power supply conductors for each unit.

(2) **Control panels.** If control panels are not located in the same space as the drive machine, they shall be located in cabinets with doors or panels capable of being locked closed.

## (c) Electric welders – disconnecting means.

(1) **Motor-generator, AC transformer, and DC rectifier arc welders.** A disconnecting means shall be provided in the supply circuit for each motor-generator arc welder, and for each AC transformer and DC rectifier arc welder which is not equipped with a disconnect mounted as an integral part of the welder.

(2) **Resistance welders.** A switch or circuit breaker shall be provided by which each resistance welder and its control equipment can be isolated from the supply circuit. The ampere rating of this disconnecting means shall not be less than the supply conductor ampacity.

## (d) X-Ray equipment.

### (1) Disconnecting means.

(i) **General.** A disconnecting means shall be provided in the supply circuit. The disconnecting means shall be operable from a location readily accessible from the X-ray control. For equipment connected to a 120-volt branch circuit of 30 amperes or less, a grounding-type attachment plug cap and receptacle of proper rating may serve as a disconnecting means.

(ii) **More than one piece of equipment.** If more than one piece of equipment is operated from the same high-voltage circuit, each piece or each group of equipment as a unit shall be provided with a high-voltage switch or equivalent disconnecting means. This disconnecting means shall be constructed, enclosed, or located so as to avoid contact by employees with its live parts.

(2) **Control – Radiographic and fluoroscopic types.** Radiographic and fluoroscopic-type equipment shall be effectively enclosed or shall have interlocks that deenergize the equipment automatically to prevent ready access to live current-carrying parts.

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

# HAZARDOUS (CLASSIFIED) LOCATIONS

# K

## §1926.407 Hazardous (Classified) Locations.

**(a) Scope.** This section sets forth requirements for electric equipment and wiring in locations which are classified depending on the properties of the flammable vapors, liquids or gases, or combustible dusts or fibers which may be present therein and the likelihood that a flammable or combustible concentration or quantity is present. Each room, section or area shall be considered individually in determining its classification. These hazardous (classified) locations are assigned six designations as follows:

- Class I, Division 1
- Class I, Division 2
- Class II, Division 1
- Class II, Division 2
- Class III, Division 1
- Class III, Division 2

For definitions of these locations see §1926.449. All applicable requirements in this subpart apply to all hazardous (classified) locations, unless modified by provisions of this section.

**(b) Electrical installations.** Equipment, wiring methods, and installations of equipment in hazardous (classified) locations shall be approved as intrinsically safe or approved for the hazardous (classified) location or safe for the hazardous (classified) location. Requirements for each of these options are as follows:

**(1) Intrinsically safe.** Equipment and associated wiring approved as intrinsically safe is permitted in any hazardous (classified) location included in its listing or labeling.

**(2) Approved for the hazardous (classified) location.**

**(i) General.** Equipment shall be approved not only for the class of location but also for the ignitable or combustible properties of the specific gas, vapor, dust, or fiber that will be present.

**Note:** NFPA 70, the National Electrical Code, lists or defines hazardous gases, vapors, and dusts by “**Groups**” characterized by their ignitable or combustible properties.

**(ii) Marking.** Equipment shall not be used unless it is marked to show the class, group, and operating temperature or temperature range, based on operation in a 40° C ambient, for which it is approved. The temperature marking shall not exceed the ignition temperature of the specific gas, vapor, or dust to be encountered. However, the following provisions modify this marking requirement for specific equipment:

# K

## HAZARDOUS (CLASSIFIED) LOCATIONS

Oregon Administrative Rules  
Oregon Occupational Safety  
and Health Division

(A) Equipment of the non-heat-producing type (such as junction boxes, conduit, and fitting) and equipment of the heat-producing type having a maximum temperature of not more than 100° C (212° F) need not have a marked operating temperature or temperature range.

(B) Fixed lighting fixtures marked for use only in Class I, Division 2 locations need not be marked to indicate the group.

(C) Fixed general-purpose equipment in Class I locations, other than lighting fixtures, which is acceptable for use in Class I, Division 2 locations need not be marked with the class, group, division, or operating temperature.

(D) Fixed dust-tight equipment, other than lighting fixtures, which is acceptable for use in Class II, Division 2 and Class III locations need not be marked with the class, group, division, or operating temperature.

**(3) Safe for the hazardous (classified) location.** Equipment which is safe for the location shall be of a type and design which the employer demonstrates will provide protection from the hazards arising from the combustibility and flammability of vapors, liquids, gases, dusts, or fibers.

**Note:** The National Electrical Code, NFPA 70, contains guidelines for determining the type and design of equipment and installations which will meet this requirement. The guidelines of this document address electric wiring, equipment, and systems installed in hazardous (classified) locations and contain specific provisions for the following: wiring methods, wiring connections, conductor insulation, flexible cords, sealing and drainage, transformers, capacitors, switches, circuit breakers, fuses, motor controllers, receptacles, attachment plugs, meters, relays, instruments, resistors, generators, motors, lighting fixtures, storage battery charging equipment, electric cranes, electric hoists and similar equipment, utilization equipment, signaling systems, alarm systems, remote control systems, local loud speaker and communication systems, ventilation piping, live parts, lightning surge protection, and grounding. Compliance with these guidelines will constitute one means, but not the only means, of compliance with this paragraph.

**(c) Conduits.** All conduits shall be threaded and shall be made wrench-tight. Where it is impractical to make a threaded joint tight, a bonding jumper shall be utilized.

(Information collection requirements contained in paragraph (b)(2)(ii) were approved by the Office of Management and Budget under control number 1218-0130)

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

## §1926.408 Special Systems.

**(a) Systems over 600 volts, nominal.** Paragraphs (a)(1) through (a)(4) of this section contain general requirements for all circuits and equipment operated at over 600 volts.

### **(1) Wiring methods for fixed installations.**

**(i) Above ground.** Above-ground conductors shall be installed in rigid metal conduit, in intermediate metal conduit, in cable trays, in cable bus, in other suitable raceways, or as open runs of metal-clad cable designed for the use and purpose. However, open runs of non-metallic-sheathed cable or of bare conductors or busbars may be installed in locations which are accessible only to qualified persons. Metallic shielding components, such as tapes, wires, or braids for conductors, shall be grounded. Open runs of insulated wires and cables having a bare lead sheath or a braided outer covering shall be supported in a manner designed to prevent physical damage to the braid or sheath.

**(ii) Installations emerging from the ground.** Conductors emerging from the ground shall be enclosed in raceways. Raceways installed on poles shall be of rigid metal conduit, intermediate metal conduit, PVC schedule 80 or equivalent extending from the ground line up to a point 8 feet (2.44 m) above finished grade. Conductors entering a building shall be protected by an enclosure from the ground line to the point of entrance. Metallic enclosures shall be grounded.

### **(2) Interrupting and isolating devices.**

**(i) Circuit breakers.** Circuit breakers located indoors shall consist of metal-enclosed or fire-resistant, cell-mounted units. In locations accessible only to qualified personnel, open mounting of circuit breakers is permitted. A means of indicating the open and closed position of circuit breakers shall be provided.

**(ii) Fused cutouts.** Fused cutouts installed in buildings or transformer vaults shall be of a type identified for the purpose. They shall be readily accessible for fuse replacement.

**(iii) Equipment isolating means.** A means shall be provided to completely isolate equipment for inspection and repairs. Isolating means which are not designed to interrupt the load current of the circuit shall be either interlocked with a circuit interrupter or provided with a sign warning against opening them under load.

### (3) Mobile and portable equipment.

**(i) Power cable connections to mobile machines.** A metallic enclosure shall be provided on the mobile machine for enclosing the terminals of the power cable. The enclosure shall include provisions for a solid connection for the ground wire(s) terminal to ground effectively the machine frame. The method of cable termination used shall prevent any strain or pull on the cable from stressing the electrical connections. The enclosure shall have provision for locking so only authorized qualified persons may open it and shall be marked with a sign warning of the presence of energized parts.

**(ii) Guarding live parts.** All energized switching and control parts shall be enclosed in effectively grounded metal cabinets or enclosures. Circuit breakers and protective equipment shall have the operating means projecting through the metal cabinet or enclosure so these units can be reset without locked doors being opened. Enclosures and metal cabinets shall be locked so that only authorized qualified persons have access and shall be marked with a sign warning of the presence of energized parts. Collector ring assemblies on revolving-type machines (shovels, draglines, etc.) shall be guarded.

### (4) Tunnel installations.

**(i) Application.** The provisions of this paragraph apply to installation and use of high-voltage power distribution and utilization equipment which is associated with tunnels and which is portable and/or mobile, such as substations, trailers, cars, mobile shovels, draglines, hoists, drills, dredges, compressors, pumps, conveyors, and underground excavators.

**(ii) Conductors.** Conductors in tunnels shall be installed in one or more of the following:

**(A)** Metal conduit or other metal raceway,

**(B)** Type MC cable, or

**(C)** Other suitable multiconductor cable.

Conductors shall also be so located or guarded as to protect them from physical damage. Multiconductor portable cable may supply mobile equipment. An equipment grounding conductor shall be run with circuit conductors inside the metal raceway or inside the multi-conductor cable jacket. The equipment grounding conductor may be insulated or bare.

**(iii) Guarding live parts.** Bare terminals of transformers, switches, motor controllers, and other equipment shall be enclosed to prevent accidental contact with energized parts. Enclosures for use in tunnels shall be drip-proof, weatherproof, or submersible as required by the environmental conditions.

**(iv) Disconnecting means.** A disconnecting means that simultaneously opens all ungrounded conductors shall be installed at each transformer or motor location.

**(v) Grounding and bonding.** All non-energized metal parts of electric equipment and metal raceways and cable sheaths shall be grounded and bonded to all metal pipes and rails at the portal and at intervals not exceeding 1000 feet (305 m) throughout the tunnel.

**(b) Class 1, Class 2, and Class 3 remote control, signaling, and power-limited circuits.**

**(1) Classification.** Class 1, Class 2, or Class 3 remote control, signaling, or power-limited circuits are characterized by their usage and electrical power limitation which differentiates them from light and power circuits. These circuits are classified in accordance with their respective voltage and power limitations as summarized in paragraphs (b)(1)(i) through (b)(1)(iii) of this section.

**(i) Class 1 circuits.**

**(A)** A Class 1 power-limited circuit is supplied from a source having a rated output of not more than 30 volts and 1000 volt-amperes.

**(B)** A Class 1 remote control circuit or a Class 1 signaling circuit has a voltage which does not exceed 600 volts; however, the power output of the source need not be limited.

**(ii) Class 2 and Class 3 circuits.**

**(A)** Power for Class 2 and Class 3 circuits is limited either inherently (in which no overcurrent protection is required) or by a combination of a power source and overcurrent protection.

**(B)** The maximum circuit voltage is 150 volts AC or DC for a Class 2 inherently limited power source, and 100 volts AC or DC for a Class 3 inherently limited power source.

**(C)** The maximum circuit voltage is 30 volts AC and 60 volts DC for a Class 2 power source limited by overcurrent protection, and 150 volts AC or DC for a Class 3 power source limited by overcurrent protection.

**(iii) Application.** The maximum circuit voltages in paragraphs (b)(1)(i) and (b)(1)(ii) of this section apply to sinusoidal AC or continuous DC power sources, and where wet contact occurrence is not likely.

**(2) Marking.** A Class 2 or Class 3 power supply unit shall not be used unless it is durably marked where plainly visible to indicate the class of supply and its electrical rating.

## (c) Communications systems.

**(1) Scope.** These provisions for communication systems apply to such systems as central-station-connected and non-central-station-connected telephone circuits, radio receiving and transmitting equipment, and outside wiring for fire and burglar alarm, and similar central station systems. These installations need not comply with the provisions of §§1926.403 through 1926.408(b), except §1926.404(c)(1)(ii) and §1926.407.

### (2) Protective devices.

**(i) Circuits exposed to power conductors.** Communication circuits so located as to be exposed to accidental contact with light or power conductors operating at over 300 volts shall have each circuit so exposed provided with an approved protector.

**(ii) Antenna lead-ins.** Each conductor of a lead-in from an outdoor antenna shall be provided with an antenna discharge unit or other means that will drain static charges from the antenna system.

### (3) Conductor location.

#### (i) Outside of buildings.

**(A)** Receiving distribution lead-in or aerial-drop cables attached to buildings and lead-in conductors to radio transmitters shall be so installed as to avoid the possibility of accidental contact with electric light or power conductors.

**(B)** The clearance between lead-in conductors and any lightning protection conductors shall not be less than 6 feet (1.83 m).

**(ii) On poles.** Where practicable, communication conductors on poles shall be located below the light or power conductors. Communications conductors shall not be attached to a crossarm that carries light or power conductors.

**(iii) Inside of buildings.** Indoor antennas, lead-ins, and other communication conductors attached as open conductors to the inside of buildings shall be located at least 2 inches (50.8 mm) from conductors of any light or power or Class 1 circuits unless a special and equally protective method of conductor separation is employed.

**(4) Equipment location.** Outdoor metal structures supporting antennas, as well as self-supporting antennas such as vertical rods or dipole structures, shall be located as far away from overhead conductors of electric light and power circuits of over 150 volts to ground as necessary to avoid the possibility of the antenna or structure falling into or making accidental contact with such circuits.

## **(5) Grounding.**

**(i) Lead-in conductors.** If exposed to contact with electric light or power conductors, the metal sheath of aerial cables entering buildings shall be grounded or shall be interrupted close to the entrance to the building by an insulating joint or equivalent device. Where protective devices are used, they shall be grounded.

**(ii) Antenna structures.** Masts and metal structures supporting antennas shall be permanently and effectively grounded without splice or connection in the grounding conductor.

**(iii) Equipment enclosures.** Transmitters shall be enclosed in a metal frame or grill or separated from the operating space by a barrier, all metallic parts of which are effectively connected to ground. All external metal handles and controls accessible to the operating personnel shall be effectively grounded. Unpowered equipment and enclosures shall be considered grounded where connected to an attached coaxial cable with an effectively grounded metallic shield.

(Information collection requirements contained in paragraph (b)(2) were approved by the Office of Management and Budget under control number 1218-0130)

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

## **§§1926.409 – 1926.415 (Reserved)**

# **WORKING NEAR OVERHEAD HIGH VOLTAGES LINES & EQUIPMENT**

# **K**

## **SAFETY-RELATED WORK PRACTICES**

### **437-003-0047 Working Near Overhead High Voltage Lines and Equipment.**

#### **(1) Definitions.**

**Insulating Barrier or Guard.** *A structure, installation, barrier, or guard (such as a wall, fence, pole, shield, or something similar) that stops movement and prevents all possible contact with the lines or equipment. Its design, material composition, and installation prevents possible conduction of electricity up to the maximum voltage of the system.*

#### **Restricted Space.**

**(a)** *For lines rated more than 600 V to 50 kV, restricted space extends 10 feet in all directions from the surface of the line or equipment.*

**(b)** *For lines rated over 50 kV, restricted space extends 10 feet plus 0.4 inch for each 1 kV over 50 kV, or twice the length of the insulator (but never less than 10 feet) in all directions from the surface of the line or equipment.*

**(c)** *For equipment or structures in transit, on level surfaces, restricted space extends 4 feet in all directions from lines or equipment rated 50 kV or less, 10 feet in all directions for lines or equipment rated over 50 kV, and 16 feet in all directions for lines or equipment rated over 345 kV up to and including 750 kV.*

**Proper Notification.** *The person(s) responsible for the planned activity must notify the owner/operator of the line or equipment, at their business office, at least 2 business days prior to the anticipated beginning of work (business days are Monday through Friday, excluding federal and state holidays). The notification must include: (1) the proposed date to start activity within restricted space; (2) the location of the planned activity; (3) a description of the planned activity; and (4) name and contact information of the contact person.*

**(2) General requirement.** *Do not enter, perform any function of activity (such as handling, erecting, operating, transporting, or storing any tools, equipment or materials, moving a building or structure) within the restricted space surrounding an overhead high voltage line or equipment unless:*

**(a)** *You are the owner, an authorized employee, or authorized (in writing) agent of the overhead high voltage system: or*

**(b)** *Proper notification is provided; and*

**(A)** *The line and/or equipment is de-energized and visibly grounded by the owner of the high voltage system or their authorized agent; or*

**(B)** *Accidental contact is effectively prevented by use of insulating barriers or guards. Barriers or guards must:*

**(i) Be erected or installed by the owner of the high voltage system or their authorized agent;**

**(ii) Not be attached to, or be part of the lines, equipment, or machinery;**

*Note: Overhead line covers are only for visual reference, and their use does not allow entry into restricted space. If used, they must be installed by the owner of the high voltage system or their authorized agent.*

**(iii) Prevent all possible contact with the lines or equipment; and**

**(iv) Insulate against the system's maximum voltage; or**

**(c) Insulated lines (not tree wire) and equipment (designed and engineered to allow only incidental contact) are erected or installed by the owner of the high voltage system or their authorized agent.**

*Note: Nothing in this standard shifts the responsibility for safe and healthy working conditions from the person(s) responsible for the activity to the owner of the lines or their agent.*

*Note: Nothing in this standard mandates that the owner of the lines or equipment, or their authorized agent must agree to de-energize, move, barricade, guard, or insulate lines or equipment, or take other action to allow entry into restricted space.*

**(3) Do not move, reposition, or reduce restricted space in any direction by applying stress or force to a line, equipment, or supporting structure.**

**(4) Operation of machinery or equipment.**

**(a) Do not enter restricted space when using insulating links or proximity warning devices on equipment.**

**(b) Post a warning sign on each piece of equipment which is capable of vertical, lateral, or swinging motion, such as a crane, derrick, power shovel, drilling rig, or pile driver.**

**(A) The sign must be made of durable material.**

**(B) It must be in clear view of the operator.**

**(C) The message must be legible to the operator when at the controls.**

**(D) The message must be understood by the operator.**

**(E) The message must clearly convey that it is "Unlawful to operate the piece of equipment within 10 feet of high voltage lines".**

**(c) Use an observer to provide audible warning (able to be clearly heard over surrounding noise) when it becomes difficult for an operator to identify restricted space by using visual means. The observer's only task is to watch the clearance and warn the operator if it appears that restricted space will be breached.**

# ***WORKING NEAR OVERHEAD HIGH VOLTAGES LINES & EQUIPMENT /*** **K** **GENERAL REQUIREMENTS**

---

*(d) Restrict, barricade, or otherwise make it impossible for a machine or piece of equipment to reach into restricted space if it is reasonable to anticipate that the operator's attention may be focused on the work process rather than the location of an overhead high voltage line or equipment (such as during excavating, or other fast-paced, repetitive work).*

**(5) Railway and commuter systems.**

*(a) Standard rail equipment used to transport freight and/or passengers, and relief trains or other equipment used in emergencies, may enter restricted space surrounding high voltage lines or equipment.*

*(b) Qualified employees, authorized and supervised by a person familiar with the hazards of the railway high voltage system, may perform normal repair or construction work within restricted space prior to compliance with the clearance and safeguard requirements in sections (1) through (4).*

**Stat. Auth.:** ORS 654.025(2) and 656.726(4).  
**Stats. Implemented:** ORS 654.001 through 654.295.  
**Hist:** APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89.  
OR-OSHA Admin. Order 2-2007, f. 6/8/07, ef. 6/15/07.

## **§1926.416 General Requirements.**

**(a) Protection of employees.**

**(1)** No employer shall permit an employee to work in such proximity to any part of an electric power circuit that the employee could contact the electric power circuit in the course of work, unless the employee is protected against electric shock by deenergizing the circuit and grounding it or by guarding it effectively by insulation or other means.

**NOTE:** When working near overhead high voltage lines, refer to OAR 437-003-0047.

**(2)** In work areas where the exact location of underground electric powerlines is unknown, employees using jack-hammers, bars, or other hand tools which may contact a line shall be provided with insulated protective gloves.

**NOTE:** Refer to 1910.137 and OAR 437-002-0138 (both in Division 2/I) for design, care, use, and testing requirements for insulated gloves.

**(3)** Before work is begun the employer shall ascertain by inquiry or direct observation, or by instruments, whether any part of an energized electric power circuit, exposed or concealed, is so located that the performance of the work may bring any person, tool, or machine into physical or electrical contact with the electric power circuit. The employer shall post and maintain proper warning signs where such a circuit exists. The employer shall advise employees of the location of such lines, the hazards involved, and the protective measures to be taken.

# K GENERAL REQUIREMENTS / LOCKOUT & TAGGING OF CIRCUITS

Oregon Administrative Rules  
Oregon Occupational Safety  
and Health Division

## (b) Passageways and open spaces.

(1) Barriers or other means of guarding shall be provided to ensure that workspace for electrical equipment will not be used as a passageway during periods when energized parts of electrical equipment are exposed.

(2) Working spaces, walkways, and similar locations shall be kept clear of cords so as not to create a hazard to employees.

(c) **Load ratings.** In existing installations, no changes in circuit protection shall be made to increase the load in excess of the load rating of the circuit wiring.

(d) **Fuses.** When fuses are installed or removed with one or both terminals energized, special tools insulated for the voltage shall be used.

## (e) Cords and cables.

(1) Worn or frayed electric cords or cables shall not be used.

(2) Extension cords shall not be fastened with staples, hung from nails, or suspended by wire.

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).  
OR-OSHA Admin. Order 4-1997, f. 4/2/97, ef. 4/2/97.

## §1926.417 Lockout and Tagging of Circuits.

(a) **Controls.** Controls that are to be deactivated during the course of work on energized or deenergized equipment or circuits shall be tagged.

(b) **Equipment and circuits.** Equipment or circuits that are deenergized shall be rendered inoperative and shall have tags attached at all points where such equipment or circuits can be energized.

(c) **Tags.** Tags shall be placed to identify plainly the equipment or circuits being worked on.

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).  
OR-OSHA Admin. Order 4-1997, f. 4/2/97, ef. 4/2/97.

## §§1926.418 – 1926.430 (Reserved)

# MAINTENANCE OF EQUIPMENT / ENVIRONMENTAL DETERIORATION OF EQUIPMENT **K**

---

## SAFETY-RELATED MAINTENANCE AND ENVIRONMENTAL CONSIDERATIONS

### §1926.431 Maintenance of Equipment.

The employer shall ensure that all wiring components and utilization equipment in hazardous locations are maintained in a dust-tight, dust-ignition-proof, or explosion-proof condition, as appropriate. There shall be no loose or missing screws, gaskets, threaded connections, seals, or other impairments to a tight condition.

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

### §1926.432 Environmental Deterioration of Equipment.

#### (a) Deteriorating agents.

(1) Unless identified for use in the operating environment, no conductors or equipment shall be located:

(i) In damp or wet locations;

(ii) Where exposed to gases, fumes, vapors, liquids, or other agents having a deteriorating effect on the conductors or equipment; or

(iii) Where exposed to excessive temperatures.

(2) Control equipment, utilization equipment, and busways approved for use in dry locations only shall be protected against damage from the weather during building construction.

**(b) Protection against corrosion.** Metal raceways, cable armor, boxes, cable sheathing, cabinets, elbows, couplings, fittings, supports, and support hardware shall be of materials appropriate for the environment in which they are to be installed.

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

### §§1926.433 – 1926.440 (Reserved)

# BATTERIES & BATTERY CHARGING

# K

## SAFETY REQUIREMENTS FOR SPECIAL EQUIPMENT

### §1926.441 Batteries and Battery Charging.

#### (a) General requirements.

- (1) Batteries of the unsealed type shall be located in enclosures with outside vents or in well ventilated rooms and shall be arranged so as to prevent the escape of fumes, gases, or electrolyte spray into other areas.
- (2) Ventilation shall be provided to ensure diffusion of the gases from the battery and to prevent the accumulation of an explosive mixture.
- (3) Racks and trays shall be substantial and shall be treated to make them resistant to the electrolyte.
- (4) Floors shall be of acid resistant construction unless protected from acid accumulations.
- (5) Face shields, aprons, and rubber gloves shall be provided for workers handling acids or batteries.
- (6) Facilities for quick drenching of the eyes and body shall be provided within 25 feet (7.62 m) of battery handling areas.
- (7) Facilities shall be provided for flushing and neutralizing spilled electrolyte and for fire protection.

#### (b) Charging.

- (1) Battery charging installations shall be located in areas designated for that purpose.
- (2) Charging apparatus shall be protected from damage by trucks.
- (3) When batteries are being charged, the vent caps shall be kept in place to avoid electrolyte spray. Vent caps shall be maintained in functioning condition.

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

### §§1926.442 – 1926.448 (Reserved)

# DEFINITIONS APPLICABLE TO THIS SUBDIVISION

# K

## DEFINITIONS

### §1926.449 Definitions Applicable to this Subdivision.

The definitions given in this section apply to the terms used in Subpart K. The definitions given here for “**approved**” and “**qualified person**” apply, instead of the definitions given in §1926.32, to the use of these terms in Subpart K.

**Acceptable.** An installation or equipment is acceptable to the Assistant Secretary of Labor, and approved within the meaning of this Subpart K:

(a) If it is accepted, or certified, or listed, or labeled, or otherwise determined to be safe by a qualified testing laboratory capable of determining the suitability of materials and equipment for installation and use in accordance with this standard; or

(b) With respect to an installation or equipment of a kind which no qualified testing laboratory accepts, certifies, lists, labels, or determines to be safe, if it is inspected or tested by another Federal agency, or by a State, municipal, or other local authority responsible for enforcing occupational safety provisions of the National Electrical Code, and found in compliance with those provisions; or

(c) With respect to custom-made equipment or related installations which are designed, fabricated for, and intended for use by a particular customer, if it is determined to be safe for its intended use by its manufacturer on the basis of test data which the employer keeps and makes available for inspection to the Assistant Secretary and his authorized representatives.

**Accepted.** An installation is “**accepted**” if it has been inspected and found to be safe by a qualified testing laboratory.

**Accessible.** (As applied to wiring methods.) Capable of being removed or exposed without damaging the building structure or finish, or not permanently closed in by the structure or finish of the building. (See “**concealed**” and “**exposed**.”)

**Accessible.** (As applied to equipment.) Admitting close approach; not guarded by locked doors, elevation, or other effective means. (See “**Readily accessible**.”)

**Ampacity.** The current in amperes a conductor can carry continuously under the conditions of use without exceeding its temperature rating.

**Appliances.** Utilization equipment, generally other than industrial, normally built in standardized sizes or types, which is installed or connected as a unit to perform one or more functions.

**Approved.** Acceptable to the authority enforcing this Subpart. The authority enforcing this Subpart is the Assistant Secretary of Labor for Occupational Safety and Health. The definition of “**acceptable**” indicates what is acceptable to the Assistant Secretary of Labor, and therefore approved within the meaning of this Subpart.

# K DEFINITIONS APPLICABLE TO THIS SUBDIVISION

**Askarel.** A generic term for a group of nonflammable synthetic chlorinated hydrocarbons used as electrical insulating media. Askarels of various compositional types are used. Under arcing conditions the gases produced, while consisting predominantly of noncombustible hydrogen chloride, can include varying amounts of combustible gases depending upon the askarel type.

**Attachment plug (Plug cap) (Cap).** A device which, by insertion in a receptacle, establishes connection between the conductors of the attached flexible cord and the conductors connected permanently to the receptacle.

**Automatic.** Self-acting, operating by its own mechanism when actuated by some impersonal influence, as for example, a change in current strength, pressure, temperature, or mechanical configuration.

**Bare conductor.** See “**Conductor.**”

**Bonding.** The permanent joining of metallic parts to form an electrically conductive path which will assure electrical continuity and the capacity to conduct safely any current likely to be imposed.

**Bonding jumper.** A reliable conductor to assure the required electrical conductivity between metal parts required to be electrically connected.

**Branch circuit.** The circuit conductors between the final overcurrent device protecting the circuit and the outlet(s).

**Building.** A structure which stands alone or which is cut off from adjoining structures by fire walls with all openings therein protected by approved fire doors.

**Cabinet.** An enclosure designed either for surface or flush mounting, and provided with a frame, mat, or trim in which a swinging door or doors are or may be hung.

**Certified.** Equipment is “**certified**” if it:

- (a) Has been tested and found by a qualified testing laboratory to meet applicable test standards or to be safe for use in a specified manner, and
- (b) Is of a kind whose production is periodically inspected by a qualified testing laboratory. Certified equipment must bear a label, tag, or other record of certification.

**Circuit breaker.**

- (a) (600 volts nominal, or less.) A device designed to open and close a circuit by nonautomatic means and to open the circuit automatically on a predetermined overcurrent without injury to itself when properly applied within its rating.

## DEFINITIONS APPLICABLE TO THIS SUBDIVISION

# K

**(b)** (Over 600 volts, nominal.) A switching device capable of making, carrying, and breaking currents under normal circuit conditions, and also making, carrying for a specified time, and breaking currents under specified abnormal circuit conditions, such as those of short circuit.

**CLASS I LOCATIONS.** Class I locations are those in which flammable gases or vapors are or may be present in the air in quantities sufficient to produce explosive or ignitable mixtures. Class I locations include the following:

**(a) Class I, Division 1.** A Class I, Division 1 location is a location:

- (1)** In which ignitable concentrations of flammable gases or vapors may exist under normal operating conditions; or
- (2)** In which ignitable concentrations of such gases or vapors may exist frequently because of repair or maintenance operations or because of leakage; or
- (3)** In which breakdown or faulty operation of equipment or processes might release ignitable concentrations of flammable gases or vapors, and might also cause simultaneous failure of electric equipment.

**Note:** This classification usually includes locations where volatile flammable liquids or liquefied flammable gases are transferred from one container to another; interiors of spray booths and areas in the vicinity of spraying and painting operations where volatile flammable solvents are used; locations containing open tanks or vats of volatile flammable liquids; drying rooms or compartments for the evaporation of flammable solvents; inadequately ventilated pump rooms for flammable gas or for volatile flammable liquids; and all other locations where ignitable concentrations of flammable vapors or gases are likely to occur in the course of normal operations.

**(b) Class I, Division 2.** A Class I, Division 2 location is a location:

- (1)** In which volatile flammable liquids or flammable gases are handled, processed, or used, but in which the hazardous liquids, vapors, or gases will normally be confined within closed containers or closed systems from which they can escape only in case of accidental rupture or breakdown of such containers or systems, or in case of abnormal operation of equipment; or
- (2)** In which ignitable concentrations of gases or vapors are normally prevented by positive mechanical ventilation, and which might become hazardous through failure or abnormal operations of the ventilating equipment; or
- (3)** That is adjacent to a Class I, Division 1 location, and to which ignitable concentrations of gases or vapors might occasionally be communicated unless such communication is prevented by adequate positive-pressure ventilation from a source of clean air, and effective safeguards against ventilation failure are provided.

**Note:** This classification usually includes locations where volatile flammable liquids or flammable gases or vapors are used, but which would become hazardous only in case of an accident or of some unusual operating condition. The quantity of flammable material that might escape in case of accident, the adequacy of ventilating equipment, the total area involved, and the record of the industry or business with respect to explosions or fires are all factors that merit consideration in determining the classification and extent of each location.

Piping without valves, checks, meters, and similar devices would not ordinarily introduce a hazardous condition even though used for flammable liquids or gases. Locations used for the storage of flammable liquids or of liquefied or compressed gases in sealed containers would not normally be considered hazardous unless also subject to other hazardous conditions.

Electrical conduits and their associated enclosures separated from process fluids by a single seal or barrier are classed as a Division 2 location if the outside of the conduit and enclosures is a nonhazardous location.

**CLASS II LOCATIONS.** Class II locations are those that are hazardous because of the presence of combustible dust. Class II locations include the following:

**(a) Class II, Division 1.** A Class II, Division 1 location is a location:

- (1)** In which combustible dust is or may be in suspension in the air under normal operating conditions, in quantities sufficient to produce explosive or ignitable mixtures; or
- (2)** Where mechanical failure or abnormal operation of machinery or equipment might cause such explosive or ignitable mixtures to be produced, and might also provide a source of ignition through simultaneous failure of electric equipment, operation of protection devices, or from other causes, or
- (3)** In which combustible dusts of an electrically conductive nature may be present.

**Note:** Combustible dusts which are electrically nonconductive include dusts produced in the handling and processing of grain and grain products, pulverized sugar and cocoa, dried egg and milk powders, pulverized spices, starch and pastes, potato and woodflour, oil meal from beans and seed, dried hay, and other organic materials which may produce combustible dusts when processed or handled. Dusts containing magnesium or aluminum are particularly hazardous and the use of extreme caution is necessary to avoid ignition and explosion.

**(b) Class II, Division 2.** A Class II, Division 2 location is a location in which:

- (1)** Combustible dust will not normally be in suspension in the air in quantities sufficient to produce explosive or ignitable mixtures, and dust accumulations are normally insufficient to interfere with the normal operation of electrical equipment or other apparatus; or

## DEFINITIONS APPLICABLE TO THIS SUBDIVISION

# K

(2) Dust may be in suspension in the air as a result of infrequent malfunctioning of handling or processing equipment, and dust accumulations resulting therefrom may be ignitable by abnormal operation or failure of electrical equipment or other apparatus.

**Note:** This classification includes locations where dangerous concentrations of suspended dust would not be likely but where dust accumulations might form on or in the vicinity of electric equipment. These areas may contain equipment from which appreciable quantities of dust would escape under abnormal operating conditions or be adjacent to a Class II Division 1 location, as described above, into which an explosive or ignitable concentration of dust may be put into suspension under abnormal operating conditions.

**CLASS III LOCATIONS.** Class III locations are those that are hazardous because of the presence of easily ignitable fibers or flyings but in which such fibers or flyings are not likely to be in suspension in the air in quantities sufficient to produce ignitable mixtures. Class III locations include the following:

(a) **Class III, Division 1.** A Class III, Division 1 location is a location in which easily ignitable fibers or materials producing combustible flyings are handled, manufactured, or used.

**Note:** Easily ignitable fibers and flyings include rayon, cotton (including cotton linters and cotton waste), sisal or henequen, istle, jute, hemp, tow, cocoa fiber, oakum, baled waste kapok, Spanish moss, excelsior, sawdust, woodchips, and other material of similar nature.

(b) **Class III, Division 2.** A Class III, Division 2 location is a location in which easily ignitable fibers are stored or handled, except in process of manufacture.

**Collector ring.** A collector ring is an assembly of slip rings for transferring electrical energy from a stationary to a rotating member.

**Concealed.** Rendered inaccessible by the structure or finish of the building. Wires in concealed raceways are considered concealed, even though they may become accessible by withdrawing them. (See "**Accessible.** (As applied to wiring methods).")

**Conductor.**

(a) **Bare.** A conductor having no covering or electrical insulation whatsoever.

(b) **Covered.** A conductor encased within material of composition or thickness that is not recognized as electrical insulation.

(c) **Insulated.** A conductor encased within material of composition and thickness that is recognized as electrical insulation.

**Controller.** A device or group of devices that serves to govern, in some predetermined manner, the electric power delivered to the apparatus to which it is connected.

**Covered conductor.** See "**Conductor.**"

# K DEFINITIONS APPLICABLE TO THIS SUBDIVISION

**Cutout. (Over 600 volts, nominal.)** An assembly of a fuse support with either a fuse holder, fuse carrier, or disconnecting blade. The fuse holder or fuse carrier may include a conducting element (fuse link), or may act as the disconnecting blade by the inclusion of a nonfusible member.

**Cutout box.** An enclosure designed for surface mounting and having swinging doors or covers secured directly to and telescoping with the walls of the box proper. (See “**Cabinet.**”)

**Damp location.** See “**Location.**”

**Dead front.** Without live parts exposed to a person on the operating side of the equipment.

**Device.** A unit of an electrical system which is intended to carry but not utilize electric energy.

**Disconnecting means.** A device, or group of devices, or other means by which the conductors of a circuit can be disconnected from their source of supply.

**Disconnecting (or Isolating) switch.** (Over 600 volts, nominal.) A mechanical switching device used for isolating a circuit or equipment from a source of power.

**Dry location.** See “**Location.**”

**Enclosed.** Surrounded by a case, housing, fence or walls which will prevent persons from accidentally contacting energized parts.

**Enclosure.** The case or housing of apparatus, or the fence or walls surrounding an installation to prevent personnel from accidentally contacting energized parts, or to protect the equipment from physical damage.

**Equipment.** A general term including material, fittings, devices, appliances, fixtures, apparatus, and the like, used as a part of, or in connection with, an electrical installation.

**Equipment grounding conductor.** See “**Grounding conductor, equipment.**”

**Explosion-proof apparatus.** Apparatus enclosed in a case that is capable of withstanding an explosion of a specified gas or vapor which may occur within it and of preventing the ignition of a specified gas or vapor surrounding the enclosure by sparks, flashes, or explosion of the gas or vapor within, and which operates at such an external temperature that it will not ignite a surrounding flammable atmosphere.

**Exposed. (As applied to live parts.)** Capable of being inadvertently touched or approached nearer than a safe distance by a person. It is applied to parts not suitably guarded, isolated, or insulated. (See “**Accessible**” and “**Concealed.**”)

**Exposed. (As applied to wiring methods.)** On or attached to the surface or behind panels designed to allow access. (See “**Accessible. (As applied to wiring methods.)**”)

## DEFINITIONS APPLICABLE TO THIS SUBDIVISION

# K

**Exposed.** (For the purposes of §1926.408(d), Communications systems.) Where the circuit is in such a position that in case of failure of supports or insulation, contact with another circuit may result.

**Externally operable.** Capable of being operated without exposing the operator to contact with live parts.

**Feeder.** All circuit conductors between the service equipment, or the generator switchboard of an isolated plant, and the final branch-circuit overcurrent device.

**Festoon lighting.** A string of outdoor lights suspended between two points more than 15 feet (4.57 m) apart.

**Fitting.** An accessory such as a locknut, bushing, or other part of a wiring system that is intended primarily to perform a mechanical rather than an electrical function.

**Fuse. (Over 600 volts, nominal.)** An overcurrent protective device with a circuit opening fusible part that is heated and severed by the passage of overcurrent through it. A fuse comprises all the parts that form a unit capable of performing the prescribed functions. It may or may not be the complete device necessary to connect it into an electrical circuit.

**Ground.** A conducting connection, whether intentional or accidental, between an electrical circuit or equipment and the earth, or to some conducting body that serves in place of the earth.

**Grounded.** Connected to earth or to some conducting body that serves in place of the earth.

**Grounded, effectively (Over 600 volts, nominal).** Permanently connected to earth through a ground connection of sufficiently low impedance and having sufficient ampacity that ground fault current which may occur cannot build up to voltages dangerous to personnel.

**Grounded conductor.** A system or circuit conductor that is intentionally grounded.

**Grounding conductor.** A conductor used to connect equipment or the grounded circuit of a wiring system to a grounding electrode or electrodes.

**Grounding conductor, equipment.** The conductor used to connect the noncurrent-carrying metal parts of equipment, raceways, and other enclosures to the system grounded conductor and/or the grounding electrode conductor at the service equipment or at the source of a separately derived system.

**Grounding electrode conductor.** The conductor used to connect the grounding electrode to the equipment grounding conductor and/or to the grounded conductor of the circuit at the service equipment or at the source of a separately derived system.

# K DEFINITIONS APPLICABLE TO THIS SUBDIVISION

**Ground-fault circuit interrupter.** A device for the protection of personnel that functions to deenergize a circuit or portion thereof within an established period of time when a current to ground exceeds some pre-determined value that is less than that required to operate the overcurrent protective device of the supply circuit.

**Guarded.** Covered, shielded, fenced, enclosed, or otherwise protected by means of suitable covers, casings, barriers, rails, screens, mats, or platforms to remove the likelihood of approach to a point of danger or contact by persons or objects.

**Hoistway.** Any shaftway, hatchway, well hole, or other vertical opening or space in which an elevator or dumbwaiter is designed to operate.

**Identified (conductors or terminals).** Identified, as used in reference to a conductor or its terminal, means that such conductor or terminal can be recognized as grounded.

**Identified (for the use).** Recognized as suitable for the specific purpose, function, use, environment, application, etc. where described as a requirement in this standard. Suitability of equipment for a specific purpose, environment, or application is determined by a qualified testing laboratory where such identification includes labeling or listing.

**Insulated conductor.** See “Conductor.”

**Interrupter switch. (Over 600 volts, nominal.)** A switch capable of making, carrying, and interrupting specified currents.

**Intrinsically safe equipment and associated wiring.** Equipment and associated wiring in which any spark or thermal effect, produced either normally or in specified fault conditions, is incapable, under certain prescribed test conditions, of causing ignition of a mixture of flammable or combustible material in air in its most easily ignitable concentration.

**Isolated.** Not readily accessible to persons unless special means for access are used.

**Isolated power system.** A system comprising an isolating transformer or its equivalent, a line isolation monitor, and its ungrounded circuit conductors.

**Labeled.** Equipment or materials to which has been attached a label, symbol or other identifying mark of a qualified testing laboratory which indicates compliance with appropriate standards or performance in a specified manner.

**Lighting outlet.** An outlet intended for the direct connection of a lampholder, a lighting fixture, or a pendant cord terminating in a lampholder.

**Listed.** Equipment or materials included in a list published by a qualified testing laboratory whose listing states either that the equipment or material meets appropriate standards or has been tested and found suitable for use in a specified manner.

## DEFINITIONS APPLICABLE TO THIS SUBDIVISION

# K

### Location.

**(a) Damp location.** Partially protected locations under canopies, marquees, roofed open porches, and like locations, and interior locations subject to moderate degrees of moisture, such as some basements.

**(b) Dry location.** A location not normally subject to dampness or wetness. A location classified as dry may be temporarily subject to dampness or wetness, as in the case of a building under construction.

**(c) Wet location.** Installations underground or in concrete slabs or masonry in direct contact with the earth, and locations subject to saturation with water or other liquids, such as locations exposed to weather and unprotected.

**Mobile X-ray.** X-ray equipment mounted on a permanent base with wheels and/or casters for moving while completely assembled.

**Motor control center.** An assembly of one or more enclosed sections having a common power bus and principally containing motor control units.

**Outlet.** A point on the wiring system at which current is taken to supply utilization equipment.

**Overcurrent.** Any current in excess of the rated current of equipment or the ampacity of a conductor. It may result from overload (see definition), short circuit, or ground fault. A current in excess of rating may be accommodated by certain equipment and conductors for a given set of conditions. Hence the rules for overcurrent protection are specific for particular situations.

**Overload.** Operation of equipment in excess of normal, full load rating, or of a conductor in excess of rated ampacity which, when it persists for a sufficient length of time, would cause damage or dangerous overheating. A fault, such as a short circuit or ground fault, is not an overload. (See “**Overcurrent.**”)

**Panelboard.** A single panel or group of panel units designed for assembly in the form of a single panel; including buses, automatic overcurrent devices, and with or without switches for the control of light, heat, or power circuits; designed to be placed in a cabinet or cutout box placed in or against a wall or partition and accessible only from the front. (See “**Switchboard.**”)

**Portable X-ray.** X-ray equipment designed to be hand-carried.

**Power fuse. (Over 600 volts, nominal.)** See “**Fuse.**”

**Power outlet.** An enclosed assembly which may include receptacles, circuit breakers, fuseholders, fused switches, buses and watt-hour meter mounting means; intended to serve as a means for distributing power required to operate mobile or temporarily installed equipment.

# K DEFINITIONS APPLICABLE TO THIS SUBDIVISION

**Premises wiring system.** That interior and exterior wiring, including power, lighting, control, and signal circuit wiring together with all of its associated hardware, fittings, and wiring devices, both permanently and temporarily installed, which extends from the load end of the service drop, or load end of the service lateral conductors to the outlet(s). Such wiring does not include wiring internal to appliances, fixtures, motors, controllers, motor control centers, and similar equipment.

**Qualified person.** One familiar with the construction and operation of the equipment and the hazards involved.

**Qualified testing laboratory.** A properly equipped and staffed testing laboratory which has capabilities for and which provides the following services:

- (a) Experimental testing for safety of specified items of equipment and materials referred to in this standard to determine compliance with appropriate test standards or performance in a specified manner;
- (b) Inspecting the run of such items of equipment and materials at factories for product evaluation to assure compliance with the test standards;
- (c) Service-value determinations through field inspections to monitor the proper use of labels on products and with authority for recall of the label in the event a hazardous product is installed;
- (d) Employing a controlled procedure for identifying the listed and/or labeled equipment or materials tested; and
- (e) Rendering creditable reports or findings that are objective and without bias of the tests and test methods employed.

**Raceway.** A channel designed expressly for holding wires, cables, or busbars, with additional functions as permitted in this subpart. Raceways may be of metal or insulating material, and the term includes rigid metal conduit, rigid nonmetallic conduit, intermediate metal conduit, liquidtight flexible metal conduit, flexible metallic tubing, flexible metal conduit, electrical metallic tubing, underfloor raceways, cellular concrete floor raceways, cellular metal floor raceways, surface raceways, wireways, and busways.

**Readily accessible.** Capable of being reached quickly for operation, renewal, or inspections, without requiring those to whom ready access is requisite to climb over or remove obstacles or to resort to portable ladders, chairs, etc. (See “**Accessible.**”)

**Receptacle.** A receptacle is a contact device installed at the outlet for the connection of a single attachment plug. A single receptacle is a single contact device with no other contact device on the same yoke. A multiple receptacle is a single device containing two or more receptacles.

**Receptacle outlet.** An outlet where one or more receptacles are installed.

## DEFINITIONS APPLICABLE TO THIS SUBDIVISION

# K

**Remote-control circuit.** Any electric circuit that controls any other circuit through a relay or an equivalent device.

**Sealable equipment.** Equipment enclosed in a case or cabinet that is provided with a means of sealing or locking so that live parts cannot be made accessible without opening the enclosure. The equipment may or may not be operable without opening the enclosure.

**Separately derived system.** A premises wiring system whose power is derived from generator, transformer, or converter windings and has no direct electrical connection, including a solidly connected grounded circuit conductor, to supply conductors originating in another system.

**Service.** The conductors and equipment for delivering energy from the electricity supply system to the wiring system of the premises served.

**Service conductors.** The supply conductors that extend from the street main or from transformers to the service equipment of the premises supplied.

**Service drop.** The overhead service conductors from the last pole or other aerial support to and including the splices, if any, connecting to the service-entrance conductors at the building or other structure.

**Service-entrance conductors, overhead system.** The service conductors between the terminals of the service equipment and a point usually outside the building, clear of building walls, where joined by tap or splice to the service drop.

**Service-entrance conductors, underground system.** The service conductors between the terminals of the service equipment and the point of connection to the service lateral. Where service equipment is located outside the building walls, there may be no service-entrance conductors, or they may be entirely outside the building.

**Service equipment.** The necessary equipment, usually consisting of a circuit breaker or switch and fuses, and their accessories, located near the point of entrance of supply conductors to a building or other structure, or an otherwise defined area, and intended to constitute the main control and means of cutoff of the supply.

**Service raceway.** The raceway that encloses the service-entrance conductors.

**Signaling circuit.** Any electric circuit that energizes signaling equipment.

**Switchboard.** A large single panel, frame, or assembly of panels which have switches, buses, instruments, overcurrent and other protective devices mounted on the face or back or both. Switchboards are generally accessible from the rear as well as from the front and are not intended to be installed in cabinets. (See “**Panelboard.**”)

# K DEFINITIONS APPLICABLE TO THIS SUBDIVISION

## Switches.

(a) **General-use switch.** A switch intended for use in general distribution and branch circuits. It is rated in amperes, and it is capable of interrupting its rated current at its rated voltage.

(b) **General-use snap switch.** A form of general-use switch so constructed that it can be installed in flush device boxes or on outlet box covers, or otherwise used in conjunction with wiring systems recognized by this subpart.

(c) **Isolating switch.** A switch intended for isolating an electric circuit from the source of power. It has no interrupting rating, and it is intended to be operated only after the circuit has been opened by some other means.

(d) **Motor-circuit switch.** A switch, rated in horsepower, capable of interrupting the maximum operating overload current of a motor of the same horsepower rating as the switch at the rated voltage.

**Switching devices. (Over 600 volts, nominal.)** Devices designed to close and/or open one or more electric circuits. Included in this category are circuit breakers, cutouts, disconnecting (or isolating) switches, disconnecting means, and interrupter switches.

**Transportable X-ray.** X-ray equipment installed in a vehicle or that may readily be disassembled for transport in a vehicle.

**Utilization equipment.** Utilization equipment means equipment which utilizes electric energy for mechanical, chemical, heating, lighting, or similar useful purpose.

**Utilization system.** A utilization system is a system which provides electric power and light for employee workplaces, and includes the premises wiring system and utilization equipment.

**Ventilated.** Provided with a means to permit circulation of air sufficient to remove an excess of heat, fumes, or vapors.

**Volatile flammable liquid.** A flammable liquid having a flash point below 38° C (100° F) or whose temperature is above its flash point, or a Class II combustible liquid having a vapor pressure not exceeding 40 psia (276 kPa) at 38° C (100° F) whose temperature is above its flash point.

**Voltage. (Of a circuit.)** The greatest root-mean-square (effective) difference of potential between any two conductors of the circuit concerned.

**Voltage, nominal.** A nominal value assigned to a circuit or system for the purpose of conveniently designating its voltage class (as 120/240, 480Y/277, 600, etc.). The actual voltage at which a circuit operates can vary from the nominal within a range that permits satisfactory operation of equipment.

# DEFINITIONS APPLICABLE TO THIS SUBDIVISION

---

# K

**Voltage to ground.** For grounded circuits, the voltage between the given conductor and that point or conductor of the circuit that is grounded; for ungrounded circuits, the greatest voltage between the given conductor and any other conductor of the circuit.

**Watertight.** So constructed that moisture will not enter the enclosure.

**Weatherproof.** So constructed or protected that exposure to the weather will not interfere with successful operation. Rainproof, raintight, or watertight equipment can fulfill the requirements for weatherproof where varying weather conditions other than wetness, such as snow, ice, dust, or temperature extremes, are not a factor.

**Wet location.** See “**Location.**”

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Hist:** APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89.

- END OF DOCUMENT -

**OREGON OCCUPATIONAL  
SAFETY AND HEALTH STANDARDS**

Oregon Administrative Rules, Chapter 437

**DIVISION 3 (29 CFR 1926)  
CONSTRUCTION**

Oregon Occupational Safety and Health Division (Oregon OSHA)  
Department of Consumer and Business Services  
Salem, Oregon 97301-3882

AO 1-2011

The Oregon Department of Consumer and Business Services adopted these rules pursuant to ORS 654.025(2).

The Secretary of State Designated OAR Chapter 437 as the "Oregon Occupational Safety and Health Code." Six general subject areas within this code are designated as "Divisions."

- **Division 1** General Administrative Rules
- **Division 2** General Occupational Safety and Health Rules
- **Division 3** Construction
- **Division 4** Agriculture
- **Division 5** Maritime Activities
- **Division 7** Forest Activities
- **Oregon Revised Statutes (ORS) 654** The Oregon Safe Employment Act (OSEAct)

Oregon-initiated rules in this division of the Oregon Occupational Safety and Health Code are numbered in a uniform system developed by the Secretary of State. This system does not number the rules in sequence (001, 002, 003, etc.). Omitted numbers may be assigned to new rules at the time of their adoption.

**Oregon-initiated rules** are arranged in the following Basic Codification Structure adopted by the Secretary of State for Oregon Administrative Rules (OAR):

Chapter	Division	Rule	Section	Subsection	Paragraphs
437	003	1760	(1)	(a)	(A)(i)(I)

The majority of Oregon OSHA codes are adopted by reference from the Code of Federal Regulations (CFR), and are arranged in the following basic federal numbering system:

Chapter	Division	Part	Subpart (Subdivision)	Section	Paragraphs
437	003	1926	M	.502	(a)

The terms "subdivision" and "subpart" are synonymous within OAR 437, Oregon Occupational Safety and Health Code.

---

To obtain an order form or copies of these codes, address:

**Department of Consumer & Business Services  
Oregon Occupational Safety & Health Division (Oregon OSHA)  
350 Winter St. NE, Room 430  
Salem, OR 97301-3882**

Or call the Oregon OSHA Resource Library at 503-378-3272

The rules referenced in this division are available for viewing in the Office of the Secretary of State, Administrative Rules and Office Document Section, Oregon State Archives Building, Salem, Oregon 97310, or the Central Office, Oregon Occupational Safety and Health Division of the Department of Consumer and Business Services, Room 430, 350 Winter St. NE Salem, OR 97301-3882. ## OAR 437, DIVISION 3

### CONSTRUCTION

#### SUBDIVISION L – SCAFFOLDING

**437-003-0001 Adoption by Reference.** *In addition to, and not in lieu of, any other safety and health codes contained in OAR Chapter 437, the Department adopts by reference the following federal regulations printed as part of the Code of Federal Regulations, in the Federal Register:*

**(12 Subdivision L – Scaffolding.**

**(a)** 29 CFR 1926.450 **Scope, application and definitions applicable to this subpart**, published 8/9/10, FR vol. 75, no. 152, pp. 47906-48177.

**(b)** 29 CFR 1926.451 **General requirements**, published 11/25/96, FR vol. 61, no. 228, p. 59831.

**(c)** 29 CFR 1926.452 **Additional requirements applicable to specific types of scaffolds**, published 8/30/96, FR vol. 61, no. 170, p. 46113.

**(d)** 29 CFR 1926.453 **Aerial lifts**, published 11/25/96, FR vol. 61, no. 228, p. 59832.

**(e)** 29 CFR 1926.454 **Training**, published 8/30/96, FR vol. 61, no. 170, p. 46117.

**(f)** Appendix A to Subpart L **Scaffold Specifications**, published 8/30/96, FR vol. 61, no. 170, p. 46117.

**(g)** Appendix B to Subpart L **Criteria for determining the feasibility of providing safe access and fall protection for scaffold erectors and dismantlers (Reserved)**, published 8/30/96, FR vol. 61, no. 170, p. 46122.

**(h)** Appendix C to Subpart L **List of National Consensus Standards**, published 8/30/96, FR vol. 61, no. 170, p. 46122.

**(i)** Appendix D to Subpart L **List of training topics for scaffold erectors and dismantlers**, published 8/30/96, FR vol. 61, no. 170, p. 46122.

**(j)** Appendix E to Subpart L **Drawing and illustrations**, published 11/25/96, FR vol. 61, no. 228, p. 59832.

*These standards are available at the Oregon Occupational Safety and Health Division, Oregon Department of Consumer and Business Services, and the United States Government Printing Office.*

**Stat. Auth.:** ORS 654.025(2) and 656.726(4).

**Stats. Implemented:** ORS 654.001 through 654.295.

# SCOPE, APPLICATION & DEFINITIONS APPLICABLE TO THIS SUBPART

# L

## SUBDIVISION L

### SCAFFOLDING

**Authority:** Sec. 107, Contract Work Hours and Safety Standards Act (Construction Safety Act) (40 U.S.C. 333); Sections 4, 6, 8, Occupational Safety and Health Act of 1970 (29 U.S.C. 653, 655, 657); Secretary of Labor's Order No. 1-90 (55 FR 9033) and 5-2007 (72 FR 31159) and 29 CFR part 1911.

#### **§1926.450 Scope, Application and Definitions Applicable to this Subpart.**

**(a) Scope and application.** This subpart applies to all scaffolds used in workplaces covered by this part. It does not apply to crane or derrick suspended personnel platforms. The criteria for aerial lifts are set out exclusively in §1926.453.

#### **(b) Definitions.**

**Adjustable suspension scaffold** means a suspension scaffold equipped with a hoist(s) that can be operated by an employee(s) on the scaffold.

**Bearer (putlog)** means a horizontal transverse scaffold member (which may be supported by ledgers or runners) upon which the scaffold platform rests and which joins scaffold uprights, posts, poles, and similar members.

**Boatswains' chair** means a single-point adjustable suspension scaffold consisting of a seat or sling designed to support one employee in a sitting position.

**Body belt (safety belt)** means a strap with means both for securing it about the waist and for attaching it to a lanyard, lifeline, or deceleration device.

**Body harness** means a design of straps which may be secured about the employee in a manner to distribute the fall arrest forces over at least the thighs, pelvis, waist, chest and shoulders, with means for attaching it to other components of a personal fall arrest system.

**Brace** means a rigid connection that holds one scaffold member in a fixed position with respect to another member, or to a building or structure.

**Bricklayers' square scaffold** means a supported scaffold composed of framed squares which support a platform.

**Carpenters' bracket scaffold** means a supported scaffold consisting of a platform supported by brackets attached to building or structural walls.

# L SCOPE, APPLICATION & DEFINITIONS APPLICABLE TO THIS SUBPART

---

**Catenary scaffold** means a suspension scaffold consisting of a platform supported by two essentially horizontal and parallel ropes attached to structural members of a building or other structure. Additional support may be provided by vertical pickups.

**Chimney hoist** means a multi-point adjustable suspension scaffold used to provide access to work inside chimneys. (See “Multi-point adjustable suspension scaffold”.)

**Cleat** means a structural block used at the end of a platform to prevent the platform from slipping off its supports. Cleats are also used to provide footing on sloped surfaces such as crawling boards.

**Competent person** means one who is capable of identifying existing and predictable hazards in the surroundings or working conditions which are unsanitary, hazardous, or dangerous to employees, and who has authorization to take prompt corrective measures to eliminate them.

**Continuous run scaffold (Run scaffold)** means a two-point or multi-point adjustable suspension scaffold constructed using a series of interconnected braced scaffold members or supporting structures erected to form a continuous scaffold.

**Coupler** means a device for locking together the tubes of a tube and coupler scaffold.

**Crawling board (chicken ladder)** means a supported scaffold consisting of a plank with cleats spaced and secured to provide footing, for use on sloped surfaces such as roofs.

**Deceleration device** means any mechanism, such as a rope grab, rip-stitch lanyard, specially-oven lanyard, tearing or deforming lanyard, or automatic self-retracting lifeline lanyard, which dissipates a substantial amount of energy during a fall arrest or limits the energy imposed on an employee during fall arrest.

**Double pole (independent pole) scaffold** means a supported scaffold consisting of a platform(s) resting on cross beams (bearers) supported by ledgers and a double row of uprights independent of support (except ties, guys, braces) from any structure.

**Equivalent** means alternative designs, materials or methods to protect against a hazard which the employer can demonstrate will provide an equal or greater degree of safety for employees than the methods, materials or designs specified in the standard.

**Exposed power lines** means electrical power lines which are accessible to employees and which are not shielded from contact. Such lines do not include extension cords or power tool cords.

**Eye or Eye splice** means a loop with or without a thimble at the end of a wire rope.

**Fabricated decking and planking** means manufactured platforms made of wood (including laminated wood, and solid sawn wood planks), metal or other materials.

# SCOPE, APPLICATION & DEFINITIONS APPLICABLE TO THIS SUBPART

L

**Fabricated frame scaffold (tubular welded frame scaffold)** means a scaffold consisting of a platform(s) supported on fabricated end frames with integral posts, horizontal bearers, and intermediate members.

**Failure** means load refusal, breakage, or separation of component parts. Load refusal is the point where the ultimate strength is exceeded.

**Float (ship) scaffold** means a suspension scaffold consisting of a braced platform resting on two parallel bearers and hung from overhead supports by ropes of fixed length.

**Form scaffold** means a supported scaffold consisting of a platform supported by brackets attached to formwork.

**Guardrail system** means a vertical barrier, consisting of, but not limited to, top rails, midrails, and posts, erected to prevent employees from falling off a scaffold platform or walkway to lower levels.

**Hoist** means a manual or power-operated mechanical device to raise or lower a suspended scaffold.

**Horse scaffold** means a supported scaffold consisting of a platform supported by construction horses (saw horses). Horse scaffolds constructed of metal are sometimes known as trestle scaffolds.

**Independent pole scaffold** (see "Double pole scaffold").

**Interior hung scaffold** means a suspension scaffold consisting of a platform suspended from the ceiling or roof structure by fixed length supports.

**Ladder jack scaffold** means a supported scaffold consisting of a platform resting on brackets attached to ladders.

**Ladder stand** means a mobile, fixed-size, self-supporting ladder consisting of a wide flat tread ladder in the form of stairs.

**Landing** means a platform at the end of a flight of stairs.

**Large area scaffold** means a pole scaffold, tube and coupler scaffold, systems scaffold, or fabricated frame scaffold erected over substantially the entire work area. For example: a scaffold erected over the entire floor area of a room.

**Lean-to scaffold** means a supported scaffold which is kept erect by tilting it toward and resting it against a building or structure.

**Lifeline** means a component consisting of a flexible line that connects to an anchorage at one end to hang vertically (vertical lifeline), or that connects to anchorages at both ends to stretch horizontally (horizontal lifeline), and which serves as a means for connecting other components of a personal fall arrest system to the anchorage.

# L SCOPE, APPLICATION & DEFINITIONS APPLICABLE TO THIS SUBPART

---

**Lower levels** means areas below the level where the employee is located and to which an employee can fall. Such areas include, but are not limited to, ground levels, floors, roofs, ramps, runways, excavations, pits, tanks, materials, water, and equipment.

**Masons' adjustable supported scaffold** (see "Self-contained adjustable scaffold").

**Masons' multi-point adjustable suspension scaffold** means a continuous run suspension scaffold designed and used for masonry operations.

**Maximum intended load** means the total load of all persons, equipment, tools, materials, transmitted loads, and other loads reasonably anticipated to be applied to a scaffold or scaffold component at any one time.

**Mobile scaffold** means a powered or unpowered, portable, caster or wheel-mounted supported scaffold.

**Multi-level suspended scaffold** means a two-point or multi-point adjustable suspension scaffold with a series of platforms at various levels resting on common stirrups.

**Multi-point adjustable suspension scaffold** means a suspension scaffold consisting of a platform(s) which is suspended by more than two ropes from overhead supports and equipped with means to raise and lower the platform to desired work levels. Such scaffolds include chimney hoists.

**Needle beam scaffold** means a platform suspended from needle beams.

**Open sides and ends** means the edges of a platform that are more than 14 inches (36 cm) away horizontally from a sturdy, continuous, vertical surface (such as a building wall) or a sturdy, continuous horizontal surface (such as a floor), or a point of access. Exception: For plastering and lathing operations the horizontal threshold distance is 18 inches (46 cm).

**Outrigger** means the structural member of a supported scaffold used to increase the base width of a scaffold in order to provide support for and increased stability of the scaffold.

**Outrigger beam (Thrustout)** means the structural member of a suspension scaffold or outrigger scaffold which provides support for the scaffold by extending the scaffold point of attachment to a point out and away from the structure or building.

**Outrigger scaffold** means a supported scaffold consisting of a platform resting on outrigger beams (thrustouts) projecting beyond the wall or face of the building or structure, the inboard ends of which are secured inside the building or structure.

**Overhand bricklaying** means the process of laying bricks and masonry units such that the surface of the wall to be jointed is on the opposite side of the wall from the mason, requiring the mason to lean over the wall to complete the work. It includes mason tending and electrical installation incorporated into the brick wall during the overhand bricklaying process.

# SCOPE, APPLICATION & DEFINITIONS APPLICABLE TO THIS SUBPART

L

**Personal fall arrest system** means a system used to arrest an employee's fall. It consists of an anchorage, connectors, a body belt or body harness and may include a lanyard, deceleration device, lifeline, or combinations of these.

**Platform** means a work surface elevated above lower levels. Platforms can be constructed using individual wood planks, fabricated planks, fabricated decks, and fabricated platforms.

**Pole scaffold** (see definitions for "Single-pole scaffold" and "Double (independent) pole scaffold").

**Power operated hoist** means a hoist which is powered by other than human energy.

**Pump jack scaffold** means a supported scaffold consisting of a platform supported by vertical poles and movable support brackets.

**Qualified** means one who, by possession of a recognized degree, certificate, or professional standing, or who by extensive knowledge, training, and experience, has successfully demonstrated his/her ability to solve or resolve problems related to the subject matter, the work, or the project.

**Rated load** means the manufacturer's specified maximum load to be lifted by a hoist or to be applied to a scaffold or scaffold component.

**Repair bracket scaffold** means a supported scaffold consisting of a platform supported by brackets which are secured in place around the circumference or perimeter of a chimney, stack, tank or other supporting structure by one or more wire ropes placed around the supporting structure.

**Roof bracket scaffold** means a rooftop supported scaffold consisting of a platform resting on angular-shaped supports.

**Runner (ledger or ribbon)** means the lengthwise horizontal spacing or bracing member which may support the bearers.

**Scaffold** means any temporary elevated platform (supported or suspended) and its supporting structure (including points of anchorage), used for supporting employees or materials or both.

**Self-contained adjustable scaffold** means a combination supported and suspension scaffold consisting of an adjustable platform(s) mounted on an independent supporting frame(s) not a part of the object being worked on, and which is equipped with a means to permit the raising and lowering of the platform(s). Such systems include rolling roof rigs, rolling outrigger systems, and some masons' adjustable supported scaffolds.

**Shore scaffold** means a supported scaffold which is placed against a building or structure and held in place with props.

# L SCOPE, APPLICATION & DEFINITIONS APPLICABLE TO THIS SUBPART

---

**Single-point adjustable suspension scaffold** means a suspension scaffold consisting of a platform suspended by one rope from an overhead support and equipped with means to permit the movement of the platform to desired work levels.

**Single-pole scaffold** means a supported scaffold consisting of a platform(s) resting on bearers, the outside ends of which are supported on runners secured to a single row of posts or uprights, and the inner ends of which are supported on or in a structure or building wall.

**Stair tower (Scaffold stairway/tower)** means a tower comprised of scaffold components and which contains internal stairway units and rest platforms. These towers are used to provide access to scaffold platforms and other elevated points such as floors and roofs.

**Stall load** means the load at which the prime-mover of a power-operated hoist stalls or the power to the prime-mover is automatically disconnected.

**Step, platform, and trestle ladder scaffold** means a platform resting directly on the rungs of step ladders or trestle ladders.

**Stilts** means a pair of poles or similar supports with raised footrests, used to permit walking above the ground or working surface.

**Stonesetters' multi-point adjustable suspension scaffold** means a continuous run suspension scaffold designed and used for stonesetters' operations.

**Supported scaffold** means one or more platforms supported by outrigger beams, brackets, poles, legs, uprights, posts, frames, or similar rigid support.

**Suspension scaffold** means one or more platforms suspended by ropes or other non-rigid means from an overhead structure(s).

**System scaffold** means a scaffold consisting of posts with fixed connection points that accept runners, bearers, and diagonals that can be interconnected at predetermined levels.

**Tank builders' scaffold** means a supported scaffold consisting of a platform resting on brackets that are either directly attached to a cylindrical tank or attached to devices that are attached to such a tank.

**Top plate bracket scaffold** means a scaffold supported by brackets that hook over or are attached to the top of a wall. This type of scaffold is similar to carpenters' bracket scaffolds and form scaffolds and is used in residential construction for setting trusses.

**Tube and coupler scaffold** means a supported or suspended scaffold consisting of a platform(s) supported by tubing, erected with coupling devices connecting uprights, braces, bearers, and runners.

# SCOPE, APPLICATION & DEFINITIONS APPLICABLE TO THIS SUBPART

L

**Tubular welded frame scaffold** (see “Fabricated frame scaffold”).

**Two-point suspension scaffold (swing stage)** means a suspension scaffold consisting of a platform supported by hangers (stirrups) suspended by two ropes from overhead supports and equipped with means to permit the raising and lowering of the platform to desired work levels.

**Unstable objects** means items whose strength, configuration, or lack of stability may allow them to become dislocated and shift and therefore may not properly support the loads imposed on them. Unstable objects do not constitute a safe base support for scaffolds, platforms, or employees. Examples include, but are not limited to, barrels, boxes, loose brick, and concrete blocks.

**Vertical pickup** means a rope used to support the horizontal rope in catenary scaffolds.

**Walkway** means a portion of a scaffold platform used only for access and not as a work level.

**Window jack scaffold** means a platform resting on a bracket or jack which projects through a window opening.

**Stat. Auth.:** ORS 654.025(2) and 656.726(4).

**Stats. Implemented:** ORS 654.001 to 654.295.

**Hist:** OR-OSHA Admin. Order 2-1997, f. 3/12/97, ef. 3/12/97.

OR-OSHA Admin. Order 1-2011, f. 2/9/11, ef. 2/9/11.

**L**

## **§1926.451 General Requirements.**

This section does not apply to aerial lifts, the criteria for which are set out exclusively in §1926.453.

### **(a) Capacity.**

- (1)** Except as provided in paragraphs (a)(2), (a)(3), (a)(4), (a)(5) and (g) of this section, each scaffold and scaffold component shall be capable of supporting, without failure, its own weight and at least 4 times the maximum intended load applied or transmitted to it.
- (2)** Direct connections to roofs and floors, and counterweights used to balance adjustable suspension scaffolds, shall be capable of resisting at least 4 times the tipping moment imposed by the scaffold operating at the rated load of the hoist, or 1.5 (minimum) times the tipping moment imposed by the scaffold operating at the stall load of the hoist, whichever is greater.
- (3)** Each suspension rope, including connecting hardware, used on non-adjustable suspension scaffolds shall be capable of supporting, without failure, at least 6 times the maximum intended load applied or transmitted to that rope.
- (4)** Each suspension rope, including connecting hardware, used on adjustable suspension scaffolds shall be capable of supporting, without failure, at least 6 times the maximum intended load applied or transmitted to that rope with the scaffold operating at either the rated load of the hoist, or 2 (minimum) times the stall load of the hoist, whichever is greater.
- (5)** The stall load of any scaffold hoist shall not exceed 3 times its rated load.
- (6)** Scaffolds shall be designed by a qualified person and shall be constructed and loaded in accordance with that design. Non-mandatory Appendix A to this subpart contains examples of criteria that will enable an employer to comply with paragraph (a) of this section.

### **(b) Scaffold platform construction.**

- (1)** Each platform on all working levels of scaffolds shall be fully planked or decked between the front uprights and the guardrail supports as follows:
  - (i)** Each platform unit (e.g., scaffold plank, fabricated plank, fabricated deck, or fabricated platform) shall be installed so that the space between adjacent units and the space between the platform and the uprights is no more than 1 inch (2.5 cm) wide, except where the employer can demonstrate that a wider space is necessary (for example, to fit around uprights when side brackets are used to extend the width of the platform).

# L GENERAL REQUIREMENTS

(ii) Where the employer makes the demonstration provided for in paragraph (b)(1)(i) of this section, the platform shall be planked or decked as fully as possible and the remaining open space between the platform and the uprights shall not exceed 9 1/2 inches (24.1 cm).

**Exception to paragraph (b)(1):** The requirement in paragraph (b)(1) to provide full planking or decking does not apply to platforms used solely as walkways or solely by employees performing scaffold erection or dismantling. In these situations, only the planking that the employer establishes is necessary to provide safe working conditions is required.

(2) Except as provided in paragraphs (b)(2)(i) and (b)(2)(ii) of this section, each scaffold platform and walkway shall be at least 18 inches (46 cm) wide.

(i) Each ladder jack scaffold, top plate bracket scaffold, roof bracket scaffold, and pump jack scaffold shall be at least 12 inches (30 cm) wide. There is no minimum width requirement for boatswains' chairs.

**Note to paragraph (b)(2)(i):** pursuant to an administrative stay effective November 29, 1996 and published in the Federal Register on November 25, 1996, the requirement in paragraph (b)(2)(i) that roof bracket scaffolds be at least 12 inches wide is stayed until November 25, 1997 or until rulemaking regarding the minimum width of roof bracket scaffolds has been completed, whichever is later.

(ii) Where scaffolds must be used in areas that the employer can demonstrate are so narrow that platforms and walkways cannot be at least 18 inches (46 cm) wide, such platforms and walkways shall be as wide as feasible, and employees on those platforms and walkways shall be protected from fall hazards by the use of guardrails and/or personal fall arrest systems.

(3) Except as provided in paragraphs (b)(3)(i) and (ii) of this section, the front edge of all platforms shall not be more than 14 inches (36 cm) from the face of the work, unless guardrail systems are erected along the front edge and/or personal fall arrest systems are used in accordance with paragraph (g) of this section to protect employees from falling.

(i) The maximum distance from the face for outrigger scaffolds shall be 3 inches (8 cm);

(ii) The maximum distance from the face for plastering and lathing operations shall be 18 inches (46 cm).

(4) Each end of a platform, unless cleated or otherwise restrained by hooks or equivalent means, shall extend over the centerline of its support at least 6 inches (15 cm).

**(5)**

**(i)** Each end of a platform 10 feet or less in length shall not extend over its support more than 12 inches (30 cm) unless the platform is designed and installed so that the cantilevered portion of the platform is able to support employees and/or materials without tipping, or has guardrails which block employee access to the cantilevered end.

**(ii)** Each platform greater than 10 feet in length shall not extend over its support more than 18 inches (46 cm), unless it is designed and installed so that the cantilevered portion of the platform is able to support employees without tipping, or has guardrails which block employee access to the cantilevered end.

**(6)** On scaffolds where scaffold planks are abutted to create a long platform, each abutted end shall rest on a separate support surface. This provision does not preclude the use of common support members, such as "T" sections, to support abutting planks, or hook on platforms designed to rest on common supports.

**(7)** On scaffolds where platforms are overlapped to create a long platform, the overlap shall occur only over supports, and shall not be less than 12 inches (30 cm) unless the platforms are nailed together or otherwise restrained to prevent movement.

**(8)** At all points of a scaffold where the platform changes direction, such as turning a corner, any platform that rests on a bearer at an angle other than a right angle shall be laid first, and platforms which rest at right angles over the same bearer shall be laid second, on top of the first platform.

**(9)** Wood platforms shall not be covered with opaque finishes, except that platform edges may be covered or marked for identification. Platforms may be coated periodically with wood preservatives, fire-retardant finishes, and slip-resistant finishes; however, the coating may not obscure the top or bottom wood surfaces.

**(10)** Scaffold components manufactured by different manufacturers shall not be intermixed unless the components fit together without force and the scaffold's structural integrity is maintained by the user. Scaffold components manufactured by different manufacturers shall not be modified in order to intermix them unless a competent person determines the resulting scaffold is structurally sound.

**(11)** Scaffold components made of dissimilar metals shall not be used together unless a competent person has determined that galvanic action will not reduce the strength of any component to a level below that required by paragraph (a)(1) of this section.

**(c) Criteria for supported scaffolds.**

**(1)** Supported scaffolds with a height to base width (including outrigger supports, if used) ratio of more than four to one (4:1) shall be restrained from tipping by guying, tying, bracing, or equivalent means, as follows:

# L GENERAL REQUIREMENTS

(i) Guys, ties, and braces shall be installed at locations where horizontal members support both inner and outer legs.

(ii) Guys, ties, and braces shall be installed according to the scaffold manufacturer's recommendations or at the closest horizontal member to the 4:1 height and be repeated vertically at locations of horizontal members every 20 feet (6.1 m) or less thereafter for scaffolds 3 feet (0.91 m) wide or less, and every 26 feet (7.9 m) or less thereafter for scaffolds greater than 3 feet (0.91 m) wide.

The top guy, tie or brace of completed scaffolds shall be placed no further than the 4:1 height from the top. Such guys, ties and braces shall be installed at each end of the scaffold and at horizontal intervals not to exceed 30 feet (9.1 m) (measured from one end [not both] towards the other).

(iii) Ties, guys, braces, or outriggers shall be used to prevent the tipping of supported scaffolds in all circumstances where an eccentric load, such as a cantilevered work platform, is applied or is transmitted to the scaffold.

(2) Supported scaffold poles, legs, posts, frames, and uprights shall bear on base plates and mud sills or other adequate firm foundation.

(i) Footings shall be level, sound, rigid, and capable of supporting the loaded scaffold without settling or displacement.

(ii) Unstable objects shall not be used to support scaffolds or platform units.

(iii) Unstable objects shall not be used as working platforms.

(iv) Front-end loaders and similar pieces of equipment shall not be used to support scaffold platforms unless they have been specifically designed by the manufacturer for such use.

(v) Forklifts shall not be used to support scaffold platforms unless the entire platform is attached to the fork and the forklift is not moved horizontally while the platform is occupied.

(3) Supported scaffold poles, legs, posts, frames, and uprights shall be plumb and braced to prevent swaying and displacement.

## (d) Criteria for suspension scaffolds.

(1) All suspension scaffold support devices, such as outrigger beams, cornice hooks, parapet clamps, and similar devices, shall rest on surfaces capable of supporting at least 4 times the load imposed on them by the scaffold operating at the rated load of the hoist (or at least 1.5 times the load imposed on them by the scaffold at the stall capacity of the hoist, whichever is greater).

(2) Suspension scaffold outrigger beams, when used, shall be made of structural metal or equivalent strength material, and shall be restrained to prevent movement.

# GENERAL REQUIREMENTS **L**

---

**(3)** The inboard ends of suspension scaffold outrigger beams shall be stabilized by bolts or other direct connections to the floor or roof deck, or they shall have their inboard ends stabilized by counterweights, except masons' multi-point adjustable suspension scaffold outrigger beams shall not be stabilized by counterweights.

**(i)** Before the scaffold is used, direct connections shall be evaluated by a competent person who shall confirm, based on the evaluation, that the supporting surfaces are capable of supporting the loads to be imposed. In addition, masons' multi-point adjustable suspension scaffold connections shall be designed by an engineer experienced in such scaffold design.

**(ii)** Counterweights shall be made of non-flowable material. Sand, gravel and similar materials that can be easily dislocated shall not be used as counterweights.

**(iii)** Only those items specifically designed as counterweights shall be used to counterweight scaffold systems. Construction materials such as, but not limited to, masonry units and rolls of roofing felt, shall not be used as counterweights.

**(iv)** Counterweights shall be secured by mechanical means to the outrigger beams to prevent accidental displacement.

**(v)** Counterweights shall not be removed from an outrigger beam until the scaffold is disassembled.

**(vi)** Outrigger beams which are not stabilized by bolts or other direct connections to the floor or roof deck shall be secured by tiebacks.

**(vii)** Tiebacks shall be equivalent in strength to the suspension ropes.

**(viii)** Outrigger beams shall be placed perpendicular to its bearing support (usually the face of the building or structure). However, where the employer can demonstrate that it is not possible to place an outrigger beam perpendicular to the face of the building or structure because of obstructions that cannot be moved, the outrigger beam may be placed at some other angle, provided opposing angle tiebacks are used.

**(ix)** Tiebacks shall be secured to a structurally sound anchorage on the building or structure. Sound anchorages include structural members, but do not include standpipes, vents, other piping systems, or electrical conduit.

**(x)** Tiebacks shall be installed perpendicular to the face of the building or structure, or opposing angle tiebacks shall be installed. Single tiebacks installed at an angle are prohibited.

**(4)** Suspension scaffold outrigger beams shall be:

**(i)** Provided with stop bolts or shackles at both ends;

# L GENERAL REQUIREMENTS

- (ii) Securely fastened together with the flanges turned out when channel iron beams are used in place of I-beams;
  - (iii) Installed with all bearing supports perpendicular to the beam center line;
  - (iv) Set and maintained with the web in a vertical position; and
  - (v) When an outrigger beam is used, the shackle or clevis with which the rope is attached to the outrigger beam shall be placed directly over the center line of the stirrup.
- (5) Suspension scaffold support devices such as cornice hooks, roof hooks, roof irons, parapet clamps, or similar devices shall be:
- (i) Made of steel, wrought iron, or materials of equivalent strength;
  - (ii) Supported by bearing blocks; and
  - (iii) Secured against movement by tiebacks installed at right angles to the face of the building or structure, or opposing angle tiebacks shall be installed and secured to a structurally sound point of anchorage on the building or structure. Sound points of anchorage include structural members, but do not include standpipes, vents, other piping systems, or electrical conduit.
  - (iv) Tiebacks shall be equivalent in strength to the hoisting rope.
- (6) When winding drum hoists are used on a suspension scaffold, they shall contain not less than four wraps of the suspension rope at the lowest point of scaffold travel. When other types of hoists are used, the suspension ropes shall be long enough to allow the scaffold to be lowered to the level below without the rope end passing through the hoist, or the rope end shall be configured or provided with means to prevent the end from passing through the hoist.
- (7) The use of repaired wire rope as suspension rope is prohibited.
- (8) Wire suspension ropes shall not be joined together except through the use of eye splice thimbles connected with shackles or coverplates and bolts.
- (9) The load end of wire suspension ropes shall be equipped with proper size thimbles and secured by eyesplicing or equivalent means.
- (10) Ropes shall be inspected for defects by a competent person prior to each workshift and after every occurrence which could affect a rope's integrity. Ropes shall be replaced if any of the following conditions exist:
- (i) Any physical damage which impairs the function and strength of the rope.
  - (ii) Kinks that might impair the tracking or wrapping of rope around the drum(s) or sheave(s).

# GENERAL REQUIREMENTS **L**

---

- (iii) Six randomly distributed broken wires in one rope lay or three broken wires in one strand in one rope lay.
  - (iv) Abrasion, corrosion, scrubbing, flattening or peening causing loss of more than one-third of the original diameter of the outside wires.
  - (v) Heat damage caused by a torch or any damage caused by contact with electrical wires.
  - (vi) Evidence that the secondary brake has been activated during an overspeed condition and has engaged the suspension rope.
- (11) Swaged attachments or spliced eyes on wire suspension ropes shall not be used unless they are made by the wire rope manufacturer or a qualified person.
- (12) When wire rope clips are used on suspension scaffolds:
- (i) There shall be a minimum of 3 wire rope clips installed, with the clips a minimum of 6 rope diameters apart;
  - (ii) Clips shall be installed according to the manufacturer's recommendations;
  - (iii) Clips shall be retightened to the manufacturer's recommendations after the initial loading;
  - (iv) Clips shall be inspected and retightened to the manufacturer's recommendations at the start of each workshift thereafter;
  - (v) U-bolt clips shall not be used at the point of suspension for any scaffold hoist;
  - (vi) When U-bolt clips are used, the U-bolt shall be placed over the dead end of the rope, and the saddle shall be placed over the live end of the rope.
- (13) Suspension scaffold power-operated hoists and manual hoists shall be tested by a qualified testing laboratory.
- (14) Gasoline-powered equipment and hoists shall not be used on suspension scaffolds.
- (15) Gears and brakes of power-operated hoists used on suspension scaffolds shall be enclosed.
- (16) In addition to the normal operating brake, suspension scaffold power-operated hoists and manually operated hoists shall have a braking device or locking pawl which engages automatically when a hoist makes either of the following uncontrolled movements: an instantaneous change in momentum or an accelerated overspeed.
- (17) Manually operated hoists shall require a positive crank force to descend.

# L GENERAL REQUIREMENTS

**(18)** Two-point and multi-point suspension scaffolds shall be tied or otherwise secured to prevent them from swaying, as determined to be necessary based on an evaluation by a competent person. Window cleaners' anchors shall not be used for this purpose.

**(19)** Devices whose sole function is to provide emergency escape and rescue shall not be used as working platforms. This provision does not preclude the use of systems which are designed to function both as suspension scaffolds and emergency systems.

**(e) Access.** This paragraph applies to scaffold access for all employees. Access requirements for employees erecting or dismantling supported scaffolds are specifically addressed in paragraph (e)(9) of this section.

**(1)** When scaffold platforms are more than 2 feet (0.6 m) above or below a point of access, portable ladders, hook-on ladders, attachable ladders, stair towers (scaffold stairways/towers), stairway-type ladders (such as ladder stands), ramps, walkways, integral prefabricated scaffold access, or direct access from another scaffold, structure, personnel hoist, or similar surface shall be used. Cross-braces shall not be used as a means of access.

**(2)** Portable, hook-on, and attachable ladders (Additional requirements for the proper construction and use of portable ladders are contained in subpart X of this part – Stairways and Ladders):

**(i)** Portable, hook-on, and attachable ladders shall be positioned so as not to tip the scaffold;

**(ii)** Hook-on and attachable ladders shall be positioned so that their bottom rung is not more than 24 inches (61 cm) above the scaffold supporting level;

**(iii)** When hook-on and attachable ladders are used on a supported scaffold more than 35 feet (10.7 m) high, they shall have rest platforms at 35-foot (10.7 m) maximum vertical intervals.

**(iv)** Hook-on and attachable ladders shall be specifically designed for use with the type of scaffold used;

**(v)** Hook-on and attachable ladders shall have a minimum rung length of 11 1/2 inches (29 cm); and

**(vi)** Hook-on and attachable ladders shall have uniformly spaced rungs with a maximum spacing between rungs of 16 3/4 inches.

**(3)** Stairway-type ladders shall:

**(i)** Be positioned such that their bottom step is not more than 24 inches (61 cm) above the scaffold supporting level;

**(ii)** Be provided with rest platforms at 12 foot (3.7 m) maximum vertical intervals;

# GENERAL REQUIREMENTS L

---

- (iii) Have a minimum step width of 16 inches (41 cm), except that mobile scaffold stairway-type ladders shall have a minimum step width of 11 1/2 inches (30 cm); and
- (iv) Have slip-resistant treads on all steps and landings.
- (4) Stairtowers (scaffold stairway/towers) shall be positioned such that their bottom step is not more than 24 inches (61 cm.) above the scaffold supporting level.

  - (i) A stairrail consisting of a toprail and a midrail shall be provided on each side of each scaffold stairway.
  - (ii) The toprail of each stairrail system shall also be capable of serving as a handrail, unless a separate handrail is provided.
  - (iii) Handrails, and toprails that serve as handrails, shall provide an adequate handhold for employees grasping them to avoid falling.
  - (iv) Stairrail systems and handrails shall be surfaced to prevent injury to employees from punctures or lacerations, and to prevent snagging of clothing.
  - (v) The ends of stairrail systems and handrails shall be constructed so that they do not constitute a projection hazard.
  - (vi) Handrails, and toprails that are used as handrails, shall be at least 3 inches (7.6 cm) from other objects.
  - (vii) Stairrails shall be not less than 28 inches (71 cm) nor more than 37 inches (94 cm) from the upper surface of the stairrail to the surface of the tread, in line with the face of the riser at the forward edge of the tread.
  - (viii) A landing platform at least 18 inches (45.7 cm) wide by at least 18 inches (45.7 cm) long shall be provided at each level.
  - (ix) Each scaffold stairway shall be at least 18 inches (45.7 cm) wide between stairrails.
  - (x) Treads and landings shall have slip-resistant surfaces.
  - (xi) Stairways shall be installed between 40 degrees and 60 degrees from the horizontal.
  - (xii) Guardrails meeting the requirements of paragraph (g)(4) of this section shall be provided on the open sides and ends of each landing.
  - (xiii) Riser height shall be uniform, within 1/4 inch (0.6 cm), for each flight of stairs. Greater variations in riser height are allowed for the top and bottom steps of the entire system, not for each flight of stairs.
  - (xiv) Tread depth shall be uniform, within 1/4 inch, for each flight of stairs.

# L GENERAL REQUIREMENTS

## (5) Ramps and walkways.

- (i) Ramps and walkways 6 feet (1.8 m) or more above lower levels shall have guardrail systems which comply with subpart M of this part – Fall Protection;
- (ii) No ramp or walkway shall be inclined more than a slope of one (1) vertical to three (3) horizontal (20 degrees above the horizontal).
- (iii) If the slope of a ramp or a walkway is steeper than one (1) vertical in eight (8) horizontal (*Clarification note: 7 degrees above the horizontal*), the ramp or walkway shall have cleats not more than fourteen (14) inches (35 cm) apart which are securely fastened to the planks to provide footing.

## (6) Integral prefabricated scaffold access frames shall:

- (i) Be specifically designed and constructed for use as ladder rungs;
- (ii) Have a rung length of at least 8 inches (20 cm);
- (iii) Not be used as work platforms when rungs are less than 11 1/2 inches in length, unless each affected employee uses fall protection, or a positioning device, which complies with §1926.502;
- (iv) Be uniformly spaced within each frame section;
- (v) Be provided with rest platforms at 35-foot (10.7 m) maximum vertical intervals on all supported scaffolds more than 35 feet (10.7 m) high; and
- (vi) Have a maximum spacing between rungs of 16 3/4 inches (43 cm). Non-uniform rung spacing caused by joining end frames together is allowed, provided the resulting spacing does not exceed 16 3/4 inches (43 cm).

## (7) Steps and rungs of ladder and stairway type access shall line up vertically with each other between rest platforms.

## (8) Direct access to or from another surface shall be used only when the scaffold is not more than 14 inches (36 cm) horizontally and not more than 24 inches (61 cm) vertically from the other surface.

## (9) Effective September 2, 1997, access for employees erecting or dismantling supported scaffolds shall be in accordance with the following:

- (i) The employer shall provide safe means of access for each employee erecting or dismantling a scaffold where the provision of safe access is feasible and does not create a greater hazard. The employer shall have a competent person determine whether it is feasible or would pose a greater hazard to provide, and have employees use a safe means of access. This determination shall be based on site conditions and the type of scaffold being erected or dismantled.
- (ii) Hook-on or attachable ladders shall be installed as soon as scaffold erection has progressed to a point that permits safe installation and use.

# GENERAL REQUIREMENTS L

(iii) When erecting or dismantling tubular welded frame scaffolds, (end) frames, with horizontal members that are parallel, level and are not more than 22 inches apart vertically may be used as climbing devices for access, provided they are erected in a manner that creates a usable ladder and provides good hand hold and foot space.

(iv) Cross braces on tubular welded frame scaffolds shall not be used as a means of access or egress.

**(f) Use.**

(1) Scaffolds and scaffold components shall not be loaded in excess of their maximum intended loads or rated capacities, whichever is less.

(2) The use of shore or lean-to scaffolds is prohibited.

(3) Scaffolds and scaffold components shall be inspected for visible defects by a competent person before each work shift, and after any occurrence which could affect a scaffold's structural integrity.

(4) Any part of a scaffold damaged or weakened such that its strength is less than that required by paragraph (a) of this section shall be immediately repaired or replaced, braced to meet those provisions, or removed from service until repaired.

(5) Scaffolds shall not be moved horizontally while employees are on them, unless they have been designed by a registered professional engineer specifically for such movement or, for mobile scaffolds, where the provisions of §1926.452(w) are followed.

(6) The clearance between scaffolds and power lines shall be as follows: Scaffolds shall not be erected, used, dismantled, altered, or moved such that they or any conductive material handled on them might come closer to exposed and energized power lines than as follows:

Insulated Lines		
Voltage	Minimum distance	Alternatives
Less than 300 volts	3 feet (0.9 m)	2 times the length of the line insulator, but never less than 10 feet (3.1 m).
300 volts to 50 kv	10 feet (3.1 m)	
More than 50 kv	10 feet (3.1 m) plus 0.4 inches (1.0 cm) for each 1 kv over 50 kv.	
Uninsulated Lines		
Voltage	Minimum distance	Alternatives
Less than 50 kv	10 feet (3.1 m)	2 times the length of the line insulator, but never less than 10 feet (3.1 m).
More than 50 kv	10 feet (3.1 m) plus 0.4 inches (1.0 cm) for each 1 kv over 50 kv.	

**Exception to paragraph (f)(6):** Scaffolds and materials may be closer to power lines than specified above where such clearance is necessary for performance of work, and only after the utility company, or electrical system operator, has been notified of the need to work closer and the utility company, or electrical system operator, has deenergized the lines, relocated the lines, or installed protective coverings to prevent accidental contact with the lines.

# L GENERAL REQUIREMENTS

(7) Scaffolds shall be erected, moved, dismantled, or altered only under the supervision and direction of a competent person qualified in scaffold erection, moving, dismantling or alteration. Such activities shall be performed only by experienced and trained employees selected for such work by the competent person.

(8) Employees shall be prohibited from working on scaffolds covered with snow, ice, or other slippery material except as necessary for removal of such materials.

(9) Where swinging loads are being hoisted onto or near scaffolds such that the loads might contact the scaffold, tag lines or equivalent measures to control the loads shall be used.

(10) Suspension ropes supporting adjustable suspension scaffolds shall be of a diameter large enough to provide sufficient surface area for the functioning of brake and hoist mechanisms.

(11) Suspension ropes shall be shielded from heat-producing processes. When acids or other corrosive substances are used on a scaffold, the ropes shall be shielded, treated to protect against the corrosive substances, or shall be of a material that will not be damaged by the substance being used.

(12) Work on or from scaffolds is prohibited during storms or high winds unless a competent person has determined that it is safe for employees to be on the scaffold and those employees are protected by a personal fall arrest system or wind screens. Wind screens shall not be used unless the scaffold is secured against the anticipated wind forces imposed.

(13) Debris shall not be allowed to accumulate on platforms.

(14) Makeshift devices, such as but not limited to boxes and barrels, shall not be used on top of scaffold platforms to increase the working level height of employees.

(15) Ladders shall not be used on scaffolds to increase the working level height of employees, except on large area scaffolds where employers have satisfied the following criteria:

(i) When the ladder is placed against a structure which is not a part of the scaffold, the scaffold shall be secured against the sideways thrust exerted by the ladder;

(ii) The platform units shall be secured to the scaffold to prevent their movement;

(iii) The ladder legs shall be on the same platform or other means shall be provided to stabilize the ladder against unequal platform deflection, and

(iv) The ladder legs shall be secured to prevent them from slipping or being pushed off the platform.

(16) Platforms shall not deflect more than 1/60 of the span when loaded.

**(17)** To reduce the possibility of welding current arcing through the suspension wire rope when performing welding from suspended scaffolds, the following precautions shall be taken, as applicable:

- (i)** An insulated thimble shall be used to attach each suspension wire rope to its hanging support (such as cornice hook or outrigger). Excess suspension wire rope and any additional independent lines from grounding shall be insulated;
- (ii)** The suspension wire rope shall be covered with insulating material extending at least 4 feet (1.2 m) above the hoist. If there is a tail line below the hoist, it shall be insulated to prevent contact with the platform. The portion of the tail line that hangs free below the scaffold shall be guided or retained, or both, so that it does not become grounded;
- (iii)** Each hoist shall be covered with insulated protective covers;
- (iv)** In addition to a work lead attachment required by the welding process, a grounding conductor shall be connected from the scaffold to the structure. The size of this conductor shall be at least the size of the welding process work lead, and this conductor shall not be in series with the welding process or the work piece;
- (v)** If the scaffold grounding lead is disconnected at any time, the welding machine shall be shut off; and
- (vi)** An active welding rod or uninsulated welding lead shall not be allowed to contact the scaffold or its suspension system.

**(g) Fall protection.**

**(1)** Each employee on a scaffold more than 10 feet (3.1 m) above a lower level shall be protected from falling to that lower level. Paragraphs (g)(1)(i) through (vii) of this section establish the types of fall protection to be provided to the employees on each type of scaffold. Paragraph (g)(2) of this section addresses fall protection for scaffold erectors and dismantlers.

**Note to paragraph (g)(1):** The fall protection requirements for employees installing suspension scaffold support systems on floors, roofs, and other elevated surfaces are set forth in subpart M of this part.

- (i)** Each employee on a boatswains' chair, catenary scaffold, float scaffold, needle beam scaffold, or ladder jack scaffold shall be protected by a personal fall arrest system;
- (ii)** Each employee on a single-point or two-point adjustable suspension scaffold shall be protected by both a personal fall arrest system and guardrail system;

# L GENERAL REQUIREMENTS

(iii) Each employee on a crawling board (chicken ladder) shall be protected by a personal fall arrest system, a guardrail system (with minimum 200 pound toprail capacity), or by a three-fourth inch (1.9 cm) diameter grabline or equivalent handhold securely fastened beside each crawling board;

(iv) Each employee on a self-contained adjustable scaffold shall be protected by a guardrail system (with minimum 200 pound toprail capacity) when the platform is supported by the frame structure, and by both a personal fall arrest system and a guardrail system (with minimum 200 pound toprail capacity) when the platform is supported by ropes;

(v) Each employee on a walkway located within a scaffold shall be protected by a guardrail system (with minimum 200 pound toprail capacity) installed within 9 1/2 inches (24.1 cm) of and along at least one side of the walkway.

(vi) Each employee performing overhand bricklaying operations from a supported scaffold shall be protected from falling from all open sides and ends of the scaffold (except at the side next to the wall being laid) by the use of a personal fall arrest system or guardrail system (with minimum 200 pound toprail capacity).

(vii) For all scaffolds not otherwise specified in paragraphs (g)(1)(i) through (g)(1)(vi) of this section, each employee shall be protected by the use of personal fall arrest systems or guardrail systems meeting the requirements of paragraph (g)(4) of this section.

(2) Effective September 2, 1997, the employer shall have a competent person determine the feasibility and safety of providing fall protection for employees erecting or dismantling supported scaffolds. Employers are required to provide fall protection for employees erecting or dismantling supported scaffolds where the installation and use of such protection is feasible and does not create a greater hazard.

(3) In addition to meeting the requirements of §1926.502(d), personal fall arrest systems used on scaffolds shall be attached by lanyard to a vertical lifeline, horizontal lifeline, or scaffold structural member. Vertical lifelines shall not be used when overhead components, such as overhead protection or additional platform levels, are part of a single-point or two-point adjustable suspension scaffold.

(i) When vertical lifelines are used, they shall be fastened to a fixed safe point of anchorage, shall be independent of the scaffold, and shall be protected from sharp edges and abrasion. Safe points of anchorage include structural members of buildings, but do not include standpipes, vents, other piping systems, electrical conduit, outrigger beams, or counterweights.

(ii) When horizontal lifelines are used, they shall be secured to two or more structural members of the scaffold, or they may be looped around both suspension and independent suspension lines (on scaffolds so equipped) above the hoist and brake attached to the end of the scaffold. Horizontal lifelines shall not be attached only to the suspension ropes.

# GENERAL REQUIREMENTS L

---

- (iii)** When lanyards are connected to horizontal lifelines or structural members on a single-point or two-point adjustable suspension scaffold, the scaffold shall be equipped with additional independent support lines and automatic locking devices capable of stopping the fall of the scaffold in the event one or both of the suspension ropes fail. The independent support lines shall be equal in number and strength to the suspension ropes.
- (iv)** Vertical lifelines, independent support lines, and suspension ropes shall not be attached to each other, nor shall they be attached to or use the same point of anchorage, nor shall they be attached to the same point on the scaffold or personal fall arrest system.
- (4)** Guardrail systems installed to meet the requirements of this section shall comply with the following provisions (guardrail systems built in accordance with Appendix A to this subpart will be deemed to meet the requirements of paragraphs (g)(4)(vii), (viii), and (ix) of this section):
- (i)** Guardrail systems shall be installed along all open sides and ends of platforms. Guardrail systems shall be installed before the scaffold is released for use by employees other than erection/dismantling crews.
- (ii)** The top edge height of toprails or equivalent member on supported scaffolds manufactured or placed in service after January 1, 2000 shall be installed between 38 inches (0.97 m) and 45 inches (1.2 m) above the platform surface. The top edge height on supported scaffolds manufactured and placed in service before January 1, 2000, and on all suspended scaffolds where both a guardrail and a personal fall arrest system are required shall be between 36 inches (0.9 m) and 45 inches (1.2 m). When conditions warrant, the height of the top edge may exceed the 45-inch height, provided the guardrail system meets all other criteria of paragraph (g)(4).
- (iii)** When midrails, screens, mesh, intermediate vertical members, solid panels, or equivalent structural members are used, they shall be installed between the top edge of the guardrail system and the scaffold platform.
- (iv)** When midrails are used, they shall be installed at a height approximately midway between the top edge of the guardrail system and the platform surface.
- (v)** When screens and mesh are used, they shall extend from the top edge of the guardrail system to the scaffold platform, and along the entire opening between the supports.
- (vi)** When intermediate members (such as balusters or additional rails) are used, they shall not be more than 19 inches (48 cm) apart.

# L GENERAL REQUIREMENTS

(vii) Each toprail or equivalent member of a guardrail system shall be capable of withstanding, without failure, a force applied in any downward or horizontal direction at any point along its top edge of at least 100 pounds (445 n) for guardrail systems installed on single-point adjustable suspension scaffolds or two-point adjustable suspension scaffolds, and at least 200 pounds (890 n) for guardrail systems installed on all other scaffolds.

(viii) When the loads specified in paragraph (g)(4)(vii) of this section are applied in a downward direction, the top edge shall not drop below the height above the platform surface that is prescribed in paragraph (g)(4)(ii) of this section.

(ix) Midrails, screens, mesh, intermediate vertical members, solid panels, and equivalent structural members of a guardrail system shall be capable of withstanding, without failure, a force applied in any downward or horizontal direction at any point along the midrail or other member of at least 75 pounds (333 n) for guardrail systems with a minimum 100 pound toprail capacity, and at least 150 pounds (666 n) for guardrail systems with a minimum 200 pound toprail capacity.

(x) Suspension scaffold hoists and non-walkthrough stirrups may be used as end guardrails, if the space between the hoist or stirrup and the side guardrail or structure does not allow passage of an employee to the end of the scaffold.

(xi) Guardrails shall be surfaced to prevent injury to an employee from punctures or lacerations, and to prevent snagging of clothing.

(xii) The ends of all rails shall not overhang the terminal posts except when such overhang does not constitute a projection hazard to employees.

(xiii) Steel or plastic banding shall not be used as a toprail or midrail.

(xiv) Manila or plastic (or other synthetic) rope being used for toprails or midrails shall be inspected by a competent person as frequently as necessary to ensure that it continues to meet the strength requirements of paragraph (g) of this section.

(xv) Crossbracing is acceptable in place of a midrail when the crossing point of two braces is between 20 inches (0.5 m) and 30 inches (0.8 m) above the work platform or as a toprail when the crossing point of two braces is between 38 inches (0.97 m) and 48 inches (1.3 m) above the work platform. The end points at each upright shall be no more than 48 inches (1.3 m) apart.

## (h) Falling object protection.

(1) In addition to wearing hardhats each employee on a scaffold shall be provided with additional protection from falling hand tools, debris, and other small objects through the installation of toeboards, screens, or guardrail systems, or through the erection of debris nets, catch platforms, or canopy structures that contain or deflect the falling objects. When the falling objects are too large, heavy or massive to be contained or deflected by any of the above-listed measures, the employer shall place such potential falling objects away from the edge of the surface from which they could fall and shall secure those materials as necessary to prevent their falling.

# GENERAL REQUIREMENTS L

---

**NOTE:** This paragraph does not require all employees on scaffolding to wear hardhats. It simply details additional responsibilities when hardhats are required. Requirements for hardhats are found in OAR 437-003-1926.100.

**(2)** Where there is a danger of tools, materials, or equipment falling from a scaffold and striking employees below, the following provisions apply:

**(i)** The area below the scaffold to which objects can fall shall be barricaded, and employees shall not be permitted to enter the hazard area; or

**(ii)** A toeboard shall be erected along the edge of platforms more than 10 feet (3.1 m) above lower levels for a distance sufficient to protect employees below, except on float (ship) scaffolds where an edging of 3/4 X 1 1/2 inch (2 X 4 cm) wood or equivalent may be used in lieu of toeboards;

**(iii)** Where tools, materials, or equipment are piled to a height higher than the top edge of the toeboard, paneling or screening extending from the toeboard or platform to the top of the guardrail shall be erected for a distance sufficient to protect employees below; or

**(iv)** A guardrail system shall be installed with openings small enough to prevent passage of potential falling objects; or

**(v)** A canopy structure, debris net, or catch platform strong enough to withstand the impact forces of the potential falling objects shall be erected over the employees below.

**(3)** Canopies, when used for falling object protection, shall comply with the following criteria:

**(i)** Canopies shall be installed between the falling object hazard and the employees.

**(ii)** When canopies are used on suspension scaffolds for falling object protection, the scaffold shall be equipped with additional independent support lines equal in number to the number of points supported, and equivalent in strength to the strength of the suspension ropes.

**(iii)** Independent support lines and suspension ropes shall not be attached to the same points of anchorage.

**(4)** Where used, toeboards shall be:

**(i)** Capable of withstanding, without failure, a force of at least 50 pounds (222 n) applied in any downward or horizontal direction at any point along the toeboard (toeboards built in accordance with Appendix A to this subpart will be deemed to meet this requirement); and

# L GENERAL REQUIREMENTS

(ii) At least three and one-half inches (9 cm) high from the top edge of the toeboard to the level of the walking/working surface. Toeboards shall be securely fastened in place at the outermost edge of the platform and have not more than 1/4 inch (0.7 cm) clearance above the walking/working surface. Toeboards shall be solid or with openings not over one inch (2.5 cm) in the greatest dimension.

[61 FR 59831, November 25, 1996]

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Stats. Implemented:** ORS 654.001 to 654.295.

## ADDITIONAL REQUIREMENTS APPLICABLE TO SPECIFIC TYPES OF SCAFFOLDS

L

### §1926.452 Additional Requirements Applicable to Specific Types of Scaffolds.

In addition to the applicable requirements of §1926.451, the following requirements apply to the specific types of scaffolds indicated. Scaffolds not specifically addressed by §1926.452, such as but not limited to systems scaffolds, must meet the requirements of §1926.451.

#### (a) Pole scaffolds.

- (1) When platforms are being moved to the next level, the existing platform shall be left undisturbed until the new bearers have been set in place and braced, prior to receiving the new platforms.
- (2) Crossbracing shall be installed between the inner and outer sets of poles on double pole scaffolds.
- (3) Diagonal bracing in both directions shall be installed across the entire inside face of double-pole scaffolds used to support loads equivalent to a uniformly distributed load of 50 pounds (222 kg) or more per square foot (929 square cm).
- (4) Diagonal bracing in both directions shall be installed across the entire outside face of all double- and single-pole scaffolds.
- (5) Runners and bearers shall be installed on edge.
- (6) Bearers shall extend a minimum of 3 inches (7.6 cm) over the outside edges of runners.
- (7) Runners shall extend over a minimum of two poles, and shall be supported by bearing blocks securely attached to the poles.
- (8) Braces, bearers, and runners shall not be spliced between poles.
- (9) Where wooden poles are spliced, the ends shall be squared and the upper section shall rest squarely on the lower section. Wood splice plates shall be provided on at least two adjacent sides, and shall extend at least 2 feet (0.6 m) on either side of the splice, overlap the abutted ends equally, and have at least the same cross-sectional areas as the pole. Splice plates of other materials of equivalent strength may be used.
- (10) Pole scaffolds over 60 feet in height shall be designed by a registered professional engineer, and shall be constructed and loaded in accordance with that design. Non-mandatory Appendix A to this subpart contains examples of criteria that will enable an employer to comply with design and loading requirements for pole scaffolds under 60 feet in height.

## ADDITIONAL REQUIREMENTS APPLICABLE TO SPECIFIC TYPES OF SCAFFOLDS

---

### **(b) Tube and coupler scaffolds.**

(1) When platforms are being moved to the next level, the existing platform shall be left undisturbed until the new bearers have been set in place and braced prior to receiving the new platforms.

(2) Transverse bracing forming an "X" across the width of the scaffold shall be installed at the scaffold ends and at least at every third set of posts horizontally (measured from only one end) and every fourth runner vertically. Bracing shall extend diagonally from the inner or outer posts or runners upward to the next outer or inner posts or runners. Building ties shall be installed at the bearer levels between the transverse bracing and shall conform to the requirements of §1926.451(c)(1).

(3) On straight run scaffolds, longitudinal bracing across the inner and outer rows of posts shall be installed diagonally in both directions, and shall extend from the base of the end posts upward to the top of the scaffold at approximately a 45 degree angle. On scaffolds whose length is greater than their height, such bracing shall be repeated beginning at least at every fifth post. On scaffolds whose length is less than their height, such bracing shall be installed from the base of the end posts upward to the opposite end posts, and then in alternating directions until reaching the top of the scaffold. Bracing shall be installed as close as possible to the intersection of the bearer and post or runner and post.

(4) Where conditions preclude the attachment of bracing to posts, bracing shall be attached to the runners as close to the post as possible.

(5) Bearers shall be installed transversely between posts, and when coupled to the posts, shall have the inboard coupler bear directly on the runner coupler. When the bearers are coupled to the runners, the couplers shall be as close to the posts as possible.

(6) Bearers shall extend beyond the posts and runners, and shall provide full contact with the coupler.

(7) Runners shall be installed along the length of the scaffold, located on both the inside and outside posts at level heights (when tube and coupler guardrails and midrails are used on outside posts, they may be used in lieu of outside runners).

(8) Runners shall be interlocked on straight runs to form continuous lengths, and shall be coupled to each post. The bottom runners and bearers shall be located as close to the base as possible.

(9) Couplers shall be of a structural metal, such as drop-forged steel, malleable iron, or structural grade aluminum. The use of gray cast iron is prohibited.

## ADDITIONAL REQUIREMENTS APPLICABLE TO SPECIFIC TYPES OF SCAFFOLDS

L

(10) Tube and coupler scaffolds over 125 feet in height shall be designed by a registered professional engineer, and shall be constructed and loaded in accordance with such design. Non-mandatory Appendix A to this subpart contains examples of criteria that will enable an employer to comply with design and loading requirements for tube and coupler scaffolds under 125 feet in height.

**(c) Fabricated frame scaffolds (tubular welded frame scaffolds).**

(1) When moving platforms to the next level, the existing platform shall be left undisturbed until the new end frames have been set in place and braced prior to receiving the new platforms.

(2) Frames and panels shall be braced by cross, horizontal, or diagonal braces, or combination thereof, which secure vertical members together laterally. The cross braces shall be of such length as will automatically square and align vertical members so that the erected scaffold is always plumb, level, and square. All brace connections shall be secured.

(3) Frames and panels shall be joined together vertically by coupling or stacking pins or equivalent means.

(4) Where uplift can occur which would displace scaffold end frames or panels, the frames or panels shall be locked together vertically by pins or equivalent means.

(5) Brackets used to support cantilevered loads shall:

(i) Be seated with side-brackets parallel to the frames and end-brackets at 90 degrees to the frames;

(ii) Not be bent or twisted from these positions; and

(iii) Be used only to support personnel, unless the scaffold has been designed for other loads by a qualified engineer and built to withstand the tipping forces caused by those other loads being placed on the bracket-supported section of the scaffold.

(6) Scaffolds over 125 feet (38.0 m) in height above their base plates shall be designed by a registered professional engineer, and shall be constructed and loaded in accordance with such design.

**(d) Plasterers', decorators', and large area scaffolds.** Scaffolds shall be constructed in accordance with paragraphs (a), (b), or (c) of this section, as appropriate.

**(e) Bricklayers' square scaffolds (squares).**

(1) Scaffolds made of wood shall be reinforced with gussets on both sides of each corner.

## ADDITIONAL REQUIREMENTS APPLICABLE TO SPECIFIC TYPES OF SCAFFOLDS

---

(2) Diagonal braces shall be installed on all sides of each square.

(3) Diagonal braces shall be installed between squares on the rear and front sides of the scaffold, and shall extend from the bottom of each square to the top of the next square.

(4) Scaffolds shall not exceed three tiers in height, and shall be so constructed and arranged that one square rests directly above the other. The upper tiers shall stand on a continuous row of planks laid across the next lower tier, and shall be nailed down or otherwise secured to prevent displacement.

### **(f) Horse scaffolds.**

(1) Scaffolds shall not be constructed or arranged more than two tiers or 10 feet (3.0 m) in height, whichever is less.

(2) When horses are arranged in tiers, each horse shall be placed directly over the horse in the tier below.

(3) When horses are arranged in tiers, the legs of each horse shall be nailed down or otherwise secured to prevent displacement.

(4) When horses are arranged in tiers, each tier shall be crossbraced.

### **(g) Form scaffolds and carpenters' bracket scaffolds.**

(1) Each bracket, except those for wooden bracket-form scaffolds, shall be attached to the supporting formwork or structure by means of one or more of the following: nails; a metal stud attachment device; welding; hooking over a secured structural supporting member, with the form wales either bolted to the form or secured by snap ties or tie bolts extending through the form and securely anchored; or, for carpenters' bracket scaffolds only, by a bolt extending through to the opposite side of the structure's wall.

(2) Wooden bracket-form scaffolds shall be an integral part of the form panel.

(3) Folding type metal brackets, when extended for use, shall be either bolted or secured with a locking-type pin.

### **(h) Roof bracket scaffolds.**

(1) Scaffold brackets shall be constructed to fit the pitch of the roof and shall provide a level support for the platform.

(2) Brackets (including those provided with pointed metal projections) shall be anchored in place by nails unless it is impractical to use nails. When nails are not used, brackets shall be secured in place with first-grade manila rope of at least three-fourth inch (1.9 cm) diameter, or equivalent.

## ADDITIONAL REQUIREMENTS APPLICABLE TO SPECIFIC TYPES OF SCAFFOLDS

L

### (i) Outrigger scaffolds.

- (1) The inboard end of outrigger beams, measured from the fulcrum point to the extreme point of anchorage, shall be not less than one and one-half times the outboard end in length.
- (2) Outrigger beams fabricated in the shape of an I-beam or channel shall be placed so that the web section is vertical.
- (3) The fulcrum point of outrigger beams shall rest on secure bearings at least 6 inches (15.2 cm) in each horizontal dimension.
- (4) Outrigger beams shall be secured in place against movement, and shall be securely braced at the fulcrum point against tipping.
- (5) The inboard ends of outrigger beams shall be securely anchored either by means of braced struts bearing against sills in contact with the overhead beams or ceiling, or by means of tension members secured to the floor joists underfoot, or by both.
- (6) The entire supporting structure shall be securely braced to prevent any horizontal movement.
- (7) To prevent their displacement, platform units shall be nailed, bolted, or otherwise secured to outriggers.
- (8) Scaffolds and scaffold components shall be designed by a registered professional engineer and shall be constructed and loaded in accordance with such design.

### (j) Pump jack scaffolds.

- (1) Pump jack brackets, braces, and accessories shall be fabricated from metal plates and angles. Each pump jack bracket shall have two positive gripping mechanisms to prevent any failure or slippage.
- (2) Poles shall be secured to the structure by rigid triangular bracing or equivalent at the bottom, top, and other points as necessary. When the pump jack has to pass bracing already installed, an additional brace shall be installed approximately 4 feet (1.2 m) above the brace to be passed, and shall be left in place until the pump jack has been moved and the original brace reinstalled.
- (3) When guardrails are used for fall protection, a workbench may be used as the toprail only if it meets all the requirements in paragraphs (g)(4)(ii), (vii), (viii), and (xiii) of §1926.451.
- (4) Work benches shall not be used as scaffold platforms.
- (5) When poles are made of wood, the pole lumber shall be straight-grained, free of shakes, large loose or dead knots, and other defects which might impair strength.

# L

## ADDITIONAL REQUIREMENTS APPLICABLE TO SPECIFIC TYPES OF SCAFFOLDS

---

(6) When wood poles are constructed of two continuous lengths, they shall be joined together with the seam parallel to the bracket.

(7) When two by fours are spliced to make a pole, mending plates shall be installed at all splices to develop the full strength of the member.

### (k) Ladder jack scaffolds.

(1) Platforms shall not exceed a height of 20 feet (6.1 m).

(2) All ladders used to support ladder jack scaffolds shall meet the requirements of subpart X of this part – Stairways and Ladders, except that job-made ladders shall not be used to support ladder jack scaffolds.

(3) The ladder jack shall be so designed and constructed that it will bear on the side rails and ladder rungs or on the ladder rungs alone. If bearing on rungs only, the bearing area shall include a length of at least 10 inches (25.4 cm) on each rung.

(4) Ladders used to support ladder jacks shall be placed, fastened, or equipped with devices to prevent slipping.

(5) Scaffold platforms shall not be bridged one to another.

### (l) Window jack scaffolds.

(1) Scaffolds shall be securely attached to the window opening.

(2) Scaffolds shall be used only for the purpose of working at the window opening through which the jack is placed.

(3) Window jacks shall not be used to support planks placed between one window jack and another, or for other elements of scaffolding.

### (m) Crawling boards (chicken ladders).

(1) Crawling boards shall extend from the roof peak to the eaves when used in connection with roof construction, repair, or maintenance.

(2) Crawling boards shall be secured to the roof by ridge hooks or by means that meet equivalent criteria (e.g., strength and durability).

### (n) Step, platform, and trestle ladder scaffolds.

(1) Scaffold platforms shall not be placed any higher than the second highest rung or step of the ladder supporting the platform.

(2) All ladders used in conjunction with step, platform and trestle ladder scaffolds shall meet the pertinent requirements of subpart X of this part – Stairways and Ladders, except that job-made ladders shall not be used to support such scaffolds.

## ADDITIONAL REQUIREMENTS APPLICABLE TO SPECIFIC TYPES OF SCAFFOLDS

L

(3) Ladders used to support step, platform, and trestle ladder scaffolds shall be placed, fastened, or equipped with devices to prevent slipping.

(4) Scaffolds shall not be bridged one to another.

**(o) Single-point adjustable suspension scaffolds.**

(1) When two single-point adjustable suspension scaffolds are combined to form a two-point adjustable suspension scaffold, the resulting two-point scaffold shall comply with the requirements for two-point adjustable suspension scaffolds in paragraph (p) of this section.

(2) The supporting rope between the scaffold and the suspension device shall be kept vertical unless all of the following conditions are met:

(i) The rigging has been designed by a qualified person, and

(ii) The scaffold is accessible to rescuers, and

(iii) The supporting rope is protected to ensure that it will not chafe at any point where a change in direction occurs, and

(iv) The scaffold is positioned so that swinging cannot bring the scaffold into contact with another surface.

(3) Boatswains' chair tackle shall consist of correct size ball bearings or bushed blocks containing safety hooks and properly "eye-spliced" minimum five-eighth (5/8) inch (1.6 cm) diameter first-grade manila rope, or other rope which will satisfy the criteria (e.g., strength and durability) of manila rope.

(4) Boatswains' chair seat slings shall be reeved through four corner holes in the seat; shall cross each other on the underside of the seat; and shall be rigged so as to prevent slippage which could cause an out-of-level condition.

(5) Boatswains' chair seat slings shall be a minimum of five-eighth (5/8) inch (1.6 cm) diameter fiber, synthetic, or other rope which will satisfy the criteria (e.g., strength, slip resistance, durability, etc.) of first grade manila rope.

(6) When a heat-producing process such as gas or arc welding is being conducted, boatswains' chair seat slings shall be a minimum of three-eighth (3/8) inch (1.0 cm) wire rope.

(7) Non-cross-laminated wood boatswains' chairs shall be reinforced on their underside by cleats securely fastened to prevent the board from splitting.

## ADDITIONAL REQUIREMENTS APPLICABLE TO SPECIFIC TYPES OF SCAFFOLDS

---

**(p) Two-point adjustable suspension scaffolds (swing stages).** The following requirements do not apply to two-point adjustable suspension scaffolds used as masons' or stonemasons' scaffolds. Such scaffolds are covered by paragraph (q) of this section.

- (1) Platforms shall not be more than 36 inches (0.9 m) wide unless designed by a qualified person to prevent unstable conditions.
- (2) The platform shall be securely fastened to hangers (stirrups) by U-bolts or by other means which satisfy the requirements of §1926.451(a).
- (3) The blocks for fiber or synthetic ropes shall consist of at least one double and one single block. The sheaves of all blocks shall fit the size of the rope used.
- (4) Platforms shall be of the ladder-type, plank-type, beam-type, or light-metal type. Light metal-type platforms having a rated capacity of 750 pounds or less and platforms 40 feet (12.2 m) or less in length shall be tested and listed by a nationally recognized testing laboratory.
- (5) Two-point scaffolds shall not be bridged or otherwise connected one to another during raising and lowering operations unless the bridge connections are articulated (attached), and the hoists properly sized.
- (6) Passage may be made from one platform to another only when the platforms are at the same height, are abutting, and walk-through stirrups specifically designed for this purpose are used.

**(q) Multi-point adjustable suspension scaffolds, stonemasons' multi-point adjustable suspension scaffolds, and masons' multi-point adjustable suspension scaffolds.**

- (1) When two or more scaffolds are used they shall not be bridged one to another unless they are designed to be bridged, the bridge connections are articulated, and the hoists are properly sized.
- (2) If bridges are not used, passage may be made from one platform to another only when the platforms are at the same height and are abutting.
- (3) Scaffolds shall be suspended from metal outriggers, brackets, wire rope slings, hooks, or means that meet equivalent criteria (e.g., strength, durability).

**(r) Catenary scaffolds.**

- (1) No more than one platform shall be placed between consecutive vertical pickups, and no more than two platforms shall be used on a catenary scaffold.
- (2) Platforms supported by wire ropes shall have hook-shaped stops on each end of the platforms to prevent them from slipping off the wire ropes. These hooks shall be so placed that they will prevent the platform from falling if one of the horizontal wire ropes breaks.

## ADDITIONAL REQUIREMENTS APPLICABLE TO SPECIFIC TYPES OF SCAFFOLDS

L

(3) Wire ropes shall not be tightened to the extent that the application of a scaffold load will overstress them.

(4) Wire ropes shall be continuous and without splices between anchors.

### **(s) Float (ship) scaffolds.**

(1) The platform shall be supported by a minimum of two bearers, each of which shall project a minimum of 6 inches (15.2 cm) beyond the platform on both sides. Each bearer shall be securely fastened to the platform.

(2) Rope connections shall be such that the platform cannot shift or slip.

(3) When only two ropes are used with each float:

(i) They shall be arranged so as to provide four ends which are securely fastened to overhead supports.

(ii) Each supporting rope shall be hitched around one end of the bearer and pass under the platform to the other end of the bearer where it is hitched again, leaving sufficient rope at each end for the supporting ties.

### **(t) Interior hung scaffolds.**

(1) Scaffolds shall be suspended only from the roof structure or other structural member such as ceiling beams.

(2) Overhead supporting members (roof structure, ceiling beams, or other structural members) shall be inspected and checked for strength before the scaffold is erected.

(3) Suspension ropes and cables shall be connected to the overhead supporting members by shackles, clips, thimbles, or other means that meet equivalent criteria (e.g., strength, durability).

### **(u) Needle beam scaffolds.**

(1) Scaffold support beams shall be installed on edge.

(2) Ropes or hangers shall be used for supports, except that one end of a needle beam scaffold may be supported by a permanent structural member.

(3) The ropes shall be securely attached to the needle beams.

(4) The support connection shall be arranged so as to prevent the needle beam from rolling or becoming displaced.

(5) Platform units shall be securely attached to the needle beams by bolts or equivalent means. Cleats and overhang are not considered to be adequate means of attachment.

## ADDITIONAL REQUIREMENTS APPLICABLE TO SPECIFIC TYPES OF SCAFFOLDS

---

### (v) Multi-level suspended scaffolds.

(1) Scaffolds shall be equipped with additional independent support lines, equal in number to the number of points supported, and of equivalent strength to the suspension ropes, and rigged to support the scaffold in the event the suspension rope(s) fail.

(2) Independent support lines and suspension ropes shall not be attached to the same points of anchorage.

(3) Supports for platforms shall be attached directly to the support stirrup and not to any other platform.

### (w) Mobile scaffolds.

(1) Scaffolds shall be braced by cross, horizontal, or diagonal braces, or combination thereof, to prevent racking or collapse of the scaffold and to secure vertical members together laterally so as to automatically square and align the vertical members. Scaffolds shall be plumb, level, and squared. All brace connections shall be secured.

(i) Scaffolds constructed of tube and coupler components shall also comply with the requirements of paragraph (b) of this section;

(ii) Scaffolds constructed of fabricated frame components shall also comply with the requirements of paragraph (c) of this section.

(2) Scaffold casters and wheels shall be locked with positive wheel and/or wheel and swivel locks, or equivalent means, to prevent movement of the scaffold while the scaffold is used in a stationary manner.

(3) Manual force used to move the scaffold shall be applied as close to the base as practicable, but not more than 5 feet (1.5 m) above the supporting surface.

(4) Power systems used to propel mobile scaffolds shall be designed for such use. Forklifts, trucks, similar motor vehicles or add-on motors shall not be used to propel scaffolds unless the scaffold is designed for such propulsion systems.

(5) Scaffolds shall be stabilized to prevent tipping during movement.

(6) Employees shall not be allowed to ride on scaffolds unless the following conditions exist:

(i) The surface on which the scaffold is being moved is within 3 degrees of level, and free of pits, holes, and obstructions;

(ii) The height to base width ratio of the scaffold during movement is two to one or less, unless the scaffold is designed and constructed to meet or exceed nationally recognized stability test requirements such as those listed in paragraph (x) of Appendix A to this subpart (ANSI/SIA A92.5 and A92.6);

## ADDITIONAL REQUIREMENTS APPLICABLE TO SPECIFIC TYPES OF SCAFFOLDS

L

- 
- (iii) Outrigger frames, when used, are installed on both sides of the scaffold;
  - (iv) When power systems are used, the propelling force is applied directly to the wheels, and does not produce a speed in excess of 1 foot per second (.3 mps); and
  - (v) No employee is on any part of the scaffold which extends outward beyond the wheels, casters, or other supports.
- (7) Platforms shall not extend outward beyond the base supports of the scaffold unless outrigger frames or equivalent devices are used to ensure stability.
- (8) Where leveling of the scaffold is necessary, screw jacks or equivalent means shall be used.
- (9) Caster stems and wheel stems shall be pinned or otherwise secured in scaffold legs or adjustment screws.
- (10) Before a scaffold is moved, each employee on the scaffold shall be made aware of the move.
- (x) Repair bracket scaffolds.**
- (1) Brackets shall be secured in place by at least one wire rope at least 1/2 inch (1.27 cm) in diameter.
  - (2) Each bracket shall be attached to the securing wire rope (or ropes) by a positive locking device capable of preventing the unintentional detachment of the bracket from the rope, or by equivalent means.
  - (3) Each bracket, at the contact point between the supporting structure and the bottom of the bracket, shall be provided with a shoe (heel block or foot) capable of preventing the lateral movement of the bracket.
  - (4) Platforms shall be secured to the brackets in a manner that will prevent the separation of the platforms from the brackets and the movement of the platforms or the brackets on a completed scaffold.
  - (5) When a wire rope is placed around the structure in order to provide a safe anchorage for personal fall arrest systems used by employees erecting or dismantling scaffolds, the wire rope shall meet the requirements of subpart M of this part, but shall be at least 5/16 inch (0.8 cm) in diameter.
  - (6) Each wire rope used for securing brackets in place or as an anchorage for personal fall arrest systems shall be protected from damage due to contact with edges, corners, protrusions, or other discontinuities of the supporting structure or scaffold components.

# L

## ADDITIONAL REQUIREMENTS APPLICABLE TO SPECIFIC TYPES OF SCAFFOLDS

---

(7) Tensioning of each wire rope used for securing brackets in place or as an anchorage for personal fall arrest systems shall be by means of a turnbuckle at least 1 inch (2.54 cm) in diameter, or by equivalent means.

(8) Each turnbuckle shall be connected to the other end of its rope by use of an eyesplice thimble of a size appropriate to the turnbuckle to which it is attached.

(9) U-bolt wire rope clips shall not be used on any wire rope used to secure brackets or to serve as an anchor for personal fall arrest systems.

(10) The employer shall ensure that materials shall not be dropped to the outside of the supporting structure.

(11) Scaffold erection shall progress in only one direction around any structure.

(y) **Stilts.** Stilts, when used, shall be used in accordance with the following requirements:

(1) An employee may wear stilts on a scaffold only if it is a large area scaffold.

(2) When an employee is using stilts on a large area scaffold where a guardrail system is used to provide fall protection, the guardrail system shall be increased in height by an amount equal to the height of the stilts being used by the employee.

(3) Surfaces on which stilts are used shall be flat and free of pits, holes and obstructions, such as debris, as well as other tripping and falling hazards.

(4) Stilts shall be properly maintained. Any alteration of the original equipment shall be approved by the manufacturer.

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Stats. Implemented:** ORS 654.001 to 654.295.

**Hist:** OR-OSHA Admin. Order 2-1997, f. 3/12/97, ef. 3/12/97.

## §1926.453 Aerial Lifts.

### (a) General requirements.

(1) Unless otherwise provided in this section, aerial lifts acquired for use on or after January 22, 1973 shall be designed and constructed in conformance with the applicable requirements of the American National Standards for "Vehicle Mounted Elevating and Rotating Work Platforms," ANSI A92.2-1969, including appendix. Aerial lifts acquired before January 22, 1973 which do not meet the requirements of ANSI A92.2-1969, may not be used after January 1, 1976, unless they shall have been modified so as to conform with the applicable design and construction requirements of ANSI A92.2-1969. Aerial lifts include the following types of vehicle-mounted aerial devices used to elevate personnel to job-sites above ground:

(i) Extensible boom platforms;

(ii) Aerial ladders;

(iii) Articulating boom platforms;

(iv) Vertical towers; and

(v) A combination of any such devices. Aerial equipment may be made of metal, wood, fiberglass reinforced plastic (FRP), or other material; may be powered or manually operated; and are deemed to be aerial lifts whether or not they are capable of rotating about a substantially vertical axis.

(2) Aerial lifts may be "field modified" for uses other than those intended by the manufacturer provided the modification has been certified in writing by the manufacturer or by any other equivalent entity, such as a nationally recognized testing laboratory, to be in conformity with all applicable provisions of ANSI A92.2-1969 and this section and to be at least as safe as the equipment was before modification.

### (b) Specific requirements.

(1) **Ladder trucks and tower trucks.** Aerial ladders shall be secured in the lower traveling position by the locking device on top of the truck cab, and the manually operated device at the base of the ladder before the truck is moved for highway travel.

#### (2) Extensible and articulating boom platforms.

(i) Lift controls shall be tested each day prior to use to determine that such controls are in safe working condition.

(ii) Only authorized persons shall operate an aerial lift.

(iii) Belting off to an adjacent pole, structure, or equipment while working from an aerial lift shall not be permitted.

(iv) Employees shall always stand firmly on the floor of the basket, and shall not sit or climb on the edge of the basket or use planks, ladders, or other devices for a work position.

(v) A body belt shall be worn and a lanyard attached to the boom or basket when working from an aerial lift.

**Note to paragraph (b)(2)(v):** As of January 1, 1998, subpart M of this part (§1926.502(d)) provides that body belts are not acceptable as part of a personal fall arrest system. The use of a body belt in a tethering system or in a restraint system is acceptable and is regulated under §1926.502(e).

(vi) Boom and basket load limits specified by the manufacturer shall not be exceeded.

(vii) The brakes shall be set and when outriggers are used, they shall be positioned on pads or a solid surface. Wheel chocks shall be installed before using an aerial lift on an incline, provided they can be safely installed.

(viii) An aerial lift truck shall not be moved when the boom is elevated in a working position with men in the basket, except for equipment which is specifically designed for this type of operation in accordance with the provisions of paragraphs (a)(1) and (2) of this section.

(ix) Articulating boom and extensible boom platforms, primarily designed as personnel carriers, shall have both platform (upper) and lower controls. Upper controls shall be in or beside the platform within easy reach of the operator. Lower controls shall provide for overriding the upper controls. Controls shall be plainly marked as to their function. Lower level controls shall not be operated unless permission has been obtained from the employee in the lift, except in case of emergency.

(x) Climbers shall not be worn while performing work from an aerial lift.

(xi) The insulated portion of an aerial lift shall not be altered in any manner that might reduce its insulating value.

(xii) Before moving an aerial lift for travel, the boom(s) shall be inspected to see that it is properly cradled and outriggers are in stowed position except as provided in paragraph (b)(2)(viii) of this section.

**(3) Electrical tests.** All electrical tests shall conform to the requirements of ANSI A92.2-1969 section 5. However equivalent d.c.; voltage tests may be used in lieu of the a.c. voltage specified in A92.2-1969; d.c. voltage tests which are approved by the equipment manufacturer or equivalent entity shall be considered an equivalent test for the purpose of this paragraph (b)(3).

# **AERIAL LIFTS / MANUALLY PROPELLED ELEVATING AERIAL PLATFORMS**

**L**

**(4) Bursting safety factor.** The provisions of the American National Standards Institute standard ANSI A92.2-1969, section 4.9 Bursting Safety Factor shall apply to all critical hydraulic and pneumatic components. Critical components are those in which a failure would result in a free fall or free rotation of the boom. All noncritical components shall have a bursting safety factor of at least 2 to 1.

**(5) Welding standards.** All welding shall conform to the following standards as applicable:

- (i)** Standard Qualification Procedure, AWS B3.0-41.
- (ii)** Recommended Practices for Automotive Welding Design, AWS D8.4-61.
- (iii)** Standard Qualification of Welding Procedures and Welders for Piping and Tubing, AWS D10.9-69.
- (iv)** Specifications for Welding Highway and Railway Bridges, AWS D2.0-69.

**Note to §1926.453:** Non-mandatory Appendix C to this subpart lists examples of national consensus standards that are considered to provide employee protection equivalent to that provided through the application of ANSI A92.2-1969, where appropriate. This incorporation by reference was approved by the Director of the Federal Register in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. Copies may be obtained from the American National Standards Institute. Copies may be inspected at the Docket Office, Occupational Safety and Health Administration, U.S. Department of Labor, 200 Constitution Avenue NW, room N2634, Washington, DC, or at the Office of the Federal Register, 800 North Capitol Street NW, suite 700, Washington, DC.

**BOOM SUPPORTED ELEVATING  
WORK PLATFORMS / SCISSOR  
LIFTS – SELF-PROPELLED  
ELEVATING WORK PLATFORMS**

---

**437-003-0073 Boom Supported Elevating Work Platforms.**

*(1) When using boom supported elevating work platforms as covered by ANSI/SIA A92.5-1992, the manufacturer's operating manual must be with the equipment. You must follow all operating and maintenance instructions and recommendations of the manufacturer.*

*(2) Workers must use personal fall protection that complies with subdivision M of this division, when working in these devices.*

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Stats. Implemented:** ORS 654.001 to 654.295.

**Hist:** OR-OSHA Admin. Order 2-1997, f. 3/12/97, ef. 3/12/97.

**437-003-0074 Scissor Lifts – Self-Propelled Elevating Work Platforms.**

*(1) When using self-propelled elevating aerial platforms, scissor lifts, as covered by ANSI/SIA A92.6-1990, the manufacturer's operating manual must be with the equipment. You must follow all operating and maintenance instructions and recommendations of the manufacturer.*

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Stats. Implemented:** ORS 654.001 to 654.295.

**Hist:** OR-OSHA Admin. Order 2-1997, f. 3/12/97, ef. 3/12/97.

## **§1926.454 Training Requirements.**

This section supplements and clarifies the requirements of §1926.21(b)(2) as these relate to the hazards of work on scaffolds.

**(a)** The employer shall have each employee who performs work while on a scaffold trained by a person qualified in the subject matter to recognize the hazards associated with the type of scaffold being used and to understand the procedures to control or minimize those hazards. The training shall include the following areas, as applicable:

- (1)** The nature of any electrical hazards, fall hazards and falling object hazards in the work area;
- (2)** The correct procedures for dealing with electrical hazards and for erecting, maintaining, and disassembling the fall protection systems and falling object protection systems being used;
- (3)** The proper use of the scaffold, and the proper handling of materials on the scaffold;
- (4)** The maximum intended load and the load-carrying capacities of the scaffolds used; and
- (5)** Any other pertinent requirements of this subpart.

**(b)** The employer shall have each employee who is involved in erecting, disassembling, moving, operating, repairing, maintaining, or inspecting a scaffold trained by a competent person to recognize any hazards associated with the work in question. The training shall include the following topics, as applicable:

- (1)** The nature of scaffold hazards;
- (2)** The correct procedures for erecting, disassembling, moving, operating, repairing, inspecting, and maintaining the type of scaffold in question;
- (3)** The design criteria, maximum intended load-carrying capacity and intended use of the scaffold;
- (4)** Any other pertinent requirements of this subpart.

**(c)** When the employer has reason to believe that an employee lacks the skill or understanding needed for safe work involving the erection, use or dismantling of scaffolds, the employer shall retrain each such employee so that the requisite proficiency is regained. Retraining is required in at least the following situations:

- (1)** Where changes at the worksite present a hazard about which an employee has not been previously trained; or

**(2)** Where changes in the types of scaffolds, fall protection, falling object protection, or other equipment present a hazard about which an employee has not been previously trained; or

**(3)** Where inadequacies in an affected employee's work involving scaffolds indicate that the employee has not retained the requisite proficiency.

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Stats. Implemented:** ORS 654.001 to 654.295.

**Hist:** OR-OSHA Admin. Order 2-1997, f. 3/12/97, ef. 3/12/97.

## Non-Mandatory Appendix A to Subpart L – Scaffold Specifications

This Appendix provides non-mandatory guidelines to assist employers in complying with the requirements of subpart L of this part. An employer may use these guidelines and tables as a starting point for designing scaffold systems. However, the guidelines do not provide all the information necessary to build a complete system, and the employer is still responsible for designing and assembling these components in such a way that the completed system will meet the requirements of §1926.451(a). Scaffold components which are not selected and loaded in accordance with this Appendix, and components for which no specific guidelines or tables are given in this Appendix (e.g., joints, ties, components for wood pole scaffolds more than 60 feet in height, components for heavy-duty horse scaffolds, components made with other materials, and components with other dimensions, etc.) must be designed and constructed in accordance with the capacity requirements of §1926.451(a), and loaded in accordance with §1926.451(d)(1).

### Index to Appendix A for Subpart L

1. General guidelines and tables.
2. Specific guidelines and tables.
  - (a) Pole scaffolds:
    - Single-pole wood pole scaffolds.
    - Independent wood pole scaffolds.
  - (b) Tube and coupler scaffolds.
  - (c) Fabricated frame scaffolds.
  - (d) Plasterers', decorators' and large area scaffolds.
  - (e) Bricklayers' square scaffolds.
  - (f) Horse scaffolds.
  - (g) Form scaffolds and carpenters' bracket scaffolds.
  - (h) Roof bracket scaffolds.
  - (i) Outrigger scaffolds (one level).
  - (j) Pump jack scaffolds.
  - (k) Ladder jack scaffolds.

# L SCAFFOLD SPECIFICATIONS

- (l) Window jack scaffolds.
- (m) Crawling boards (chicken ladders).
- (n) Step, platform and trestle ladder scaffolds.
- (o) Single-point adjustable suspension scaffolds.
- (p) Two-point adjustable suspension scaffolds.
- (q)
  - (1) Stonesetters' multi-point adjustable suspension scaffolds.
  - (2) Masons' multi-point adjustable suspension scaffolds.
- (r) Catenary scaffolds.
- (s) Float (ship) scaffolds.
- (t) Interior hung scaffolds.
- (u) Needle beam scaffolds.
- (v) Multi-level suspension scaffolds.
- (w) Mobile scaffolds.
- (x) Repair bracket scaffolds.
- (y) Stilts.
- (z) Tank builders' scaffolds.

## 1. General Guidelines and Tables

(a) The following tables, and the tables in Part 2 – Specific guidelines and tables, assume that all load-carrying timber members (except planks) of the scaffold are a minimum of 1,500 lb-f/in<sup>2</sup> (stress grade) construction grade lumber. All dimensions are nominal sizes as provided in the American Softwood Lumber Standards, dated January 1970, except that, where rough sizes are noted, only rough or undressed lumber of the size specified will satisfy minimum requirements.

(b) Solid sawn wood used as scaffold planks shall be selected for such use following the grading rules established by a recognized lumber grading association or by an independent lumber grading inspection agency. Such planks shall be identified by the grade stamp of such association or agency. The association or agency and the grading rules under which the wood is graded shall be certified by the Board of Review, American Lumber Standard Committee, as set forth in the American Softwood Lumber Standard of the U.S. Department of Commerce.

# SCAFFOLD SPECIFICATIONS L

(i) Allowable spans shall be determined in compliance with the National Design Specification for Wood Construction published by the National Forest Products Association; paragraph 5 of ANSI A10.8-1988 Scaffolding – Safety Requirements published by the American National Standards Institute; or for 2 X 10 inch (nominal) or 2 X 9 inch (rough) solid sawn wood planks, as shown in the following table:

Maximum intended nominal load (lb/ft <sup>2</sup> )	Maximum permissible span using full thickness undressed lumber (ft)	Maximum permissible span using nominal thickness lumber (ft)
25 .....	10	8
50 .....	8	6
75 .....	6	

(ii) The maximum permissible span for 1 1/4 X 9-inch or wider wood plank of full thickness with a maximum intended load of 50 lb/ft.<sup>2</sup> shall be 4 feet.

(c) Fabricated planks and platforms may be used in lieu of solid sawn wood planks. Maximum spans for such units shall be as recommended by the manufacturer based on the maximum intended load being calculated as follows:

Rated load capacity	Intended load
Light-duty	25 pounds per square foot applied uniformly over the entire span area.
Medium-duty	50 pounds per square foot applied uniformly over the entire span area.
Heavy-duty	75 pounds per square foot applied uniformly over the entire span area.
One-person	250 pounds placed at the center of the span (total 250 pounds).
Two-person	250 pounds placed 18 inches to the left and right of the center of the span (total 500 pounds).
Three-person	250 pounds placed at the center of the span and 250 pounds placed 18 inches to the left and right of the center of the span (total 750 pounds).

**Note:** Platform units used to make scaffold platforms intended for light-duty use shall be capable of supporting at least 25 pounds per square foot applied uniformly over the entire unit-span area, or a 250-pound point load placed on the unit at the center of the span, whichever load produces the greater shear force.

(d) Guardrails shall be as follows:

(i) Toprails shall be equivalent in strength to 2 inch by 4 inch lumber; or 1 1/4 inch X 1/8 inch structural angle iron; or 1 inch X .070 inch wall steel tubing; or 1.990 inch X .058 inch wall aluminum tubing.

(ii) Midrails shall be equivalent in strength to 1 inch by 6 inch lumber; or 1 1/4 inch X 1 1/4 inch X 1/8 inch structural angle iron; or 1 inch X .070 inch wall steel tubing; or 1.990 inch X .058 inch wall aluminum tubing.

# L SCAFFOLD SPECIFICATIONS

(iii) Toeboards shall be equivalent in strength to 1 inch by 4 inch lumber; or 1 1/4 inch X 1 1/4 inch structural angle iron; or 1 inch X .070 inch wall steel tubing; or 1.990 inch X .058 inch wall aluminum tubing.

(iv) Posts shall be equivalent in strength to 2 inch by 4 inch lumber; or 1 1/4 inch X 1 1/4 inch X 1/8 inch structural angle iron; or 1 inch X .070 inch wall steel tubing; or 1.990 inch X .058 inch wall aluminum tubing.

(v) Distance between posts shall not exceed 8 feet.

(e) Overhead protection shall consist of 2 inch nominal planking laid tight, or 3/4-inch plywood.

(f) Screen installed between toeboards and midrails or top rails shall consist of No. 18 gauge U.S. Standard wire one inch mesh.

## 2. Specific guidelines and tables.

### (a) Pole Scaffolds.

Single Pole Wood Pole Scaffolds

	Light duty up to 20 feet high	Light duty up to 60 feet high	Medium duty up to 60 feet high	Heavy duty up to 60 feet high
Maximum intended load (lbs/ft <sup>2</sup> )	25	25	50	75
Poles or uprights	2 X 4 in	4 X 4 in	4 X 4 in	4 X 6 in
Maximum pole spacing (longitudinal)	6 feet	10 feet	8 feet	6 feet
Maximum pole spacing (transverse)	5 feet	5 feet	5 feet	5 feet
Runners	1 X 4 in	1 1/4 X 9 in	2 X 10 in	2 X 10 in.
Bearers and maximum spacing of bearers:				
3 feet	2 X 4 in	2 X 4 in	2 X 10 in or 3 X 4 in	2 X 10 in or 3 X 5 in
5 feet	2 X 6 in or 3 X 4 in	2 X 6 in or 3 X 4 in (rough)	2 X 10 in or 3 X 4 in	2 X 10 in or 3 X 5 in
6 feet	.....	....	2 X 10 in or 3 X 4 in	2 X 10 in or 3 X 5 in
8 feet	.....	....	2 X 10 in or 3 X 4 in	
Planking	1 1/4 X 9 in	2 X 10 in	2 X 10 in	2 X 10 in.
Maximum vertical spacing of horizontal members	7 feet	9 feet	7 feet	6 ft. 6 in.
Bracing horizontal	1 X 4 in	1 X 4 in	1 X 6 in. or 1 1/4 X 4 in	2 X 4 in.
Bracing diagonal	1 X 4 in	1 X 4 in	1 X 4 in	2 X 4 in.
Tie-ins	1 X 4 in	1 X 4 in	1 X 4 in	1 X 4 in.

**Note:** All members except planking are used on edge. All wood bearers shall be reinforced with 3/16 X 2 inch steel strip, or the equivalent, secured to the lower edges for the entire length of the bearer.

2 .....	11	1	0	125
3 .....	6	0	0	125
4 .....	1	0	0	125

(c) **Fabricated frame scaffolds.** Because of their prefabricated nature, no additional guidelines or tables for these scaffolds are being adopted in this Appendix.

(d) **Plasterers', decorators', and large area scaffolds.** The guidelines for pole scaffolds or tube and coupler scaffolds (Appendix A (a) and (b)) may be applied.

(e) **Bricklayers' square scaffolds.**  
 Maximum intended load: 50 lb/ft.<sup>2</sup> \*  
 Maximum width: 5 ft.  
 Maximum height: 5 ft.  
 Gussets: 1 X 6 in.  
 Braces: 1 X 8 in.  
 Legs: 2 X 6 in.  
 Bearers (horizontal members): 2 X 6 in.

(f) **Horse scaffolds.**  
 Maximum intended load (light duty): 25 lb/ft.<sup>2</sup> \*\*  
 Maximum intended load (medium duty): 50 lb/ft.<sup>2</sup> \*\*  
 Horizontal members or bearers:  
 Light duty: 2 X 4 in.  
 Medium duty: 3 X 4 in.  
 Legs: 2 X 4 in.  
 Longitudinal brace between legs: 1 X 6 in.  
 Gusset brace at top of legs: 1 X 8 in.  
 Half diagonal braces: 2 X 4 in.

(g) **Form scaffolds and carpenters' bracket scaffolds.**

(1) Brackets shall consist of a triangular-shaped frame made of wood with a cross-section not less than 2 inches by 3 inches, or of 1 1/4 inch X 1 1/4 inch X 1/8 inch structural angle iron.

\* The squares shall be set not more than 8 feet apart for light duty scaffolds and not more than 5 feet apart for medium duty scaffolds.

\*\* Horses shall be spaced not more than 8 feet apart for light duty loads, and not more than 5 feet apart for medium duty loads.

# SCAFFOLD SPECIFICATIONS L

---

- (2) Bolts used to attach brackets to structures shall not be less than 5/8 inches in diameter.
- (3) Maximum bracket spacing shall be 8 feet on centers.
- (4) No more than two employees shall occupy any given 8 feet of a bracket or form scaffold at any one time. Tools and materials shall not exceed 75 pounds in addition to the occupancy.
- (5) **Wooden figure-four scaffolds:**
  - Maximum intended load: 25 lb/ft.<sup>2</sup>
  - Uprights: 2 X 4 in. or 2 X 6 in.
  - Bearers (two): 1 X 6 in.
  - Braces: 1 X 6 in.
  - Maximum length of bearers (unsupported): 3 ft. 6 in.
  - (i) Outrigger bearers shall consist of two pieces of 1 X 6 inch lumber nailed on opposite sides of the vertical support.
  - (ii) Bearers for wood figure-four brackets shall project not more than 3 feet 6 inches from the outside of the form support, and shall be braced and secured to prevent tipping or turning. The knee or angle brace shall intersect the bearer at least 3 feet from the form at an angle of approximately 45 degrees, and the lower end shall be nailed to a vertical support.
- (6) **Metal bracket scaffolds:**
  - Maximum intended load: 25 lb/ft.<sup>2</sup>
  - Uprights: 2 X 4 inch
  - Bearers: As designed.
  - Braces: As designed.
- (7) **Wood bracket scaffolds:**
  - Maximum intended load: 25 lb/ft.<sup>2</sup>
  - Uprights: 2 X 4 in or 2 X 6 in
  - Bearers: 2 X 6 in
  - Maximum scaffold width: 3 ft 6 in
  - Braces: 1 X 6 in
- (h) **Roof bracket scaffolds.** No specific guidelines or tables are given.
- (i) **Outrigger scaffolds (single level).** No specific guidelines or tables are given.
- (j) **Pump jack scaffolds.** Wood poles shall not exceed 30 feet in height. Maximum intended load – 500 lbs between poles; applied at the center of the span. Not more than two employees shall be on a pump jack scaffold at one time between any two supports. When 2 X 4's are spliced together to make a 4 X 4 inch wood pole, they shall be spliced with "10 penny" common nails no more than 12 inches center to center, staggered uniformly from the opposite outside edges.

# L SCAFFOLD SPECIFICATIONS

(k) **Ladder jack scaffolds.** Maximum intended load – 25 lb/ft<sup>2</sup>. However, not more than two employees shall occupy any platform at any one time. Maximum span between supports shall be 8 feet.

(l) **Window jack scaffolds.** Not more than one employee shall occupy a window jack scaffold at any one time.

(m) **Crawling boards (chicken ladders).** Crawling boards shall be not less than 10 inches wide and 1 inch thick, with cleats having a minimum 1 X 1 1/2 inch cross-sectional area. The cleats shall be equal in length to the width of the board and spaced at equal intervals not to exceed 24 inches.

(n) **Step, platform, and trestle ladder scaffolds.** No additional guidelines or tables are given.

(o) **Single-point adjustable suspension scaffolds.** Maximum intended load – 250 lbs. Wood seats for boatswains' chairs shall be not less than 1 inch thick if made of non-laminated wood, or 5/8 inches thick if made of marine quality plywood.

(p) **Two-point adjustable suspension scaffolds.**

(1) In addition to direct connections to buildings (except window cleaners' anchors) acceptable ways to prevent scaffold sway include angulated roping and static lines. Angulated roping is a system of platform suspension in which the upper wire rope sheaves or suspension points are closer to the plane of the building face than the corresponding attachment points on the platform, thus causing the platform to press against the face of the building. Static lines are separate ropes secured at their top and bottom ends closer to the plane of the building face than the outer-most edge of the platform. By drawing the static line taut, the platform is drawn against the face of the building.

(2) On suspension scaffolds designed for a working load of 500 pounds, no more than two employees shall be permitted on the scaffold at one time. On suspension scaffolds with a working load of 750 pounds, no more than three employees shall be permitted on the scaffold at one time.

(3) **Ladder-type platforms.** The side stringer shall be of clear straight-grained spruce. The rungs shall be of straight-grained oak, ash, or hickory, at least 1 1/8 inches in diameter, with 7/8 inch tenons mortised into the side stringers at least 7/8 inch. The stringers shall be tied together with tie rods not less than 1/4 inch in diameter, passing through the stringers and riveted up tight against washers on both ends. The flooring strips shall be spaced not more than 5/8 inch apart, except at the side rails where the space may be 1 inch. Ladder-type platforms shall be constructed in accordance with the following table:

# SCAFFOLD SPECIFICATIONS L

Schedule for Ladder-Type Platforms

Length of Platform	12 feet	14 & 16 feet	18 & 20 feet	22 & 24 feet	28 & 30 feet
Side stringers, minimum cross section (finished sizes):					
At ends .....	1¾ X 2¾ in.	1¾ X 2¾ in.	1¾ X 3 in.	1¾ X 3 in.	1¾ X 3½ in.
At middle .....	1¾ X 3¾ in.	1¾ X 3¾ in.	1¾ X 4 in.	1¾ X 4¼ in.	1¾ X 5 in.
Reinforcing strip (minimum) .....	A 1/8 X 7/8 inch steel reinforcing strip shall be attached to the side or underside, full length.				
Rungs .....	Rungs shall be 1-1/8 inch minimum diameter with at least 7/8 inch in diameter tenons, and the maximum spacing shall be 12 inches to center.				
Tie rods:					
Number (minimum) ...	3	4	4	5	6
Diameter (minimum)	¼ inch	¼ inch	¼ inch	¼ inch	¼ inch
Flooring, minimum finished size .....	½ X 2¾ in.	½ X 2¾ in.	½ X 2¾ in.	½ X 2¾ in.	½ X 2¾ in.

**(4) Plank-Type Platforms.** Plank-type platforms shall be composed of not less than nominal 2 X 8 inch unspliced planks, connected together on the underside with cleats at intervals not exceeding 4 feet, starting 6 inches from each end. A bar or other effective means shall be securely fastened to the platform at each end to prevent the platform from slipping off the hanger. The span between hangers for plank-type platforms shall not exceed 10 feet.

**(5) Beam-Type Platforms.** Beam platforms shall have side stringers of lumber not less than 2 X 6 inches set on edge. The span between hangers shall not exceed 12 feet when beam platforms are used. The flooring shall be supported on 2 X 6 inch cross beams, laid flat and set into the upper edge of the stringers with a snug fit, at intervals of not more than 4 feet, securely nailed to the cross beams. Floorboards shall not be spaced more than 1/2 inch apart.

(q)

**(1) Multi-point adjustable suspension scaffolds and stonemasons' multi-point adjustable suspension scaffolds.** No specific guidelines or tables are given for these scaffolds.

**(2) Masons' multi-point adjustable suspension scaffolds.** Maximum intended load – 50 lb/ft<sup>2</sup>. Each outrigger beam shall be at least a standard 7 inch, 15.3 pound steel I-beam, at least 15 feet long. Such beams shall not project more than 6 feet 6 inches beyond the bearing point. Where the overhang exceeds 6 feet 6 inches, outrigger beams shall be composed of stronger beams or multiple beams.

(r) **Catenary scaffolds.**

**(1)** Maximum intended load – 500 lbs.

# L SCAFFOLD SPECIFICATIONS

- (2) Not more than two employees shall be permitted on the scaffold at one time.
  - (3) Maximum capacity of come-along shall be 2,000 lbs.
  - (4) Vertical pickups shall be spaced not more than 50 feet apart.
  - (5) Ropes shall be equivalent in strength to at least 1/2 inch (1.3 cm) diameter improved plow steel wire rope.
- (s) **Float (ship) scaffolds.**
- (1) Maximum intended load – 750 lbs.
  - (2) Platforms shall be made of 3/4 inch plywood, equivalent in rating to American Plywood Association Grade B-B, Group I, Exterior.
  - (3) Bearers shall be made from 2 X 4 inch, or 1 X 10 inch rough lumber. They shall be free of knots and other flaws.
  - (4) Ropes shall be equivalent in strength to at least 1 inch (2.5 cm) diameter first grade manila rope.
- (t) **Interior hung scaffolds.**  
Bearers (use on edge): 2 X 10 in.  
Maximum intended load: Maximum span  
25 lb/ft.<sup>2</sup>: 10 ft.  
50 lb/ft.<sup>2</sup>: 10 ft.  
75 lb/ft.<sup>2</sup>: 7 ft.
- (u) **Needle beam scaffolds.**  
Maximum intended load: 25 lb/ft.<sup>2</sup>  
Beams: 4 X 6 in.  
Maximum platform span: 8 ft.  
Maximum beam span: 10 ft.
- (1) Ropes shall be attached to the needle beams by a scaffold hitch or an eye splice. The loose end of the rope shall be tied by a bowline knot or by a round turn and a half hitch.
  - (2) Ropes shall be equivalent in strength to at least 1 inch (2.5 cm) diameter first grade manila rope.
- (v) **Multi-level suspension scaffolds.** No additional guidelines or tables are being given for these scaffolds.
- (w) **Mobile Scaffolds.** Stability test as described in the ANSI A92 series documents, as appropriate for the type of scaffold, can be used to establish stability for the purpose of §1926.452(w)(6).

- (x) Repair bracket scaffolds.** No additional guidelines or tables are being given for these scaffolds.
- (y) Stilts.** No specific guidelines or tables are given.
- (z) Tank builder's scaffold.**
- (1)** The maximum distance between brackets to which scaffolding and guardrail supports are attached shall be no more than 10 feet 6 inches.
- (2)** Not more than three employees shall occupy a 10 feet 6 inch span of scaffold planking at any time.
- (3)** A taut wire or synthetic rope supported on the scaffold brackets shall be installed at the scaffold plank level between the innermost edge of the scaffold platform and the curved plate structure of the tank shell to serve as a safety line in lieu of an inner guardrail assembly where the space between the scaffold platform and the tank exceeds 12 inches (30.48 cm). In the event the open space on either side of the rope exceeds 12 inches (30.48 cm), a second wire or synthetic rope appropriately placed, or guardrails in accordance with §1926.451(e)(4), shall be installed in order to reduce that open space to less than 12 inches (30.48 cm).
- (4)** Scaffold planks of rough full-dimensioned 2-inch (5.1 cm) X 12-inch (30.5 cm) Douglas Fir or Southern Yellow Pine of Select Structural Grade shall be used. Douglas Fir planks shall have a fiber stress of at least 1900 lb/in<sup>2</sup> (130,929 n/cm<sup>2</sup>) and a modulus of elasticity of at least 1,900,000 lb/in<sup>2</sup> (130,929,000 n/cm<sup>2</sup>), while Yellow Pine planks shall have a fiber stress of at least 2500 lb/in<sup>2</sup> (172,275 n/cm<sup>2</sup>) and a modulus of elasticity of at least 2,000,000 lb/in<sup>2</sup> (137,820,000 n/cm<sup>2</sup>).
- (5)** Guardrails shall be constructed of a taut wire or synthetic rope, and shall be supported by angle irons attached to brackets welded to the steel plates. These guardrails shall comply with §1926.451(e)(4). Guardrail supports shall be located at no greater than 10 feet 6 inch intervals.

# LIST OF TRAINING TOPICS FOR SCAFFOLD ERECTORS & L DISMANTLERS

---

## **Non-Mandatory Appendix D to Subpart L – List of Training Topics for Scaffold Erectors and Dismantlers**

This Appendix D is provided to serve as a guide to assist employers when evaluating the training needs of employees erecting or dismantling supported scaffolds.

The Agency believes that employees erecting or dismantling scaffolds should be trained in the following topics:

- General Overview of Scaffolding
  - regulations and standards
  - erection/dismantling planning
  - PPE and proper procedures
  - fall protection
  - materials handling
  - access
  - working platforms
  - foundations
  - guys, ties and braces
  
- Tubular Welded Frame Scaffolds
  - specific regulations and standards
  - components
  - parts inspection
  - erection/dismantling planning
  - guys, ties and braces
  - fall protection
  - general safety
  - access and platforms
  - erection/dismantling procedures
  - rolling scaffold assembly
  - putlogs

# L LIST OF TRAINING TOPICS FOR SCAFFOLD ERECTORS & DISMANTLERS

---

- Tube and Clamp Scaffolds
  - specific regulations and standards
  - components
  - parts inspection
  - erection/dismantling planning
  - guys, ties and braces
  - fall protection
  - general safety
  - access and platforms
  - erection/dismantling procedures
  - buttresses, cantilevers, & bridges
  
- System Scaffolds
  - specific regulations and standards
  - components
  - parts inspection
  - erection/dismantling planning
  - guys, ties and braces
  - fall protection
  - general safety
  - access and platforms
  - erection/dismantling procedures
  - buttresses, cantilevers, & bridges

Scaffold erectors and dismantlers should all receive the general overview, and, in addition, specific training for the type of supported scaffold being erected or dismantled.

## Non-Mandatory Appendix E to Subpart L – Drawings and Illustrations

This Appendix provides drawings of particular types of scaffolds and scaffold components, and graphic illustrations of bracing patterns and tie spacing patterns.

This Appendix is intended to provide visual guidance to assist the user in complying with the requirements of subpart L, part 1926.

Oregon Administrative Rules  
Chapter 437

Division 3  
Construction

---

# Fall Protection

Subdivision

# M

AO 2-2016

The Oregon Department of Consumer and Business Services adopted these rules pursuant to ORS 654.025(2).

The Secretary of State designated OAR Chapter 437 as the "Oregon Occupational Safety and Health Code." Six general subject areas within this code are designated as "Divisions."

- **Division 1** General Administrative Rules
- **Division 2** General Occupational Safety and Health Rules
- **Division 3** Construction
- **Division 4** Agriculture
- **Division 5** Maritime Activities
- **Division 7** Forest Activities
- **Oregon Revised Statutes (ORS) 654** The Oregon Safe Employment Act (OSEAct)

Oregon-initiated rules in this division of the Oregon Occupational Safety and Health Code are numbered in a uniform system developed by the Secretary of State. This system does not number the rules in sequence (001, 002, 003, etc.). Omitted numbers may be assigned to new rules at the time of their adoption.

**Oregon-initiated rules** are arranged in the following Basic Codification Structure adopted by the Secretary of State for Oregon Administrative Rules (OAR):

Chapter	Division	Rule	Section	Subsection	Paragraphs
<i>437</i>	<i>003</i>	<i>1760</i>	<i>(1)</i>	<i>(a)</i>	<i>(A)(i)(I)</i>

The majority of Oregon OSHA rules are adopted by reference from the Code of Federal Regulations (CFR), and are arranged in the following basic federal numbering system:

Chapter	Division	Part	Subpart (Subdivision)	Section	Paragraphs
437	003	1926	M	.502	(a)

The terms "subdivision" and "subpart" are synonymous within OAR 437, Oregon Occupational Safety and Health Code.

---

To obtain an order form or copies of these codes, address:

**Department of Consumer & Business Services**  
**Oregon Occupational Safety & Health Division (Oregon OSHA)**  
350 Winter St. NE, 3<sup>rd</sup> Floor  
Salem, OR 97301-3882

Or call the Oregon OSHA Resource Library at 503-378-3272

The rules referenced in this division are available for viewing in the Office of the Secretary of State, Administrative Rules and Office Document Section, Oregon State Archives Building, Salem, Oregon 97310, or the Central Office, Oregon Occupational Safety and Health Division of the Department of Consumer and Business Services, 350 Winter St. NE, Salem, OR 97301-3882. **437-003-0001 Adoption by Reference**

*In addition to, and not in lieu of, any other safety and health codes contained in OAR Chapter 437, the Department adopts by reference the following federal regulations printed as part of the Code of Federal Regulations, in the Federal Register:*

(13) Subdivision M – Fall Protection.

(a) 29 CFR 1926.500 Scope, application, and definitions applicable to this subpart, published 4/11/14, FR vol. 79, no. 70, p. 20316; amended with AO 1-2017, f. 3/1/16, ef. 1/1/17.

(b) 29 CFR 1926.501 Duty to have fall protection, repealed with AO 1-2016, f. 3j/1/16, ef. 1/1/17. In Oregon 437-003-1501 applies.

(c) 29 CFR 1926.502 Fall protection systems criteria and practices, published 8/9/94, FR vol. 59, no. 152, p. 40733-40738; amended with AO 6-2002, f. and ef. 7/19/02.

(d) 29 CFR 1926.503 Training requirements. REPEALED with AO 6-2002, f. and ef. 7/19/02, in Oregon 437-003-0503 applies..

(e) Appendix A to Subpart M Determining Roof Widths, published 8/9/94, FR vol. 59, no. 152, p. 40738-40742.

(f) Appendix B to Subpart M Guardrail Systems, published 8/9/94, FR vol. 59, no. 152, p. 40743.

**Authority:** 40 U.S.C. 3701 et seq.; 29 U.S.C. 653, 655, 657; Secretary of Labor's Orders Nos. 1-90 (55 FR 9033), 6-96 (62 FR 111); 3-2000 (65 FR 50017), 5-2007 (72 FR 31159), or 1-2012 (77 FR 3912), as applicable; and 29 CFR Part 1911.

## 1926.500 Scope, Application, and Definitions Applicable to this Subpart

### (a) Scope and application.

- (1) This subpart sets forth requirements and criteria for fall protection in construction workplaces covered under 29 CFR Part 1926.

Exception: The provisions of this subpart do not apply when employees are making an inspection, investigation, or assessment of workplace conditions prior to the actual start of construction work or after all construction work has been completed.

- (2) *OAR 437-003-1501* sets forth those workplaces, conditions, operations, and circumstances for which fall protection shall be provided except as follows:
- (i) Requirements relating to fall protection for employees working on scaffolds are provided in subpart L of this part.
  - (ii) Requirements relating to fall protection for employees working on cranes and derricks are provided in subpart CC of this part.
  - (iii) Requirements relating to fall protection for employees performing steel erection work in buildings are provided in subpart R of this part.
  - (iv) Requirements relating to fall protection for employees working on certain types of equipment used in tunneling operations are provided in subpart S of this part.  
  
Note: 1926.500(a)(2)(v) was not adopted because fall protection requirements for the erection of tanks and communication and broadcast towers are provided in 1926.500 - .503.
  - (vi) *Division 2/RR Electrical Power Generation, Transmission, and Distribution* provides requirements relating to fall protection for employees working from aerial lifts or on poles, towers, or similar structures while engaged in the construction of electric transmission or distribution lines or equipment.
  - (vii) Requirements relating to fall protection for employees working on stairways and ladders are provided in subpart X of this part.

- (3) Sections 1926.502, *OARs 437-003-0502, 437-003-1502, and 437-003-2502* set forth the requirements for the installation, construction, and proper use of fall protection required by Part 1926, except as follows:
- (i) Performance requirements for guardrail systems used on scaffolds and performance requirements for falling object protection used on scaffolds are provided in subpart L of this part.
  - (ii) Performance requirements for stairways, stairrail systems, and handrails are provided in subpart X of this part.
  - (iii) Additional performance requirements for fall arrest and work-positioning equipment are provided in *Division 2/RR Electrical Power Generation, Transmission, and Distribution*.
- Note: 1926.500(a)(3)(iv) was not adopted because 1926.502 does apply to the erection of tanks and communication and broadcast towers.
- (v) Criteria for steps, handholds, ladders, and grabrails/guardrails/railings required by subpart CC are provided in subpart CC. Sections 1926.502(a), (c) through (e), and (i) apply to activities covered under subpart CC unless otherwise stated in subpart CC. No other paragraphs of § 1926.502 apply to subpart CC.
- (4) Section 1926.503 sets forth requirements for training in the installation and use of fall protection systems, except in relation to steel erection activities and the use of equipment covered by subpart CC.

(b) Definitions.

**Anchorage** means a secure point of attachment for lifelines, lanyards or deceleration devices.

#### ***437-003-1500 Additional Definitions***

(1) ***Body belt*** means a Type 1 safety belt used in conjunction with lanyard or lifeline for fall restraint only.

**Body harness** means straps which may be secured about the employee in a manner that will distribute the fall arrest forces over at least the thighs, pelvis, waist, chest and shoulders with means for attaching it to other components of a personal fall arrest system.

**Buckle** means any device for holding the body belt or body harness closed around the employee's body.

**Competent person** means one who is capable of identifying existing and predictable hazards in the surroundings or working conditions which are unsanitary, hazardous, or dangerous to employees, and who has authorization to take prompt corrective measures to eliminate them.

Note: For the ease of the reader, this definition is reprinted here from 1926.32.

**Connector** means a device which is used to couple (connect) parts of the personal fall arrest system and positioning device systems together. It may be an independent component of the system, such as a carabiner, or it may be an integral component of part of the system (such as a buckle or dee-ring sewn into a body belt or body harness, or a snap-hook spliced or sewn to a lanyard or self-retracting lanyard).

**Dangerous equipment** means equipment (such as pickling or galvanizing tanks, degreasing units, machinery, electrical equipment, and other units) which, as a result of form or function, may be hazardous to employees who fall onto or into such equipment.

**Deceleration device** means any mechanism, such as a rope grab, rip-stitch lanyard, specifically-woven lanyard, tearing or deforming lanyards, automatic self-retracting lifelines/lanyards, etc., which serves to dissipate a substantial amount of energy during a fall arrest, or otherwise limit the energy imposed on an employee during fall arrest.

**Deceleration distance** means the additional vertical distance a falling employee travels, excluding lifeline elongation and free fall distance, before stopping, from the point at which the deceleration device begins to operate. It is measured as the distance between the location of an employee's body belt or body harness attachment point at the moment of activation (at the onset of fall arrest forces) of the deceleration device during a fall, and the location of that attachment point after the employee comes to a full stop.

**Equivalent** means alternative designs, materials, or methods to protect against a hazard which the employer can demonstrate will provide an equal or greater degree of safety for employees than the methods, materials or designs specified in the standard.

**Failure** means load refusal, breakage, or separation of component parts. Load refusal is the point where the ultimate strength is exceeded.

*437-003-1500(2) **Fall protection system** means personal fall arrest system, personal fall restraint system, positioning device system, guardrail system, safety net system, warning line system, or safety monitoring system.*

**Free fall** means the act of falling before a personal fall arrest system begins to apply force to arrest the fall.

**Free fall distance** means the vertical displacement of the fall arrest attachment point on the employee's body belt or body harness between onset of the fall and just before the system begins to apply force to arrest the fall. This distance excludes deceleration distance, and lifeline/lanyard elongation, but includes any deceleration device slide distance or self-retracting lifeline/lanyard extension before they operate and fall arrest forces occur.

**Guardrail system** means a barrier erected to prevent employees from falling to lower levels.

**Hole** means a gap or void 2 inches (5.1 cm) or more in its least dimension, in a floor, roof, or other walking/working surface.

**Infeasible** means that it is impossible to perform the construction work using a conventional fall protection system (i.e., guardrail system, safety net system, or personal fall arrest system) or that it is technologically impossible to use any one of these systems to provide fall protection.

**Lanyard** means a flexible line of rope, wire rope, or strap which generally has a connector at each end for connecting the body belt or body harness to a deceleration device, lifeline, or anchorage.

**Leading edge** means the edge of a floor, roof, or formwork for a floor or other walking/working surface (such as the deck) which changes location as additional floor, roof, decking, or formwork sections are placed, formed, or constructed. A leading edge is considered to be an "unprotected side and edge" during periods when it is not actively and continuously under construction.

**Lifeline** means a component consisting of a flexible line for connection to an anchorage at one end to hang vertically (vertical lifeline), or for connection to anchorages at both ends to stretch horizontally (horizontal lifeline), and which serves as a means for connecting other components of a personal fall arrest system to the anchorage.

**Lower levels** means those areas or surfaces to which an employee can fall. Such areas or surfaces include, but are not limited to, ground levels, floors, platforms, ramps, runways, excavations, pits, tanks, material, water, equipment, structures, or portions thereof.

**Mechanical equipment** means all motor or human propelled wheeled equipment used for roofing work, except wheelbarrows and mopcars.

**Opening** means a gap or void 30 inches (76 cm) or more high and 18 inches (48 cm) or more wide, in a wall or partition, through which employees can fall to a lower level.

Note: Overhand bricklaying from scaffolds is addressed in Subdivision L.

**Personal fall arrest system** means a system used to arrest an employee in a fall from a working level. It consists of an anchorage, connectors, a body belt or body harness and may include a lanyard, deceleration device, lifeline, or suitable combinations of these. As of January 1, 1998, the use of a body belt for fall arrest is prohibited.

*437-003-1500(3) **Personal fall restraint system** means a fall protection system that prevents the user from falling any distance. The system is comprised of either a body belt or body harness, along with an anchorage, connectors and other necessary equipment. The other components typically include a lanyard, and may also include a lifeline and other devices.*

**Positioning device system** means a body belt or body harness system rigged to allow an employee to be supported on an elevated vertical surface, such as a wall, and work with both hands free while leaning.

**Qualified person** means one who, by possession of a recognized degree, certificate or professional standing, or who by extensive knowledge, training and experience, has successfully demonstrated his/her ability to solve or resolve problems relating to the subject matter, the work or the project.

Note: For the ease of the reader, this definition is reprinted here from 1926.32.

*437-003-1500(4) **Rake edge** means the inclined roof edges, such as those on the gable end of a building.*

**Rope grab** means a deceleration device which travels on a lifeline and automatically, by friction, engages the lifeline and locks so as to arrest the fall of an employee. A rope grab usually employs the principle of inertial locking, cam/level locking, or both.

**Roof** means the exterior surface on the top of a building. This does not include floors or formwork which, because a building has not been completed, temporarily become the top surface of a building.

*437-003-1500(5) **Roofing work** means the hoisting, storage, application, and removal of roofing materials and equipment, including related insulation, sheet metal, and vapor barrier work, but not including the construction of the roof deck and leading edge work.*

**Safety-monitoring system** means a safety system in which a competent person is responsible for recognizing and warning employees of fall hazards.

**Self-retracting lifeline/lanyard** means a deceleration device containing a drum-wound line which can be slowly extracted from, or retracted onto, the drum under slight tension during normal employee movement, and which, after onset of a fall, automatically locks the drum and arrests the fall.

**Snaphook** means a connector comprised of a hook-shaped member with a normally closed keeper, or similar arrangement, which may be opened to permit the hook to receive an object and, when released, automatically closes to retain the object. Snaphooks are generally one of two types:

- (1) The locking type with a self-closing, self-locking keeper which remains closed and locked until unlocked and pressed open for connection or disconnection; or
- (2) The non-locking type with a self-closing keeper which remains closed until pressed open for connection or disconnection. As of January 1, 1998, the use of a non-locking snaphook as part of personal fall arrest systems and positioning device systems is prohibited.

**Toeboard** means a low protective barrier that will prevent the fall of materials and equipment to lower levels and provide protection from falls for personnel.

**Unprotected sides and edges** means any side or edge (except at entrances to points of access) of a walking/working surface, e.g., floor, roof, ramp, or runway where there is no wall or guardrail system at least 39 inches (1.0 m) high.

*437-003-1500(6) **Walking/working surface** means any surface, whether horizontal or vertical on which an employee walks or works, including, but not limited to, floors, roofs, ramps, bridges, runways, formwork, beams, columns, trusses and concrete reinforcing steel but not ladders, vehicles, or trailers, on which employees must be located in order to perform their job duties.*

**Stat. Auth.:** ORS 654.025(2) and 656.726(4).

**Stats. Implemented:** ORS 654.001 through 654.295.

**Hist:** OR-OSHA Admin. Order 6-2002, f. 7/19/02, ef. 7/19/02.

OR-OSHA Admin. Order 2-2016, f. 3/1/16, ef. 10/1/17.

**Warning line system** means a barrier erected on a roof to warn employees that they are approaching an unprotected roof side or edge, and which designates an area in which roofing work may take place without the use of guardrail, body belt, or safety net systems to protect employees in the area.

**Work area** means that portion of a walking/working surface where job duties are being performed.

**Stat. Auth.:** ORS 654.025(2) and 656.726(4).

**Stats. Implemented:** ORS 654.001 through 654.295.

**Hist:** APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89.

OR-OSHA Admin. Order 6-1991, f. 3/18/91, ef. 4/15/91.

OR-OSHA Admin. Order 6-1995, f. 4/18/95, ef. 6/1/95.

OR-OSHA Admin. Order 3-2002, f. 4/15/02, ef. 4/18/02.

OR-OSHA Admin. Order 6-2002, f. 7/19/02, ef. 7/19/02.

OR-OSHA Admin. Order 1-2011, f. 2/9/11, ef. 2/9/11.

OR-OSHA Admin. Order 3-2015, f. 10/9/15, ef. 1/1/16.

OR-OSHA Admin. Order 1-2016, f. 3/1/16, ef. 1/1/17.

Note: 1926.501(a) and (b) were repealed, in Oregon, 437-003-1501 Fall Protection applies.

Note: 1926.501(c) was repealed, in Oregon 437-003-2501 Protection From Falling Objects applies.

### **437-003-1501 Fall Protection**

- (1) General. Except where permitted by another standard, when employees are exposed to a hazard of falling 6 feet or more to a lower level, the employer must ensure that fall protection systems are provided, installed, and implemented according to the criteria in 1926.502, 437-003-0502, 437-003-1502, and 437-003-2502.*
- (2) Walking/working surfaces. The employer must determine if the walking/working surfaces on which its employees are to work have the strength and structural integrity to safely support employees. Employees may work on those surfaces only when the surfaces have the requisite strength and structural integrity.*
- (3) Holes. Regardless of height, each employee on a walking/working surface must be protected from tripping in or stepping into or through holes (including skylights) by covers, or equivalent.*

Note: Smoke domes or skylight fixtures are not considered covers for the purpose of this section unless they meet the strength requirements of 1926.502(i).

- (4) Wall openings. Each employee working on, at, above, or near wall openings (including those with chutes attached) where the inside bottom edge of the wall opening is less than 39 inches above the walking/working surface and the outside bottom edge of the wall opening is 6 feet or more above lower levels, must be protected from falling by the use of guardrail systems, safety net systems, personal fall arrest systems, or personal fall restraint systems.*
- (5) Excavations.*
  - (a) Employers must use guardrail systems, fences, or barricades to protect any employee who might approach the edge of an excavation, when the excavation is 6 feet or more in depth and is not readily seen because of plant growth or other visual barrier.*
  - (b) Employers must use guardrail systems, fences, barricades, or covers to protect any employee who might approach the edge of a well, pit, shaft, or other similar excavation, when the excavation is 6 feet or more in depth.*

*(6) Dangerous equipment. In addition to the fall protection requirements under 437-003-1501(1), each employee working less than 6 feet above dangerous equipment must be protected from falls into or onto dangerous equipment by guardrail systems or equipment guards.*

**Stat. Auth.:** ORS 654.025(2) and 656.726(4).

**Stats. Implemented:** ORS 654.001 through 654.295.

**Hist:** OR-OSHA Admin. Order 6-2002, f. 7/19/02, ef. 7/19/02.  
OR-OSHA Admin. Order 1-2016, f. 3/1/16, ef. 1/1/17.

### **437-003-2501 Protection From Falling Objects**

*(1) General. Except as otherwise provided in paragraph (2) of this section, when employees are exposed to falling objects, the employer must have each employee wear a hard hat and must implement one of the following measures in accordance with the criteria in 1926.502(j):*

*(a) Erect toeboards, screens, or guardrail systems to prevent objects from falling from higher levels; or,*

*(b) Erect a canopy structure and keep potential fall objects far enough from the edge of the higher level so that those objects would not go over the edge if they were accidentally displaced; or,*

*(c) Barricade the area to which objects could fall, prohibit employees from entering the barricaded area, and keep objects that may fall far enough away from the edge of a higher level so that those objects would not go over the edge if they were accidentally displaced.*

*(2) Holes. Employees working below walking/working surface holes (including skylights) must be protected from objects falling through by covers meeting the criteria in 1926.502(i), or equivalent.*

**Stat. Auth.:** ORS 654.025(2) and 656.726(4).

**Stats Implemented:** ORS 654.001 through 654.295.

**Hist:** OR-OSHA Admin. Order 1-2016, f. 3/1/16, ef. 1/1/17.

**1926.502 Fall Protection Systems Criteria and Practices****(a) General.**

- (1) Fall protection systems required by this part shall comply with the applicable provisions of this section.
- (2) Employers shall provide and install all fall protection systems required by this subpart for an employee, and shall comply with all other pertinent requirements of this subpart before that employee begins the work that necessitates the fall protection.

**(b) Guardrail systems. Guardrail systems and their use shall comply with the following provisions:**

- (1) Top edge height of top rails, or equivalent guardrail system members, shall be 42 inches (1.1 m) plus or minus 3 inches (8 cm) above the walking/working level. When conditions warrant, the height of the top edge may exceed the 45-inch height, provided the guardrail system meets all other criteria of this paragraph.

Note: When employees are using stilts, the top edge height of the top rail, or equivalent member, shall be increased an amount equal to the height of the stilts.

- (2) Midrails, screens, mesh, intermediate vertical members, or equivalent intermediate structural members shall be installed between the top edge of the guardrail system and the walking/working surface when there is no wall or parapet wall at least 21 inches (53 cm) high.
  - (i) Midrails, when used, shall be installed at a height midway between the top edge of the guardrail system and the walking/working level.
  - (ii) Screens and mesh, when used, shall extend from the top rail to the walking/ working level and along the entire opening between top rail supports.
  - (iii) Intermediate members (such as balusters), when used between posts, shall be not more than 19 inches (48 cm) apart.
  - (iv) Other structural members (such as additional midrails and architectural panels) shall be installed such that there are no openings in the guardrail system that are more than 19 inches (.5 m) wide.

- (3) Guardrail systems shall be capable of withstanding, without failure, a force of at least 200 pounds (890 N) applied within 2 inches (5.1 cm) of the top edge, in any outward or downward direction, at any point along the top edge.
- (4) When the 200 pound (890 N) test load specified in paragraph (b)(3) of this section is applied in a downward direction, the top edge of the guardrail shall not deflect to a height less than 39 inches (1.0 m) above the walking/working level. Guardrail system components selected and constructed in accordance with the Appendix B to subpart M of this part will be deemed to meet this requirement.
- (5) Midrails, screens, mesh, intermediate vertical members, solid panels, and equivalent structural members shall be capable of withstanding, without failure, a force of at least 150 pounds (666 N) applied in any downward or outward direction at any point along the midrail or other member.
- (6) Guardrail systems shall be so surfaced as to prevent injury to an employee from punctures or lacerations, and to prevent snagging of clothing.
- (7) The ends of all top rails and midrails shall not overhang the terminal posts, except where such overhang does not constitute a projection hazard.
- (8) Steel banding and plastic banding shall not be used as top rails or midrails.
- (9) Top rails and midrails shall be at least one-quarter inch (0.6 cm) nominal diameter or thickness to prevent cuts and lacerations. If wire rope is used for top rails, it shall be flagged at not more than 6-foot intervals with high-visibility material.
- (10) When guardrail systems are used at hoisting areas, a chain, gate or removable guardrail section shall be placed across the access opening between guardrail sections when hoisting operations are not taking place.
- (11) When guardrail systems are used at holes, they shall be erected on all unprotected sides or edges of the hole.
- (12) When guardrail systems are used around holes used for the passage of materials, the hole shall have not more than two sides provided with removable guardrail sections to allow the passage of materials. When the hole is not in use, it shall be closed over with a cover, or a guardrail system shall be provided along all unprotected sides or edges.

- (13) When guardrail systems are used around holes which are used as points of access (such as ladderways), they shall be provided with a gate, or be so offset that a person cannot walk directly into the hole.
- (14) Guardrail systems used on ramps and runways shall be erected along each unprotected side or edge.
- (15) Manila, plastic or synthetic rope being used for top rails or midrails shall be inspected as frequently as necessary to ensure that it continues to meet the strength requirements of paragraph (b)(3) of this section.
- (c) Safety net systems. Safety net systems and their use shall comply with the following provisions:
- (1) Safety nets shall be installed as close as practicable under the walking/working surface on which employees are working, but in no case more than 30 feet (9.1 m) below such level. When nets are used on bridges, the potential fall area from the walking/working surface to the net shall be unobstructed.
- (2) Safety nets shall extend outward from the outermost projection of the work surface as follows:

Table 1 - Safety net systems

Vertical distance from working level to horizontal plane of net	Minimum required horizontal distance of outer edge of net from the edge of the working surface
Up to 5 feet	8 feet
More than 5 feet up to 10 feet	10 feet
More than 10 feet	13 feet

- (3) Safety nets shall be installed with sufficient clearance under them to prevent contact with the surface or structures below when subjected to an impact force equal to the drop test specified in paragraph (c)(4) of this section.
- (4) Safety nets and their installations shall be capable of absorbing an impact force equal to that produced by the drop test specified in paragraph (c)(4)(i) of this section.

- (i) Except as provided in paragraph (c)(4)(ii) of this section, safety nets and safety net installations shall be drop-tested at the jobsite after initial installation and before being used as a fall protection system, whenever relocated, after major repair, and at 6-month intervals if left in one place. The drop-test shall consist of a 400 pound (180 kg) bag of sand  $30 \pm 2$  inches ( $76 \pm 5$  cm) in diameter dropped into the net from the highest walking/working surface at which employees are exposed to fall hazards, but not from less than 42 inches (1.1 m) above that level.
  - (ii) When the employer can demonstrate that it is unreasonable to perform the drop-test required by paragraph (c)(4)(i) of this section, the employer (or a designated competent person) shall certify that the net and net installation is in compliance with the provisions of paragraphs (c)(3) and (c)(4)(i) of this section by preparing a certification record prior to the net being used as a fall protection system. The certification record must include an identification of the net and net installation for which the certification record is being prepared; the date that it was determined that the identified net and net installation were in compliance with paragraph (c)(3) of this section and the signature of the person making the determination and certification. The most recent certification record for each net and net installation shall be available at the jobsite for inspection.
- (5) Defective nets shall not be used. Safety nets shall be inspected at least once a week for wear, damage, and other deterioration. Defective components shall be removed from service. Safety nets shall also be inspected after any occurrence which could affect the integrity of the safety net system.
  - (6) Materials, scrap pieces, equipment, and tools which have fallen into the safety net shall be removed as soon as possible from the net and at least before the next work shift.
  - (7) The maximum size of each safety net mesh opening shall not exceed 36 square inches (230 cm<sup>2</sup>) nor be longer than 6 inches (15 cm) on any side, and the opening, measured center-to-center of mesh ropes or webbing, shall not be longer than 6 inches (15 cm). All mesh crossings shall be secured to prevent enlargement of the mesh opening.
  - (8) Each safety net (or section of it) shall have a border rope for webbing with a minimum breaking strength of 5,000 pounds (22.2 kN).

- (9) Connections between safety net panels shall be as strong as integral net components and shall be spaced not more than 6 inches (15 cm) apart.
- (d) Personal fall arrest systems. Personal fall arrest systems and their use shall comply with the provisions set forth below. Effective January 1, 1998, body belts are not acceptable as part of a personal fall arrest system.

Note: The use of a body belt in a positioning device system is acceptable and is regulated under paragraph (e) of this section.

- (1) Connectors shall be drop forged, pressed or formed steel, or made of equivalent materials.
- (2) Connectors shall have a corrosion-resistant finish, and all surfaces and edges shall be smooth to prevent damage to interfacing parts of the system.
- (3) Dee-rings and snaphooks shall have a minimum tensile strength of 5,000 pounds (22.2 kN).
- (4) Dee-rings and snaphooks shall be proof-tested to a minimum tensile load of 3,600 pounds (16 kN) without cracking, breaking, or taking permanent deformation.
- (5) Snaphooks shall be sized to be compatible with the member to which they are connected to prevent unintentional disengagement of the snaphook by depression of the snaphook keeper by the connected member, or shall be a locking type snaphook designed and used to prevent disengagement of the snaphook by the contact of the snaphook keeper by the connected member. Effective January 1, 1998, only locking type snaphooks shall be used.
- (6) Unless the snaphook is a locking type and designed for the following connections, snaphooks shall not be engaged:
  - (i) directly to webbing, rope or wire rope;
  - (ii) to each other;
  - (iii) to a dee-ring to which another snaphook or other connector is attached;
  - (iv) to a horizontal lifeline; or

- (v) to any object which is incompatibly shaped or dimensioned in relation to the snaphook such that unintentional disengagement could occur by the connected object being able to depress the snaphook keeper and release itself.
- (7) On suspended scaffolds or similar work platforms with horizontal lifelines which may become vertical lifelines, the devices used to connect to a horizontal lifeline shall be capable of locking in both directions on the lifeline.
- (8) Horizontal lifelines shall be designed, installed, and used, under the supervision of a qualified person, as part of a complete personal fall arrest system, which maintains a safety factor of at least two.
- (9) Lanyards and vertical lifelines shall have a minimum breaking strength of 5,000 pounds (22.2 kN).
- (10)
  - (i) Except as provided in paragraph (d)(10)(ii) of this section, when vertical lifelines are used, each employee shall be attached to a separate lifeline.
  - (ii) During the construction of elevator shafts, two employees may be attached to the same lifeline in the hoistway, provided both employees are working atop a false car that is equipped with guardrails; the strength of the lifeline is 10,000 pounds [5,000 pounds per employee attached] (44.4 kN); and all other criteria specified in this paragraph for lifelines have been met.
- (11) Lifelines shall be protected against being cut or abraded.
- (12) Self-retracting lifelines and lanyards which automatically limit free fall distance to 2 feet (0.61 m) or less shall be capable of sustaining a minimum tensile load of 3,000 pounds (13.3 kN) applied to the device with the lifeline or lanyard in the fully extended position.
- (13) Self-retracting lifelines and lanyards which do not limit free fall distance to 2 feet (0.61 m) or less, ripstitch lanyards, and tearing and deforming lanyards shall be capable of sustaining a minimum tensile load of 5,000 pounds (22.2 kN) applied to the device with the lifeline or lanyard in the fully extended position.

- (14) Ropes and straps (webbing) used in lanyards, lifelines, and strength components of body belts and body harnesses shall be made from synthetic fibers.
- (15) Anchorages used for attachment of personal fall arrest equipment shall be independent of any anchorage being used to support or suspend platforms and capable of supporting at least 5,000 pounds (22.2 kN) per employee attached, or shall be designed, installed, and used as follows:
- (i) as part of a complete personal fall arrest system which maintains a safety factor of at least two; and
  - (ii) under the supervision of a qualified person.
- (16) Personal fall arrest systems, when stopping a fall, shall:
- (i) limit maximum arresting force on an employee to 900 pounds (4 kN) when used with a body belt;  
(Note: body belts not allowed after January 1, 1998.)
  - (ii) limit maximum arresting force on an employee to 1,800 pounds (8 kN) when used with a body harness;
  - (iii) be rigged such that an employee can neither free fall more than 6 feet (1.8 m), nor contact any lower level;
  - (iv) bring an employee to a complete stop and limit maximum deceleration distance an employee travels to 3.5 feet (1.07 m); and,
  - (v) have sufficient strength to withstand twice the potential impact energy of an employee free falling a distance of 6 feet (1.8 m), or the free fall distance permitted by the system, whichever is less.

Note: If the personal fall arrest system meets the criteria and protocols contained in Appendix C to subpart M, and if the system is being used by an employee having a combined person and tool weight of less than 310 pounds (140 kg), the system will be considered to be in compliance with the provisions of paragraph (d)(16) of this section. If the system is used by an employee having a combined tool and body weight of 310 pounds (140 kg) or more, then the employer must appropriately modify the criteria and protocols of the Appendix to provide proper protection for such heavier weights, or the system will not be deemed to be in compliance with the requirements of paragraph (d)(16) of this section.

- (17) The attachment point of the body belt shall be located in the center of the wearer's back. The attachment point of the body harness shall be located in the center of the wearer's back near shoulder level, or above the wearer's head.

- (18) Body belts, harnesses, and components shall be used only for employee protection (as part of a personal fall arrest system or positioning device system) and not to hoist materials.
- (19) Personal fall arrest systems and components subjected to impact loading shall be immediately removed from service and shall not be used again for employee protection until inspected and determined by a competent person to be undamaged and suitable for reuse.
- (20) The employer shall provide for prompt rescue of employees in the event of a fall or shall assure that employees are able to rescue themselves.
- (21) Personal fall arrest systems shall be inspected prior to each use for wear, damage and other deterioration, and defective components shall be removed from service.
- (22) Body belts shall be at least one and five-eighths (1 5/8) inches (4.1 cm) wide.
- (23) Personal fall arrest systems shall not be attached to guardrail systems, nor shall they be attached to hoists except as specified in other subparts of this Part.
- (24) When a personal fall arrest system is used at hoist areas, it shall be rigged to allow the movement of the employee only as far as the edge of the walking/working surface.

### **437-003-0502 Personal Fall Restraint**

*Fall restraint systems and their use shall conform to the following provisions:*

- (1) Personal fall restraint systems shall be rigged to prevent the user from falling any distance.*
- (2) Fall restraint systems must use fall arrest system components that conform to the criteria in 1926.502, except as otherwise provided for in this section.*

*Exception: A body belt may be used in fall restraint systems.*

- (3) The attachment point to the body belt or full body harness may be at the back, front or side dee-rings.*
- (4) Anchorages used for attachment of personal fall restraint equipment shall be independent of any anchorage being used to support or suspend platforms and shall be capable of supporting 3000 pounds (13.3kN) per employee attached, or be designed, installed and used as follows:*

- (a) as part of a complete personal fall restraint system which maintains a safety factor of at least two; and*
- (b) under the supervision of a qualified person.*

**Stat. Auth.:** ORS 654.025(2) and 656.726(4).

**Stats. Implemented:** ORS 654.001 through 654.295.

**Hist:** OR-OSHA Admin. Order 6-2002, f. 7/19/02, ef. 7/19/02

- (e) Positioning device systems. Positioning device systems and their use shall conform to the following provisions:
- (1) Positioning devices shall be rigged such that an employee cannot free fall more than 2 feet (.9 m).
  - (2) Positioning devices shall be secured to an anchorage capable of supporting at least twice the potential impact load of an employee's fall or 3,000 pounds (13.3 kN), whichever is greater.
  - (3) Connectors shall be drop forged, pressed or formed steel, or made of equivalent materials.
  - (4) Connectors shall have a corrosion-resistant finish, and all surfaces and edges shall be smooth to prevent damage to interfacing parts of this system.
  - (5) Connecting assemblies shall have a minimum tensile strength of 5,000 pounds (22.2 kN).
  - (6) Dee-rings and snaphooks shall be proof-tested to a minimum tensile load of 3,600 pounds (16 kN) without cracking, breaking, or taking permanent deformation.
  - (7) Snaphooks shall be sized to be compatible with the member to which they are connected to prevent unintentional disengagement of the snaphook by depression of the snaphook keeper by the connected member, or shall be a locking type snaphook designed and used to prevent disengagement of the snaphook by the contact of the snaphook keeper by the connected member. As of January 1, 1998, only locking type snaphooks shall be used.
  - (8) Unless the snaphook is a locking type and designed for the following connections, snaphooks shall not be engaged:
    - (i) directly to webbing, rope or wire rope;
    - (ii) to each other;

- (iii) to a dee-ring to which another snaphook or other connector is attached;
  - (iv) to a horizontal lifeline; or
  - (v) to any object which is incompatibly shaped or dimensioned in relation to the snaphook such that unintentional disengagement could occur by the connected object being able to depress the snaphook keeper and release itself.
- (9) Positioning device systems shall be inspected prior to each use for wear, damage, and other deterioration, and defective components shall be removed from service.
- (10) Body belts, harnesses, and components shall be used only for employee protection (as part of a personal fall arrest system or positioning device system) and not to hoist materials.

#### ***437-003-1502 Warning line systems for roofing work***

- (1) *A warning line system shall not be used as fall protection on roof slopes greater than 2 in 12 (vertical to horizontal).*
- (2) *Employees performing roofing work between a roof edge and a warning line must be protected by a personal fall arrest system, personal fall restraint system, guardrail system, safety net system, or safety monitoring system.*

**Stat. Auth.:** ORS 654.025(2) and 656.726(4).

**Stats. Implemented:** ORS 654.001 through 654.295.

**Hist:** OR-OSHA Admin. Order 6-2002, f. 7/19/02, ef. 7/19/02.

- (f) Warning line systems. Warning line systems and their use shall comply with the following provisions:
- (1) The warning line shall be erected around all sides of the roof work area.
    - (i) When mechanical equipment is not being used, the warning line shall be erected not less than 6 feet (1.8 m) from the roof edge.
    - (ii) When mechanical equipment is being used, the warning line shall be erected not less than 6 feet (1.8 m) from the roof edge which is parallel to the direction of mechanical equipment operation, and not less than 10 feet (3.1 m) from the roof edge which is perpendicular to the direction of mechanical equipment operation.

- (iii) Points of access, materials handling areas, storage areas, and hoisting areas shall be connected to the work area by an access path formed by two warning lines.
  - (iv) When the path to a point of access is not in use, a rope, wire, chain, or other barricade, equivalent in strength and height to the warning line, shall be placed across the path at the point where the path intersects the warning line erected around the work area, or the path shall be offset such that a person cannot walk directly into the work area.
- (2) Warning lines shall consist of ropes, wires, or chains, and supporting stanchions erected as follows:
- (i) The rope, wire, or chain shall be flagged at not more than 6-foot (1.8 m) intervals with high-visibility material;
  - (ii) The rope, wire, or chain shall be rigged and supported in such a way that its lowest point (including sag) is no less than 34 inches (.9 m) from the walking/ working surface and its highest point is no more than 39 inches (1.0 m) from the walking/working surface;
  - (iii) After being erected, with the rope, wire, or chain attached, stanchions shall be capable of resisting, without tipping over, a force of at least 16 pounds (71 N) applied horizontally against the stanchion, 30 inches (.8 m) above the walking/ working surface, perpendicular to the warning line, and in the direction of the floor, roof, or platform edge;
  - (iv) The rope, wire, or chain shall have a minimum tensile strength of 500 pounds (2.22 kN), and after being attached to the stanchions, shall be capable of supporting, without breaking, the loads applied to the stanchions as prescribed in paragraph (f)(2)(iii) of this section; and
  - (v) The line shall be attached at each stanchion in such a way that pulling on one section of the line between stanchions will not result in slack being taken up in adjacent sections before the stanchion tips over.
- (3) No employee shall be allowed in the area between a roof edge and a warning line unless the employee is performing roofing work in that area.
- (4) Mechanical equipment on roofs shall be used or stored only in areas where employees are protected by a warning line system, guardrail system, or personal fall arrest system.

Note: 1926.502(g) and (h) were repealed. In Oregon, 437-003-2502 applies.

### **437-003-2502 Safety monitoring systems**

*Safety monitoring systems for roofing work and their use shall comply with the following provisions.*

- (1) A safety monitoring system shall not be used as a fall protection system for any work other than roofing work on roof slopes of 2 in 12 (vertical to horizontal) or less.*
- (2) The use of a safety monitoring system alone (i.e., without the warning line system) is not permitted on roofs more than 50 feet (15.25 m) in width. (see Appendix A of this subdivision)*
- (3) The employer shall designate a competent person to monitor the safety of other employees and the employer shall ensure that the safety monitor complies with the following requirements:*
  - (a) The safety monitor shall be competent to recognize fall hazards;*
  - (b) The safety monitor shall warn the employee when it appears that the employee is unaware of a fall hazard or is acting in an unsafe manner;*
  - (c) The safety monitor shall be on the same walking/working surface and within visual sighting distance of the employee being monitored;*
  - (d) The safety monitor shall be close enough to communicate orally with the employee; and*
  - (e) The safety monitor shall not have other responsibilities which could take the monitor's attention from the monitoring function.*
- (4) Mechanical equipment shall not be used or stored in areas where safety monitoring systems are being used to monitor employees engaged in roofing operations.*
- (5) No employee, other than an employee engaged in roofing work shall be allowed in an area where an employee is being protected by a safety monitoring system.*

**Stat. Auth.:** ORS 654.025(2) and 656.726(4).

**Stats. Implemented:** ORS 654.001 through 654.295.

**Hist:** OR-OSHA Admin. Order 6-2002, f. 7/19/02, ef. 7/19/02

- (i) Covers. Covers for holes in floors, roofs, and other walking/working surfaces shall meet the following requirements:*

- (1) Covers located in roadways and vehicular aisles shall be capable of supporting, without failure, at least twice the maximum axle load of the largest vehicle expected to cross over the cover.
- (2) All other covers shall be capable of supporting, without failure, at least twice the weight of employees, equipment, and materials that may be imposed on the cover at any one time.
- (3) All covers shall be secured when installed so as to prevent accidental displacement by the wind, equipment, or employees.
- (4) All covers shall be color coded or they shall be marked with the word "HOLE" or "COVER" to provide warning of the hazard.

Note: This provision does not apply to cast iron manhole covers or steel grates used on streets or roadways.

- (j) Protection from falling objects. Falling object protection shall comply with the following provisions:
- (1) Toeboards, when used as falling object protection, shall be erected along the edge of the overhead walking/working surface for a distance sufficient to protect employees below.
  - (2) Toeboards shall be capable of withstanding, without failure, a force of at least 50 pounds (222 N) applied in any downward or outward direction at any point along the toeboard.
  - (3) Toeboards shall be a minimum of 3 1/2 inches (9 cm) in vertical height from their top edge to the level of the walking/working surface. They shall have not more than 1/4 inch (0.6 cm) clearance above the walking/working surface. They shall be solid or have openings not over 1 inch (2.5 cm) in greatest dimension.
  - (4) Where tools, equipment, or materials are piled higher than the top edge of a toeboard, paneling or screening shall be erected from the walking/working surface or toeboard to the top of a guardrail system's top rail or midrail, for a distance sufficient to protect employees below.
  - (5) Guardrail systems, when used as falling object protection, shall have all openings small enough to prevent passage of potential falling objects.
  - (6) During the performance of overhand bricklaying and related work:
    - (i) No materials or equipment except masonry and mortar shall be stored within 4 feet (1.2 m) of the working edge.

(ii) Excess mortar, broken or scattered masonry units, and all other materials and debris shall be kept clear from the work area by removal at regular intervals.

(7) During the performance of roofing work:

(i) Materials and equipment shall not be stored within 6 feet (1.8 m) of a roof edge unless guardrails are erected at the edge.

(ii) Materials which are piled, grouped, or stacked near a roof edge shall be stable and self-supporting.

(8) Canopies, when used as falling object protection, shall be strong enough to prevent collapse and to prevent penetration by any objects which may fall onto the canopy.

**Stat. Auth.:** ORS 654.025(2) and 656.726(4).

**Stats. Implemented:** ORS 654.001 through 654.295.

**Hist:** OR-OSHA Admin. Order 6-1995, f. 4/18/95, ef. 6/1/95.

OR-OSHA Admin. Order 6-2002, f. 7/19/02, ef. 7/19/02.

Note: 1926.502(k) was repealed. In Oregon, 437-003-1501 applies.

Note: 1926.503 was repealed. In Oregon, 437-003-0503 applies.

### ***437-003-0503 Training requirements***

#### ***(1) Training Program.***

- (a) The employer shall provide a training program for each employee who might be exposed to fall hazards. The program shall enable each employee to recognize the hazards of falling and shall train each employee in the procedures to be followed in order to minimize these hazards.***
- (b) The employer shall assure that each employee has been trained, as necessary, by a competent person qualified in the following areas:***
  - (A) The nature of fall hazards in the work area;***
  - (B) The correct procedures for erecting, maintaining, disassembling, and inspecting the fall protection systems to be used;***
  - (C) The use and operation of guardrail systems, personal fall arrest systems, safety net systems, warning line systems, safety monitoring systems, personal fall restraint systems, positioning devices, and other appropriate protection to be used;***
  - (D) The role of each employee in the safety monitoring system when this system is used;***
  - (E) The limitations on the use of mechanical equipment during the performance of roofing work;***
  - (F) The correct procedures for the handling and storage of equipment and materials and the erection of overhead protection; and***
  - (G) The role of employees in the fall protection work plan;***
  - (H) The standards contained in this subpart.***

#### ***(2) Certification of training.***

- (a) The employer shall verify compliance with paragraph (a) of this section by preparing a written certification record. The written certification record shall contain the name or other identity of the employee trained, the date(s) of the training, and the signature of the person who conducted the training or the signature of the employer. If the employer relies on training conducted by another employer or completed prior to the effective date of this section, the certification record shall indicate the date the employer determined the prior training was adequate rather than the date of actual training.*
- (b) The latest training certification shall be maintained.*
- (3) Retraining. When the employer has reason to believe that any affected employee who has already been trained does not have the understanding and skill required by paragraph (a) of this section, the employer shall retrain each such employee. Circumstances where retraining is required include, but are not limited to, situations where:*
- (a) Changes in the workplace render previous training obsolete; or*
- (b) Changes in the types of fall protection systems or equipment to be used render previous training obsolete; or*
- (c) Inadequacies in an affected employee's knowledge or use of fall protection systems or equipment indicate that the employee has not retained the requisite understanding or skill.*

**Stat. Auth.:** ORS 654.025(2) and 656.726(4).

**Stats. Implemented:** ORS 654.001 through 654.295.

**Hist:** OR-OSHA Admin. Order 6-2002, f. 7/19/02, ef. 7/19/02.  
OR-OSHA Admin. Order 2-2016, f. 3/1/16, ef. 10/1/17.

Note: Oregon repealed 1926.501(b). In Oregon, use 437-003-2502(2) with this Appendix.

Note: The following appendices to subpart M of this part serve as non-mandatory guidelines to assist employers in complying with the appropriate requirements of subpart M of this part.

## **Appendix A to Subpart M – Determining Roof Widths Non-Mandatory Guidelines for Complying with 437-003-2502(2)**

- (1) This Appendix serves as a guideline to assist employers complying with the requirements of 1926.501(b)(10). Section 1910.501(b)(10) allows the use of a safety monitoring system alone as a means of providing fall protection during the performance of roofing operations on low-sloped roofs 50 feet (15.25 m) or less in width. Each example in the appendix shows a roof plan or plans and indicates where each roof or roof area is to be measured to determine its width. Section views or elevation views are shown where appropriate. Some examples show “correct” and “incorrect” subdivisions of irregularly shaped roofs divided into smaller, regularly shaped areas. In all examples, the dimension selected to be the width of an area is the lesser of the two primary dimensions of the area, as viewed from above. [Example A](#) shows that on a simple rectangular roof, width is the lesser of the two primary overall dimensions. This is also the case with roofs which are sloped toward or away from the roof center, as shown in [Example B](#).
- (2) Many roofs are not simple rectangles. Such roofs may be broken down into subareas as shown in [Example C](#). The process of dividing a roof area can produce many different configurations. [Example C](#) gives the general rule of using dividing lines of minimum length to minimize the size and number of the areas which are potentially less than 50 feet (15.25 m) wide. The intent is to minimize the number of roof areas where safety monitoring systems alone are sufficient protection.
- (3) Roofs which are comprised of several separate, non-contiguous roof areas, as in [Example D](#), may be considered as a series of individual roofs. Some roofs have penthouses, additional floors, courtyard openings, or similar architectural features; [Example E](#) shows how the rule for dividing roofs into subareas is applied to such configurations. Irregular, non-rectangular roofs must be considered on an individual basis, as shown in [Example F](#).

1 Example A  
Rectangular Shaped Roofs

2 Example B  
Sloped Regular Shaped Roofs

3 Example C

Irregularly Shaped Roofs With Regular Shaped Sections

Such roofs are to be divided into sub-areas by using dividing lines of minimum length to minimize the size and number of the areas which are potentially less than or equal to 50 feet (15.25 meters) in width, in order to limit the size of roof areas where the safety monitoring system alone can be used. Dotted lines are used in the examples to show the location of dividing lines. W (with a circle around it) denotes incorrect measurements of width.

## Appendix B to Subpart M – Guardrail Systems Non-Mandatory Guidelines for Complying with 1926.502(b)

The standard requires guardrail systems and components to be designed and built to meet the requirements of 1926.502(b)(3), (4), and (5). This Appendix serves as a non-mandatory guideline to assist employers in complying with these requirements. An employer may use these guidelines as a starting point for designing guardrail systems. However, the guidelines do not provide all the information necessary to build a complete system, and the employer is still responsible for designing and assembling these components in such a way that the completed system will meet the requirements of 1926.502(b)(3), (4), and (5). Components for which no specific guidelines are given in this Appendix (e.g., joints, base connections, components made with other materials, and components with other dimensions) must also be designed and constructed in such a way that the completed system meets the requirements of 1926.502.

- (1) For wood railings: Wood components shall be minimum 1500 lb-ft/in<sup>2</sup> fiber (stress grade) construction grade lumber; the posts shall be at least 2-inch by 4-inch (5 cm x 10 cm) lumber spaced not more than 8 feet (2.4 m) apart on centers; the top rail shall be at least 2 inch by 4-inch (5 cm x 10 cm) lumber, the intermediate rail shall be at least 1-inch by 6 inch (2.5 cm x 15 cm) lumber. All lumber dimensions are nominal sizes as provided by the American Softwood Lumber Standards, dated January 1970.
- (2) For pipe railings: posts, top rails, and intermediate railings shall be at least one and one-half inches nominal diameter (schedule 40 pipe) with posts spaced not more than 8 feet (2.4 m) apart on centers.
- (3) For structural steel railings: posts, top rails, and intermediate rails shall be at least 2 inch by 2-inch (5 cm x 10 cm) by 3/8-inch (1.1 cm) angles, with posts spaced not more than 8 feet (2.4 m) apart on centers.

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Hist:** OR-OSHA Admin. Order 6-1995, f. 4/18/95, ef. 6/1/95.

## **Appendix C to Subpart M – Personal Fall Arrest Systems Non-Mandatory Guidelines for Complying with 1926.502(d)**

### **I. Test methods for personal fall arrest systems and positioning device systems.**

- (a) General. This appendix serves as a non-mandatory guideline to assist employers comply with the requirements in 1926.502(d). Paragraphs (b), (c), (d) and (e) of this Appendix describe test procedures which may be used to determine compliance with the requirements in 1926.502(d)(16). As noted in Appendix D of this subpart, the test methods listed here in Appendix C can also be used to assist employers comply with the requirements in 1926.502(e)(3) and (4) for positioning device systems.
- (b) General conditions for all tests in the Appendix to 1926.502(d).
  - (1) Lifelines, lanyards and deceleration devices should be attached to an anchorage and connected to the body-belt or body harness in the same manner as they would be when used to protect employees.
  - (2) The anchorage should be rigid, and should not have a deflection greater than 0.04 inches (1 mm) when a force of 2,250 pounds (10 kN) is applied.
  - (3) The frequency response of the load measuring instrumentation should be 500 Hz.
  - (4) The test weight used in the strength and force tests should be a rigid, metal, cylindrical or torso-shaped object with a girth of 38 inches plus or minus 4 inches (96 cm plus or minus 10 cm).
  - (5) The lanyard or lifeline used to create the free fall distance should be supplied with the system, or in its absence, the least elastic lanyard or lifeline available to be used with the system.
  - (6) The test weight for each test should be hoisted to the required level and should be quickly released without having any appreciable motion imparted to it.
  - (7) The system's performance should be evaluated taking into account the range of environmental conditions for which it is designed to be used.
  - (8) Following the test, the system need not be capable of further operation.
- (c) Strength test.

- (1) During the testing of all systems, a test weight of 300 pounds plus or minus 5 pounds (135 kg plus or minus 2.5 kg) should be used. (See paragraph (b)(4) of this section.)
- (2) The test consists of dropping the test weight once. A new unused system should be used for each test.
- (3) For lanyard systems, the lanyard length should be 6 feet plus or minus 2 inches (1.83 m plus or minus 5 cm) as measured from the fixed anchorage to the attachment on the body belt or body harness.
- (4) For rope-grab-type deceleration systems, the length of the lifeline above the centerline of the grabbing mechanism to the lifeline's anchorage point should not exceed 2 feet (0.61 m).
- (5) For lanyard systems, for systems with deceleration devices which do not automatically limit free fall distance to 2 feet (0.61 m) or less, and for systems with deceleration devices which have a connection distance in excess of 1 foot (0.3 m) (measured between the centerline of the lifeline and the attachment point to the body belt or harness), the test weight should be rigged to free fall a distance of 7.5 feet (2.3 m) from a point that is 1.5 feet (.46 m) above the anchorage point, to its hanging location (6 feet below the anchorage). The test weight should fall without interference, obstruction, or hitting the floor or ground during the test. In some cases a non-elastic wire lanyard of sufficient length may need to be added to the system (for test purposes) to create the necessary free fall distance.
- (6) For deceleration device systems with integral lifelines or lanyards which automatically limit free fall distance to 2 feet (0.61 m) or less, the test weight should be rigged to free fall a distance of 4 feet (1.22 m).
- (7) Any weight which detaches from the belt or harness has failed the strength test.

(d) Force test.

- (1) General. The test consists of dropping the respective test weight once as specified in paragraph (d)(2)(i) or (d)(3)(i) of this section. A new, unused system should be used for each test.
- (2) For lanyard systems.

- (i) A test weight of 220 pounds plus or minus 3 pounds (100 kg plus or minus 1.6 kg) should be used. (See paragraph (b)(4) of this appendix.)
  - (ii) Lanyard length should be 6 feet plus or minus two inches (1.83 m plus or minus 5 cm) as measured from the fixed anchorage to the attachment on the body belt or body harness.
  - (iii) The test weight should fall free from the anchorage level to its hanging location (a total of 6 feet (1.83 m) free fall distance) without interference, obstruction, or hitting the floor or ground during the test.
- (3) For all other systems.
- (i) A test weight of 220 pounds plus or minus 3 pounds (100 kg plus or minus 1.6 kg) should be used. (See paragraph (b)(4) of this appendix.)
  - (ii) The free fall distance to be used in the test should be the maximum fall distance physically permitted by the system during normal use conditions, up to a maximum free fall distance for the test weight of 6 feet (1.83 m), except as follows:
    - (A) For deceleration systems which have a connection link or lanyard, the test weight should free fall a distance equal to the connection distance (measured between the centerline of the lifeline and the attachment point to the body belt or harness).
    - (B) For deceleration device systems with integral lifelines or lanyards which automatically limit free fall distance to 2 feet (0.61 m) or less, the test weight should free fall a distance equal to that permitted by the system in normal use. (For example, to test a system with a self-retracting lifeline or lanyard, the test weight should be supported and the system allowed to retract the lifeline or lanyard as it would in normal use. The test weight would then be released and the force and deceleration distance measured.)
- (4) A system fails the force test if the recorded maximum arresting force exceeds 1,260 pounds (5.6 kN) when using a body belt, and/or exceeds 2,520 pounds (11.2 kN) when using a body harness.
- (5) The maximum elongation and deceleration distance should be recorded during the force test.

(e) Deceleration device tests.

- (1) General. The device should be evaluated or tested under the environmental conditions, (such as rain, ice, grease, dirt, type of lifeline, etc.), for which the device is designed.
- (2) Rope-grab-type deceleration devices.
  - (i) Devices should be moved on a lifeline 1,000 times over the same length of line a distance of not less than 1 foot (30.5 cm), and the mechanism should lock each time.
  - (ii) Unless the device is permanently marked to indicate the type(s) of lifeline which must be used, several types (different diameters and different materials), of lifelines should be used to test the device.
- (3) Other self-activating-type deceleration devices. The locking mechanisms of other self-activating-type deceleration devices designed for more than one arrest should lock each of 1,000 times as they would in normal service.

II. Additional non-mandatory guidelines for personal fall arrest systems. The following information constitutes additional guidelines for use in complying with requirements for a personal fall arrest system.

(a) Selection and use considerations.

- (1) The kind of personal fall arrest system selected should match the particular work situation, and any possible free fall distance should be kept to a minimum. Consideration should be given to the particular work environment. For example, the presence of acids, dirt, moisture, oil, grease, etc., and their effect on the system, should be evaluated. Hot or cold environments may also have an adverse effect on the system. Wire rope should not be used where an electrical hazard is anticipated. As required by the standard, the employer must plan to have means available to promptly rescue an employee should a fall occur, since the suspended employee may not be able to reach a work level independently.

- (2) Where lanyards, connectors, and lifelines are subject to damage by work operations such as welding, chemical cleaning, and sandblasting, the component should be protected, or other securing systems should be used. The employer should fully evaluate the work conditions and environment (including seasonal weather changes) before selecting the appropriate personal fall protection system. Once in use, the system's effectiveness should be monitored. In some cases, a program for cleaning and maintenance of the system may be necessary.
- (b) Testing considerations. Before purchasing or putting into use a personal fall arrest system, an employer should obtain from the supplier information about the system based on its performance during testing so that the employer can know if the system meets this standard. Testing should be done using recognized test methods. This Appendix contains test methods recognized for evaluating the performance of fall arrest systems. Not all systems may need to be individually tested; the performance of some systems may be based on data and calculations derived from testing of similar systems, provided that enough information is available to demonstrate similarity of function and design.
- (c) Component compatibility considerations. Ideally, a personal fall arrest system is designed, tested, and supplied as a complete system. However, it is common practice for lanyards, connectors, lifelines, deceleration devices, body belts and body harnesses to be interchanged since some components wear out before others. The employer and employee should realize that not all components are interchangeable. For instance, a lanyard should not be connected between a body belt (or harness) and a deceleration device of the self-retracting type since this can result in additional free fall for which the system was not designed. Any substitution or change to a personal fall arrest system should be fully evaluated or tested by a competent person to determine that it meets the standard, before the modified system is put in use.

- (d) Employee training considerations. Thorough employee training in the selection and use of personal fall arrest systems is imperative. Employees must be trained in the safe use of the system. This should include the following: application limits; proper anchoring and tie-off techniques; estimation of free fall distance, including determination of deceleration distance, and total fall distance to prevent striking a lower level; methods of use; and inspection and storage of the system. Careless or improper use of the equipment can result in serious injury or death. Employers and employees should become familiar with the material in this Appendix, as well as manufacturer's recommendations, before a system is used. Of uppermost importance is the reduction in strength caused by certain tie-offs (such as using knots, tying around sharp edges, etc.) and maximum permitted free fall distance. Also, to be stressed are the importance of inspections prior to use, the limitations of the equipment, and unique conditions at the worksite which may be important in determining the type of system to use.
- (e) Instruction considerations. Employers should obtain comprehensive instructions from the supplier as to the system's proper use and application, including, where applicable:
- (1) The force measured during the sample force test;
  - (2) The maximum elongation measured for lanyards during the force test;
  - (3) The deceleration distance measured for deceleration devices during the force test;
  - (4) Caution statements on critical use limitations;
  - (5) Application limits;
  - (6) Proper hook-up, anchoring and tie-off techniques, including the proper dee-ring or other attachment point to use on the body belt and harness for fall arrest;
  - (7) Proper climbing techniques;
  - (8) Methods of inspection, use, cleaning, and storage; and
  - (9) Specific lifelines which may be used. This information should be provided to employees during training.

- (f) Rescue considerations. As required by §1926.502(d)(20), when personal fall arrest systems are used, the employer must assure that employees can be promptly rescued or can rescue themselves should a fall occur. The availability of rescue personnel, ladders or other rescue equipment should be evaluated. In some situations, equipment which allows employees to rescue themselves after the fall has been arrested may be desirable, such as devices which have descent capability.
- (g) Inspection considerations. As required by §1926.502(d)(21), personal fall arrest systems must be regularly inspected. Any component with any significant defect, such as cuts, tears, abrasions, mold, or undue stretching; alterations or additions which might affect its efficiency; damage due to deterioration; contact with fire, acids, or other corrosives; distorted hooks or faulty hook springs; tongues unfitted to the shoulder of buckles; loose or damaged mountings; non-functioning parts; or wearing or internal deterioration in the ropes must be withdrawn from service immediately, and should be tagged or marked as unusable, or destroyed.
- (h) Tie-off considerations.
  - (1) One of the most important aspects of personal fall protection systems is fully planning the system before it is put into use. Probably the most overlooked component is planning for suitable anchorage points. Such planning should ideally be done before the structure or building is constructed so that anchorage points can be incorporated during construction for use later for window cleaning or other building maintenance. If properly planned, these anchorage points may be used during construction, as well as afterwards.
  - (i) Properly planned anchorages should be used if they are available. In some cases, anchorages must be installed immediately prior to use. In such cases, a registered professional engineer with experience in designing fall protection systems, or another qualified person with appropriate education and experience should design an anchor point to be installed.

- (ii) In other cases, the Agency recognizes that there will be a need to devise an anchor point from existing structures. Examples of what might be appropriate anchor points are steel members or I-beams if an acceptable strap is available for the connection (do not use a lanyard with a snaphook clipped onto itself); large eye-bolts made of an appropriate grade steel; guardrails or railings if they have been designed for use as an anchor point; or masonry or wood members only if the attachment point is substantial and precautions have been taken to assure that bolts or other connectors will not pull through. A qualified person should be used to evaluate the suitability of these "make shift" anchorages with a focus on proper strength.
- (2) Employers and employees should at all times be aware that the strength of a personal fall arrest system is based on its being attached to an anchoring system which does not reduce the strength of the system (such as a properly dimensioned eye-bolt/snap-hook anchorage). Therefore, if a means of attachment is used that will reduce the strength of the system, that component should be replaced by a stronger one, but one that will also maintain the appropriate maximum arrest force characteristics.
- (3) Tie-off using a knot in a rope lanyard or lifeline (at any location) can reduce the lifeline or lanyard strength by 50 percent or more. Therefore, a stronger lanyard or lifeline should be used to compensate for the weakening effect of the knot, or the lanyard length should be reduced (or the tie-off location raised) to minimize free fall distance, or the lanyard or lifeline should be replaced by one which has an appropriately incorporated connector to eliminate the need for a knot.
- (4) Tie-off of a rope lanyard or lifeline around an "H" or "I" beam or similar support can reduce its strength as much as 70 percent due to the cutting action of the beam edges. Therefore, use should be made of a webbing lanyard or wire core lifeline around the beam; or the lanyard or lifeline should be protected from the edge; or free fall distance should be greatly minimized.
- (5) Tie-off where the line passes over or around rough or sharp surfaces reduces strength drastically. Such a tie-off should be avoided or an alternative tie-off rigging should be used. Such alternatives may include use of a snap-hook/dee-ring connection, wire rope tie-off, an effective padding of the surfaces, or an abrasion-resistance strap around or over the problem surface.

- (6) Horizontal lifelines may, depending on their geometry and angle of sag, be subjected to greater loads than the impact load imposed by an attached component. When the angle of horizontal lifeline sag is less than 30 degrees, the impact force imparted to the lifeline by an attached lanyard is greatly amplified. For example, with a sag angle of 15 degrees, the force amplification is about 2:1 and at 5 degrees sag, it is about 6:1. Depending on the angle of sag, and the line's elasticity, the strength of the horizontal lifeline and the anchorages to which it is attached should be increased a number of times over that of the lanyard. Extreme care should be taken in considering a horizontal lifeline for multiple tie-offs. The reason for this is that in multiple tie-offs to a horizontal lifeline, if one employee falls, the movement of the falling employee and the horizontal lifeline during arrest of the fall may cause other employees to fall also. Horizontal lifeline and anchorage strength should be increased for each additional employee to be tied off. For these and other reasons, the design of systems using horizontal lifelines must only be done by qualified persons. Testing of installed lifelines and anchors prior to use is recommended.
- (7) The strength of an eye-bolt is rated along the axis of the bolt and its strength is greatly reduced if the force is applied at an angle to this axis (in the direction of shear). Also, care should be exercised in selecting the proper diameter of the eye to avoid accidental disengagement of snap-hooks not designed to be compatible for the connection.
- (8) Due to the significant reduction in the strength of the lifeline/lanyard (in some cases, as much as a 70 percent reduction), the sliding hitch knot (prusik) should not be used for lifeline/lanyard connections except in emergency situations where no other available system is practical. The "one-and-one" sliding hitch knot should never be used because it is unreliable in stopping a fall. The "two-and-two," or "three-and-three" knot (preferable) may be used in emergency situations; however, care should be taken to limit free fall distance to a minimum because of reduced lifeline/lanyard strength.
- (i) Vertical lifeline considerations. As required by the standard, each employee must have a separate lifeline [except employees engaged in constructing elevator shafts who are permitted to have two employees on one lifeline] when the lifeline is vertical. The reason for this is that in multiple tie-offs to a single lifeline, if one employee falls, the movement of the lifeline during the arrest of the fall may pull other employees' lanyards, causing them to fall as well.

(j) Saphook considerations.

- (1) Although not required by this standard for all connections until January 1, 1998, locking saphooks designed for connection to suitable objects (of sufficient strength) are highly recommended in lieu of the nonlocking type. Locking saphooks incorporate a positive locking mechanism in addition to the spring loaded keeper, which will not allow the keeper to open under moderate pressure without someone first releasing the mechanism. Such a feature, properly designed, effectively prevents roll-out from occurring.
- (2) As required by §1926.502(d)(6), the following connections must be avoided (unless properly designed locking saphooks are used) because they are conditions which can result in roll-out when a nonlocking saphook is used:
  - (i) Direct connection of a saphook to a horizontal lifeline.
  - (ii) Two (or more) saphooks connected to one dee-ring.
  - (iii) Two saphooks connected to each other.
  - (iv) A saphook connected back on its integral lanyard.
  - (v) A saphook connected to a webbing loop or webbing lanyard.
  - (vi) Improper dimensions of the dee-ring, rebar, or other connection point in relation to the saphook dimensions which would allow the saphook keeper to be depressed by a turning motion of the saphook.

- (k) Free fall considerations. The employer and employee should at all times be aware that a system's maximum arresting force is evaluated under normal use conditions established by the manufacturer, and in no case using a free fall distance in excess of 6 feet (1.8 m). A few extra feet of free fall can significantly increase the arresting force on the employee, possibly to the point of causing injury. Because of this, the free fall distance should be kept at a minimum, and, as required by the standard, in no case greater than 6 feet (1.8 m). To help assure this, the tie-off attachment point to the lifeline or anchor should be located at or above the connection point of the fall arrest equipment to belt or harness. (Since otherwise additional free fall distance is added to the length of the connecting means (i.e., lanyard)). Attaching to the working surface will often result in a free fall greater than 6 feet (1.8 m). For instance, if a 6 foot (1.8 m) lanyard is used, the total free fall distance will be the distance from the working level to the body belt (or harness) attachment point plus the 6 feet (1.8 m) of lanyard length.

Another important consideration is that the arresting force which the fall system must withstand also goes up with greater distances of free fall, possibly exceeding the strength of the system.

- (l) Elongation and deceleration distance considerations. Other factors involved in a proper tie-off are elongation and deceleration distance. During the arresting of a fall, a lanyard will experience a length of stretching or elongation, whereas activation of a deceleration device will result in a certain stopping distance. These distances should be available with the lanyard or device's instructions and must be added to the free fall distance to arrive at the total fall distance before an employee is fully stopped. The additional stopping distance may be very significant if the lanyard or deceleration device is attached near or at the end of a long lifeline, which may itself add considerable distance due to its own elongation. As required by the standard, sufficient distance to allow for all of these factors must also be maintained between the employee and obstructions below, to prevent an injury due to impact before the system fully arrests the fall. In addition, a minimum of 12 feet (3.7 m) of lifeline should be allowed below the securing point of a rope grab type deceleration device, and the end terminated to prevent the device from sliding off the lifeline. Alternatively, the lifeline should extend to the ground or the next working level below. These measures are suggested to prevent the worker from inadvertently moving past the end of the lifeline and having the rope grab become disengaged from the lifeline.

- (m) Obstruction considerations. The location of the tie-off should also consider the hazard of obstructions in the potential fall path of the employee. Tie-offs which minimize the possibilities of exaggerated swinging should be considered. In addition, when a body belt is used, the employee's body will go through a horizontal position to a jackknifed position during the arrest of all falls. Thus, obstructions which might interfere with this motion should be avoided or a severe injury could occur.
- (n) Other considerations. Because of the design of some personal fall arrest systems, additional considerations may be required for proper tie-off. For example, heavy deceleration devices of the self-retracting type should be secured overhead in order to avoid the weight of the device having to be supported by the employee. Also, if self-retracting equipment is connected to a horizontal lifeline, the sag in the lifeline should be minimized to prevent the device from sliding down the lifeline to a position which creates a swing hazard during fall arrest. In all cases, manufacturer's instructions should be followed.

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

## Appendix D to Subpart M – Positioning Device Systems Non-Mandatory Guidelines for Complying with 1926.502(e)

I. Testing Methods For Positioning Device Systems. This appendix serves as a non-mandatory guideline to assist employers comply with the requirements for positioning device systems in 1926.502(e). Paragraphs (b), (c), (d) and (e) of Appendix C of subpart M relating to 1926.502(d) – Personal Fall Arrest Systems – set forth test procedures which may be used, along with the procedures listed below, to determine compliance with the requirements for positioning device systems in 1926.502(e)(3) and (4) of Subpart M.

(a) General.

- (1) Single strap positioning devices shall have one end attached to a fixed anchorage and the other end connected to a body belt or harness in the same manner as they would be used to protect employees. Double strap positioning devices, similar to window cleaner's belts, shall have one end of the strap attached to a fixed anchorage and the other end shall hang free. The body belt or harness shall be attached to the strap in the same manner as it would be used to protect employees. The two strap ends shall be adjusted to their maximum span.
- (2) The fixed anchorage shall be rigid, and shall not have a deflection greater than .04 inches (1 mm) when a force of 2,250 pounds (10 kN) is applied.
- (3) During the testing of all systems, a test weight of 250 pounds plus or minus 3 pounds (113 kg plus or minus 1.6 kg) shall be used. The weight shall be a rigid object with a girth of 38 inches plus or minus 4 inches (96 cm plus or minus 10 cm).
- (4) Each test shall consist of dropping the specified weight one time without failure of the system being tested. A new system shall be used for each test.
- (5) The test weight for each test shall be hoisted exactly 4 feet (1.2 m) above its "at rest" position, and shall be dropped so as to permit a vertical free fall of 4 feet (1.2 m).
- (6) The test is failed whenever any breakage or slippage occurs which permits the weight to fall free of the system.
- (7) Following the test, the system need not be capable of further operation; however, all such incapacities shall be readily apparent.

II. Inspection Considerations. As required in §1926.502(e)(5), positioning device systems must be regularly inspected. Any component with any significant defect, such as cuts, tears, abrasions, mold, or undue stretching; alterations or additions which might affect its efficiency; damage due to deterioration; contact with fire, acids, or other corrosives; distorted hooks or faulty hook springs; tongues unfitted to the shoulder of buckles; loose or damaged mountings; non-functioning parts; or wearing or internal deterioration in the ropes must be withdrawn from service immediately, and should be tagged or marked as unusable, or destroyed.

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Hist:** OR-OSHA Admin. Order 6-1995, f. 4/18/95, ef. 6/1/95.

## Notes

### Historical Notes for Subdivision M

**NOTE:** In November of 2015, Oregon OSHA proposed to revise the general fall protection requirements covered under Division 3 (Construction Industry), Subdivisions 3/M (Fall Protection) and 3/E (Personal Protective and Life Saving Equipment), as requested by federal OSHA. Federal OSHA's request was not based on data related to enforcement, but on the effectiveness of the rule itself, presuming it is followed. The proposed revisions to Subdivision 3/M and Subdivision 3/E, includes amending the 10-foot general trigger height for fall protection to 6 feet, and repealing 437-003-0134(5)(a), which has a 10-foot general fall protection trigger height requirement, due to redundancy.

Five public hearings were held during January of 2016. Oregon OSHA received oral testimony in addition to written comments. Several comments received opposed lowering the 10-foot general trigger height for fall protection to 6 feet. Reasons for the opposing comments included, but were not limited to; the belief that the hazard associated with a 6-foot fall is not an "extreme difference" than that of a 10-foot fall; employers' difficulty of ensuring employees follow company policy to use personal fall protection systems; additional costs incurred by employers and homeowners for increase use of fall protection systems, in lieu of slide guards; lack of data that supports the need to lower the current 10-foot trigger height.

Oregon OSHA considered all comments received. However, since federal OSHA's request was not based on data related to enforcement, but rather on the literal effectiveness of the rule itself, presuming it is followed, Oregon OSHA must comply with federal OSHA's request.

This is OR-OSHA Administrative Order 01-2016, adopted March 1, 2016 and effective January 1, 2017.

**NOTE:** In November of 2015, Oregon OSHA proposed to revise the general fall protection requirements covered under Division 3 (Construction Industry), Subdivisions 3/M (Fall Protection), as requested by federal OSHA. The proposed revisions to Subdivision 3/M, includes revoking the use of slide guards as a sole or primary fall protection system.

Five public hearings were held during January of 2016. Oregon OSHA received oral testimony in addition to written comments. Several comments received opposed the elimination of slide guards as an acceptable method of fall protection. Reasons for the opposing comments included, but were not limited to; the belief that slide guards are an effective method of fall protection, and are largely accepted; employers' difficulty of ensuring employees follow company policy to use personal fall protection systems; a potential increase of exposures to falls for delivery employees needing to install their own fall protection system rather than relying upon already installed slide guards; having multiple employees engaged in roofing work while wearing ropes and harnesses increases trip hazards; ropes can catch on and knock over stacks of material; using ropes and harnesses can slow down the job; and lack of data that supports the opinion that slide guards are not an effective means of fall protection.

Oregon OSHA considered all comments received. However, since federal OSHA’s request was not based on data related to enforcement, but rather on the literal effectiveness of the rule itself, presuming it is followed, Oregon OSHA must comply with federal OSHA’s request.

This is OR-OSHA Administrative Order 2-2016, adopted March 1, 2016 and effective October 1, 2017.

**OREGON OCCUPATIONAL  
SAFETY AND HEALTH STANDARDS**

Oregon Administrative Rules, Chapter 437

**DIVISION 3 (29 CFR 1926)  
CONSTRUCTION**

Oregon Occupational Safety and Health Division (Oregon OSHA)  
Department of Consumer and Business Services  
Salem, Oregon 97301-3882

AO 1-2011

The Oregon Department of Consumer and Business Services adopted these rules pursuant to ORS 654.025(2).

The Secretary of State Designated OAR Chapter 437 as the “Oregon Occupational Safety and Health Code.” Six general subject areas within this code are designated as “Divisions.”

- **Division 1** General Administrative Rules
- **Division 2** General Occupational Safety and Health Rules
- **Division 3** Construction
- **Division 4** Agriculture
- **Division 5** Maritime Activities
- **Division 7** Forest Activities
- **Oregon Revised Statutes (ORS) 654** The Oregon Safe Employment Act (OSEAct)

Oregon-initiated rules in this division of the Oregon Occupational Safety and Health Code are numbered in a uniform system developed by the Secretary of State. This system does not number the rules in sequence (001, 002, 003, etc.). Omitted numbers may be assigned to new rules at the time of their adoption.

**Oregon-initiated rules** are arranged in the following Basic Codification Structure adopted by the Secretary of State for Oregon Administrative Rules (OAR):

Chapter	Division	Rule	Section	Subsection	Paragraphs
437	003	1760	(1)	(a)	(A)(i)(I)

The majority of Oregon OSHA codes are adopted by reference from the Code of Federal Regulations (CFR), and are arranged in the following basic federal numbering system:

Chapter	Division	Part	Subpart (Subdivision)	Section	Paragraphs
437	003	1926	M	.502	(a)

The terms “subdivision” and “subpart” are synonymous within OAR 437, Oregon Occupational Safety and Health Code.

---

To obtain an order form or copies of these codes, address:

**Department of Consumer & Business Services  
Oregon Occupational Safety & Health Division (Oregon OSHA)  
350 Winter St. NE, Room 430  
Salem, OR 97301-3882**

Or call the Oregon OSHA Resource Library at 503-378-3272

The rules referenced in this division are available for viewing in the Office of the Secretary of State, Administrative Rules and Office Document Section, Oregon State Archives Building, Salem, Oregon 97310, or the Central Office, Oregon Occupational Safety and Health Division of the Department of Consumer and Business Services, Room 430, 350 Winter St. NE Salem, OR 97301-3882. ## SUBDIVISION N

### HELICOPTERS, HOISTS, ELEVATORS AND CONVEYORS

**Authority:** Section 3704 of the Contract Work Hours and Safety Standards Act (40 U.S.C. 3701); Sections 4, 6, and 8 of the Occupational Safety and Health Act of 1970 (29 U.S.C. 653, 655, 657); Secretary of Labor's Order Nos. 12-71 (36 FR 8754), 8-76 (41 FR 25059), or 9-83 (49 FR 35736), and 5-2007 (72 FR 31159).

#### **§1926.550 Reserved.**

#### **§1926.551 Helicopters.**

**(a) Helicopter regulations.** Helicopter cranes shall be expected to comply with any applicable regulations of the Federal Aviation Administration.

**(b) Briefing.** Prior to each day's operation a briefing shall be conducted. This briefing shall set forth the plan of operation for the pilot and ground personnel.

**(c) Slings and tag lines.** Load shall be properly slung. Tag lines shall be of a length that will not permit their being drawn up into rotors. Pressed sleeve, swedged eyes, or equivalent means shall be used for all freely suspended loads to prevent hand splices from spinning open or cable clamps from loosening.

**(d) Cargo hooks.** All electrically operated cargo hooks shall have the electrical activating device so designed and installed as to prevent inadvertent operation. In addition, these cargo hooks shall be equipped with an emergency mechanical control for releasing the load. The hooks shall be tested prior to each day's operation to determine that the release functions properly, both electrically and mechanically.

#### **(e) Personal protective equipment.**

**(1)** Personal protective equipment for employees receiving the load shall consist of complete eye protection and hard hats secured by chinstraps.

**(2)** Loose-fitting clothing likely to flap in the downwash, and thus be snagged on hoist line, shall not be worn.

**(f) Loose gear and objects.** Every practical precaution shall be taken to provide for the protection of the employees from flying objects in the rotor downwash. All loose gear within 100 feet of the place of lifting the load, depositing the load, and all other areas susceptible to rotor downwash shall be secured or removed.

**(g) Housekeeping.** Good housekeeping shall be maintained in all helicopter loading and unloading areas.

**(h) Operator responsibility.** The helicopter operator shall be responsible for size, weight, and manner in which loads are connected to the helicopter. If, for any reason, the helicopter operator believes the lift cannot be made safely, the lift shall not be made.

**(i) Hooking and unhooking loads.** When employees are required to perform work under hovering craft, a safe means of access shall be provided for employees to reach the hoist line hook and engage or disengage cargo slings. Employees shall not perform work under hovering craft except when necessary to hook or unhook loads.

**(j) Static charge.** Static charge on the suspended load shall be dissipated with a grounding device before ground personnel touch the suspended load, or protective rubber gloves shall be worn by all ground personnel touching the suspended load.

**(k) Weight limitation.** The weight of an external load shall not exceed the manufacturer's rating.

**(l) Ground lines.** Hoist wires or other gear, except for pulling lines or conductors that are allowed to "pay out" from a container or roll off a reel, shall not be attached to any fixed ground structure, or allowed to foul on any fixed structure.

**(m) Visibility.** When visibility is reduced by dust or other conditions, ground personnel shall exercise special caution to keep clear of main and stabilizing rotors. Precautions shall also be taken by the employer to eliminate as far as practical reduced visibility.

**(n) Signal systems.** Signal systems between aircrew and ground personnel shall be understood and checked in advance of hoisting the load. This applies to either radio or hand signal systems. Hand signals shall be as shown in Figure N-1.

Figure N-1 – Helicopter Hand Signal

**(o) Approach distance.** No unauthorized person shall be allowed to approach within 50 feet of the helicopter when the rotor blades are turning.

**(p) Approaching helicopter.** Whenever approaching or leaving a helicopter with blades rotating, all employees shall remain in full view of the pilot and keep in a crouched position. Employees shall avoid the area from the cockpit or cabin rearward unless authorized by the helicopter operator to work there.

**(q) Personnel.** Sufficient ground personnel shall be provided when required for safe helicopter loading and unloading operations.

**(r) Communications.** There shall be constant reliable communication between the pilot, and a designated employee of the ground crew who acts as a signalman during the period of loading and unloading. This signalman shall be distinctly recognizable from other ground personnel.

**(s) Fires.** Open fires shall not be permitted in an area that could result in such fires being spread by the rotor downwash.

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

# MATERIAL HOISTS, PERSONNEL HOISTS, & ELEVATORS **N**

---

## **§1926.552 Material Hoists, Personnel Hoists, and Elevators.**

### **(a) General requirements.**

- (1)** The employer shall comply with the manufacturer's specifications and limitations applicable to the operation of all hoists and elevators. Where manufacturer's specifications are not available, the limitations assigned to the equipment shall be based on the determinations of a professional engineer competent in the field.
- (2)** Rated load capacities, recommended operating speeds, and special hazard warnings or instructions shall be posted on cars and platforms.
- (3)** Wire rope shall be removed from service when any of the following conditions exists:
  - (i)** In hoisting ropes, six randomly distributed broken wires in one rope lay or three broken wires in one strand in one rope lay;
  - (ii)** Abrasion, scrubbing, flattening, or peening, causing loss of more than one-third of the original diameter of the outside wires;
  - (iii)** Evidence of any heat damage resulting from a torch or any damage caused by contact with electrical wires;
  - (iv)** Reduction from nominal diameter of more than three sixty-fourths inch for diameters up to and including three-fourths inch; one-sixteenth inch for diameters seven-eighths to 1-1/8 inches; and three thirty-seconds inch for diameters 1-1/4 to 1-1/2 inches.
- (4)** Hoisting ropes shall be installed in accordance with the wire rope manufacturers' recommendations.
- (5)** The installation of live booms on hoists is prohibited.
- (6)** The use of endless belt-type manlifts on construction shall be prohibited.

### **(b) Material hoists.**

- (1)**
  - (i)** Operating rules shall be established and posted at the operator's station of the hoist. Such rules shall include signal system and allowable line speed for various loads. Rules and notices shall be posted on the car frame or cross-head in a conspicuous location, including the statement "No Riders Allowed."
  - (ii)** No person shall be allowed to ride on material hoists except for the purposes of inspection and maintenance.

# **N MATERIAL HOISTS, PERSONNEL HOISTS, & ELEVATORS**

(2) All entrances of the hoistways shall be protected by substantial gates or bars which shall guard the full width of the landing entrance. All hoistway entrance bars and gates shall be painted with diagonal contrasting colors, such as black and yellow stripes.

(i) Bars shall be not less than 2 by 4 inch wooden bars or the equivalent, located 2 feet from the hoistway line. Bars shall be located not less than 36 inches nor more than 42 inches above the floor.

(ii) Gates or bars protecting the entrances to hoistways shall be equipped with a latching device.

(3) Overhead protective covering of 2-inch planking, 3/4 inch plywood, or other solid material of equivalent strength, shall be provided on the top of every material hoist cage or platform.

(4) The operator's station of a hoisting machine shall be provided with overhead protection equivalent to tight planking not less than 2 inches thick. The support for the overhead protection shall be of equal strength.

(5) Hoist towers may be used with or without an enclosure on all sides. However, whichever alternative is chosen, the following applicable conditions shall be met:

(i) When a hoist tower is enclosed, it shall be enclosed on all sides for its entire height with a screen enclosure of 1/2 inch mesh, No. 18 U.S. gauge wire or equivalent, except for landing access.

(ii) When a hoist tower is not enclosed, the hoist platform or car shall be totally enclosed (caged) on all sides for the full height between the floor and the overhead protective covering with 1/2 inch mesh of No. 14 U.S. gauge wire or equivalent. The hoist platform enclosure shall include the required gates for loading and unloading. A 6-foot high enclosure shall be provided on the unused sides of the hoist tower at ground level.

(6) Car arresting devices shall be installed to function in case of rope failure.

(7) All material hoist towers shall be designed by a licensed professional engineer.

(8) All material hoists shall conform to the requirements of ANSI A10.5-1969, Safety Requirements for Material Hoists.

## **(c) Personnel hoists.**

(1) Hoist towers outside the structure shall be enclosed for the full height on the side or sides used for entrance and exit to the structure. At the lowest landing, the enclosure on the sides not used for exit or entrance to the structure shall be enclosed to a height of at least 10 feet. Other sides of the tower adjacent to floors or scaffold platforms shall be enclosed to a height of 10 feet above the level of such floors or scaffolds.

# MATERIAL HOISTS, PERSONNEL HOISTS, & ELEVATORS **N**

---

- (2)** Towers inside of structures shall be enclosed on all four sides throughout the full height.
- (3)** Towers shall be anchored to the structure at intervals not exceeding 25 feet. In addition to tie-ins, a series of guys shall be installed.
- (4)** Hoistway doors or gates shall be not less than 6 feet 6 inches high and shall be provided with mechanical locks which cannot be operated from the landing side, and shall be accessible only to persons on the car.
- (5)** Cars shall be permanently enclosed on all sides and the top, except sides used for entrance and exit which have car gates or doors.
- (6)** A door or gate shall be provided at each entrance to the car which shall protect the full width and height of the car entrance opening.
- (7)** Overhead protective covering of 2-inch planking, 3/4 inch plywood or other solid material or equivalent strength shall be provided on the top of every personnel hoist.
- (8)** Doors or gates shall be provided with electric contacts which do not allow movement of the hoist when door or gate is open.
- (9)** Safeties shall be capable of stopping and holding the car and rated load when traveling at governor tripping speed.
- (10)** Cars shall be provided with a capacity and data plate secured in a conspicuous place on the car or crosshead.
- (11)** Internal combustion engines shall not be permitted for direct drive.
- (12)** Normal and final terminal stopping devices shall be provided.
- (13)** An emergency stop switch shall be provided in the car and marked "Stop."
- (14) Ropes:**
  - (i)** The minimum number of hoisting ropes used shall be three for traction hoists and two for drum-type hoists.
  - (ii)** The minimum diameter of hoisting and counterweight wire ropes shall be 1/2 inch.

# N MATERIAL HOISTS, PERSONNEL HOISTS, & ELEVATORS

(iii) Safety factors:

Minimum Factors of Safety for Suspension Wire Ropes					
Rope speed in feet per minute	Minimum factor of safety	Rope speed in feet per minute	Minimum factor of safety	Rope speed in feet per minute	Minimum factor of safety
50	7.60	200	8.60	400	9.75
75	7.75	225	8.75	450	10.00

175	8.40				

(15) Following assembly and erection of hoists, and before being put in service, an inspection and test of all functions and safety devices shall be made under the supervision of a competent person. A similar inspection and test is required following major alteration of an existing installation. All hoists shall be inspected and tested at not more than 3-month intervals. The employer shall prepare a certification record which includes the date the inspection and test of all functions and safety devices was performed; the signature of the person who performed the inspection and test; and a serial number, or other identifier, for the hoist that was inspected and tested. The most recent certification record shall be maintained on file.

(16) All personnel hoists used by employees shall be constructed of materials and components which meet the specifications for materials, construction, safety devices, assembly, and structural integrity as stated in the American National Standard A10.4-1963, Safety Requirements for Workmen's Hoists. The requirements of this paragraph (c)(16) do not apply to cantilever type personnel hoists.

(17)

(i) Personnel hoists used in bridge tower construction shall be approved by a registered professional engineer and erected under the supervision of a qualified engineer competent in this field.

(ii) When a hoist tower is not enclosed, the hoist platform or car shall be totally enclosed (caged) on all sides for the full height between the floor and the overhead protective covering with 3/4 inch mesh of No. 14 U.S. gauge wire or equivalent. The hoist platform enclosure shall include the required gates for loading and unloading.

(iii) These hoists shall be inspected and maintained on a weekly basis. Whenever the hoisting equipment is exposed to winds exceeding 35 miles per hour it shall be inspected and put in operable condition before reuse.

(iv) Wire rope shall be taken out of service when any of the following conditions exist:

# MATERIAL HOISTS, PERSONNEL HOISTS, & ELEVATORS **N**

---

**(A)** In running ropes, six randomly distributed broken wires in one lay or three broken wires in one strand in one lay;

**(B)** Wear of one-third the original diameter of outside individual wires. Kinking, crushing, bird caging, or any other damage resulting in distortion of the rope structure;

**(C)** Evidence of any heat damage from any cause;

**(D)** Reductions from nominal diameter of more than three-sixty-fourths inch for diameters to and including three-fourths inch, one-sixteenth inch for diameters seven-eighths inch to 1-1/8 inches inclusive, three-thirty-seconds inch for diameters 1-1/4 to 1-1/2 inches inclusive;

**(E)** In standing ropes, more than two broken wires in one lay in sections beyond end connections or more than one broken wire at an end connection.

**(d)** Permanent elevators under the care and custody of the employer and used by employees for work covered by this Act shall comply with the requirements of American National Standards Institute A17.1-1965 with addenda A17.1a-1967, A17.1b-1968, A17.1c-1969, A17.1d-1970, and inspected in accordance with A17.2-1960 with addenda A17.2a-1965, A17.2b-1967.

(44 FR 8577, Feb. 9, 1979; 44 FR 20940, Apr. 6, 1979, as amended at 52 FR 36382, Sept. 28, 1987)

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).

APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

## §1926.553 Base-mounted Drum Hoists.

### (a) General requirements.

- (1) Exposed moving parts such as gears, projecting screws, setscrews, chain, cables, chain sprockets, and reciprocating or rotating parts, which constitute a hazard, shall be guarded.
- (2) All controls used during the normal operation cycle shall be located within easy reach of the operator's station.
- (3) Electric motor operated hoists shall be provided with:
  - (i) A device to disconnect all motors from the line upon power failure and not permit any motor to be restarted until the controller handle is brought to the "off" position;
  - (ii) Where applicable, an overspeed preventive device;
  - (iii) A means whereby remotely operated hoists stop when any control is ineffective.
- (4) All base-mounted drum hoists in use shall meet the applicable requirements for design, construction, installation, testing, inspection, maintenance, and operations, as prescribed by the manufacturer.

### (b) Specific requirements. (Reserved)

(c) This section does not apply to base-mounted drum hoists used in conjunction with derricks. Base-mounted drum hoists used in conjunction with derricks must conform to §1926.1436(e).

**Stat. Auth.:** ORS 654.025(2) and 656.726(4).

**Stats. Implemented:** ORS 654.001 through 654.295.

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).  
OR-OSHA Admin. Order 1-2011, f. 2/9/11, ef. 2/9/11.

## §1926.554 Overhead Hoists.

### (a) General requirements.

- (1) The safe working load of the overhead hoist, as determined by the manufacturer, shall be indicated on the hoist, and this safe working load shall not be exceeded.
- (2) The supporting structure to which the hoist is attached shall have a safe working load equal to that of the hoist.
- (3) The support shall be arranged so as to provide for free movement of the hoist and shall not restrict the hoist from lining itself up with the load.
- (4) The hoist shall be installed only in locations that will permit the operator to stand clear of the load at all times.
- (5) Air hoists shall be connected to an air supply of sufficient capacity and pressure to safely operate the hoist. All air hoses supplying air shall be positively connected to prevent their becoming disconnected during use.
- (6) All overhead hoists in use shall meet the applicable requirements for construction, design, installation, testing, inspection, maintenance, and operation, as prescribed by the manufacturer.

### (b) Specific requirements. (Reserved)

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

**§1926.555 Conveyors.****(a) General requirements.**

- (1)** Means for stopping the motor or engine shall be provided at the operator's station. Conveyor systems shall be equipped with an audible warning signal to be sounded immediately before starting up the conveyor.
- (2)** If the operator's station is at a remote point, similar provisions for stopping the motor or engine shall be provided at the motor or engine location.
- (3)** Emergency stop switches shall be arranged so that the conveyor cannot be started again until the actuating stop switch has been reset to running or "on" position.
- (4)** Screw conveyors shall be guarded to prevent employee contact with turning flights.
- (5)** Where a conveyor passes over work areas, aisles, or thoroughfares, suitable guards shall be provided to protect employees required to work below the conveyors.
- (6)** All crossovers, aisles, and passageways shall be conspicuously marked by suitable signs, as required by Subpart G of this part.
- (7)** Conveyors shall be locked out or otherwise rendered inoperable, and tagged out with a "Do Not Operate" tag during repairs and when operation is hazardous to employees performing maintenance work.
- (8)** All conveyors in use shall meet the applicable requirements for design, construction, inspection, testing, maintenance, and operation, as prescribed in the ANSI B20.1-1957, Safety Code for Conveyors, Cableways, and Related Equipment.

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).

- END OF DOCUMENT -

Oregon Administrative Rules  
Chapter 437

Division 3  
Construction

---

Motor Vehicles, Mechanized  
Equipment, and Marine  
Operations

Subdivision

**O**

Administrative  
Order 3-2019

The Oregon Department of Consumer and Business Services adopted these rules pursuant to ORS 654.025(2).

The Secretary of State designated OAR Chapter 437 as the “Oregon Occupational Safety and Health Code.” Six general subject areas within this code are designated as “Divisions.”

- **Division 1** General Administrative Rules
- **Division 2** General Occupational Safety and Health Rules
- **Division 3** Construction
- **Division 4** Agriculture
- **Division 5** Maritime Activities
- **Division 7** Forest Activities
- **Oregon Revised Statutes (ORS) 654** The Oregon Safe Employment Act (OSEAct)

Oregon-initiated rules in this division of the Oregon Occupational Safety and Health Code are numbered in a uniform system developed by the Secretary of State. This system does not number the rules in sequence (001, 002, 003, etc.). Omitted numbers may be assigned to new rules at the time of their adoption.

**Oregon-initiated rules** are arranged in the following Basic Codification Structure adopted by the Secretary of State for Oregon Administrative Rules (OAR):

Chapter	Division	Rule	Section	Subsection	Paragraphs
437	002	0322	(1)	(a)	(A)(i)(I)

The majority of Oregon OSHA rules are adopted by reference from the Code of Federal Regulations (CFR), and are arranged in the following basic federal numbering system:

Chapter	Division	Part	Subpart (Subdivision)	Section	Paragraphs
437	002	1910	G	.303	(a)(1)(i)(A)(1)

The terms “subdivision” and “subpart” are synonymous within OAR 437, Oregon Occupational Safety and Health Code.

---

To obtain an order form or copies of these codes, address:

**Department of Consumer & Business Services**  
**Oregon Occupational Safety & Health Division (Oregon OSHA)**  
350 Winter St. NE  
Salem, OR 97301-3882

Or call the Oregon OSHA Resource Library at 503-378-3272

The rules referenced in this division are available for viewing in the Office of the Secretary of State, Oregon State Archives Building, Salem, Oregon, or the Central Office, Oregon Occupational Safety and Health Division of the Department of Consumer and Business Services, 350 Winter St. NE, Salem, Oregon, and on our website at [osha.oregon.gov](http://osha.oregon.gov).

**437-003-0001 Adoption by Reference**

*In addition to, and not in lieu of, any other safety and health codes contained in OAR Chapter 437, the Department adopts by reference the following federal regulations printed as part of the Code of Federal Regulations, in the Federal Register:*

(15) Subdivision O – Motor Vehicles, Mechanized Equipment, and Marine Operations.

- (a) 29 CFR 1926.600 Equipment, published 8/9/10, FR vol. 75, no. 152, pp. 47906-48177.
- (b) 29 CFR 1926.601 Motor vehicles, REPEALED by OR-OSHA Admin. Order 6-2007, f. 9/26/07, ef. 9/26/07.
- (c) 29 CFR 1926.602 Material handling equipment, published 12/1/98, FR vol. 63, no. 230, p. 66274; amended by AO 7-2003, f. 12/5/03, ef. 12/5/03.
- (d) 29 CFR 1926.603 Pile driving equipment, published 4/6/79, FR vol. 44, p. 20940.
- (e) 29 CFR 1926.604 Site clearing, published 7/22/77, FR vol. 42, p. 37674.
- (f) 29 CFR 1926.605 Marine operations and equipment, published 4/6/79, FR vol. 44, p. 20940.
- (g) 29 CFR 1926.606 Definitions applicable to this subpart, published 4/6/79, FR vol. 44, p. 20940.

*These standards are available at the Oregon Occupational Safety and Health Division, Oregon Department of Consumer and Business Services, and the United States Government Printing Office.*

## 1926.600 Equipment

### (a) General requirements.

- (1) All equipment left unattended at night, adjacent to a highway in normal use, or adjacent to construction areas where work is in progress, shall have appropriate lights or reflectors, or barricades equipped with appropriate lights or reflectors, to identify the location of the equipment.
- (2) A safety tire rack, cage, or equivalent protection shall be provided and used when inflating, mounting, or dismounting tires installed on split rims, or rims equipped with locking rings or similar devices.
- (3)
  - (i) Heavy machinery, equipment, or parts thereof, which are suspended or held aloft by use of slings, hoists, or jacks shall be substantially blocked or cribbed to prevent falling or shifting before employees are permitted to work under or between them. Bulldozer and scraper blades, end-loader buckets, dump bodies, and similar equipment, shall be either fully lowered or blocked when being repaired or when not in use. All controls shall be in a neutral position, with the motors stopped and brakes set, unless work being performed requires otherwise.
  - (ii) Whenever the equipment is parked, the parking brake shall be set. Equipment parked on inclines shall have the wheels chocked and the parking brake set.
- (4) The use, care and charging of all batteries shall conform to the requirements of Subpart K of this part.
- (5) All cab glass shall be safety glass, or equivalent, that introduces no visible distortion affecting the safe operation of any machine covered by this subpart.
- (6) All equipment covered by this subpart shall comply with the following requirements when working or being moved in the vicinity of power lines or energized transmitters, except where electrical distribution and transmission lines have been deenergized and visibly grounded at point of work or where insulating barriers, not a part of or an attachment to the equipment or machinery, have been erected to prevent physical contact with the lines:

**Note:** 1926.600(a)(6)(i), (ii), and (v) were not adopted by Oregon OSHA. In Oregon, 437-003-3600 applies.

### **437-003-3600     *Equipment***

- (1) *For lines rated 50 kV or below, minimum clearance between the lines and any part of the equipment or load must be 10 feet.*

- (2) *For lines rated over 50 kV, minimum clearance between the lines and any part of the equipment or load must be 10 feet plus 0.4 inch for each 1 kV over 50 kV, or twice the length of the line insulator, but never less than 10 feet.*
- (3) *Cage-type boom guards, insulating links, or proximity warning devices may be used on equipment but the use of such devices must not alter the requirements of any other regulation of this part even if such device is required by law or regulation.*

Stats. Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 1-2011, f. 2/9/11, ef. 2/9/11.

- 1926.600 (a)(6)(iii) In transmit with no load and boom lowered, the equipment clearance shall be a minimum of 4 feet for voltages less than 50 kV, and 10 feet for voltages over 50 kV, up to and including 345 kV, and 16 feet for voltages up to and including 750 kV;
- (iv) A person shall be designated to observe clearance of the equipment and give timely warning for all operations where it is difficult for the operator to maintain the desired clearance by visual means;
- Note:** 1926.600(a)(6)(i), (ii), and (v) were not adopted by Oregon OSHA. In Oregon, 437-003-3600 applies.
- (vi) Any overhead wire shall be considered to be an energized line unless and until the person owning such line or the electrical utility authorities indicate that it is not an energized line and it has been visibly grounded;
- (vii) Prior to work near transmitter towers where an electrical charge can be induced in the equipment or materials being handled, the transmitter shall be de-energized or tests shall be made to determine if electrical charge is induced on the crane. The following precautions shall be taken when necessary to dissipate induced voltages:
- (A) The equipment shall be provided with an electrical ground directly to the upper rotating structure supporting the boom; and
- (B) Ground jumper cables shall be attached to materials being handled by boom equipment when electrical charge is induced while working near energized transmitters. Crews shall be provided with nonconductive poles having large alligator clips or other similar protection to attach the ground cable to the load.

(C) Combustible and flammable materials shall be removed from the immediate area prior to operations.

(7) Rolling railroad cars. Derail and/or bumper blocks shall be provided on spur railroad tracks where a rolling car could contact other cars being worked, enter a building, work or traffic areas.

(b) Specific requirements. (Reserved)

[44 FR 8577, Feb. 9, 1979; 44 FR 20940, Apr. 6, 1979, as amended at 58 FR 35183, June 30, 1993; 75 FR 48134, Aug. 9, 2010]

Stat. Auth.: ORS 654.025(2) and 656.726(4).

Stats. Implemented: ORS 654.001 through 654.295.

Hist: APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).

APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

OR-OSHA Admin. Order 6-1999, f. 5/26/99, ef. 5/26/99.

OR-OSHA Admin. Order 1-2011, f. 2/9/11, ef. 2/9/11.

### **437-003-0085      *General Requirement***

*An unimpaired horizontal clearance of not less than three feet shall be maintained between the rotating superstructure of any mechanical equipment and any adjacent object or surface. If this clearance cannot be maintained, barricades shall be installed to isolate the hazardous area.*

Stat. Auth.: ORS 654.025(2) and 656.726(3).

Hist: APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89.

### **437-003-0090      *Pinchpoints***

*To protect against workers being exposed to the hazardous pinchpoint area between the rotating superstructure and the non-rotating undercarriage of any mechanical equipment:*

(1) *Signs shall be conspicuously posted on all sides of any mechanical equipment warning workers:*

**DANGER – STAY CLEAR**

(2) *Items of personal property, tools, or other miscellaneous materials shall not be stored on or near any mechanical equipment if retrieval of such items would expose a worker to the hazardous pinchpoint.*

(3) *Workers shall approach the hazardous pinchpoint area only after informing the operator of his intent and receiving acknowledgment from the operator that the operator understands his intention. All mechanical equipment shall be stopped while any worker is in the hazardous pinchpoint area; and*

- (4) *When the nature of the work requires a person to work within three feet of the swing radius of the rotating upper structure, a warning barricade shall be provided. This requirement shall not apply to mechanical equipment when:*
- (a) *The distance from the highest point of the undercarriage to the lowest point of the rotating superstructure is greater than 18 inches. This applies only to that portion of the rotating superstructure that swings directly over the undercarriage;*
  - (b) *The distance from the ground to the lowest point of the rotating superstructure is greater than five feet six inches. This applies only to that portion of the rotating superstructure that swings directly over the undercarriage; or*
  - (c) *On crawler-type track-mounted mechanical equipment only, the rotating superstructure is positioned at a right angle to the tracks, and the distance from the side of the cab to the extreme end of the track is 4 feet or less. This exemption shall apply to side barricades only; barricades between the tracks at both ends of any crawler-type mechanical equipment are required regardless of the right angle dimension.*

Stat. Auth.: ORS 654.025(2) and 656.726(3).

Hist: APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89.

### **437-003-3224      Vehicle Drivers and Riders**

- (1) *Scope. This rule applies, without regard to vehicle ownership when your employees drive or ride as part of their employment.*

*Note: The Oregon Bureau of Labor and Industries (BOLI) administers rules about using minors as drivers. Please contact the nearest BOLI office for more information.*

- (2) *Driver Qualifications. You must not allow an employee to drive a vehicle on a public highway or road unless they have a valid driver's license appropriate for that type vehicle.*
- (3) *General Safety.*
- (a) *Do not allow employees to drive or ride in any vehicle known to be unsafe.*
  - (b) *Require employees to report any safety problems effecting vehicles you own or provide.*
- (4) *Rider Safety - General.*
- (a) *Except as in (5), (6) and (7), do not allow employees to occupy a vehicle in excess of its seating capacity.*

- (b) Require employees to comply with all applicable seatbelt and traffic safety laws.*
- (5) Rider Safety in the Bed of Dump Trucks, Pickups and Similar Vehicles. Do not transport workers in the beds of dump trucks, pickups or similar vehicles unless these conditions are met when applicable:*
- (a) When seating is available, it must be secure to the floor and passengers may not stand.*
- (b) The bed is secure to the frame. Beds that tilt or slide must be secure from movement.*
- (c) Dump beds must be secure or the activating lever locked.*
- (d) The total height of the sides of the transport area must be at least 42 inches. If riders sit on the floor, the height must be at least 24 inches.*
- (e) There must be a tailgate the same height as the sides or three evenly spaced chains, cables or ropes taut across the back.*
- (f) Not more than 4 workers may ride on a flatbed without sides or a tailgate and then only when the speed will not be more than 30 mph. There must be two handholds for each rider.*
- (g) Workers must not ride in space with cargo unless it is secure from movement.*
- (6) Standing Rider Safety – Buses. Riders must not sit on the floor while the vehicle is moving. Riders may stand if these conditions are met:*
- (a) There must be an aisle at least 12 inches wide leading to the emergency exit.*
- (b) There are no seats in or boards across the aisle.*
- (c) There must be handholds for standing riders.*
- (d) Not more than one rider per row of seats may stand.*
- (e) Riders may not sit or stand near the driver and not ahead of the forward-most row of seats.*
- (f) Workers in transit must not stand for more than one hour or 45 miles, whichever is less. At the end of that period, the standing workers must get a seat or the vehicle must stop for a 15-minute rest allowing the workers to get out.*
- (7) Fueling.*
- (a) There must be no smoking or other source of ignition within 25 feet of any refueling operation.*

- (b) Do not fill any container that is not bonded or grounded while it is inside the vehicle in the pickup bed or anyplace other than on the ground.*
- (c) Stop the engine (except diesels) during fueling.*
- (d) Refueling vehicles with LPG must be outdoors.*
- (8) Hauling gasoline or flammable liquid.*
- (a) For buses, vehicles that carry 16 or more, crew trucks, vans and passenger cars, use only DOT or UL approved containers that hold 5 gallons or less and secure them in an area separate from passengers.*
- (b) For pickups, flatbeds and other vehicles not in (a), there is no container size limit as long it is not in an enclosed passenger area.*
- (9) Hauling Explosives. When hauling explosives, only the driver and one qualified person may be in the vehicle. Comply with OAR 437-002-1910.109 and 437-002-0109.*
- (10) Loading or Unloading. When loading or unloading vehicles in a manner that is likely to cause the vehicle to move, set the brakes and chock the wheels.*
- (11) High Voltage Clearances. When operating a vehicle near overhead lines carrying more than 600v, OAR 437-002-0047 applies for general industry employers and OAR 437-003-0047 applies for Construction employers.*
- (12) Traffic Control. Adequate and appropriate traffic control devices must be used when vehicles are parked on or adjacent to a highway, street, or road in a way that creates a hazard and when traffic cannot adjust safely on its own. The traffic control devices' design and use must conform to the Manual of Uniform Traffic Control Devices for Streets and Highways, 2009 Edition, December 2009 (including Revision 1 dated May 2012 and Revision 2 dated May 2012) (MUTCD), incorporated by reference in 1926.6.*

**Note:** The MUTCD is available electronically at [mutcd.fhwa.dot.gov](http://mutcd.fhwa.dot.gov), or printed copies are available to purchase from The American Traffic Safety Services Association, 1-800-231-3475, [www.atssa.com](http://www.atssa.com); the Institute of Transportation Engineers, 202-785-0060, [www.ite.org](http://www.ite.org); or the American Association of State Highway and Transportation Officials, 1-800-231-3475, [store.transportation.org](http://store.transportation.org)

**Note:** Employers who follow the most current edition of the Oregon Department of Transportation's Temporary Traffic Control Handbook are considered in compliance with this requirement.

Stat. Auth.: ORS 654.025(2) and 656.726(4).

Stats. Implemented: ORS 654.001 through 654.295.

Hist: OR-OSHA Admin. Order 6-2007, f. 9/26/07, ef. 9/26/07.

OR-OSHA Admin. Order 3-2019, f. 10/29/19, ef. 10/29/19.

### **437-003-3225    Vehicles for Highway and Road Operation Characteristics and Maintenance**

- (1) *Scope. This applies to employer-owned vehicles licensed for highway and road use, driven and/or maintained by employees on public or private property, except the following:*
- (a) *Powered Industrial Trucks covered by OR-OSHA standard 1910.178 and OAR 437-002-0227.*
  - (b) *Earth moving equipment (scrapers, loaders, bulldozers and graders) covered by OAR 437-003-1926.602.*
  - (c) *Manufactured structures, ATVs, golf carts and other similar devices not intended for highway or road use.*
- Note:** *When operating a vehicle near overhead power lines more than 600 volts, OAR 437-002-0047 applies for General Industry employers and OAR 437-003-0047 applies for Construction employers.*
- (2) *Vehicle Components.*
- (a) *The engine start/stop control must be within reach of the driver.*
  - (b) *There must be steps, ladders and railings to allow safe access to and exit from areas on vehicles where employees must access. Steps and rungs must be slip resistant.*
  - (c) *Vehicles whose cargo is loaded by cranes, power shovels or other powered loaders must have a cab or cab shield that protects the occupants from the impact of falling material.*
  - (d) *Secure all material, equipment or tools to prevent movement or a barrier must be in place to protect the occupants from moving items.*
  - (e) *Vehicles with cabs must have a door or doors for entry and exit.*
  - (f) *Vehicle cargo must not prevent occupants from exiting under any condition.*
  - (g) *Vehicles must comply with ORS 811.225, Failure to Maintain Safety Belts in Working Order.*
- (3) *Flashing Warning Lights. Buses with a capacity of 16 or more passengers must have a working flashing light system that complies with ORS 816.260 if they load or unload passengers on a public highway or road.*
- (4) *Buses and Crew Trucks.*

- (a) Buses and crew trucks must have a secure seat with back rest for each occupant.*
  - (b) Buses with an enclosed seating area for 12 or more workers, unless loaded from the rear, must have an emergency exit not less than 24 inches wide by not less than 48 inches high on the left side or rear of the vehicle. It must open easily from inside or outside the vehicle.*
- (5) Passenger Compartments.*
- (a) Floors and decks must be slip resistant.*
  - (b) Seal openings between the engine compartment and muffler area to prevent carbon monoxide from entering the enclosed passenger compartment.*
  - (c) Enclosed passenger compartment must be substantially dust proof and watertight.*
  - (d) Areas where workers sit or stand must be free of protruding nails, screws, splinters or similar physical hazards.*
  - (e) Protect riders from inclement weather by enclosing riding areas as necessary.*
- (6) Steering. Do not allow spinner knobs on vehicles without power steering. Spinner knobs must be on the inside of the steering wheel.*
- (7) Lighting. Where general lighting in vehicle operating areas is less than 2 footcandles per square foot, vehicles must have working lights that sufficiently light the travel path.*
- (8) Testing, Maintenance, and Repair.*
- (a) Block or crib heavy machinery, equipment or parts supported by slings, hoists, jacks or otherwise prevent it from falling before employees work underneath or between such objects.*
  - (b) During repair or maintenance set all controls in neutral, stop the motor and set the brakes unless the work requires otherwise.*
  - (c) During maintenance or inspection on vehicles with dump bins, use an attached, lockable support that prevents unintentional lowering of the bin.*
  - (d) Disconnect the vehicle battery when the work allows and the energized system could cause injury.*
- (9) Warning Devices.*
- (a) All vehicles must have a working horn that can be heard above surrounding area noise.*

*Paragraph (b) does not apply when the vehicle backs up with an observer or when the operator verifies that there is nobody behind the vehicle or when nobody may enter the danger area without the operator's knowledge.*

*(b) Vehicles with an obstructed view to the rear must have a backup alarm that can be heard over the surrounding noise. If surrounding noise prevents this or if there are so many vehicles using backup alarms that they cannot be distinguished from each other, flashing or strobe lights are acceptable.*

*(10) Control of Exhaust Gases.*

*(a) Vehicles must have a working muffler.*

*(b) Exhaust pipes must direct the gasses away from occupants.*

*(c) Insulate or otherwise protect exhaust pipes exposed to worker contact.*

*(11) First Aid Kits. Vehicles for transport of 16 or more workers must have a clean, stocked first aid kit with enough supplies for the number of workers usually transported.*

*Note: Laws and/or administrative rules administered by other government agencies require fire extinguishers in vehicles under specifically defined circumstances.*

*(12) Controls.*

*(a) Levers that control dump or hoist devices must have a latch or other device that prevents accidental starting or tripping of the mechanism.*

*(b) The operator of a dump truck must be able to operate the tailgate trip handle from a position clear of the dumping load.*

Stat. Auth.: ORS 654.025(2) and 656.726(4).

Stats. Implemented: ORS 654.001 through 654.295.

Hist: OR-OSHA Admin. Order 6-2007, f. 9/26/07, ef. 9/26/07.

**437-003-3226 Vehicles for Use on Property Other Than Public Roads and Highways Operation, Characteristics and Maintenance**

*(1) Scope. This rule applies to employer-owned vehicles, not licensed or normally operated on public highways or roads, except the following:*

*(a) Powered Industrial Trucks covered in OR-OSHA standard 1910.178 and OAR 437-002-0227.*

*(b) Earth moving equipment, (scrapers, loaders, bulldozers and graders) covered by OAR 437-003-1926.602.*

*(c) Manufactured structures, ATVs, golf carts and other similar devices not intended for highway or road use.*

*(2) Safe Operation. You must require the driver to:*

*(a) Look in the direction of travel and have a clear view unless being guided by somebody with a clear view of the route.*

*(b) Slow or stop as appropriate at intersections and not drive in marked pedestrian lanes.*

*(c) Not drive a vehicle up to a person standing in front of a stationary object.*

*(d) Manually control all towed or pushed vehicles unless they use a towbar.*

*(3) Vehicle Loads. You must protect employees from hazardous vehicle loads by requiring that they:*

*(a) Not load a vehicle beyond its rated capacity.*

*(b) Stabilize, lash down or otherwise secure the load.*

*(c) Never be under an elevated load.*

*(4) Basic Equipment Requirements. You must assure your vehicles comply with the following:*

*(a) Vehicles with windshields must have working powered wipers and an effective defroster.*

*(b) There must be no broken glass that impairs the driver's vision.*

*(c) When the load or passengers obstruct the use of the interior rear view mirror, there must be an outside rear view mirror on each side of the vehicle.*

*(d) Vehicle brakes must be effective when the vehicle is fully loaded. The parking brake must hold the loaded vehicle on any slope which it may operate.*

**Note:** *The rules on safety chains do not apply to saddle-mount towing, or to a semitrailer coupled to a towing vehicle with a fifth wheel and kingpin assembly so designed that the upper and lower halves may not separate without being manually released onto a dolly without a tow bar.*

*(5) Uncoupled towing. You must assure that:*

*(a) Towed vehicles with a gross weight of 5,000 pounds or less must have at least one safety chain or cable. Towed vehicles with a gross weight more than 5,000 pounds must have at least two safety chains or cables.*

*(b) Safety chains or cables must be strong enough to control the towed vehicle in event the tow bar or coupling device fails.*

- (c) Safety chains or cables must connect to the towed and towing vehicles and to the tow bar so as to prevent the tow bar from dropping to the ground if it or the coupling device fails.*
  - (d) There must be only enough slack in safety chains or cables to permit proper turning.*
- (6) Coupled towing. You must assure that:*
- (a) Drawbar, coupling device, and other connections for towing of trailers must be strong enough to hold the weight of the towed vehicle on any grade over which it may operate.*
  - (b) Any coupling device on any towing vehicle used as a connection for the tow bar on any towed vehicle with a gross weight more than 5,000 pounds must be firmly attached to the frame or to a solid connection to the frame.*
  - (c) There must be a suitable locking means to prevent accidental separation of the towed and towing vehicles.*
  - (d) Connections must have only enough slack to allow for universal action of the connections.*

**Note:** *When operating a vehicle near overhead power lines more than 600 volts, OAR 437-002-0047 applies for General Industry employers and OAR 437-003-0047 applies for Construction employers.*

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 6-2007, f. 9/26/07, ef. 9/26/07.

## **1926.602 Material Handling Equipment**

### **(a) Earthmoving equipment; General.**

- (1) These rules apply to the following types of earthmoving equipment: scrapers, loaders, crawler or wheel tractors, bulldozers, off-highway trucks, graders, agricultural and industrial tractors, and similar equipment. The promulgation of specific rules for compactors and rubber-tired "skid-steer" equipment is reserved pending consideration of standards currently being developed.**
- (2) Seat belts.**

- (i) Seat belts shall be provided on all equipment covered by this section and shall meet the requirements of the Society of Automotive Engineers, J386-1969, Seat Belts for Construction Equipment. Seat belts for agricultural and light industrial tractors shall meet the seat belt requirements of Society of Automotive Engineers J333a-1970, Operator Protection for Agricultural and Light Industrial Tractors.
  - (ii) Seat belts need not be provided for equipment which is designed only for standup operation.
  - (iii) Seat belts need not be provided for equipment which does not have roll-over protective structure (ROPS) or adequate canopy protection.
- (3) Access roadways and grades.
- (i) No employer shall move or cause to be moved construction equipment or vehicles upon any access roadway or grade unless the access roadway or grade is constructed and maintained to accommodate safely the movement of the equipment and vehicles involved.
  - (ii) Every emergency access ramp and berm used by an employer shall be constructed to restrain and control runaway vehicles.
- (4) Brakes. All earthmoving equipment mentioned in this 1926.602(a) shall have a service braking system capable of stopping and holding the equipment fully loaded, as specified in Society of Automotive Engineers SAE-J237, Loader Dozer-1971, J236, Graders-1971, and J319b, Scrapers-1971. Brake systems for self-propelled rubber-tired off-highway equipment manufactured after January 1, 1972 shall meet the applicable minimum performance criteria set forth in the following Society of Automotive Engineers Recommended Practices:

Self-Propelled Scrapers	SAE J319b-1971
Self-Propelled Graders	SAE J236-1971
Trucks and Wagons	SAE J166-1971
Front End Loaders and Dozers	SAE J237-1971

- (5) Fenders. Pneumatic-tired earth-moving haulage equipment (trucks, scrapers, tractors, and trailing units) whose maximum speed exceeds 15 miles per hour, shall be equipped with fenders on all wheels to meet the requirements of Society of Automotive Engineers SAE J321a-1970, Fenders for Pneumatic-Tired Earthmoving Haulage Equipment. An employer may, of course, at any time seek to show under 1926.2, that the uncovered wheels present no hazard to personnel from flying materials.

- (6) Rollover protective structures (ROPS). See Subpart W of this part for requirements for rollover protective structures and overhead protection.
- (7) Rollover protective structures for off-highway trucks. The promulgation of standards for rollover protective structures for off-highway trucks is reserved pending further study and development.
- (8) Specific effective dates – brakes and fenders.
  - (i) Equipment mentioned in paragraph (a)(4) and (5) of this section, and manufactured after January 1, 1972, which is used by any employer after that date, shall comply with the applicable rules prescribed therein concerning brakes and fenders. Equipment mentioned in paragraphs (a)(4) and (5) of this section, and manufactured before January 1, 1972, which is used by any employer after that date, shall meet the applicable rules prescribed herein not later than June 30, 1973. It should be noted that, as permitted under 1926.2, employers may request variations from the applicable brakes and fender standards required by this subpart. Employers wishing to seek variations from the applicable brakes and fenders rules may submit any requests for variations after the publication of this document in the Federal Register. Any statements intending to meet the requirements of 1926.2(b)(4), should specify how the variation would protect the safety of the employees by providing for any compensating restrictions on the operation of equipment.
  - (ii) Notwithstanding the provisions of paragraphs (a)(5) and (a)(8)(i) of this section, the requirement that fenders be installed on pneumatic-tired earth-moving haulage equipment, is suspended pending reconsideration of the requirement.
- (9) Audible alarms.
  - (i) All bidirectional machines, such as rollers, compacters, front-end loaders, bulldozers, and similar equipment, shall be equipped with a horn, distinguishable from the surrounding noise level, which shall be operated as needed when the machine is moving in either direction. The horn shall be maintained in an operative condition.
  - (ii) No employer shall permit earthmoving or compacting equipment which has an obstructed view to the rear to be used in reverse gear unless the equipment has in operation a reverse signal alarm distinguishable from the surrounding noise level or an employee signals that it is safe to do so.
- (10) Scissor points. Scissor points on all front-end loaders, which constitute a hazard to the operator during normal operation, shall be guarded.

(b) Excavating and other equipment.

- (1) Tractors covered in paragraph (a) of this section shall have seat belts as required for the operators when seated in the normal seating arrangement for tractor operation, even though back-hoes, breakers, or other similar attachments are used on these machines for excavating or other work.
- (2) For the purposes of this subpart and of Subpart N of this part, the nomenclatures and descriptions for measurement of dimensions of machinery and attachments shall be as described in Society of Automotive Engineers 1970 Handbook, pages 1088 through 1103.
- (3) The safety requirements, ratios, or limitations applicable to machines or attachment usage covered in Power Crane and Shovel Associations Standards No. 1 and No. 2 of 1968, and No. 3 of 1969, shall be complied with, and shall apply to cranes, machines, and attachments under this part.

(c) Lifting and hauling (other than equipment covered under Subpart N of this part).

**Note:** See Subdivision CC.

- (1) Industrial trucks shall meet the requirements of 1926.600 and the following:
  - (i) Lift trucks, stackers, etc., shall have the rated capacity clearly posted on the vehicle so as to be clearly visible to the operator. When auxiliary removable counterweights are provided by the manufacturer, corresponding alternate rated capacities also shall be clearly shown on the vehicle. These ratings shall not be exceeded.
  - (ii) No modifications or additions which affect the capacity or safe operation of the equipment shall be made without the manufacturer's written approval. If such modifications or changes are made, the capacity, operation, and maintenance instruction plates, tags, or decals shall be changed accordingly. In no case shall the original safety factor of the equipment be reduced.
  - (iii) If a load is lifted by two or more trucks working in unison, the proportion of the total load carried by any one truck shall not exceed its capacity.
  - (iv) Steering or spinner knobs shall not be attached to the steering wheel unless the steering mechanism is of a type that prevents road reactions from causing the steering handwheel to spin. The steering knob shall be mounted within the periphery of the wheel.

- (v) All high lift rider industrial trucks shall be equipped with overhead guards which meet the configuration and structural requirements as defined in paragraph 421 of American National Standards Institute B56.1-1969, Safety Standards for Powered Industrial Trucks.
- (vi) All industrial trucks in use shall meet the applicable requirements of design, construction, stability, inspection, testing, maintenance, and operation, as defined in American National Standards Institute B56.1-1969, Safety Standards for Powered Industrial Trucks.
- (vii) Unauthorized personnel shall not be permitted to ride on powered industrial trucks. A safe place to ride shall be provided where riding of trucks is authorized.
- (viii) Whenever a truck is equipped with vertical only, or vertical and horizontal controls elevatable with the lifting carriage or forks for lifting personnel, the following additional precautions shall be taken for the protection of personnel being elevated:
  - (A) Use of safety platform firmly secured to the lifting carriage and/or forks.
  - (B) Means shall be provided whereby personnel on the platform can shut off power to the truck.
  - (C) Such protection from falling objects as indicated necessary by the operating conditions shall be provided.

#### **437-003-0094    Personnel Platforms**

*Whenever a lift truck is used for lifting personnel without controls at the platform, the following precautions shall be taken for the protection of personnel being elevated:*

- (1) A work platform equipped with standard guardrails or equivalent means, and firmly secured to the lifting carriage or forks, shall be used.*
- (2) The hydraulic system shall be so designed that the lift mechanism will not drop faster than 135 feet per minute in the event of a failure in any part of the system.*
- (3) An operator shall attend the lift equipment while workers are on the platform.*
- (4) The operator shall be in the normal operating position while raising or lowering the platform.*

- (5) The vehicle shall not travel from point to point with the work platform elevated at a height greater than 4 feet while workers are on the platform. When necessary at heights greater than 4 feet, inching may be permitted provided it is done at a very slow speed.*
- (6) If workers on the platform can contact the lift chains or other dangerous pinch or shear points on the mast or carriage, the platform must have a screen or guard that prevents contact.*

Stat. Auth.: ORS 654.025(2) and 656.726(3).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 6-1999, f. 5/26/99, ef. 5/26/99.

## 1926.602 (d) Powered industrial truck operator training.

**Note:** The requirements applicable to construction work under this paragraph are identical to those set forth at 1910.178(l) of this chapter.

For your convenience, 1910.178(l) is printed here.

### 1910.178 Powered Industrial Trucks

#### (l) Operator training

##### (1) Safe operation.

- (i) The employer shall ensure that each powered industrial truck operator is competent to operate a powered industrial truck safely, as demonstrated by the successful completion of the training and evaluation specified in this paragraph (l).
- (ii) Prior to permitting an employee to operate a powered industrial truck (except for training purposes), the employer shall ensure that each operator has successfully completed the training required by this paragraph (l), except as permitted by paragraph (l)(5).

##### (2) Training program implementation.

- (i) Trainees may operate a powered industrial truck only:
  - (A) Under the direct supervision of persons who have the knowledge, training, and experience to train operators and evaluate their competence; and
  - (B) Where such operation does not endanger the trainee or other employees.
- (ii) Training shall consist of a combination of formal instruction (e.g., lecture, discussion, interactive computer learning, video tape, written material), practical training (demonstrations performed by the trainer and practical exercises performed by the trainee), and evaluation of the operator's performance in the workplace.
- (iii) All operator training and evaluation shall be conducted by persons who have the knowledge, training, and experience to train powered industrial truck operators and evaluate their competence.

(3) Training program content. Powered industrial truck operators shall receive initial training in the following topics, except in topics which the employer can demonstrate are not applicable to safe operation of the truck in the employer's workplace.

(i) Truck-related topics:

- (A) Operating instructions, warnings, and precautions for the types of truck the operator will be authorized to operate;
- (B) Differences between the truck and the automobile;
- (C) Truck controls and instrumentation: where they are located, what they do, and how they work;
- (D) Engine or motor operation;
- (E) Steering and maneuvering;
- (F) Visibility (including restrictions due to loading);
- (G) Fork and attachment adaptation, operation, and use limitations;
- (H) Vehicle capacity;
- (I) Vehicle stability;
- (J) Any vehicle inspection and maintenance that the operator will be required to perform;
- (K) Refueling and/or charging and recharging of batteries;
- (L) Operating limitations;
- (M) Any other operating instructions, warnings, or precautions listed in the operator's manual for the types of vehicle that the employee is being trained to operate.

(ii) Workplace-related topics:

- (A) Surface conditions where the vehicle will be operated;
- (B) Composition of loads to be carried and load stability;
- (C) Load manipulation, stacking, and unstacking;
- (D) Pedestrian traffic in areas where the vehicle will be operated;
- (E) Narrow aisles and other restricted places where the vehicle will be operated;
- (F) Hazardous (classified) locations where the vehicle will be operated;
- (G) Ramps and other sloped surfaces that could affect the vehicle's stability;
- (H) Closed environments and other areas where insufficient ventilation or poor vehicle maintenance could cause a buildup of carbon monoxide or diesel exhaust;
- (I) Other unique or potentially hazardous environmental conditions in the workplace that could affect safe operation.

(iii) The requirements of this section.

(4) Refresher training and evaluation.

(i) Refresher training, including an evaluation of the effectiveness of that training, shall be conducted as required by paragraph (l)(4)(ii) to ensure that the operator has the knowledge and skills needed to operate the powered industrial truck safely.

(ii) Refresher training in relevant topics shall be provided to the operator when:

- (A) The operator has been observed to operate the vehicle in an unsafe manner;
- (B) The operator has been involved in an accident or near-miss incident;
- (C) The operator has received an evaluation that reveals that the operator is not operating the truck safely;
- (D) The operator is assigned to drive a different type of truck; or
- (E) A condition in the workplace changes in a manner that could affect safe operation of the truck.

(iii) An evaluation of each powered industrial truck operator’s performance shall be conducted at least once every three years.

(5) Avoidance of duplicative training. If an operator has previously received training in a topic specified in paragraph (l)(3) of this section, and such training is appropriate to the truck and working conditions encountered, additional training in that topic is not required if the operator has been evaluated and found competent to operate the truck safely.

(6) Certification. The employer shall certify that each operator has been trained and evaluated as required by this paragraph (l). The certification shall include the name of the operator, the date of the training, the date of the evaluation, and the identity of the person(s) performing the training or evaluation.

(7) Dates. The employer shall ensure that operators of powered industrial trucks are trained, as appropriate, by the dates shown in the following table.

If the employee was hired:	The initial training and evaluation of that employee must be completed:
Before December 1, 1999	By December 1, 1999.
After December 1, 1999	Before the employee is assigned to operate a powered industrial truck.

(8) Appendix A to this section provides non-mandatory guidance to assist employers in implementing this paragraph (l). This appendix does not add to, alter, or reduce the requirements of this section.

## 1926.603 Pile Driving Equipment

### (a) General requirements.

- (1) Boilers and piping systems which are a part of, or used with, pile driving equipment shall meet the applicable requirements of the American Society of Mechanical Engineers, Power Boilers (section I).
- (2) All pressure vessels which are a part of, or used with, pile driving equipment shall meet the applicable requirements of the American Society of Mechanical Engineers, Pressure Vessels (section VIII).
- (3) Overhead protection, which will not obscure the vision of the operator and which meets the requirements of Subpart N of this part, shall be provided. Protection shall be the equivalent of 2-inch planking or other solid material of equivalent strength.
- (4) Stop blocks shall be provided for the leads to prevent the hammer from being raised against the head block.
- (5) A blocking device, capable of safely supporting the weight of the hammer, shall be provided for placement in the leads under the hammer at all times while employees are working under the hammer.
- (6) Guards shall be provided across the top of the head block to prevent the cable from jumping out of the sheaves.
- (7) When the leads must be inclined in the driving of batter piles, provisions shall be made to stabilize the leads.
- (8) Fixed leads shall be provided with ladder, and adequate rings, or similar attachment points, so that the loft worker may engage his safety belt lanyard to the leads. If the leads are provided with loft platform(s), such platform(s) shall be protected by standard guardrails.
- (9) Steam hose leading to a steam hammer or jet pipe shall be securely attached to the hammer with an adequate length of at least 1/4 inch diameter chain or cable to prevent whipping in the event the joint at the hammer is broken. Air hammer hoses shall be provided with the same protection as required for steam lines.
- (10) Safety chains, or equivalent means, shall be provided for each hose connection to prevent the line from thrashing around in case the coupling becomes disconnected.
- (11) Steam line controls shall consist of two shutoff valves, one of which shall be a quick-acting lever type within easy reach of the hammer operator.

- (12) Guys, outriggers, thrustouts, or counterbalances shall be provided as necessary to maintain stability of pile driver rigs.
- (b) Pile driving from barges and floats. Barges or floats supporting pile driving operations shall meet the applicable requirements of 1926.605.
- (c) Pile driving equipment.
- (1) Engineers and winchers shall accept signals only from the designated signalers.
  - (2) All employees shall be kept clear when piling is being hoisted into the leads.
  - (3) When piles are being driven in an excavated pit, the walls of the pit shall be sloped to the angle of repose or sheet-piled and braced.
  - (4) When steel tube piles are being “blown out”, employees shall be kept well beyond the range of falling materials.
  - (5) When it is necessary to cut off the tops of driven piles, pile driving operations shall be suspended except where the cutting operations are located at least twice the length of the longest pile from the driver.
  - (6) When driving jacked piles, all access pits shall be provided with ladders and bulkheaded curbs to prevent material from falling into the pit.

Stat. Auth.: ORS 654.025(2) and 656.726(3).

Hist: APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).

APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

## 1926.604 Site Clearing

- (a) General requirements.
- (1) Employees engaged in site clearing shall be protected from hazards of irritant and toxic plants and suitably instructed in the first aid treatment available.
  - (2) All equipment used in site clearing operations shall be equipped with rollover guards meeting the requirements of this subpart. In addition, rider-operated equipment shall be equipped with an overhead and rear canopy guard meeting the following requirements:
    - (i) The overhead covering on this canopy structure shall be of not less than 1/8 inch steel plate or 1/4 inch woven wire mesh with openings no greater than 1 inch, or equivalent.
    - (ii) The opening in the rear of the canopy structure shall be covered with not less than 1/4 inch woven wire mesh with openings no greater than 1 inch.

**(b) Specific requirements. (Reserved)**

Stat. Auth.: ORS 654.025(2) and 656.726(3).  
Hist: APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

**1926.605 Marine Operations and Equipment****(a) Material handling operations.**

- (1) Operations fitting the definition of “material handling” shall be performed in conformance with applicable requirements of Part 1918, “Safety and Health Regulations for Longshoring” of this chapter. The term “longshoring operations” means the loading, unloading, moving, or handling of construction materials, equipment and supplies, etc. into, in, on, or out of any vessel from a fixed structure or shore-to-vessel, vessel-to-shore or fixed structure or vessel-to-vessel.

**(b) Access to barges.**

- (1) Ramps for access of vehicles to or between barges shall be of adequate strength, provided with side boards, well maintained, and properly secured.
- (2) Unless employees can step safely to or from the wharf, float, barge, or river towboat, either a ramp, meeting the requirements of paragraph (b)(1) of this section, or a safe walkway, shall be provided.
- (3) Jacob’s ladders shall be of the double rung or flat tread type. They shall be well maintained and properly secured.
- (4) A Jacob’s ladder shall either hang without slack from its lashings or be pulled up entirely.
- (5) When the upper end of the means of access rests on or is flush with the top of the bulwark, substantial steps properly secured and equipped with at least one substantial hand rail approximately 33 inches in height, shall be provided between the top of the bulwark and the deck.
- (6) Obstructions shall not be laid on or across the gangway.
- (7) The means of access shall be adequately illuminated for its full length.
- (8) Unless the structure makes it impossible, the means of access shall be so located that the load will not pass over employees.

**(c) Working surfaces of barges.**

- (1) Employees shall not be permitted to walk along the sides of covered lighters or barges with coamings more than 5 feet high, unless there is a 3-foot clear walkway, or a grab rail, or a taut handline is provided.
  - (2) Decks and other working surfaces shall be maintained in a safe condition.
  - (3) Employees shall not be permitted to pass fore and aft, over, or around deckloads, unless there is a safe passage.
  - (4) Employees shall not be permitted to walk over deckloads from rail to coaming unless there is a safe passage. If it is necessary to stand at the outboard or inboard edge of the deckload where less than 24 inches of bulwark, rail, coaming, or other protection exists, all employees shall be provided with a suitable means of protection against falling from the deckload.
- (d) First-aid and lifesaving equipment.
- (1) Provisions for rendering first aid and medical assistance shall be in accordance with Subpart D of this part.
  - (2) The employer shall ensure that there is in the vicinity of each barge in use at least one U.S. Coast Guard-approved 30-inch lifering with not less than 90 feet of line attached, and at least one portable or permanent ladder which will reach the top of the apron to the surface of the water. If the above equipment is not available at the pier, the employer shall furnish it during the time that he is working the barge.
  - (3) Employees walking or working on the unguarded decks of barges shall be protected with U.S. Coast Guard-approved work vests or buoyant vests.
- (e) Commercial diving operations. Commercial diving operations shall be subject to Subpart T of Part 1910, 1910.401-1910.441, of this chapter.

[39 FR 22801, June 24, 1974, as amended at 42 FR 37674, July 22, 1977]

## 1926.606 Definitions Applicable to this Subdivision

- (a) **Apron** – The area along the waterfront edge of the pier or wharf.
- (b) **Bulwark** – The side of a ship above the upper deck.
- (c) **Coaming** – The raised frame, as around a hatchway in the deck, to keep out water.
- (d) **Jacob's ladder** – A marine ladder of rope or chain with wooden or metal rungs.

(e) **Rail**, for the purpose of 1926.605, means a light structure serving as a guard at the outer edge of a ship's deck.

Stat. Auth.: ORS 654.025(2) and 656.726(3).

Hist: APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89).

OR-OSHA Admin. Order 6-1991, f. 3/18/91, ef. 4/15/91.

## Historical Notes for Subdivision O

**Note:** The Accident Prevention Division adopted Division 3, Construction on a temporary basis effective May 1, 1989. It contained new and revised federal occupational safety and health rules for the Construction industry. APD is now announcing that these same rules have been duly filed for permanent adoption. Division 3, Construction replaced Oregon codes Division 83 and 84. Some individual rules from each of these divisions have been retained and adopted into the new Division 3 as Oregon initiated rules.

This is Oregon OSHA Administrative Order 8-1989, filed and effective July 7, 1989.

**Note:** Oregon OSHA adopted by reference the new federal OSHA powered industrial truck operator training standard. The new rule requires a training program based on: the trainee's prior knowledge and skill, types of powered industrial trucks in use, hazards in the workplace, and the operator's demonstrated ability to handle a powered industrial truck safely. The new training standard will apply to all Oregon employers except agriculture.

The existing Oregon initiated rule 437-002-0227, Additional Oregon Rules for powered industrial trucks in Division 2/N was amended to avoid any duplication with federal text. Similar language was added in Oregon OSHA's Division 3/O, ad rule 437-003-0094, to accompany the new federal standard on powered industrial truck operator training to maintain uniformity between construction and general industry standards. Also adopted at this time, is a portion of the material handling equipment rule in the construction standard (Oregon's Division 3/O), 1926.602(c)(vii) and (viii); and, a portion of the cranes and derricks rule (in Division 3/N) 1926.550(a)(19), which Oregon had inadvertently not adopted from the June 30, 1993 Federal Register.

This is Oregon OSHA Administrative Order 6-1999, filed and effective May 26, 1999.

**Note:** Federal OSHA published in the June 2, 2003 Federal Register a technical amendment that affects Oregon's Division 2/N and 3/O. This technical amendment deletes a powered industrial truck standard covering the use of powered industrial trucks to life personnel. It was deleted because it was invalidly promulgated from a non-mandatory provision of a national consensus standard.

Oregon OSHA deleted paragraph 1910.178(m)(12) from Division 2/N, and an identical paragraph applicable to construction, 1926.602(c)(1)(viii) from Division 3/O. Oregon OSHA's OAR 437-002-0227(4), Personnel platforms, still applies in general industry, and 437-003-0094 applies in construction. These standards address similar hazards as the repealed federal standards.

This is Oregon OSHA Administrative Order 7-2003, filed and effective December 5, 2003.

**Note:** This is a reorganization of the existing Oregon OSHA rules on vehicles in Divisions 2, General Industry, and 3, Construction. Current vehicle rules in both divisions are repealed. This rulemaking converts the rules to plain language. It also deletes a few rules that were deemed outdated or unnecessary as duplicative of rules administered by other Oregon agencies. It reorganized the old rule into three new rules. The requirement for fire extinguishers in vehicles is deleted. The requirement prohibiting persons under 18 from operating vehicles is eliminated and a note is added referring readers to BOLI for guidance on the employment of minors. New requirements: Not allow an employee to drive a vehicle on a public highway or road unless they have a valid driver's license appropriate for vehicle type; employees are to report any safety problems effecting vehicles the employer owns or provides; and a requirement to fill flammable containers outside the vehicle.

This is Oregon OSHA Administrative Order 6-2007, filed and effective September 26, 2007.

**Note:** This rulemaking is to keep Oregon OSHA in harmony with recent changes to federal OSHA's standards. Oregon OSHA adopted most of the federal OSHA changes as they appeared in the August 9, 2010 federal register. These changes revise the construction industry crane and derrick rules found in Subpart CC. 1926.600 was amended by revising paragraph (a)(6). Oregon OSHA is not adopting 1926.600(a)(6)(i), (a)(6)(ii), and (a)(6)(v), but adopted new rule OAR 437-003-3600 Equipment, to replace federal OSHA language of "crane" with "equipment" in the three paragraphs.

This is Oregon OSHA Administrative Order 1-2011, filed and effective February 9, 2011.

**Note:** Oregon OSHA is adopting changes to their administrative (recordkeeping), general industry, and construction standards, and updating references in the maritime activity standards in response to federal OSHA's adoption of final rules published in the May 14, 2019 Federal Register. This is Phase IV of federal OSHA's Standards Improvement Project (SIP-IV), the fourth in a series of rulemakings to improve and streamline workplace safety and health standards. Oregon's response removes or revises rules or requirements within our corresponding rules that are outdated, duplicative, or inconsistent. This rulemaking is anticipated to reduce regulatory burden and compliance costs while maintaining or enhancing worker safety and health as well as worker privacy protections.

In Division 30, Oregon OSHA adopted updates to the 2009 edition of the Manual of Uniform Traffic Control Devices (MUTCD)- including two revisions dated May 2012- as incorporated by reference in 1926.6

This is Oregon OSHA Administrative Order 3-2019, filed and effective October 29, 2019.

**OREGON OCCUPATIONAL  
SAFETY AND HEALTH STANDARDS**

Oregon Administrative Rules, Chapter 437

**DIVISION 3 (29 CFR 1926)  
CONSTRUCTION**

**CONSTRUCTION**

**Subdivision P  
Excavations**

Oregon Occupational Safety and Health Division (Oregon OSHA)  
Department of Consumer and Business Services  
Salem, Oregon 97301-3882

AO 4-2011

The Oregon Department of Consumer and Business Services adopted these rules pursuant to ORS 654.025(2).

The Secretary of State Designated OAR Chapter 437 as the “Oregon Occupational Safety and Health Code.” Six general subject areas within this code are designated as “Divisions.”

- **Division 1** General Administrative Rules
- **Division 2** General Occupational Safety and Health Rules
- **Division 3** Construction
- **Division 4** Agriculture
- **Division 5** Maritime Activities
- **Division 7** Forest Activities
- **Oregon Revised Statutes (ORS) 654** The Oregon Safe Employment Act (OSEAct)

Oregon-initiated rules in this division of the Oregon Occupational Safety and Health Code are numbered in a uniform system developed by the Secretary of State. This system does not number the rules in sequence (001, 002, 003, etc.). Omitted numbers may be assigned to new rules at the time of their adoption.

**Oregon-initiated rules** are arranged in the following Basic Codification Structure adopted by the Secretary of State for Oregon Administrative Rules (OAR):

Chapter	Division	Rule	Section	Subsection	Paragraphs
437	003	1760	(1)	(a)	(A)(i)(I)

The majority of Oregon OSHA codes are adopted by reference from the Code of Federal Regulations (CFR), and are arranged in the following basic federal numbering system:

Chapter	Division	Part	Subpart (Subdivision)	Section	Paragraphs
437	003	1926	M	.502	(a)

The terms “subdivision” and “subpart” are synonymous within OAR 437, Oregon Occupational Safety and Health Code.

---

To obtain an order form or copies of these codes, address:

**Department of Consumer & Business Services  
Oregon Occupational Safety & Health Division (Oregon OSHA)  
350 Winter St. NE, Room 430  
Salem, OR 97301-3882**

Or call the Oregon OSHA Resource Library at 503-378-3272

The rules referenced in this division are available for viewing in the Office of the Secretary of State, Administrative Rules and Office Document Section, Oregon State Archives Building, Salem, Oregon 97310, or the Central Office, Oregon Occupational Safety and Health Division of the Department of Consumer and Business Services, Room 430, 350 Winter St. NE Salem, OR 97301-3882. # SCOPE, APPLICATION, & DEFINITIONS APPLICABLE TO THIS SUBDIVISION

P

## SUBDIVISION P

### EXCAVATIONS

**Authority:** Sec. 107, Contract Work Hours and Safety Standards Act (Construction Safety Act) (40 U.S.C. 333); Sections 4, 6, 8, Occupational Safety and Health Act of 1970 (29 U.S.C. 653, 655, 657); Secretary of Labor's Order No. 12-71 (36 FR 8754), 8-76 (41 FR 25059), or 9-83 (48 FR 35736), as applicable; and 29 CFR part 1911.

#### **§1926.650 Scope, Application, and Definitions Applicable to this Subdivision.**

**(a) Scope and application.** This subpart applies to all open excavations made in the earth's surface. Excavations are defined to include trenches.

#### **(b) Definitions applicable to this subdivision.**

**Accepted engineering practices** means those requirements which are compatible with standards of practice required by a registered professional engineer.

**Aluminum Hydraulic Shoring** means a pre-engineered shoring system comprised of aluminum hydraulic cylinders (crossbraces) used in conjunction with vertical rails (uprights) or horizontal rails (walers). Such system is designed, specifically to support the sidewalls of an excavation and prevent cave-ins.

**Bell-bottom pier hole** means a type of shaft or footing excavation, the bottom of which is made larger than the cross section above to form a belled shape.

**Benching (Benching system)** means a method of protecting employees from cave-ins by excavating the sides of an excavation to form one or a series of horizontal levels or steps, usually with vertical or near-vertical surfaces between levels.

**Cave-in** means the separation of a mass of soil or rock material from the side of an excavation, or the loss of soil from under a trench shield or support system, and its sudden movement into the excavation, either by falling or sliding, in sufficient quantity so that it could entrap, bury, or otherwise injure and immobilize a person.

**Competent person** means one who is capable of identifying existing and predictable hazards in the surroundings, or working conditions which are unsanitary, hazardous, or dangerous to employees, and who has authorization to take prompt corrective measures to eliminate them.

**Cross braces** mean the horizontal members of a shoring system installed perpendicular to the sides of the excavation, the ends of which bear against either uprights or wales.

# **P** SCOPE, APPLICATION, & DEFINITIONS APPLICABLE TO THIS SUBDIVISION

---

**Excavation** means any man-made cut, cavity, trench, or depression in an earth surface, formed by earth removal.

**Faces or sides** means the vertical or inclined earth surfaces formed as a result of excavation work.

**Failure** means the breakage, displacement, or permanent deformation of a structural member or connection so as to reduce its structural integrity and its supportive capabilities.

**Hazardous atmosphere** means an atmosphere which by reason of being explosive, flammable, poisonous, corrosive, oxidizing, irritating, oxygen deficient, toxic, or otherwise harmful, may cause death, illness, or injury.

**Kickout** means the accidental release or failure of a cross brace.

**Protective system** means a method of protecting employees from cave-ins, from material that could fall or roll from an excavation face or into an excavation, or from the collapse of adjacent structures. Protective systems include support systems, sloping and benching systems, shield systems, and other systems that provide the necessary protection.

**Ramp** means an inclined walking or working surface that is used to gain access to one point from another, and is constructed from earth or from structural materials such as steel or wood.

**Registered Professional Engineer** means a person who is registered as a professional engineer in the state where the work is to be performed. However, a professional engineer, registered in any state is deemed to be a “registered professional engineer” within the meaning of this standard when approving designs for “manufactured protective systems” or “tabulated data” to be used in interstate commerce.

**Sheeting** means the members of a shoring system that retain the earth in position and in turn are supported by other members of the shoring system.

**Shield (Shield system)** means a structure that is able to withstand the forces imposed on it by a cave-in and thereby protect employees within the structure. Shields can be permanent structures or can be designed to be portable and moved along as work progresses. Additionally, shields can be either pre-manufactured or job-built in accordance with §1926.652(c)(3) or (c)(4). Shields used in trenches are usually referred to as “trench boxes” or “trench shields.”

**Shoring (Shoring system)** means a structure such as a metal hydraulic, mechanical or timber shoring system that supports the sides of an excavation and which is designed to prevent cave-ins.

**Sides.** See “Faces.”

# SCOPE, APPLICATION, & DEFINITIONS APPLICABLE TO THIS SUBDIVISION

P

**Sloping (Sloping system)** means a method of protecting employees from cave-ins by excavating to form sides of an excavation that are inclined away from the excavation so as to prevent cave-ins. The angle of incline required to prevent a cave-in varies with differences in such factors as the soil type, environmental conditions of exposure, and application of surcharge loads.

**Stable rock** means natural solid mineral material that can be excavated with vertical sides and will remain intact while exposed. Unstable rock is considered to be stable when the rock material on the side or sides of the excavation is secured against caving-in or movement by rock bolts or by another protective system that has been designed by a registered professional engineer.

**Structural ramp** means a ramp built of steel or wood, usually used for vehicle access. Ramps made of soil or rock are not considered structural ramps.

**Support system** means a structure such as underpinning, bracing, or shoring, which provides support to an adjacent structure, underground installation, or the sides of an excavation.

**Tabulated data** means tables and charts approved by a registered professional engineer and used to design and construct a protective system.

**Trench (Trench excavation)** means a narrow excavation (in relation to its length) made below the surface of the ground. In general, the depth is greater than the width, but the width of a trench (measured at the bottom) is not greater than 15 feet (4.6 m). If forms or other structures are installed or constructed in an excavation so as to reduce the dimension measured from the forms or structure to the side of the excavation to 15 feet (4.6 m) or less (measured at the bottom of the excavation), the excavation is also considered to be a trench.

**Trench box.** See "Shield."

**Trench shield.** See "Shield."

**Uprights** means the vertical members of a trench shoring system placed in contact with the earth and usually positioned so that individual members do not contact each other. Uprights placed so that individual members are closely spaced, in contact with or interconnected to each other, are often called "sheeting."

**Wales** means horizontal members of a shoring system placed parallel to the excavation face whose sides bear against the vertical members of the shoring system or earth.

**Stat. Auth.:** ORS 654.025(2) and 656.726(4).

**Stats. Implemented:** ORS 654.001 through 654.295.

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

**§1926.651 Specific Excavation Requirements.**

***437-003-0096 Underground Installations.*** *In addition to and not in lieu of any rules relating to “underground installations” adopted in Oregon Administrative Rules, Chapter 437, the following Oregon Revised Statutes and Oregon Administrative Rules administered by the Oregon Public Utility Commission (PUC) shall apply:*

1. *ORS 757.541 through 757.571; and*
2. *OAR 952-001-0050 and OAR 860-024-0007.*

**Stat. Auth.:** ORS 654.025(2) and 656.726(4).

**Stats. Implemented:** ORS 654.001 through 654.295.

**Hist:** OR-OSHA Admin. Order 8-1990, f. 3/30/90, ef. 9/1/90.  
OR-OSHA Admin. Order 4-2011, f. 12/8/11, ef. 12/8/11.

**(a) Surface encumbrances.** All surface encumbrances that are located so as to create a hazard to employees shall be removed or supported, as necessary, to safeguard employees.

**(b) Underground installations.**

**(1) The estimated location of utility installations, such as** sewer, telephone, fuel, electric, water lines, or any other underground installations that reasonably may be expected to be encountered during excavation work, shall be determined prior to opening an excavation.

**Note:** 1910.651(b)(2) was NOT adopted by OR-OSHA. In Oregon OAR 437-003-0096 (printed in italics above) applies.

**(3)** When excavation operations approach the estimated location of underground installations, the exact location of the installations shall be determined by safe and acceptable means.

**(4)** While the excavation is open, underground installations shall be protected, supported or removed as necessary to safeguard employees.

**(c) Access and egress.**

**(1) Structural ramps.**

**(i)** Structural ramps that are used solely by employees as a means of access or egress from excavations shall be designed by a competent person. Structural ramps used for access or egress of equipment shall be designed by a competent person qualified in structural design, and shall be constructed in accordance with the design.

# SPECIFIC EXCAVATION REQUIREMENTS

(ii) Ramps and runways constructed of two or more structural members shall have the structural members connected together to prevent displacement.

(iii) Structural members used for ramps and runways shall be of uniform thickness.

(iv) Cleats or other appropriate means used to connect runway structural members shall be attached to the bottom of the runway or shall be attached in a manner to prevent tripping.

(v) Structural ramps used in lieu of steps shall be provided with cleats or other surface treatments on the top surface to prevent slipping.

(2) Means of egress from trench excavations. A stairway, ladder, ramp or other safe means of egress shall be located in trench excavations that are 4 feet (1.22 m) or more in depth so as to require no more than 25 feet (7.62 m) of lateral travel for employees.

(d) **Exposure to vehicular traffic.** Employees exposed to public vehicular traffic shall be provided with, and shall wear, warning vests or other suitable garments marked with or made of reflectorized or high-visibility material.

(e) **Exposure to falling loads.** No employee shall be permitted underneath loads handled by lifting or digging equipment. Employees shall be required to stand away from any vehicle being loaded or unloaded to avoid being struck by any spillage or falling materials. Operators may remain in the cabs of vehicles being loaded or unloaded when the vehicles are equipped, in accordance with §1926.601(b)(6), to provide adequate protection for the operator during loading and unloading operations.

(f) **Warning system for mobile equipment.** When mobile equipment is operated adjacent to an excavation, or when such equipment is required to approach the edge of an excavation, and the operator does not have a clear and direct view of the edge of the excavation, a warning system shall be utilized such as barricades, hand or mechanical signals, or stop logs. If possible, the grade should be away from the excavation.

(g) **Hazardous atmospheres.**

(1) **Testing and controls.** In addition to the requirements set forth in subparts D and E of this part (29 CFR 1926.50-1926.107) to prevent exposure to harmful levels of atmospheric contaminants and to assure acceptable atmospheric conditions, the following requirements shall apply:

(i) Where oxygen deficiency (atmospheres containing less than 19.5 percent oxygen) or a hazardous atmosphere exists or could reasonably be expected to exist, such as in excavations in landfill areas or excavations in areas where hazardous substances are stored nearby, the atmospheres in the excavation shall be tested before employees enter excavations greater than 4 feet (1.22 m) in depth.

# SPECIFIC EXCAVATION REQUIREMENTS

P

(ii) Adequate precautions shall be taken to prevent employee exposure to atmospheres containing less than 19.5 percent oxygen and other hazardous atmospheres. These precautions include providing proper respiratory protection or ventilation in accordance with subparts D and E of this part respectively.

(iii) Adequate precaution shall be taken such as providing ventilation, to prevent employee exposure to an atmosphere containing a concentration of a flammable gas in excess of 20 percent of the lower flammable limit of the gas.

(iv) When controls are used that are intended to reduce the level of atmospheric contaminants to acceptable levels, testing shall be conducted as often as necessary to ensure that the atmosphere remains safe.

## **(2) Emergency rescue equipment.**

(i) Emergency rescue equipment, such as breathing apparatus, a safety harness and line, or a basket stretcher, shall be readily available where hazardous atmospheric conditions exist or may reasonably be expected to develop during work in an excavation. This equipment shall be attended when in use.

(ii) Employees entering bell-bottom pier holes, or other similar deep and confined footing excavations, shall wear a harness with a life-line securely attached to it. The lifeline shall be separate from any line used to handle materials, and shall be individually attended at all times while the employee wearing the lifeline is in the excavation.

## **(h) Protection from hazards associated with water accumulation.**

(1) Employees shall not work in excavations in which there is accumulated water, or in excavations in which water is accumulating, unless adequate precautions have been taken to protect employees against the hazards posed by water accumulation. The precautions necessary to protect employees adequately vary with each situation, but could include special support or shield systems to protect from cave-ins, water removal to control the level of accumulating water, or use of a safety harness and lifeline.

(2) If water is controlled or prevented from accumulating by the use of water removal equipment, the water removal equipment and operations shall be monitored by a competent person to ensure proper operation.

(3) If excavation work interrupts the natural drainage of surface water (such as streams), diversion ditches, dikes, or other suitable means shall be used to prevent surface water from entering the excavation and to provide adequate drainage of the area adjacent to the excavation. Excavations subject to runoff from heavy rains will require an inspection by a competent person and compliance with paragraphs (k)(1) and (k)(2) of this section.

# P

## SPECIFIC EXCAVATION REQUIREMENTS

---

### (i) Stability of adjacent structures.

(1) Where the stability of adjoining buildings, walls, or other structures is endangered by excavation operations, support systems such as shoring, bracing, or underpinning shall be provided to ensure the stability of such structures for the protection of employees.

(2) Excavation below the level of the base or footing of any foundation or retaining wall that could be reasonably expected to pose a hazard to employees shall not be permitted except when:

(i) A support system, such as underpinning, is provided to ensure the safety of employees and the stability of the structure; or

(ii) The excavation is in stable rock; or

(iii) A registered professional engineer has approved the determination that the structure is sufficiently removed from the excavation so as to be unaffected by the excavation activity; or

(iv) A registered professional engineer has approved the determination that such excavation work will not pose a hazard to employees.

(3) Sidewalks, pavements, and appurtenant structure shall not be undermined unless a support system or another method of protection is provided to protect employees from the possible collapse of such structures

### (j) Protection of employees from loose rock or soil.

(1) Adequate protection shall be provided to protect employees from loose rock or soil that could pose a hazard by falling or rolling from an excavation face. Such protection shall consist of scaling to remove loose material; installation of protective barricades at intervals as necessary on the face to stop and contain falling material; or other means that provide equivalent protection.

(2) Employees shall be protected from excavated or other materials or equipment that could pose a hazard by falling or rolling into excavations. Protection shall be provided by placing and keeping such materials or equipment at least 2 feet (.61 m) from the edge of excavations, or by the use of retaining devices that are sufficient to prevent materials or equipment from falling or rolling into excavations, or by a combination of both if necessary.

# SPECIFIC EXCAVATION REQUIREMENTS

P

---

## (k) Inspections.

(1) Daily inspections of excavations, the adjacent areas, and protective systems shall be made by a competent person for evidence of a situation that could result in possible cave-ins, indications of failure of protective systems, hazardous atmospheres, or other hazardous conditions. An inspection shall be conducted by the competent person prior to the start of work and as needed throughout the shift. Inspections shall also be made after every rainstorm or other hazard increasing occurrence. These inspections are only required when employee exposure can be reasonably anticipated.

(2) Where the competent person finds evidence of a situation that could result in a possible cave-in, indications of failure of protective systems, hazardous atmospheres, or other hazardous conditions, exposed employees shall be removed from the hazardous area until the necessary precautions have been taken to ensure their safety.

(l) **Fall protection.** Walkways shall be provided where employees or equipment are required or permitted to cross over excavations. Guardrails which comply with §1926.502(b) shall be provided where walkways are 6 feet (1.8 m) or more above lower levels.

**Stat. Auth.:** ORS 654.025(2) and 656.726(4).

**Stats. Implemented:** ORS 654.001 through 654.295.

**Hist:** APD Admin. Order 8-1990, f. 3/30/90, ef. 9/1/90.

OR-OSHA Admin. Order 6-1995, f. 4/18/95, ef. 6/1/95.

# REQUIREMENTS FOR PROTECTIVE SYSTEMS

P

---

## §1926.652 Requirements for Protective Systems.

### (a) Protection of employees in excavations.

(1) Each employee in an excavation shall be protected from cave-ins by an adequate protective system designed in accordance with paragraph (b) or (c) of this section except when:

(i) Excavations are made entirely in stable rock; or

(ii) Excavations are less than 5 feet (1.52 m) in depth and examination of the ground by a competent person provides no indication of a potential cave-in.

(2) Protective systems shall have the capacity to resist without failure all loads that are intended or could reasonably be expected to be applied or transmitted to the system.

**NOTE:** The tables contained in Appendices A, B, C, D, E, and F do not contain sloping or shoring information for excavations over 20 feet deep. The protective systems for excavations over 20 feet in depth must be designed by a registered professional engineer in accordance with 1926.652(b) and (c).

**(b) Design of sloping and benching systems.** The slopes and configurations of sloping and benching systems shall be selected and constructed by the employer or his designee and shall be in accordance with the requirements of paragraph (b)(1); or, in the alternative, paragraph (b)(2); or, in the alternative, paragraph (b)(3), or, in the alternative, paragraph (b)(4), as follows:

#### (1) Option (1) – Allowable configurations and slopes.

(i) Excavations shall be sloped at an angle not steeper than one and one-half horizontal to one vertical (34 degrees measured from the horizontal), unless the employer uses one of the other options listed below.

(ii) Slopes specified in paragraph (b)(1)(i) of this section, shall be excavated to form configurations that are in accordance with the slopes shown for Type C soil in Appendix B to this subpart.

**(2) Option (2) – Determination of slopes and configurations using Appendices A and B.** Maximum allowable slopes, and allowable configurations for sloping and benching systems, shall be determined in accordance with the conditions and requirements set forth in Appendices A and B to this subpart.

### **(3) Option (3) – Designs using other tabulated data.**

- (i) Designs of sloping or benching systems shall be selected from and be in accordance with tabulated data, such as tables and charts.
- (ii) The tabulated data shall be in written form and shall include all of the following:
  - (A) Identification of the parameters that affect the selection of a sloping or benching system drawn from such data;
  - (B) Identification of the limits of use of the data, to include the magnitude and configuration of slopes determined to be safe;
  - (C) Explanatory information as may be necessary to aid the user in making a correct selection of a protective system from the data.
- (iii) At least one copy of the tabulated data which identifies the registered professional engineer who approved the data, shall be maintained at the jobsite during construction of the protective system. After that time the data may be stored off the jobsite, but a copy of the data shall be made available to the Secretary upon request.

### **(4) Option (4) – Design by a registered professional engineer.**

- (i) Sloping and benching systems not utilizing Option (1) or Option (2) or Option (3) under paragraph (b) of this section shall be approved by a registered professional engineer.
- (ii) Designs shall be in written form and shall include at least the following:
  - (A) The magnitude of the slopes that were determined to be safe for the particular project;
  - (B) The configurations that were determined to be safe for the particular project; and
  - (C) The identity of the registered professional engineer approving the design.
- (iii) At least one copy of the design shall be maintained at the jobsite while the slope is being constructed. After that time the design need not be at the jobsite, but a copy shall be made available to the Secretary upon request.

### **(c) Design of support systems, shield systems, and other protective systems.**

Designs of support systems shield systems, and other protective systems shall be selected and constructed by the employer or his designee and shall be in accordance with the requirements of paragraph (c)(1); or, in the alternative, paragraph (c)(2); or, in the alternative, paragraph (c)(3); or, in the alternative, paragraph (c)(4) as follows:

# REQUIREMENTS FOR PROTECTIVE SYSTEMS

P

**(1) Option (1) – Designs using Appendices A, C and D.** Designs for timber shoring in trenches shall be determined in accordance with the conditions and requirements set forth in Appendices A and C to this subpart. Designs for aluminum hydraulic shoring shall be in accordance with paragraph (c)(2) of this section, but if manufacturer's tabulated data cannot be utilized, designs shall be in accordance with Appendix D.

**(2) Option (2) – Designs Using Manufacturer's Tabulated Data.**

**(i)** Design of support systems, shield systems, or other protective systems that are drawn from manufacturer's tabulated data shall be in accordance with all specifications, recommendations, and limitations issued or made by the manufacturer.

**(ii)** Deviation from the specifications, recommendations, and limitations issued or made by the manufacturer shall only be allowed after the manufacturer issues specific written approval.

**(iii)** Manufacturer's specifications, recommendations, and limitations, and manufacturer's approval to deviate from the specifications, recommendations, and limitations shall be in written form at the jobsite during construction of the protective system. After that time this data may be stored off the jobsite, but a copy shall be made available to the Secretary upon request.

**(3) Option (3) – Designs using other tabulated data.**

**(i)** Designs of support systems, shield systems, or other protective systems shall be selected from and be in accordance with tabulated data, such as tables and charts.

**(ii)** The tabulated data shall be in written form and include all of the following:

**(A)** Identification of the parameters that affect the selection of a protective system drawn from such data;

**(B)** Identification of the limits of use of the data;

**(C)** Explanatory information as may be necessary to aid the user in making a correct selection of a protective system from the data.

**(iii)** At least one copy of the tabulated data, which identifies the registered professional engineer who approved the data, shall be maintained at the jobsite during construction of the protective system. After that time the data may be stored off the jobsite, but a copy of the data shall be made available to the Secretary upon request.

**(4) Option (4) – Design by a registered professional engineer.**

(i) Support systems, shield systems, and other protective systems not utilizing Option 1, Option 2 or Option 3, above, shall be approved by a registered professional engineer.

(ii) Designs shall be in written form and shall include the following:

(A) A plan indicating the sizes, types, and configurations of the materials to be used in the protective system; and

(B) The identity of the registered professional engineer approving the design.

(iii) At least one copy of the design shall be maintained at the jobsite during construction of the protective system. After that time, the design may be stored off the jobsite, but a copy of the design shall be made available to the Secretary upon request.

**(d) Materials and equipment.**

(1) Materials and equipment used for protective systems shall be free from damage or defects that might impair their proper function.

(2) Manufactured materials and equipment used for protective systems shall be used and maintained in a manner that is consistent with the recommendations of the manufacturer, and in a manner that will prevent employee exposure to hazards.

(3) When material or equipment that is used for protective systems is damaged, a competent person shall examine the material or equipment and evaluate its suitability for continued use. If the competent person cannot assure the material or equipment is able to support the intended loads or is otherwise suitable for safe use, then such material or equipment shall be removed from service, and shall be evaluated and approved by a registered professional engineer before being returned to service.

**(e) Installation and removal of support.****(1) General.**

(i) Members of support systems shall be securely connected together to prevent sliding, falling, kickouts, or other predictable failure.

(ii) Support systems shall be installed and removed in a manner that protects employees from cave-ins, structural collapses, or from being struck by members of the support system.

(iii) Individual members of support systems shall not be subjected to loads exceeding those which those members were designed to withstand.

# REQUIREMENTS FOR PROTECTIVE SYSTEMS

P

(iv) Before temporary removal of individual members begins, additional precautions shall be taken to ensure the safety of employees, such as installing other structural members to carry the loads imposed on the support system.

(v) Removal shall begin at, and progress from, the bottom of the excavation. Members shall be released slowly so as to note any indication of possible failure of the remaining members of the structure or possible cave-in of the sides of the excavation.

(vi) Backfilling shall progress together with the removal of support systems from excavations.

## (2) Additional requirements for support systems for trench excavations.

(i) Excavation of material to a level no greater than 2 feet (.61 m) below the bottom of the members of a support system shall be permitted, but only if the system is designed to resist the forces calculated for the full depth of the trench, and there are no indications while the trench is open of a possible loss of soil from behind or below the bottom of the support system.

(ii) Installation of a support system shall be closely coordinated with the excavation of trenches.

**(f) Sloping and benching systems.** Employees shall not be permitted to work on the faces of sloped or benched excavations at levels above other employees except when employees at the lower levels are adequately protected from the hazard of falling, rolling, or sliding material or equipment.

## (g) Shield systems.

### (1) General.

(i) Shield systems shall not be subjected to loads exceeding those which the system was designed to withstand.

(ii) Shields shall be installed in a manner to restrict lateral or other hazardous movement of the shield in the event of the application of sudden lateral loads.

(iii) Employees shall be protected from the hazard of cave-ins when entering or exiting the areas protected by shields.

(iv) Employees shall not be allowed in shields when shields are being installed, removed, or moved vertically.

# REQUIREMENTS FOR PROTECTIVE SYSTEMS

---

**(2) Additional requirement for shield systems used in trench excavations.**

Excavations of earth material to a level not greater than 2 feet (.61 m) below the bottom of a shield shall be permitted, but only if the shield is designed to resist the forces calculated for the full depth of the trench, and there are no indications while the trench is open of a possible loss of soil from behind or below the bottom of the shield.

**Stat. Auth.:** ORS 654.025(2) and 656.726(4).

**Stats. Implemented:** ORS 654.001 through 654.295.

**Hist:** OR-OSHA Admin. Order 8-1990, f. 3/30/90, ef. 9/1/90.

## Appendix A – Soil Classification

### (a) Scope and application.

**(1) Scope.** This appendix describes a method of classifying soil and rock deposits based on site and environmental conditions, and on the structure and composition of the earth deposits. The appendix contains definitions, sets forth requirements, and describes acceptable visual and manual tests for use in classifying soils.

**(2) Application.** This appendix applies when a sloping or benching system is designed in accordance with the requirements set forth in §1926.652(b)(2) as a method of protection for employees from cave-ins. This appendix also applies when timber shoring for excavations is designed as a method of protection from cave-ins in accordance with appendix C to subpart P of part 1926, and when aluminum hydraulic shoring is designed in accordance with appendix D. This Appendix also applies if other protective systems are designed and selected for use from data prepared in accordance with the requirements set forth in §1926.652(c), and the use of the data is predicated on the use of the soil classification system set forth in this appendix.

**(b) Definitions.** The definitions and examples given below are based on, in whole or in part, the following: American Society for Testing Materials (ASTM) Standards D653-85 and D2488; The Unified Soils Classification System, The U.S. Department of Agriculture (USDA) Textural Classification Scheme; and The National Bureau of Standards Report BSS-121.

**Cemented soil** means a soil in which the particles are held together by a chemical agent, such as calcium carbonate, such that a hand-size sample cannot be crushed into powder or individual soil particles by finger pressure.

**Cohesive soil** means clay (fine grained soil), or soil with a high clay content, which has cohesive strength. Cohesive soil does not crumble, can be excavated with vertical sideslopes, and is plastic when moist. Cohesive soil is hard to break up when dry, and exhibits significant cohesion when submerged. Cohesive soils include clayey silt, sandy clay, silty clay, clay and organic clay.

**Dry soil** means soil that does not exhibit visible signs of moisture content.

**Fissured** means a soil material that has a tendency to break along definite planes of fracture with little resistance, or a material that exhibits open cracks, such as tension cracks, in an exposed surface.

**Granular soil** means gravel, sand, or silt, (coarse grained soil) with little or no clay content. Granular soil has no cohesive strength. Some moist granular soils exhibit apparent cohesion. Granular soil cannot be molded when moist and crumbles easily when dry.

**Layered system** means two or more distinctly different soil or rock types arranged in layers. Micaceous seams or weakened planes in rock or shale are considered layered.

# P SOIL CLASSIFICATION

**Moist soil** means a condition in which a soil looks and feels damp. Moist cohesive soil can easily be shaped into a ball and rolled into small diameter threads before crumbling. Moist granular soil that contains some cohesive material will exhibit signs of cohesion between particles.

**Plastic** means a property of a soil which allows the soil to be deformed or molded without cracking, or appreciable volume change.

**Saturated soil** means a soil in which the voids are filled with water. Saturation does not require flow. Saturation, or near saturation, is necessary for the proper use of instruments such as a pocket penetrometer or shear vane.

**Soil classification system** means, for the purpose of this subpart, a method of categorizing soil and rock deposits in a hierarchy of Stable Rock, Type A, Type B, and Type C, in decreasing order of stability. The categories are determined based on an analysis of the properties and performance characteristics of the deposits and the environmental conditions of exposure.

**Stable rock** means natural solid mineral matter that can be excavated with vertical sides and remain intact while exposed.

**Submerged soil** means soil which is underwater or is free seeping.

**Type A** means cohesive soils with an unconfined compressive strength of 1.5 ton per square foot (tsf) (144 kPa) or greater. Examples of cohesive soils are: clay, silty clay, sandy clay, clay loam and, in some cases, silty clay loam and sandy clay loam. Cemented soils such as caliche and hardpan are also considered Type A. However, no soil is Type A if:

- (i) The soil is fissured; or
- (ii) The soil is subject to vibration from heavy traffic, pile driving, or similar effects; or
- (iii) The soil has been previously disturbed; or
- (iv) The soil is part of a sloped, layered system where the layers dip into the excavation on a slope of four horizontal to one vertical (4H:1V) or greater; or
- (v) The material is subject to other factors that would require it to be classified as a less stable material.

**Type B** means:

- (i) Cohesive soil with an unconfined compressive strength greater than 0.5 tsf (48 kPa) but less than 1.5 tsf (144 kPa); or
- (ii) Granular cohesionless soils including: angular gravel (similar to crushed rock), silt, silt loam, sandy loam and, in some cases, silty clay loam and sandy clay loam.

(iii) Previously disturbed soils except those which would otherwise be classed as Type C soil.

(iv) Soil that meets the unconfined compressive strength or cementation requirements for Type A, but is fissured or subject to vibration; or

(v) Dry rock that is not stable; or

(vi) Material that is part of a sloped, layered system where the layers dip into the excavation on a slope less steep than four horizontal to one vertical (4H:1V), but only if the material would otherwise be classified as Type B.

**Type C** means:

(i) Cohesive soil with an unconfined compressive strength of 0.5 tsf (48 kPa) or less; or

(ii) Granular soils including gravel, sand, and loamy sand; or

(iii) Submerged soil or soil from which water is freely seeping; or

(iv) Submerged rock that is not stable, or

(v) Material in a sloped, layered system where the layers dip into the excavation or a slope of four horizontal to one vertical (4H:1V) or steeper.

**Unconfined compressive strength** means the load per unit area at which a soil will fail in compression. It can be determined by laboratory testing, or estimated in the field using a pocket penetrometer, by thumb penetration tests, and other methods.

**Wet soil** means soil that contains significantly more moisture than moist soil, but in such a range of values that cohesive material will slump or begin to flow when vibrated. Granular material that would exhibit cohesive properties when moist will lose those cohesive properties when wet.

**(c) Requirements.**

**(1) Classification of soil and rock deposits.** Each soil and rock deposit shall be classified by a competent person as Stable Rock, Type A, Type B, or Type C in accordance with the definitions set forth in paragraph (b) of this appendix.

**(2) Basis of classification.** The classification of the deposits shall be made based on the results of at least one visual and at least one manual analysis. Such analyses shall be conducted by a competent person using tests described in paragraph (d) below, or in other recognized methods of soil classification and testing such as those adopted by the America Society for Testing Materials, or the U.S. Department of Agriculture textural classification system.

**(3) Visual and manual analyses.** The visual and manual analyses, such as those noted as being acceptable in paragraph (d) of this appendix, shall be designed and conducted to provide sufficient quantitative and qualitative information as may be necessary to identify properly the properties, factors, and conditions affecting the classification of the deposits.

**(4) Layered systems.** In a layered system, the system shall be classified in accordance with its weakest layer. However, each layer may be classified individually where a more stable layer lies under a less stable layer.

**(5) Reclassification.** If, after classifying a deposit, the properties, factors, or conditions affecting its classification change in any way, the changes shall be evaluated by a competent person. The deposit shall be reclassified as necessary to reflect the changed circumstances.

**(d) Acceptable visual and manual tests.**

**(1) Visual tests.** Visual analysis is conducted to determine qualitative information regarding the excavation site in general, the soil adjacent to the excavation, the soil forming the sides of the open excavation, and the soil taken as samples from excavated material.

**(i)** Observe samples of soil that are excavated and soil in the sides of the excavation. Estimate the range of particle sizes and the relative amounts of the particle sizes. Soil that is primarily composed of fine-grained material is cohesive material. Soil composed primarily of coarse-grained sand or gravel is granular material.

**(ii)** Observe soil as it is excavated. Soil that remains in clumps when excavated is cohesive. Soil that breaks up easily and does not stay in clumps is granular.

**(iii)** Observe the side of the opened excavation and the surface area adjacent to the excavation. Crack-like openings such as tension cracks could indicate fissured material. If chunks of soil spall off a vertical side, the soil could be fissured. Small spalls are evidence of moving ground and are indications of potentially hazardous situations.

**(iv)** Observe the area adjacent to the excavation and the excavation itself for evidence of existing utility and other underground structures, and to identify previously disturbed soil.

**(v)** Observe the opened side of the excavation to identify layered systems. Examine layered systems to identify if the layers slope toward the excavation. Estimate the degree of slope of the layers.

**(vi)** Observe the area adjacent to the excavation and the sides of the opened excavation for evidence of surface water, water seeping from the sides of the excavation, or the location of the level of the water table.

**(vii)** Observe the area adjacent to the excavation and the area within the excavation for sources of vibration that may affect the stability of the excavation face.

**(2) Manual tests.** Manual analysis of soil samples is conducted to determine quantitative as well as qualitative properties of soil and to provide more information in order to classify soil properly.

**(i) Plasticity.** Mold a moist or wet sample of soil into a ball and attempt to roll it into threads as thin as 1/8-inch in diameter. Cohesive material can be successfully rolled into threads without crumbling. For example, if at least a two inch (50 mm) length of 1/8-inch thread can be held on one end without tearing, the soil is cohesive.

**(ii) Dry strength.** If the soil is dry and crumbles on its own or with moderate pressure into individual grains or fine powder, it is granular (any combination of gravel, sand, or silt). If the soil is dry and falls into clumps which break up into smaller clumps, but the smaller clumps can only be broken up with difficulty, it may be clay in any combination with gravel, sand or silt. If the dry soil breaks into clumps which do not break up into small clumps and which can only be broken with difficulty, and there is no visual indication the soil is fissured, the soil may be considered unfissured.

**(iii) Thumb penetration.** The thumb penetration test can be used to estimate the unconfined compressive strength of cohesive soils. (This test is based on the thumb penetration test described in American Society for Testing and Materials (ASTM) Standard designation D2488 – “Standard Recommended Practice for Description of Soils (Visual – Manual Procedure).”) Type A soils with an unconfined compressive strength of 1.5 tsf can be readily indented by the thumb; however, they can be penetrated by the thumb only with very great effort. Type C soils with an unconfined compressive strength of 0.5 tsf can be easily penetrated several inches by the thumb, and can be molded by light finger pressure. This test should be conducted on an undisturbed soil sample, such as a large clump of spoil, as soon as practicable after excavation to keep to a minimum the effects of exposure to drying influences. If the excavation is later exposed to wetting influences (rain, flooding), the classification of the soil must be changed accordingly.

**(iv) Other strength tests.** Estimates of unconfined compressive strength of soils can also be obtained by use of a pocket penetrometer or by using a hand-operated shearvane.

**(v) Drying test.** The basic purpose of the drying test is to differentiate between cohesive material with fissures, unfissured cohesive material, and granular material. The procedure for the drying test involves drying a sample of soil that is approximately one inch thick (2.54 cm) and six inches (15.24 cm) in diameter until it is thoroughly dry:

# P SOIL CLASSIFICATION

**(A)** If the sample develops cracks as it dries, significant fissures are indicated.

**(B)** Samples that dry without cracking are to be broken by hand. If considerable force is necessary to break a sample, the soil has significant cohesive material content. The soil can be classified as a unfissured cohesive material and the unconfined compressive strength should be determined.

**(C)** If a sample breaks easily by hand, it is either a fissured cohesive material or a granular material. To distinguish between the two, pulverize the dried clumps of the sample by hand or by stepping on them. If the clumps do not pulverize easily, the material is cohesive with fissures. If they pulverize easily into very small fragments, the material is granular.

**Stat. Auth.:** ORS 654.025(2) and 656.726(4).

**Stats. Implemented:** ORS 654.001 through 654.295.

**Hist:** OR-OSHA Admin. Order 8-1990, f. 3/30/90, ef. 9/1/90.

## Appendix B – Sloping and Benching

**(a) Scope and application.** This appendix contains specifications for sloping and benching when used as methods of protecting employees working in excavations from cave-ins. The requirements of this appendix apply when the design of sloping and benching protective systems is to be performed in accordance with the requirements set forth in §1926.652(b)(2).

### **(b) Definitions.**

**Actual slope** means the slope to which an excavation face is excavated.

**Distress** means that the soil is in a condition where a cave-in is imminent or is likely to occur. Distress is evidenced by such phenomena as the development of fissures in the face of or adjacent to an open excavation; the subsidence of the edge of an excavation; the slumping of material from the face or the bulging or heaving of material from the bottom of an excavation; the spalling of material from the face of an excavation; and raveling, i.e., small amounts of material such as pebbles or little clumps of material suddenly separating from the face of an excavation and trickling or rolling down into the excavation.

**Maximum allowable slope** means the steepest incline of an excavation face that is acceptable for the most favorable site conditions as protection against cave-ins, and is expressed as the ratio of horizontal distance to vertical rise (H:V).

**Short term exposure** means a period of time less than or equal to 24 hours that an excavation is open.

### **(c) Requirements.**

**(1) Soil classification.** Soil and rock deposits shall be classified in accordance with appendix A to subpart P of part 1926.

**(2) Maximum allowable slope.** The maximum allowable slope for a soil or rock deposit shall be determined from Table B-1 of this appendix.

#### **(3) Actual slope.**

**(i)** The actual slope shall not be steeper than the maximum allowable slope.

**(ii)** The actual slope shall be less steep than the maximum allowable slope, when there are signs of distress. If that situation occurs, the slope shall be cut back to an actual slope which is at least 1/2 horizontal to one vertical (1/2 H:1V) less steep than the maximum allowable slope.

# P SLOPING & BENCHING

(iii) When surcharge loads from stored material or equipment, operating equipment, or traffic are present, a competent person shall determine the degree to which the actual slope must be reduced below the maximum allowable slope, and shall assure that such reduction is achieved. Surcharge loads from adjacent structures shall be evaluated in accordance with §1926.651(i).

(4) **Configurations.** Configurations of sloping and benching systems shall be in accordance with Figure B-1.

**Table B-1  
Maximum Allowable Slopes**

Soil or Rock Type	Maximum Allowable Slopes (H:v) <sup>[1]</sup> for Excavations less than 20 Feet Deep <sup>[3]</sup>
Stable Rock .....	Vertical (90°)
Type A <sup>[2]</sup> .....	3/4 : 1 (53°)
Type B .....	1 : 1 (45°)
Type C .....	1 1/2 : 1 (34°)

**NOTES:**

1. Numbers shown in parentheses next to maximum allowable slopes are angles expressed in degrees from the horizontal. Angles have been rounded off.
2. A short-term maximum allowable slope of 1/2H:1V(63°) is allowed in excavations in Type A soil that are 12 feet (3.67m) or less in depth. Short-term maximum allowable slopes for excavations greater than 12 feet (3.67m) in depth shall be 3/4H:1V(53°).
3. Sloping or benching for excavations greater than 20 feet deep shall be designed by a registered professional engineer.

Figure B-1

## Slope Configurations

(All slopes stated below are in the horizontal to vertical ratio)

### *B-1.1 Excavations made in Type A soil.*

1. All simple slope excavation 20 feet or less in depth shall have a maximum allowable slope of 3/4:1.

Exception: Simple slope excavations which are open 24 hours or less (short term) and which are 12 feet or less in depth shall have a maximum allowable slope of 1/2:1.

2. All benched excavations 20 feet or less in depth shall have a maximum allowable slope of 3/4 to 1 and maximum bench dimensions as follows:

# P SLOPING & BENCHING

**Multiple Bench**

3. All excavations 8 feet or less in depth which have unsupported vertically sided lower portions shall have a maximum vertical side of 3 1/2 feet.

**Unsupported Vertically Sided Lower Portion – Maximum 8 Feet Depth**

All excavations more than 8 feet but not more than 12 feet in depth which unsupported vertically sided lower portions shall have a maximum allowable slope of 1:1 and a maximum vertical side of 3 1/2 feet.

**Unsupported Vertically Sided Lower Portion – Maximum 12 Feet Depth**

# SLOPING & BENCHING P

All excavations 20 feet or less in depth which have vertically sided lower portions that are supported or shielded shall have a maximum allowable slope of 3/4:1. The support or shield system must extend at least 18 inches above the top of the vertical side.

**Support of Shielded Vertically Sided Lower Portion**

4. All other simple slope, compound slope, and vertically sided lower portion excavations shall be in accordance with the other options permitted under §1926.652(b).

## *B-1.2 Excavations made in Type B Soil.*

1. All simple slope excavations 20 feet or less in depth shall have a maximum allowable slope of 1:1.

2. All benched excavations 20 feet or less in depth shall have a maximum allowable slope of 1:1 and maximum bench dimensions as follows:

**Simple Slope**

# P SLOPING & BENCHING

Single Bench

Multiple Bench

3. All excavations 20 feet or less in depth which have vertically sided lower portions shall be shielded or supported to a height at least 18 inches above the top of the vertical side. All such excavations shall have a maximum allowable slope of 1:1.

Vertically Sided Lower Portion

4. All other sloped excavations shall be in accordance with the other options permitted in §1926.652(b).

# SLOPING & BENCHING P

## *B-1.3 Excavations made in Type C Soil.*

1. All simple slope excavations 20 feet or less in depth shall have a maximum allowable slope of 1 1/2 :1.

2. All excavations 20 feet or less in depth which have vertically sided lower portions shall be shielded or supported to a height at least 18 inches above the top of the vertical side. All such excavations shall have a maximum allowable slope of 1 1/2:1.

3. All other sloped excavations shall be in accordance with the other options permitted in §1926.652(b).

# P SLOPING & BENCHING

## B-1.4 Excavations made in Layered Soils.

1. All excavations 20 feet or less in depth made in layered soils shall have a maximum allowable slope for each layer as set forth below.

# SLOPING & BENCHING P

A over B

A over C

B over C

2. All other sloped excavations shall be in accordance with the other options permitted in §1926.652(b).

**Stat. Auth.:** ORS 654.025(2) and 656.726(4).  
**Stats. Implemented:** ORS 654.001 through 654.295.  
**Hist:** OR-OSHA Admin. Order 8-1990, f. 3/30/90, ef. 9/1/90.

---

## Appendix C – Timber Shoring for Trenches

**(a) Scope.** This appendix contains information that can be used timber shoring is provided as a method of protection from cave-ins in trenches that do not exceed 20 feet (6.1 m) in depth. This appendix must be used when design of timber shoring protective systems is to be performed in accordance with §1926.652(c)(1). Other timber shoring configurations; other systems of support such as hydraulic and pneumatic systems; and other protective systems such as sloping, benching, shielding, and freezing systems must be designed in accordance with the requirements set forth in §1926.652(b) and §1926.652(c).

**(b) Soil Classification.** In order to use the data presented in this appendix, the soil type or types in which the excavation is made must first be determined using the soil classification method set forth in appendix A of subpart P of this part.

**(c) Presentation of Information.** Information is presented in several forms as follows:

**(1)** Information is presented in tabular form in Tables C-1.1, C-1.2, and C-1.3, and Tables C-2.1, C-2.2 and C-2.3 following paragraph (g) of the appendix. Each table presents the minimum sizes of timber members to use in a shoring system, and each table contains data only for the particular soil type in which the excavation or portion of the excavation is made. The data are arranged to allow the user the flexibility to select from among several acceptable configurations of members based on varying the horizontal spacing of the crossbraces. Stable rock is exempt from shoring requirements and therefore, no data are presented for this condition.

**(2)** Information concerning the basis of the tabular data and the limitations of the data is presented in paragraph (d) of this appendix, and on the tables themselves.

**(3)** Information explaining the use of the tabular data is presented in paragraph (e) of this appendix.

**(4)** Information illustrating the use of the tabular data is presented in paragraph (f) of this appendix.

**(5)** Miscellaneous notations regarding Tables C-1.1 through C-1.3 and Tables C-2.1 through C-2.3 are presented in paragraph (g) of this Appendix.

**(d) Basis and limitations of the data.**

**(1) Dimensions of timber members.**

**(i)** The sizes of the timber members listed in Tables C-1.1 through C-1.3 are taken from the National Bureau of Standards (NBS) report, "Recommended Technical Provisions for Construction Practice in Shoring and Sloping of Trenches and Excavations." In addition, where NBS did not recommend specific sizes of members, member sizes are based on an analysis of the sizes required for use by existing codes and on empirical practice.

# TIMBER SHORING FOR TRENCHES

(ii) The required dimensions of the members listed in Tables C-1.1 through C-1.3 refer to actual dimensions and not nominal dimensions of the timber. Employers wanting to use nominal size shoring are directed to Tables C-2.1 through C-2.3, or have this choice under §1926.652(c)(3), and are referred to The Corps of Engineers, The Bureau of Reclamation or data from other acceptable sources.

## (2) Limitation of application.

(i) It is not intended that the timber shoring specification apply to every situation that may be experienced in the field. These data were developed to apply to the situations that are most commonly experienced in current trenching practice. Shoring systems for use in situations that are not covered by the data in this appendix must be designed as specified in §1926.652(c).

(ii) When any of the following conditions are present, the members specified in the tables are not considered adequate. Either an alternate timber shoring system must be designed or another type of protective system designed in accordance with §1926.652.

(A) When loads imposed by structures or by stored material adjacent to the trench weigh in excess of the load imposed by a two-foot soil surcharge. The term “adjacent” as used here means the area within a horizontal distance from the edge of the trench equal to the depth of the trench.

(B) When vertical loads imposed on cross braces exceed a 240-pound gravity load distributed on a one-foot section of the center of the cross-brace.

(C) When surcharge loads are present from equipment weighing in excess of 20,000 pounds.

(D) When only the lower portion of a trench is shored and the remaining portion of the trench is sloped or benched unless: The sloped portion is sloped at an angle less steep than three horizontal to one vertical; or the members are selected from the tables for use at a depth which is determined from the top of the overall trench, and not from the toe of the sloped portion.

**(e) Use of Tables.** The members of the shoring system that are to be selected using this information are the cross braces, the uprights, and the wales, where wales are required. Minimum sizes of members are specified for use in different types of soil. There are six tables of information, two for each soil type. The soil type must first be determined in accordance with the soil classification system described in appendix A to subpart P of part 1926. Using the appropriate table, the selection of the size and spacing of the members is then made. The selection is based on the depth and width of the trench where the members are to be installed and, in most instances, the selection is also based on the horizontal spacing of the crossbraces. Instances where a choice of horizontal spacing of crossbracing is available, the horizontal spacing of the crossbraces must be chosen by the user before the size of any member can be determined. When the soil type, the width and depth of the trench, and the horizontal spacing of the crossbraces are known, the size and vertical spacing of the crossbraces, the size and vertical spacing of the wales, and the size and horizontal spacing of the uprights can be read from the appropriate table.

# TIMBER SHORING FOR TRENCHES

P

---

**(f) Examples to Illustrate the Use of Tables C-1.1 through C-1.3.**

**(1) Example 1.**

A trench dug in Type A soil is 13 feet deep and five feet wide.

From Table C-1.1, for acceptable arrangements of timber can be used.

**Arrangement #1**

Space 4 x 4 crossbraces at six feet horizontally and four feet vertically.

Wales are not required.

Space 3 x 8 uprights at six feet horizontally. This arrangement is commonly called "skip shoring."

**Arrangement #2**

Space 4 x 6 crossbraces at eight feet horizontally and four feet vertically.

Space 8 x 8 wales at four feet vertically.

Space 2 x 6 uprights at four feet horizontally.

**Arrangement #3**

Space 6 x 6 crossbraces at 10 feet horizontally and four feet vertically.

Space 8 x 10 wales at four feet vertically.

Space 2 x 6 uprights at five feet horizontally.

**Arrangement #4**

Space 6 x 6 crossbraces at 12 feet horizontally and four feet vertically.

Space 10 x 10 wales at four feet vertically.

Spaces 3 x 8 uprights at six feet horizontally.

**(2) Example 2.**

A trench dug in Type B soil in 13 feet deep and five feet wide. From Table C-1.2 three acceptable arrangements of members are listed.

# TIMBER SHORING FOR TRENCHES

---

## Arrangement #1

Space 6 x 6 crossbraces at six feet horizontally and five feet vertically.

Space 8 x 8 wales at five feet vertically.

Space 2 x 6 uprights at two feet horizontally.

## Arrangement #2

Space 6 x 8 crossbraces at eight feet horizontally and five feet vertically.

Space 10 x 10 wales at five feet vertically.

Space 2 x 6 uprights at two feet horizontally.

## Arrangement #3

Space 8 x 8 crossbraces at 10 feet horizontally and five feet vertically.

Space 10 x 12 wales at five feet vertically.

Space 2 x 6 uprights at two feet vertically.

### (3) Example 3.

A trench dug in Type C soil is 13 feet deep and five feet wide.

From Table C-1.3 two acceptable arrangements of members can be used.

## Arrangement #1

Space 8 x 8 crossbraces at six feet horizontally and five feet vertically.

Space 10 x 12 wales at five feet vertically.

Position 2 x 6 uprights as closely together as possible.

If water must be retained use special tongue and groove uprights to form tight sheeting.

## Arrangement #2

Space 8 x 10 crossbraces at eight feet horizontally and five feet vertically.

Space 12 x 12 wales at five feet vertically.

Position 2 x 6 uprights in a close sheeting configuration unless water pressure must be resisted. Tight sheeting must be used where water must be retained.

# TIMBER SHORING FOR TRENCHES

P

## **(4) Example 4.**

A trench dug in Type C soil is 20 feet deep and 11 feet wide. The size and spacing of members for the section of trench that is over 15 feet in depth is determined using Table C-1.3. Only one arrangement of members is provided.

Space 8 x 10 crossbraces at six feet horizontally and five feet vertically.

Space 12 x 12 wales at five feet vertically.

Use 3 x 6 tight sheeting.

Use of Tables C-2.1 through C-2.3 would follow the same procedures.

## **(g) Notes for all Tables.**

1. Member sizes at spacings other than indicated are to be determined as specified in §1926.652(c), "Design of Protective Systems."
2. When conditions are saturated or submerged use Tight Sheeting. Tight Sheeting refers to the use of specially-edged timber planks (e.g., tongue and groove) at least three inches thick, steel sheet piling, or similar construction that when driven or placed in position provide a tight wall to resist the lateral pressure of water and to prevent the loss of backfill material. Close Sheeting refers to the placement of planks side-by-side allowing as little space as possible between them.
3. All spacing indicated is measured center to center.
4. Wales to be installed with greater dimension horizontal.
5. If the vertical distance from the center of the lowest crossbrace to the bottom of the trench exceeds two and one-half feet, uprights shall be firmly embedded or a mudsill shall be used. Where uprights are embedded, the vertical distance from the center of the lowest crossbrace to the bottom of the trench shall not exceed 36 inches. When mudsills are used, the vertical distance shall not exceed 42 inches. Mudsills are wales that are installed at the toe of the trench side.
6. Trench jacks may be used in lieu of or in combination with timber crossbraces.
7. Placement of crossbraces. When the vertical spacing of crossbraces is four feet, place the top crossbrace no more than two feet below the top of the trench. When the vertical spacing of crossbraces is five feet, place the top crossbrace no more than 2.5 feet below the top of the trench.

# ALUMINUM HYDRAULIC SHORING FOR TRENCHES

P

## Appendix D – Aluminum Hydraulic Shoring for Trenches

**(a) Scope.** This appendix contains information that can be used when aluminum hydraulic shoring is provided as a method of protection against cave-ins in trenches that do not exceed 20 feet (6.1m) in depth. This appendix must be used when design of the aluminum hydraulic protective system cannot be performed in accordance with §1926.652(c)(2).

**(b) Soil Classification.** In order to use data presented in this appendix, the soil type or types in which the excavation is made must first be determined using the soil classification method set forth in appendix A of subpart P of part 1926.

**(c) Presentation of Information.** Information is presented in several forms as follows:

**(1)** Information is presented in tabular form in Tables D-1.1, D-1.2, D-1.3 and E-1.4. Each table presents the maximum vertical and horizontal spacings that may be used with various aluminum member sizes and various hydraulic cylinder sizes. Each table contains data only for the particular soil type in which the excavation or portion of the excavation is made. Tables D-1.1 and D-1.2 are for vertical shores in Types A and B soil. Tables D-1.3 and D1.4 are for horizontal water systems in Types B and C soil.

**(2)** Information concerning the basis of the tabular data and the limitations of the data is presented in paragraph (d) of this appendix.

**(3)** Information explaining the use of the tabular data is presented in paragraph (e) of this appendix.

**(4)** Information illustrating the use of the tabular data is presented in paragraph (f) of this appendix.

**(5)** Miscellaneous notations (footnotes) regarding Table D-1.1 through D-1.4 are presented in paragraph (g) of this appendix.

**(6)** Figures, illustrating typical installations of hydraulic shoring, are included just prior to the Tables. The illustrations page is entitled “Aluminum Hydraulic Shoring; Typical Installations.”

**(d) Basis and limitations of the data.**

**(1)** Vertical shore rails and horizontal wales are those that meet the Section Modulus requirements in the D-1 Tables. Aluminum material is 6061-T6 or material of equivalent strength and properties.

**(2)** Hydraulic cylinders specifications.

**(i)** 2-inch cylinders shall be a minimum 2-inch inside diameter with a minimum safe working capacity of no less than 18,000 pounds axial compressive load at maximum extension. Maximum extension is to include full range of cylinder extensions as recommended by product manufacturer.

# ALUMINUM HYDRAULIC SHORING FOR TRENCHES

(ii) 3-inch cylinders shall be a minimum 3-inch inside diameter with a safe working capacity of not less than 30,000 pounds axial compressive load at extensions as recommended by product manufacturer.

(3) Limitation of application.

(i) It is not intended that the aluminum hydraulic specification apply to every situation that may be experienced in the field. These data were developed to apply to the situations that are most commonly experienced in current trenching practice. Shoring systems for use in situations that are not covered by the data in this appendix must be otherwise designed as specified in §1926.652(c).

(ii) When any of the following conditions are present, the members specified in the Tables are not considered adequate. In this case, an alternative aluminum hydraulic shoring system or other type of protective system must be designed in accordance with §1926.652.

(A) When vertical loads imposed on cross braces exceed a 100 pound gravity load distributed on a one foot section of the center of the hydraulic cylinder.

(B) When surcharge loads are present from equipment weighing in excess of 20,000 pounds.

(C) When only the lower portion of a trench is shored and the remaining portion of the trench is sloped or benched unless: The sloped portion is sloped at an angle less steep than three horizontal to one vertical; or the members are selected from the tables for use at a depth which is determined from the top of the overall trench, and not from the toe of the sloped portion.

(e) **Use of Tables D-1.1, D-1.2, D-1.3 and D-1.4.** The members of the shoring system that are to be selected using this information are the hydraulic cylinders, and either the vertical shores or the horizontal wales. When a waler system is used the vertical timber sheeting to be used is also selected from these tables. The Tables D-1.1 and D-1.2 for vertical shores are used in Type A and B soils that do not require sheeting. Type B soils that may require sheeting, and Type C soils that always require sheeting are found in the horizontal wale Tables D-1.3 and D-1.4. The soil type must first be determined in accordance with the soil classification system described in appendix A to subpart P of part 1926. Using the appropriate table, the selection of the size and spacing of the members is made. The selection is based on the depth and width of the trench where the members are to be installed. In these tables the vertical spacing is held constant at four feet on center. The tables show the maximum horizontal spacing of cylinders allowed for each size of wale in the waler system tables, and in the vertical shore tables, the hydraulic cylinder horizontal spacing is the same as the vertical shore spacing.

# ALUMINUM HYDRAULIC SHORING FOR TRENCHES

P

**(f) Example to Illustrate the Use of the Tables:**

**(1) Example 1:**

A trench dug in Type A soil is 6 feet deep and 3 feet wide. From Table D-1.1: Find vertical shores and 2 inch diameter cylinders spaced 8 feet on center (o.c.) horizontally and 4 feet on center (o.c.) vertically. (See Figures 1 & 3 for typical installations.)

**(2) Example 2:**

A trench is dug in Type B soil that does not require sheeting, 13 feet deep and 5 feet wide. From Table D-1.2: Find vertical shores and 2 inch diameter cylinders spaced 6.5 feet o.c. horizontally and 4 feet o.c. vertically. (See Figures 1 & 3 for typical installations.)

**(3)** A trench is dug in Type B soil that does not require sheeting, but does experience some minor raveling of the trench face. The trench is 16 feet deep and 9 feet wide. From Table D-1.2: Find vertical shores and 2 inch diameter cylinder (with special oversleeves as designated by footnote #2) spaced 5.5 feet o.c. horizontally and 4 feet o.c. vertically, plywood (per footnote (g)(7) to the D-1 Table) should be used behind the shores. (See Figures 2 & 3 for typical installations.)

**(4) Example 4:** A trench is dug in previously disturbed Type B soil, with characteristics of a Type C soil, and will require sheeting. The trench is 18 feet deep and 12 feet wide. 8 foot horizontal spacing between cylinders is desired for working space. From Table D-1.3: Find horizontal wale with a section modulus of 14.0 spaced at 4 feet o.c. vertically and 3 inch diameter cylinder spaced at 9 feet maximum o.c. horizontally. 3x12 timber sheeting is required at close spacing vertically. (See Figure 4 for typical installation.)

**(5) Example 5:** A trench is dug in Type C soil, 9 feet deep and 4 feet wide. Horizontal cylinder spacing in excess of 6 feet is desired for working space. From Table D-1.4: Find horizontal wale with a section modulus of 7.0 and 2 inch diameter cylinders spaced at 6.5 feet o.c. horizontally. Or, find horizontal wale with a 14.0 section modulus and 3 inch diameter cylinder spaced at 10 feet o.c. horizontally. Both wales are spaced 4 feet o.c. vertically. 3x12 timber sheeting is required at close spacing vertically. (See Figure 4 for typical installation.)

**(g) Footnotes, and general notes, for Tables D-1.1, D-1.2, D-1.3, and D-1.4.**

**(1)** For applications other than those listed in the tables, refer to §1926.652(c)(2) for use of manufacturer's tabulated data. For trench depths in excess of 20 feet, refer to §1926.652(c)(2) and §1926.652(c)(3).

**(2)** 2 inch diameter cylinders, at this width, shall have structural steel tube (3.5x3.5x0.1875) oversleeves, or structural oversleeves of manufacturer's specification, extending the full, collapsed length.

- 
- (3) Hydraulic cylinders capacities.
- (i) 2 inch cylinders shall be a minimum 2-inch inside diameter with a safe working capacity of not less than 18,000 pounds axial compressive load at maximum extension. Maximum extension is to include full range of cylinder extensions as recommended by product manufacturer.
  - (ii) 3-inch cylinders shall be a minimum 3-inch inside diameter with a safe work capacity of not less than 30,000 pounds axial compressive load at maximum extension. Maximum extension is to include full range of cylinder extensions as recommended by product manufacturer.
- (4) All spacing indicated is measured center to center.
- (5) Vertical shoring rails shall have a minimum section modulus of 0.40 inch.
- (6) When vertical shores are used, there must be a minimum of three shores spaced equally, horizontally, in a group.
- (7) Plywood shall be 1.125 in. thick softwood or 0.75 inch. thick, 14 ply, arctic white birch (Finland form). Please note that plywood is not intended as a structural member, but only for prevention of local raveling (sloughing of the trench face) between shores.
- (8) See appendix C for timber specifications.
- (9) Wales are calculated for simple span conditions.
- (10) See appendix D, item (d), for basis and limitations of the data.

# SELECTION OF PROTECTIVE SYSTEMS

P

## Appendix F – Selection of Protective Systems

The following figures are a graphic summary of the requirements in subdivision P for excavations 20 feet or less in depth. Protective systems for use in excavations more than 20 feet in depth must be designed by a registered professional engineer in accordance with §1926.652(b) and (c).

**Figure 1 – Preliminary Decisions**

# SELECTION OF PROTECTIVE SYSTEMS

**Figure 2 – Sloping Options**

# SELECTION OF PROTECTIVE SYSTEMS

P

Shoring or shielding selected as  
the method of protection.

Soil classification is required when shoring or shielding is used. The excavation must comply with one of the following four options:

Option 1:

§1926.652(c)(1) which requires Appendices A and C to be followed (e.g., timber shoring).

Option 2:

§1926.652(c)(2) which requires manufacturers data to be followed (e.g., hydraulic shoring, trench jacks, air shores, shields).

Option 3:

§1926.652(c)(3) which requires tabulated data (see definition) to be followed (e.g., any system as per the tabulated data).

Option 4:

§1926.652(c)(4) which requires the excavation to be designed by a registered professional engineer (e.g., any designed system).

**Figure 3 – Shoring and Shielding Options**

Oregon Administrative Rules  
Chapter 437

Division 3  
Construction

---

Concrete and Masonry  
Construction

Subdivision

Q

Administrative  
Order 1-2003

The Oregon Department of Consumer and Business Services adopted these rules pursuant to ORS 654.025(2).

The Secretary of State designated OAR Chapter 437 as the "Oregon Occupational Safety and Health Code." Six general subject areas within this code are designated as "Divisions."

- **Division 1** General Administrative Rules
- **Division 2** General Occupational Safety and Health Rules
- **Division 3** Construction
- **Division 4** Agriculture
- **Division 5** Maritime Activities
- **Division 7** Forest Activities
- **Oregon Revised Statutes (ORS) 654** The Oregon Safe Employment Act (OSEAct)

Oregon-initiated rules in this division of the Oregon Occupational Safety and Health Code are numbered in a uniform system developed by the Secretary of State. This system does not number the rules in sequence (001, 002, 003, etc.). Omitted numbers may be assigned to new rules at the time of their adoption.

**Oregon-initiated rules** are arranged in the following Basic Codification Structure adopted by the Secretary of State for Oregon Administrative Rules (OAR):

Chapter	Division	Rule	Section	Subsection	Paragraphs
<i>437</i>	<i>003</i>	<i>0322</i>	<i>(1)</i>	<i>(a)</i>	<i>(A)(i)(I)</i>

The majority of Oregon OSHA rules are adopted by reference from the Code of Federal Regulations (CFR), and are arranged in the following basic federal numbering system:

Chapter	Division	Part	Subpart (Subdivision)	Section	Paragraphs
437	003	1926	G	.303	(a)(1)(i)(A)(1)

The terms "subdivision" and "subpart" are synonymous within OAR 437, Oregon Occupational Safety and Health Code.

---

To obtain an order form or copies of these codes, address:

**Department of Consumer & Business Services**  
**Oregon Occupational Safety & Health Division (Oregon OSHA)**  
**350 Winter St. NE**  
**Salem, OR 97301-3882**

Or call the Oregon OSHA Resource Library at 503-378-3272

The rules referenced in this division are available for viewing in the Office of the Secretary of State, Oregon State Archives Building, Salem, Oregon, or the Central Office, Oregon Occupational Safety and Health Division of the Department of Consumer and Business Services, 350 Winter St. NE, Salem, Oregon, and on our web site at [osha.oregon.gov](http://osha.oregon.gov).

## 1926.700 Scope, Application, and Definitions Applicable to this Subpart

- (a) Scope and application. This subpart sets forth requirements to protect all construction employees from the hazards associated with concrete and masonry construction operations performed in workplaces covered under 29 CFR Part 1926. In addition to the requirements in Subpart Q, other relevant provisions in Parts 1910 and 1926 apply to concrete and masonry construction operations.
- (b) Definitions applicable to this subpart. In addition to the definitions set forth in 1926.32, the following definitions apply to this subpart.

**Bull float** means a tool used to spread out and smooth concrete.

**Formwork** means the total system of support for freshly placed or partially cured concrete, including the mold or sheeting (form) that is in contact with the concrete as well as all supporting members including shores, reshores, hardware, braces, and related hardware.

**Lift slab** means a method of concrete construction in which floor, and roof slabs are cast on or at ground level and, using jacks, lifted into position. **Limited access zone** means an area alongside a masonry wall, which is under construction, and which is clearly demarcated to limit access by employees.

**Precast concrete** means concrete members (such as walls, panels, slabs, columns, and beams) which have been formed, cast, and cured prior to final placement in a structure.

**Reshoring** means the construction operation in which shoring equipment (also called reshores or reshoring equipment) is placed, as the original forms and shores are removed, in order to support partially cured concrete and construction loads.

**Shore** means a supporting member that resists a compressive force imposed by a load.

**Vertical slip forms** means forms which are jacked vertically during the placement of concrete.

**Jacking operation** means the task of lifting a slab (or group of slabs) vertically from one location to another (e.g. from the casting location to a temporary (parked) location, or from a temporary location to another temporary location, or to its final location in the structure), during the construction of a building/structure where the lift-slab process is being used.

[53 FR 22643, June 16, 1988, as amended at 55 FR 42328, Oct. 18, 1990]

Stat. Auth.: ORS 654.025(2) and 656.726(3).

Hist: APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).

APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

### **437-003-0017 Additional Definitions to Concrete and Masonry Construction**

**Competent person** means one who is capable of identifying existing and predictable hazards in the surroundings or working conditions which are unsanitary, hazardous, or dangerous to employees, and who has authorization to take prompt corrective measures to eliminate them.

**NOTE:** For the ease of the reader, this definition is reprinted here from 1926.32.

**Deadman** is a large weight of sufficient mass used to anchor the base of a brace to a masonry wall.

**Grout lift** is an increment of grout height within the total grout pour.

**Grout pour** is the total height of a masonry wall to be grouted prior to the erection of additional masonry. A grout pour can consist of one or more grout lifts.

**High wind area** is where construction activity continues when winds are expected to exceed 35 mph on a regular basis.

**Protected area** is a location at a jobsite that is not exposed to winds, such as basements and interior areas.

**Qualified person** means one who, by possession of a recognized degree, certificate, or professional standing, or who by extensive knowledge, training, and experience, has successfully demonstrated the ability to solve or resolve problems relating to the subject matter, the work, or the project.

**NOTE:** For the ease of the reader, this definition is reprinted here from 1926.32.

***Running bond (half bond)*** is a bond pattern in which block are placed half way over units directly below creating a staggered look.

***Safe location*** is an area at a jobsite that employees can take refuge in order to avoid hazardous conditions.

***Stack bond*** is a bond pattern in which blocks are stacked directly over each other (not lapped longitudinally) creating continuous joints both vertically and horizontally.

***Straight coil loop insert*** is a wall insert that loops around the structural rebar and is suitable for the attachment of braces in a structural masonry wall. Minimum size of a coil loop insert is 3/4 inch.

***Structural rebar*** is rebar that extends full length or height and can be spliced per required lap.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 1-2003, f.1/30/03, ef. 4/30/03.

## 1926.701 General Requirements

- (a) Construction loads. No construction loads shall be placed on a concrete structure or portion of a concrete structure unless the employer determines, based on information received from a person who is qualified in structural design, that the structure or portion of the structure is capable of supporting the loads.
- (b) Reinforcing steel. All protruding reinforcing steel, onto and into which employees could fall, shall be guarded to eliminate the hazard of impalement.
- (c) Post-tensioning operations.
  - (1) No employee (except those essential to the post-tensioning operations) shall be permitted to be behind the jack during tensioning operations.
  - (2) Signs and barriers shall be erected to limit employee access to the post-tensioning area during tensioning operations.
- (d) Riding concrete buckets. No employee shall be permitted to ride concrete buckets.
- (e) Working under loads.

- (1) No employee shall be permitted to work under concrete buckets while buckets are being elevated or lowered into position.
  - (2) To the extent practical, elevated concrete buckets shall be routed so that no employee, or the fewest number of employees, are exposed to the hazards associated with falling concrete buckets.
- (f) Personal protective equipment. No employee shall be permitted to apply a cement, sand, and water mixture through a pneumatic hose unless the employee is wearing protective head and face equipment.

[53 FR 22643, June 16, 1988, as amended at 59 FR 40730, Aug. 9, 1994]

Stat. Auth.: ORS 654.025(2) and 656.726(3).

Hist: APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89.

OR-OSHA Admin. Order 6-1991, f. 3/18/91, ef. 4/15/91.

OR-OSHA Admin. Order 6-1995, f. 4/18/95, ef. 6/1/95.

## 1926.702 Requirements for Equipment and Tools

- (a) Bulk cement storage.
- (1) Bulk storage bins, containers, and silos shall be equipped with the following:
    - (i) Conical or tapered bottoms; and
    - (ii) Mechanical or pneumatic means of starting the flow of material.
  - (2) No employee shall be permitted to enter storage facilities unless the ejection system has been shut down, locked out, and tagged to indicate that the ejection system is not to be operated.
- (b) Concrete mixers. Concrete mixers with one cubic yard (.8 m<sup>3</sup>) or larger loading skips shall be equipped with the following:
- (1) A mechanical device to clear the skip of materials; and
  - (2) Guardrails installed on each side of the skip.
- (c) Power concrete trowels. Powered and rotating type concrete troweling machines that are manually guided shall be equipped with a control switch that will automatically shut off the power whenever the hands of the operator are removed from the equipment handles.
- (d) Concrete buggies. Concrete buggy handles shall not extend beyond the wheels on either side of the buggy.

(e) Concrete pumping systems.

- (1) Concrete pumping systems using discharge pipes shall be provided with pipe supports designed for 100 percent overload.
- (2) Compressed air hoses used on concrete pumping system shall be provided with positive fail-safe joint connectors to prevent separation of sections when pressurized.

(f) Concrete buckets.

- (1) Concrete buckets equipped with hydraulic or pneumatic gates shall have positive safety latches or similar safety devices installed to prevent premature or accidental dumping.
- (2) Concrete buckets shall be designed to prevent concrete from hanging up on top and the sides.

(g) Tremies. Sections of tremies and similar concrete conveyances shall be secured with wire rope (or equivalent materials) in addition to the regular couplings or connections.

(h) Bull floats. Bull float handles, used where they might contact energized electrical conductors, shall be constructed of nonconductive material or insulated with a nonconductive sheath whose electrical and mechanical characteristics provide the equivalent protection of a handle constructed of nonconductive material.

(i) Masonry saws.

- (1) Masonry saws shall be guarded with a semicircular enclosure over the blade.
- (2) A method for retaining blade fragments shall be incorporated in the design of the semicircular enclosure.

(j) Lockout/Tagout Procedures.

- (1) No employee shall be permitted to perform maintenance or repair activity on equipment (such as compressors, mixers, screens or pumps used for concrete and masonry construction activities) where the inadvertent operation of the equipment could occur and cause injury, unless all potentially hazardous energy sources have been locked out and tagged.
- (2) Tags shall read Do Not Start or similar language to indicate that the equipment is not to be operated.

## 1926.703 Requirements for Cast-in-place Concrete

### (a) General requirements for formwork.

- (1) Formwork shall be designed, fabricated, erected, supported, braced and maintained so that it will be capable of supporting without failure all vertical and lateral loads that may reasonably be anticipated to be applied to the formwork. Formwork which is designed, fabricated, erected, supported, braced and maintained in conformance with the Appendix to this section will be deemed to meet the requirements of this paragraph.
- (2) Drawings or plans, including all revisions, for the jack layout, formwork (including shoring equipment), working decks, and scaffolds, shall be available at the jobsite.

### (b) Shoring and reshoring.

- (1) All shoring equipment (including equipment used in reshoring operations) shall be inspected prior to erection to determine that the equipment meets the requirements specified in the formwork drawings.
- (2) Shoring equipment found to be damaged such that its strength is reduced to less than that required by 1926.703(a)(1) shall not be used for shoring.
- (3) Erected shoring equipment shall be inspected immediately prior to, during, and immediately after concrete placement.
- (4) Shoring equipment that is found to be damaged or weakened after erection, such that its strength is reduced to less than that required by 1926.703(a)(1), shall be immediately reinforced.
- (5) The sills for shoring shall be sound, rigid, and capable of carrying the maximum intended load.
- (6) All base plates, shore heads, extension devices, and adjustment screws shall be in firm contact, and secured when necessary, with the foundation and the form.
- (7) Eccentric loads on shore heads and similar members shall be prohibited unless these members have been designed for such loading.

- (8) Whenever single post shores are used one on top of another (tiered), the employer shall comply with the following specific requirements in addition to the general requirements for formwork:
- (i) The design of the shoring shall be prepared by a qualified designer and the erected shoring shall be inspected by an engineer qualified in structural design.
  - (ii) The single post shores shall be vertically aligned.
  - (iii) The single post shores shall be spliced to prevent misalignment.
  - (iv) The single post shores shall be adequately braced in two mutually perpendicular directions at the splice level. Each tier shall also be diagonally braced in the same two directions.
- (9) Adjustment of single post shores to raise formwork shall not be made after the placement of concrete.
- (10) Reshoring shall be erected, as the original forms and shores are removed, whenever the concrete is required to support loads in excess of its capacity.
- (c) Vertical slip forms.
- (1) The steel rods or pipes on which jacks climb or by which the forms are lifted shall be:
    - (i) Specifically designed for that purpose; and
    - (ii) Adequately braced where not encased in concrete.
  - (2) Forms shall be designed to prevent excessive distortion of the structure during the jacking operation.
  - (3) All vertical slip forms shall be provided with scaffolds or work platforms where employees are required to work or pass.
  - (4) Jacks and vertical supports shall be positioned in such a manner that the loads do not exceed the rated capacity of the jacks.
  - (5) The jacks or other lifting devices shall be provided with mechanical dogs or other automatic holding devices to support the slip forms whenever failure of the power supply or lifting mechanism occurs.
  - (6) The form structure shall be maintained within all design tolerances specified for plumbness during the jacking operation.

(7) The predetermined safe rate of lift shall not be exceeded.

(d) Reinforcing steel.

(1) Reinforcing steel for walls, piers, columns, and similar vertical structures shall be adequately supported to prevent overturning and to prevent collapse.

(2) Employers shall take measures to prevent unrolled wire mesh from recoiling. Such measures may include, but are not limited to, securing each end of the roll or turning over the roll.

(e) Removal of formwork.

(1) Forms and shores (except those used for slabs on grade and slip forms) shall not be removed until the employer determines that the concrete has gained sufficient strength to support its weight and superimposed loads. Such determination shall be based on compliance with one of the following:

(i) The plans and specifications stipulate conditions for removal of forms and shores, and such conditions have been followed, or

(ii) The concrete has been properly tested with an appropriate ASTM standard test method designed to indicate the concrete compressive strength, and the test results indicate that the concrete has gained sufficient strength to support its weight and superimposed loads.

(2) Reshoring shall not be removed until the concrete being supported has attained adequate strength to support its weight and all loads in place upon it.

## Appendix to 1926.703(a)(1) – General Requirements for Formwork

(This Appendix is non-mandatory)

This appendix serves as a non-mandatory guideline to assist employers in complying with the formwork requirements in 1926.703(a)(1). Formwork which has been designed, fabricated, erected, braced, supported and maintained in accordance with Sections 6 and 7 of the American National Standard for Construction and Demolition Operations – Concrete and Masonry Work, ANSI A10.9-1983, shall be deemed to be in compliance with the provision of 1926.703(a)(1).

Stat. Auth.: ORS 654.025(2) and 656.726(3).  
Hist: APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89.

## 1926.704 Requirements for Precast Concrete

- (a) Precast concrete wall units, structural framing, and tilt-up wall panels shall be adequately supported to prevent overturning and to prevent collapse until permanent connections are completed.
- (b) Lifting inserts which are embedded or otherwise attached to tilt-up precast concrete members shall be capable of supporting at least two times the maximum intended load applied or transmitted to them.
- (c) Lifting inserts which are embedded or otherwise attached to precast concrete members, other than the tilt-up members, shall be capable of supporting at least four times the maximum intended load applied or transmitted to them.
- (d) Lifting hardware shall be capable of supporting at least five times the maximum intended load applied or transmitted to the lifting hardware.
- (e) No employee shall be permitted under precast concrete members being lifted or tilted into position except those employees required for the erection of those members.

Hist: APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89.

OR-OSHA Admin. Order 8-1990, f. 3/30/90, ef. 9/1/90.

## 1926.705 Requirements for Lift-slab Construction Operations

- (a) Lift-slab operations shall be designed and planned by a registered professional engineer who has experience in lift-slab construction. Such plans and designs shall be implemented by the employer and shall include detailed instructions and sketches indicating the prescribed method of erection. These plans and designs shall also include provisions for ensuring lateral stability of the building/structure during construction.
- (b) Jacks/lifting units shall be marked to indicate their rated capacity as established by the manufacturer.
- (c) Jacks/lifting units shall not be loaded beyond their rated capacity as established by the manufacturer.

- (d) Jacking equipment shall be capable of supporting at least two and one-half times the load being lifted during jacking operations and the equipment shall not be overloaded. For the purpose of this provision, jacking equipment includes any load bearing component which is used to carry out the lifting operation(s). Such equipment includes, but is not limited, to the following: threaded rods, lifting attachments, lifting nuts, hook-up collars, T-caps, shearheads, columns, and footings.
- (e) Jacks/lifting units shall be designed and installed so that they will neither lift nor continue to lift when they are loaded in excess of their rated capacity.
- (f) Jacks/lifting units shall have a safety device installed which will cause the jacks/lifting units to support the load in any position in the event any jack/lifting unit malfunctions or loses its lifting ability.
- (g) Jacking operations shall be synchronized in such a manner to ensure even and uniform lifting of the slab. During lifting, all points at which the slab is supported shall be kept within 1/2 inch of that needed to maintain the slab in a level position.
- (h) If leveling is automatically controlled, a device shall be installed that will stop the operation when the 1/2 inch tolerance set forth in paragraph (g) of this section is exceeded or where there is a malfunction in the jacking (lifting) system.
- (i) If leveling is maintained by manual controls, such controls shall be located in a central location and attended by a competent person while lifting is in progress. In addition to meeting the definition in 1926.32(f), the competent person must be experienced in the lifting operation and with the lifting equipment being used.
- (j) The maximum number of manually controlled jacks/lifting units on one slab shall be limited to a number that will permit the operator to maintain the slab level within specified tolerances of paragraph (g) of this section, but in no case shall that number exceed 14.

(k)

- (1) No employee, except those essential to the jacking operation, shall be permitted in the building/structure while any jacking operation is taking place unless the building/ structure has been reinforced sufficiently to ensure its integrity during erection. The phrase "reinforced sufficiently to ensure its integrity" used in this paragraph means that a registered professional engineer, independent of the engineer who designed and planned the lifting operation, has determined from the plans that if there is a loss of support at any jack location, that loss will be confined to that location and the structure as a whole will remain stable.
  - (2) Under no circumstances, shall any employee who is not essential to the jacking operation be permitted immediately beneath a slab while it is being lifted.
  - (3) For the purpose of paragraph (k) of this section, a jacking operation begins when a slab or group of slabs is lifted and ends when such slabs are secured (with either temporary connections or permanent connections).
  - (4) Employers who comply with Appendix A to 1926.705 shall be considered to be in compliance with the provisions of paragraphs (k)(1) through (k)(3) of this section.
- (l) When making temporary connections to support slabs, wedges shall be secured by tack welding, or an equivalent method of securing the wedges to prevent them from falling out of position. Lifting rods may not be released until the wedges at that column have been secured.
- (m) All welding on temporary and permanent connections shall be performed by a certified welder, familiar with the welding requirements specified in the plans and specifications for the lift-slab operation.
- (n) Load transfer from jacks/lifting units to building columns shall not be executed until the welds on the column shear plates (weld blocks) are cooled to air temperature.
- (o) Jacks/lifting units shall be positively secured to building columns so that they do not become dislodged or dislocated.

- (p) Equipment shall be designed and installed so that the lifting rods cannot slip out of position or the employer shall institute other measures, such as the use of locking or blocking devices, which will provide positive connection between the lifting rods and attachments and will prevent components from disengaging during lifting operations.

## Appendix to 1926.705 – Lift-slab Operations

(This Appendix is non-mandatory.)

In paragraph 1926.705(k), OSHA requires employees to be removed from the building/structure during jacking operations unless an independent registered professional engineer, other than the engineer who designed and planned the lifting operation, has determined that the building/structure has been sufficiently reinforced to ensure the integrity of the building/structure. One method to comply with this provision is for the employer to ensure that continuous bottom steel is provided in every slab and in both directions through every wall or column head area. (Column head area means the distance between lines that are one and one half times the thickness of the slab or drop panel. These lines are located outside opposite faces of the outer edges of the shearhead sections – See Figure 1.) The amount of bottom steel shall be established by assuming loss of support at a given lifting jack and then determining the steel necessary to carry, by catenary action over the span between surrounding supports, the slab service dead load plus any service dead and live loads likely to be acting on the slab during jacking. In addition, the surrounding supports must be capable of resisting any additional load transferred to them as a result of the loss of support at the lifting jack considered.

Figure 1 – Column Head Area

## 1926.706 Requirements for Masonry Construction

**NOTE:** Effective April 30, 2003, 1926.706(a)(2), (5), and (b) are REPEALED. In Oregon, OAR 437-003-0706 applies and is EFFECTIVE April 30, 2003.

(a) A limited access zone shall be established whenever a masonry wall is being constructed. The limited access zone shall conform to the following:

- (1) The limited access zone shall be established prior to the start of construction of the wall.

### ***437-003-0706 Protection of Employees On or Near Masonry Walls***

*(1) Nonreinforced Masonry Walls. The limited access zone for a masonry wall that is not reinforced and braced in accordance with 437-003-0706(3) must run the entire length of the wall, and extend away from the wall a distance equal to the height of the wall plus four feet.*

1926.706 (a)

- (3) The limited access zone shall be established on the side of the wall which will be unscaffolded.
- (4) The limited access zone shall be restricted to entry by employees actively engaged in constructing the wall. No other employees shall be permitted to enter the zone.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89.  
OR-OSHA Admin. Order 1-2003, f. 1/30/03, ef. 4/30/03.

*437-003-0706 (2) Limited Access Zone for Masonry Walls. The limited access zone shall remain in place until the wall is adequately supported to prevent overturning and to prevent collapse unless the height of wall is over eight feet, in which case, the limited access zone shall remain in place until the requirements of 437-003-0706(3) of this section have been met.*

*(3) Bracing for Masonry Walls. All masonry walls over eight feet in height must be adequately braced to prevent overturning and collapse unless the wall is adequately supported. Bracing must remain in place until permanent supporting elements of the structure are in place. The bracing system must be designed by a registered professional engineer, or follow the requirements of 437-003-0706(4).*

*(4) Protection of Employees On or Near Braced Masonry Walls.*

- (a) A limited access zone must be established when constructing a reinforced masonry wall.*
  - (A) A limited access zone must be established before construction of the wall begins.*
  - (D) All activity within the limited access zone is under the direction and control of a competent person.*
  - (E) Entry into the limited access zone is limited to employees actively engaged in construction of the wall. No other employees are allowed to enter the zone without permission from a competent person.*
  - (F) A competent person is responsible for monitoring wind speeds. When speeds reach 25 mph all braces must be examined and the site made secure.*
  - (B) A limited access zone must run the entire length of the wall, and extend away from the wall a distance equal to the height of the grout pour plus four feet.*
  - (C) A limited access zone must be located on the side of the wall not scaffolded.*
  - (G) When wind speeds reach 35 mph, all employees in the limited access zone and in proximity to the wall under construction must move to a safe location.*
  - (H) The limited access zone must remain in place until any wall over 8 feet in height is adequately braced per 437-003-0706(4)(e) or supported to prevent overturning and to prevent collapse.*
- (b) During construction of a masonry wall, adequate bracing must be in place to prevent the wall from overturning or collapse. If any of these conditions exist, the bracing is not needed:*
  - (A) The wall is 8 feet or less in height.*
  - (B) A qualified person demonstrates that modifications per 437-003-0706(4)(e) are adequate when addressing these or other inherently more stable conditions:*
    - (i) Shafts;*

- (ii) *Infills in existing walls;*
        - (iii) *Construction in protected areas;*
        - (iv) *Changes in wall thickness;*
        - (v) *Masonry pilasters; or*
        - (vi) *Corner returns, intersecting walls.*
- (C) *Permanent supporting elements of the structure are in place.*
- (c) *Design bracing systems according to 437-003-0706(4)(d) and (e) and install them under the direction of a competent person.*
- (d) *A registered professional engineer must design bracing when there is one or more of the following:*
  - (A) *The wall is more than 24 feet in height;*
  - (B) *the minimum requirements of 437-003-0706(4)(e)(A) or (B) are not met;*
  - (C) *stack bond; or*
  - (D) *high wind areas.*
- (e) *A structural masonry wall bracing system must be designed by a qualified person. The design and installation of the bracing system must comply with the following requirements:*
  - (A) *Minimum design requirements, including minimum requirements per chapter 26 of the Uniform Building Code, for use in Options 1 or 2:*
    - Note:** This information may be included in the blueprints.
    - (i) *F'm 1500 psi, concrete block laid in running bond pattern.*
    - (ii) *Type S mortar*
    - (iii) *60 ksi rebar, with minimum placement of 2 - #4 horizontally and 1 - #5 vertically at 48 inches on center.*
    - (iv) *2,000 psi grout required at reinforced areas.*
    - (v) *Straight coil loop insert with coil bolts (safe working load = 2250 lb.).*
    - (vi) *Metal concrete tilt braces.*

- (vii) Wall height not to exceed 24 feet.*
- (B) Minimum field requirements for use in Options 1 or 2.*
- (i) The horizontal spacing distance between two or more braces must not exceed 20 feet;*
  - (ii) The horizontal bracing distance from an end of wall or control joint must not exceed 10 feet;*
  - (iii) A qualified person must determine if walls less than 20 feet in length require two braces;*
  - (iv) The connection of the brace to the masonry wall must consist of a minimum 3/4 inch straight coil loop insert, placed around a structural rebar located at an ungrouted bond beam;*
  - (v) At least one structural rebar must be located between the attached bar and face shell that receives brace (see figure 1);*
  - (vi) The base connection of brace must consist of a minimum 3/4 inch anchor attached to either a 4 inch minimum thick slab or deadman;*
  - (vii) The brace angle must not be greater than 60 degrees from the horizontal;*
  - (viii) The slab or deadman connection must resist a minimum 3,400 lbs. pullout force.*
- (C) Option 1 – Bracing structural masonry walls when grout pours are limited to 5 feet 4 inches or less in height.*
- (i) A maximum 8 feet of initial wall height may be laid with minimum reinforcement and then grouted.*
  - (ii) A maximum 5 feet, 4 inches of additional wall may be laid with reinforcement located to receive straight coil loop inserts at the bond beam location.*
  - (iii) The first brace must be connected to the wall insert and attached to slab or deadman at base of wall.*
  - (iv) The reinforced section must be grouted.*
  - (v) Additional wall may be constructed following steps 437-003-0706(4)(e)(C)(ii) through (iv).*

*(D) Option 2 – Bracing structural masonry walls with grout pours up to 8 feet in height.*

- (i) A maximum 8 feet of the initial wall height may be laid with minimum reinforcement and then grouted.*
- (ii) A maximum 5 feet, 4 inches of additional wall may be laid with reinforcement located to receive straight coil loop inserts at a bond beam location.*
- (iii) Braces must be connected to coil loop inserts in the wall and attached at the base to either a slab or deadman.*
- (iv) The wall may be laid and reinforced up to the grout pour.*
- (v) No more than 4 feet of ungrouted wall above the brace point is permitted.*
- (vi) Grouting may be done after each section of wall is adequately braced.*
- (vii) A maximum of 8 feet of additional wall height may be constructed and braced following steps 437-003-0706 (4)(e)(D)(ii) through (iv)*

*Figure 1. Straight coil loop insert attached to rebar with perpendicular rebar between it and face shell to receive brace.*

## Appendix A to Subpart Q – References to Subpart Q of Part 1926

(This Appendix is non-mandatory.)

The following non-mandatory references provide information which can be helpful in understanding and complying with the requirements contained in Subpart Q.

- Accident Prevention Manual for Industrial Operations; Eighth Edition; National Safety Council.
- Building Code Requirements for Reinforced Concrete (ACI 318-83).
- Formwork for Concrete (ACI SP-4).
- Recommended Practice for Concrete Formwork (ACI 347-78).
- Safety Requirements for Concrete and Masonry Work (ANSI A10.9-1983).
- Standard Test Method for Compressive Strength of Cylindrical Concrete Specimens (ASTM C39-86).
- Standard Test Method for Making and Curing Concrete Test Specimens in the Field (ASTM C31-85).
- Standard Test Method for Penetration Resistance of Hardened Concrete (ASTM C803-82).
- Standard Test Method for Compressive Strength of Concrete Cylinders Cast In-Place in Cylindrical Molds (ASTM C873-85).
- Standard Method for Developing Early Age Compressive Test Values and Projecting Later Age Strengths (ASTM C918-80).
- Recommended Practice for Inspection and Testing Agencies for Concrete, Steel and Bituminous Materials as Used in Construction (ASTM E329-77).
- Method of Making and Curing Concrete Test Specimens in the Laboratory (ASTM C192-88).
- Methods of Obtaining and Testing Drilled Cores and Sawed Beams of Concrete (ASTM C42-87).
- Methods of Securing, Preparing and Testing Specimens from Hardened Lightweight Insulating Concrete for Compressive Strength (ASTM C513-86).
- Test Method for Comprehensive Strength of Lightweight Insulating Concrete (ASTM C495-86).

- Method of Making, Accelerating Curing, and Testing of Concrete Compression Test Specimens (ASTM C684-81).
- Test Method for Compressive Strength of Concrete Using Portions of Beams Broken in Flexure (ASTM C116-68 (1980)).

Stat.Auth.: ORS 654.025(2) and 656.726(3).

Hist: APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89.

## Historical Notes for Subdivision Q

**Note:** The Accident Prevention Division adopted Division 3, Construction federal standard 29 CFR 1926 by reference on a temporary basis effective May 1, 1989. It contained new and revised federal occupational safety and health rules for the Construction industry. APD is now announcing that these same rules have been duly filed for permanent adoption, effective July 1, 1989. Division 3, Construction, includes new federal rules which cover masonry and concrete construction standards, and limits the use of construction cranes and derricks as personnel hoists, and revised federal rules and reduce occupational exposures to asbestos, tremolite, anthophyllite, and actinolite. Hazard communication rules for construction are also now included in Division 3.

Division 3, Construction, replaces Oregon codes, Division 83, construction, and Division 84, Electrical transmission and distribution facilities. However, some individual rules from each of these divisions have been retained and adopted into the new Division 3, construction, as Oregon-initiated rules.

This is Oregon OSHA administrative order 8-1989, adopted and effective July 7, 1989.

**Note:** Oregon OSHA has adopted by reference, federal OSHA's revised rules on excavations. The changes made by federal OSHA to Subdivision P of the construction code more clearly define safety criteria in order to enhance worker protection. Statistics show that accidents occur more frequently in excavation work than in any other area of construction work. Accidents while doing excavation are more likely to be fatal.

Concurrently with this adoption, Oregon OSHA amended several rules in other Subdivisions of Division 3 for editorial reasons. A technical amendment to Subdivision Q (1926.704(b)) was caused by an error in the federal printing process. OSHA submitted the adoption with a mandatory "shall", but it was printed in the Federal Register in the CFR as "should". Other corrections are also editorial in nature to update references, etc.

This is Oregon OSHA administrative order 8-1990, adopted March 30, 1990, effective September 1, 1990.

**Note:** Federal OSHA adopted amendments to their construction standard (29 CFR 1926) by reference into OAR 437, Division 3, construction. The amendments to rules on lift-slab operations ensure that all non-essential personnel are off the jobsite during the lifting operation, unless an independent registered professional engineer has determined the building's structural integrity. These rules are nearly identical to ANSI A10.9-1983, Safety Requirements for Concrete Construction & Masonry Work.

The amendments to Stairways & Ladders rules include a reorganization into a more logical grouping of topics. Subdivision X is now titled "Stairways and Ladders", and the revisions eliminate unnecessary and redundant provisions, and focus on the principal hazards involved when working on stairways and ladders. Concurrently, Oregon OSHA has amended the scope of 1926.601, Motor Vehicles, by deleting 1926.601(a), and adopting Oregon-initiated rule 437-03-093. The deletion of 1926.601(a) again makes the rule applicable to all construction jobsites, with no exceptions.

This is Oregon OSHA administrative order 6-1991, adopted March 18, 1991, effective April 15, 1991.

**Note:** Federal OSHA revised the construction industry safety standards which regulate fall protection systems and procedures, which were published in the federal register August 9, 1994. The rule applies to all construction activities unless another construction standard specifically requires fall protection, such as for steel erection of buildings and for scaffolds. The fall protection systems and procedures addressed in this rule are intended to prevent employees from falling off, onto, or through working levels and to protect employees from falling objects.

The final rule corrects problems which have arisen during enforcement of the existing standards. In this final rule, OSHA either maintains or increases the requirements for protection from those hazards, but does so using more performance-oriented criteria where possible, rather than specification-oriented language. The final rule also consolidates and simplifies many of the existing provisions. This rulemaking is another step in OSHA's plan to review its safety standards and to revise them as necessary to provide safer working conditions without imposing unnecessary burdens. The repeal of Oregon-initiated rule OAR 437-03-075 is necessary to avoid duplicative language.

This is Oregon OSHA administrative order 6-1995, adopted April 18, 1995, effective June 1, 1995.

**Note:** Oregon OSHA was petitioned by the Masonry Institute of Oregon, the Masonry Contractor's Association of America, Portland Chapter, and the International Union of Bricklayers & Allied Craftworkers, Local 1 of Oregon, to adopt rules which provide clear criteria for "adequate" bracing of masonry walls during construction. Oregon OSHA proposed to adopt new rules OAR 437-003-0017, Additional Definitions to Concrete and Masonry Construction, and OAR 437-003-0706, Protection of Employees on or Near Braced Masonry Walls. The new rules, in conjunction with (a slightly modified) 1926.706 in Division 3Q, will provide greater clarity for "adequately braced", and a higher level of safety to works constructing or working near braced masonry walls. The criteria in the proposed rules were developed under a work site redesign grant from Oregon OSHA.

A public hearing was held on November 25, 2002. In response to comments received at the hearing, and written comments that were received, a small number of changes were made to the original proposal, which include: Rules addressing non-reinforced masonry walls were added back into the proposal, language was added requiring the bracing system to be designed by a registered professional engineer, or follow the requirements of the proposed standard, language was added allowing the possibility of more than one competent person, language was changed to require bracing of all masonry walls rather than just structural masonry walls, language was changed to indicate that minimum design requirements for bracing "may be" included in blueprints, and, "length" was changed to "height" in two rules addressing bracing of walls with grout pours. Overall, the final adoption reflects very few changes from the original proposal.

This is Oregon OSHA administrative order 1-2003, adopted January 30, 2003, effective April 30, 2003.

Oregon Administrative Rules  
Chapter 437

Division 3  
Construction

---

Steel Erection

Subdivision

**R**

Administrative  
Order 1-2011

The Oregon Department of Consumer and Business Services adopted these rules pursuant to ORS 654.025(2).

The Secretary of State designated OAR Chapter 437 as the “Oregon Occupational Safety and Health Code.” Six general subject areas within this code are designated as “Divisions.”

- **Division 1** General Administrative Rules
- **Division 2** General Occupational Safety and Health Rules
- **Division 3** Construction
- **Division 4** Agriculture
- **Division 5** Maritime Activities
- **Division 7** Forest Activities
- **Oregon Revised Statutes (ORS) 654** The Oregon Safe Employment Act (OSEAct)

Oregon-initiated rules in this division of the Oregon Occupational Safety and Health Code are numbered in a uniform system developed by the Secretary of State. This system does not number the rules in sequence (001, 002, 003, etc.). Omitted numbers may be assigned to new rules at the time of their adoption.

**Oregon-initiated rules** are arranged in the following Basic Codification Structure adopted by the Secretary of State for Oregon Administrative Rules (OAR):

Chapter	Division	Rule	Section	Subsection	Paragraphs
437	002	0322	(1)	(a)	(A)(i)(I)

The majority of Oregon OSHA rules are adopted by reference from the Code of Federal Regulations (CFR), and are arranged in the following basic federal numbering system:

Chapter	Division	Part	Subpart (Subdivision)	Section	Paragraphs
437	002	1910	G	.303	(a)(1)(i)(A)(1)

The terms “subdivision” and “subpart” are synonymous within OAR 437, Oregon Occupational Safety and Health Code.

---

To obtain an order form or copies of these codes, address:

**Department of Consumer & Business Services**  
**Oregon Occupational Safety & Health Division (Oregon OSHA)**  
350 Winter St. NE  
Salem, OR 97301-3882

Or call the Oregon OSHA Resource Library at 503-378-3272

The rules referenced in this division are available for viewing in the Office of the Secretary of State, Oregon State Archives Building, Salem, Oregon, or the Central Office, Oregon Occupational Safety and Health Division of the Department of Consumer and Business Services, 350 Winter St. NE, Salem, Oregon, and on our website at [osha.oregon.gov](http://osha.oregon.gov).

## 1926.750 Scope

- (a) This subpart sets forth requirements to protect employees from the hazards associated with steel erection activities involved in the construction, alteration, and/or repair of single and multi-story buildings, bridges, and other structures where steel erection occurs. The requirements of this subpart apply to employers engaged in steel erection unless otherwise specified. This subpart does not cover electrical transmission towers, communication and broadcast towers, or tanks.

**Note to paragraph (a):** Examples of structures where steel erection may occur include but are not limited to the following: Single and multi-story buildings; systems-engineered metal buildings; lift slab/tilt-up structures; energy exploration structures; energy production, transfer and storage structures and facilities; auditoriums; malls; amphitheaters; stadiums; power plants; mills; chemical process structures; bridges; trestles; overpasses; underpasses; viaducts; aqueducts; aerospace facilities and structures; radar and communication structures; light towers; signage; billboards; scoreboards; conveyor systems; conveyor supports and related framing; stairways; stair towers; fire escapes; draft curtains; fire containment structures; monorails; aerialways; catwalks; curtain walls; window walls; store fronts; elevator fronts; entrances; skylights; metal roofs; industrial structures; hi-bay structures; rail, marine and other transportation structures; sound barriers; water process and water containment structures; air and cable supported structures; space frames; geodesic domes; canopies; racks and rack support structures and frames; platforms; walkways; balconies; atriums; penthouses; car dumpers; stackers/reclaimers; cranes and craneways; bins; hoppers; ovens; furnaces; stacks; amusement park structures and rides; and artistic and monumental structures.

(b)

(1) Steel erection activities include hoisting, laying out, placing, connecting, welding, burning, guying, bracing, bolting, plumbing and rigging structural steel, steel joists and metal buildings; installing metal decking, curtain walls, window walls, siding systems, miscellaneous metals, ornamental iron and similar materials; and moving point-to-point while performing these activities.

- (2) The following activities are covered by this subpart when they occur during and are a part of steel erection activities: rigging, hoisting, laying out, placing, connecting, guying, bracing, dismantling, burning, welding, bolting, grinding, sealing, caulking, and all related activities for construction, alteration and/or repair of materials and assemblies such as structural steel; ferrous metals and alloys; non-ferrous metals and alloys; glass; plastics and synthetic composite materials; structural metal framing and related bracing and assemblies; anchoring devices; structural cabling; cable stays; permanent and temporary bents and towers; falsework for temporary supports of permanent steel members; stone and other non-precast concrete architectural materials mounted on steel frames; safety systems for steel erection; steel and metal joists; metal decking and raceway systems and accessories; metal roofing and accessories; metal siding; bridge flooring; cold formed steel framing; elevator beams; grillage; shelf racks; multi-purpose supports; crane rails and accessories; miscellaneous, architectural and ornamental metals and metal work; ladders; railings; handrails; fences and gates; gratings; trench covers; floor plates; castings; sheet metal fabrications; metal panels and panel wall systems; louvers; column covers; enclosures and pockets; stairs; perforated metals; ornamental iron work, expansion control including bridge expansion joint assemblies; slide bearings; hydraulic structures; fascias; soffit panels; penthouse enclosures; skylights; joint fillers; gaskets; sealants and seals; doors; windows; hardware; detention/security equipment and doors, windows and hardware; conveying systems; building specialties; building equipment; machinery and plant equipment, furnishings and special construction.
- (c) The duties of controlling contractors under this subpart include, but are not limited to, the duties specified in 1926.752(a) and (c), 1926.755(b)(2), 1926.759(b), and 1926.760(e).

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.

## 1926.751 Definitions

**Anchored bridging** means that the steel joist bridging is connected to a bridging terminus point.

**Bolted diagonal bridging** means diagonal bridging that is bolted to a steel joist or joists.

**Bridging clip** means a device that is attached to the steel joist to allow the bolting of the bridging to the steel joist.

**Bridging terminus point** means a wall, a beam, tandem joists (with all bridging installed and a horizontal truss in the plane of the top chord) or other element at an end or intermediate point(s) of a line of bridging that provides an anchor point for the steel joist bridging.

#### **437-003-0045 Additional Definitions**

*The following definitions are in addition to those found in 1926.751:*

*(1) Certification required by this section means "in writing".*

**Choker** means a wire rope or synthetic fiber rigging assembly that is used to attach a load to a hoisting device.

**Cold forming** means the process of using press brakes, rolls, or other methods to shape steel into desired cross sections at room temperature.

**Column** means a load-carrying vertical member that is part of the primary skeletal framing system. Columns do not include posts.

**Competent person** (also defined in 1926.32) means one who is capable of identifying existing and predictable hazards in the surroundings or working conditions which are unsanitary, hazardous, or dangerous to employees, and who has authorization to take prompt corrective measures to eliminate them.

**Note:** In Oregon, a competent person is considered to be someone with equivalent skills as a qualified person in identifying existing and potential hazards in the workplace, while also being authorized by the employer or employer's representative to take immediate corrective action to control or eliminate hazards.

**Connector** means an employee who, working with hoisting equipment, is placing and connecting structural members and/or components.

**Constructibility** means the ability to erect structural steel members in accordance with Subpart R without having to alter the overall structural design.

**Construction load** (for joist erection) means any load other than the weight of the employee(s), the joists and the bridging bundle.

**Controlled Decking Zone (CDZ)** means an area in which certain work (for example, initial installation and placement of metal decking) may take place without the use of guardrail systems, personal fall arrest systems, fall restraint systems, or safety net systems and where access to the zone is controlled.

**Controlled load lowering** means lowering a load by means of a mechanical hoist drum device that allows a hoisted load to be lowered with maximum control using the gear train or hydraulic components of the hoist mechanism. Controlled load lowering requires the use of the hoist drive motor, rather than the load hoist brake, to lower the load.

- Controlling contractor** means a prime contractor, general contractor, construction manager or any other legal entity which has the overall responsibility for the construction of the project – its planning, quality and completion.
- Critical lift** means a lift that (1) exceeds 75 percent of the rated capacity of the crane or derrick, or (2) requires the use of more than one crane or derrick.
- 437-003-0045(2) **Dangerous equipment** – Equipment such as pickling or galvanizing tanks, degreasing units, machinery, electrical equipment, and other units which, as a result of form or function, may be hazardous to employees who fall onto or into such equipment.*
- Decking hole** means a gap or void more than 2 inches (5.1 cm) in its least dimension and less than 12 inches (30.5 cm) in its greatest dimension in a floor, roof or other walking/ working surface. Pre-engineered holes in cellular decking (for wires, cables, etc.) are not included in this definition.
- Derrick floor** means an elevated floor of a building or structure that has been designated to receive hoisted pieces of steel prior to final placement.
- Double connection** means an attachment method where the connection point is intended for two pieces of steel which share common bolts on either side of a central piece.
- Double connection seat** means a structural attachment that, during the installation of a double connection, supports the first member while the second member is connected.
- Erection bridging** means the bolted diagonal bridging that is required to be installed prior to releasing the hoisting cables from the steel joists.
- Fall restraint system** means a fall protection system that prevents the user from falling any distance. The system is comprised of either a body belt or body harness, along with an anchorage, connectors and other necessary equipment. The other components typically include a lanyard, and may also include a lifeline and other devices.
- Final interior perimeter** means the perimeter of a large permanent open space within a building such as an atrium or courtyard. This does not include openings for stairways, elevator shafts, etc.
- Girt** (in systems-engineered metal buildings) means a “Z” or “C” shaped member formed from sheet steel spanning between primary framing and supporting wall material.
- Headache ball** means a weighted hook that is used to attach loads to the hoist load line of the crane.

**Hoisting equipment** means commercially manufactured lifting equipment designed to lift and position a load of known weight to a location at some known elevation and horizontal distance from the equipment's center of rotation. "Hoisting equipment" includes but is not limited to cranes, derricks, tower cranes, barge-mounted derricks or cranes, gin poles and gantry hoist systems. A "come-a-long" (a mechanical device, usually consisting of a chain or cable attached at each end, that is used to facilitate movement of materials through leverage) is not considered "hoisting equipment."

**Leading edge** means the unprotected side and edge of a floor, roof, or formwork for a floor or other walking/working surface (such as deck) which changes location as additional floor, roof, decking or formwork sections are placed, formed or constructed.

*437-003-0045(3) **Lower levels** – Those areas or surfaces to which an employee can fall. Such areas or surfaces include, but are not limited to, ground levels, floors, platforms, ramps, runways, excavations, pits, tanks, material, water, equipment, structures.*

**Metal decking** means a commercially manufactured, structural grade, cold rolled metal panel formed into a series of parallel ribs; for this subpart, this includes metal floor and roof decks, standing seam metal roofs, other metal roof systems and other products such as bar gratings, checker plate, expanded metal panels, and similar products. After installation and proper fastening, these decking materials serve a combination of functions including, but not limited to: a structural element designed in combination with the structure to resist, distribute and transfer loads, stiffen the structure and provide a diaphragm action; a walking/ working surface; a form for concrete slabs; a support for roofing systems; and a finished floor or roof.

**Multiple lift rigging** means a rigging assembly manufactured by wire rope rigging suppliers that facilitates the attachment of up to five independent loads to the hoist rigging of a crane.

**Note:** Oregon OSHA did not adopt the federal OSHA definition of 'Opening.' In Oregon, OAR 437-003-0045(4) applies.

*437-003-0045(4) **Opening** means a gap or void 12 inches (30.5 cm) or more in any dimension in a floor, roof or other walking/working surface. For the purposes of this subpart, skylight and smoke domes that do not meet the strength requirements of 1926.754(e)(3) shall be regarded as openings.*

**Permanent floor** means a structurally completed floor at any level or elevation (including slab on grade).

**Personal fall arrest system** means a system used to arrest an employee in a fall from a working level. A personal fall arrest system consists of an anchorage, connectors, a body harness and may include a lanyard, deceleration device, lifeline, or suitable combination of these. The use of a body belt for fall arrest is prohibited.

**Positioning device system** means a body belt or body harness rigged to allow an employee to be supported on an elevated, vertical surface, such as a wall or column and work with both hands free while leaning.

**Post** means a structural member with a longitudinal axis that is essentially vertical, that: (1) weighs 300 pounds or less and is axially loaded (a load presses down on the top end), or (2) is not axially loaded, but is laterally restrained by the above member. Posts typically support stair landings, wall framing, mezzanines and other substructures.

**Project structural engineer of record** means the registered, licensed professional responsible for the design of structural steel framing and whose seal appears on the structural contract documents.

**Purlin** (in systems-engineered metal buildings) means a “Z” or “C” shaped member formed from sheet steel spanning between primary framing and supporting roof material.

**Qualified person** (also defined in 1926.32) means one who, by possession of a recognized degree, certificate, or professional standing, or who by extensive knowledge, training, and experience, has successfully demonstrated the ability to solve or resolve problems relating to the subject matter, the work, or the project.

**Safety deck attachment** means an initial attachment that is used to secure an initially placed sheet of decking to keep proper alignment and bearing with structural support members.

**Shear connector** means headed steel studs, steel bars, steel lugs, and similar devices which are attached to a structural member for the purpose of achieving composite action with concrete.

**Steel erection** means the construction, alteration or repair of steel buildings, bridges and other structures, including the installation of metal decking and all planking used during the process of erection.

**Steel joist** means an open web, secondary load-carrying member of 144 feet (43.9 m) or less, designed by the manufacturer, used for the support of floors and roofs. This does not include structural steel trusses or cold-formed joists.

**Steel joist girder** means an open web, primary load-carrying member, designed by the manufacturer, used for the support of floors and roofs. This does not include structural steel trusses.

**Steel truss** means an open web member designed of structural steel components by the project structural engineer of record. For the purposes of this subpart, a steel truss is considered equivalent to a solid web structural member.

**Structural steel** means a steel member, or a member made of a substitute material (such as, but not limited to, fiberglass, aluminum or composite members). These members include, but are not limited to, steel joists, joist girders, purlins, columns, beams, trusses, splices, seats, metal decking, girts, and all bridging, and cold formed metal framing which is integrated with the structural steel framing of a building.

**Systems-engineered metal building** means a metal, field-assembled building system consisting of framing, roof and wall coverings. Typically, many of these components are cold-formed shapes. These individual parts are fabricated in one or more manufacturing facilities and shipped to the job site for assembly into the final structure. The engineering design of the system is normally the responsibility of the systems-engineered metal building manufacturer.

**Tank** means a container for holding gases, liquids or solids.

**Unprotected sides and edges** means any side or edge (except at entrances to points of access) of a walking/working surface, for example a, floor, roof, ramp or runway, where there is no wall or guardrail system at least 39 inches (1.0 m) high.

## 1926.752 Site Layout, Site-specific Erection Plan and Construction Sequence

- (a) Approval to begin steel erection. Before authorizing the commencement of steel erection, the controlling contractor shall ensure that the steel erector is provided with the following written notifications:
- (1) The concrete in the footings, piers and walls and the mortar in the masonry piers and walls has attained, on the basis of an appropriate ASTM standard test method of field-cured samples, either 75 percent of the intended minimum compressive design strength or sufficient strength to support the loads imposed during steel erection.
  - (2) Any repairs, replacements and modifications to the anchor bolts were conducted in accordance with 1926.755(b).
- (b) Commencement of steel erection. A steel erection contractor shall not erect steel unless it has received written notification that the concrete in the footings, piers and walls or the mortar in the masonry piers and walls has attained, on the basis of an appropriate ASTM standard test method of field-cured samples, either 75 percent of the intended minimum compressive design strength or sufficient strength to support the loads imposed during steel erection.

### 437-003-1752 *Written notifications*

*A copy of the written notification(s) required by this section must be maintained on the site by the controlling contractor for review until completion of the project.*

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 6-2002, f. 7/19/02, ef. 7/19/02.

1926.752(c) Site layout. The controlling contractor shall ensure that the following is provided and maintained:

- (1) Adequate access roads into and through the site for the safe delivery and movement of derricks, cranes, trucks, other necessary equipment, and the material to be erected and means and methods for pedestrian and vehicular control. Exception: this requirement does not apply to roads outside of the construction site.
- (2) A firm, properly graded, drained area, readily accessible to the work with adequate space for the safe storage of materials and the safe operation of the erector's equipment.

- (d) Pre-planning of overhead hoisting operations. All hoisting operations in steel erection shall be pre-planned to ensure that the requirements of 1926.753(d) are met.
- (e) Site-specific erection plan. Where employers elect, due to conditions specific to the site, to develop alternate means and methods that provide employee protection in accordance with 1926.753(c)(5), 1926.757(a)(4) or 1926.757(e)(4), a site-specific erection plan shall be developed by a qualified person and be available at the work site. Guidelines for establishing a site-specific erection plan are contained in Appendix A to this subpart.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 3-2002, f. 4/15/02, ef. 4/18/02.

### **437-003-0752 Site-Specific Erection Plan**

*In addition to and not in lieu of the provisions of 29 CFR 1926.752(e), the steel erection contractor must develop and implement a written site-specific erection plan.*

*(1) The site-specific erection plan must:*

- (a) Be developed by a qualified person;*
- (b) Identify the site;*
- (c) Be available at the work site; and*
- (d) Be signed by the qualified person responsible for its development and any modification(s).*

**Note:** *The site-specific erection plan does not have to be developed by an engineer, or resemble an engineering report.*

*(2) The site-specific erection plan must contain the following:*

- (a) A description of the procedures that will be used to comply with 1926.754(a). Consider the dead weight of the structure, the weight and working reactions of all static and dynamic loads placed on it, and all external forces that may be applied such as wind and reactions by erection equipment.*

**Note:** *There is a presumption that some form of temporary guying or bracing is necessary to provide lateral stability to the structural steel framing as it is being erected. Accordingly, the employer has the burden of establishing that the structural steel framing is inherently stable during erection and/or the sequence of erection, plumbing, bolting and decking is such that structural stability is maintained at all times and no temporary guying or bracing is needed. Such determination must be documented in the site-specific erection plan.*

*(b) A description of the procedures and work practices that will be used to protect employees from falls and other hazards where it is necessary to walk/work on suspended loads. Employee(s) are allowed on suspended loads only when a competent person has determined that it is the safest way to accomplish a specific task or there is no other way to do the work.*

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 3-2002, f. 4/15/02, ef. 4/18/02.

## 1926.753 Hoisting and Rigging

(a) All the provisions of Subpart CC apply to hoisting and rigging with the exception of 1926.1431(a).

### 437-003-0753 Tag lines

*Tag lines shall be used to control loads except when it is determined, by a qualified rigger, that they create a hazard.*

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 6-2002, f. 7/19/02, ef. 7/19/02.

1926.753(b) In addition, paragraphs (c) through (e) of this section apply regarding the hazards associated with hoisting and rigging.

(c) General.

(1) Pre-shift visual inspection of cranes.

- (i) Cranes being used in steel erection activities shall be visually inspected prior to each shift by a competent person; the inspection shall include observation for deficiencies during operation. At a minimum this inspection shall include the following:
  - (A) All control mechanisms for maladjustments;
  - (B) Control and drive mechanism for excessive wear of components and contamination by lubricants, water or other foreign matter;
  - (C) Safety devices, including but not limited to boom angle indicators, boom stops, boom kick out devices, anti-two block devices, and load moment indicators where required;
  - (D) Air, hydraulic, and other pressurized lines for deterioration or leakage, particularly those which flex in normal operation;

- (E) Hooks and latches for deformation, chemical damage, cracks, or wear;
  - (F) Wire rope reeving for compliance with hoisting equipment manufacturer's specifications;
  - (G) Electrical apparatus for malfunctioning, signs of excessive deterioration, dirt, or moisture accumulation;
  - (H) Hydraulic system for proper fluid level;
  - (I) Tires for proper inflation and condition;
  - (J) Ground conditions around the hoisting equipment for proper support, including ground settling under and around outriggers, ground water accumulation, or similar conditions;
  - (K) The hoisting equipment for level position; and
  - (L) The hoisting equipment for level position after each move and setup.
- (ii) If any deficiency is identified, an immediate determination shall be made by the competent person as to whether the deficiency constitutes a hazard.
  - (iii) If the deficiency is determined to constitute a hazard, the hoisting equipment shall be removed from service until the deficiency has been corrected.
  - (iv) The operator shall be responsible for those operations under the operator's direct control. Whenever there is any doubt as to safety, the operator shall have the authority to stop and refuse to handle loads until safety has been assured.
- (2) A qualified rigger (a rigger who is also a qualified person) shall inspect the rigging prior to each shift in accordance with 1926.251.
  - (3) The headache ball, hook or load shall not be used to transport personnel except as provided in paragraph (c)(4) of this section.
  - (4) Cranes or derricks may be used to hoist employees on a personnel platform when work under this subpart is being conducted, provided that all provisions of 1926.1431 (except for 1926.1431(a)) are met.
  - (5) Safety latches on hooks shall not be deactivated or made inoperable except:
    - (i) When a qualified rigger has determined that the hoisting and placing of purlins and single joists can be performed more safely by doing so; or
    - (ii) When equivalent protection is provided in a site-specific erection plan.

(d) Working under loads.

- (1) Routes for suspended loads shall be pre-planned to ensure that no employee is required to work directly below a suspended load except for:
  - (i) Employees engaged in the initial connection of the steel; or
  - (ii) Employees necessary for the hooking or unhooking of the load.
- (2) When working under suspended loads, the following criteria shall be met:
  - (i) Materials being hoisted shall be rigged to prevent unintentional displacement;
  - (ii) Hooks with self-closing safety latches or their equivalent shall be used to prevent components from slipping out of the hook; and
  - (iii) All loads shall be rigged by a qualified rigger.

(e) Multiple lift rigging procedure.

- (1) A multiple lift shall only be performed if the following criteria are met:
  - (i) A multiple lift rigging assembly is used;
  - (ii) A maximum of five members are hoisted per lift;
  - (iii) Only beams and similar structural members are lifted; and
  - (iv) All employees engaged in the multiple lift have been trained in these procedures in accordance with 1926.761(c)(1).
  - (v) No crane is permitted to be used for a multiple lift where such use is contrary to the manufacturer's specifications and limitations.
- (2) Components of the multiple lift rigging assembly shall be specifically designed and assembled with a maximum capacity for total assembly and for each individual attachment point. This capacity, certified by the manufacturer or a qualified rigger, shall be based on the manufacturer's specifications with a 5 to 1 safety factor for all components.
- (3) The total load shall not exceed:
  - (i) The rated capacity of the hoisting equipment specified in the hoisting equipment load charts;
  - (ii) The rigging capacity specified in the rigging rating chart.
- (4) The multiple lift rigging assembly shall be rigged with members:
  - (i) Attached at their center of gravity and maintained reasonably level;

- (ii) Rigged from top down; and
  - (iii) Rigged at least 7 feet (2.1 m) apart.
- (5) The members on the multiple lift rigging assembly shall be set from the bottom up.
- (6) Controlled load lowering shall be used whenever the load is over the connectors.

[66 FR 5265, Jan. 18, 2001, as amended at 75 FR 48134, Aug. 9, 2010]

Stat. Auth.: ORS 654.025(2) and 656.726(4).

Stats. Implemented: ORS 654.001 through 654.295.

Hist: OR-OSHA Admin. Order 3-2002, f. 4/15/02, ef. 4/18/02.

OR-OSHA Admin. Order 1-2011, f. 2/9/11, ef. 2/9/11.

## 1926.754 Structural Steel Assembly

- (a) Structural stability shall be maintained at all times during the erection process.

**Note** to paragraph (a): Federal Highway Administration (FHWA) regulations incorporate by reference a number of standards, policies, and standard specifications published by the American Association of State Highway and Transportation Officials (AASHTO) and other organizations. (see 23 CFR 625.4). Many of these incorporated provisions may be relevant to maintaining structural stability during the erection process. For instance, as of May 17, 2010, in many cases FHWA requires a Registered Engineer to prepare and seal working drawings for falsework used in highway bridge construction. (See AASHTO Specifications for Highway Bridges, Div. II, 3.2.1, 15th edition, 1992, which FHWA incorporates by reference in 23 CFR 625.4). FHWA also encourages compliance with AASHTO Specifications that the FHWA regulations do not currently incorporate by reference. (See <http://www.fhwa.dot.gov/bridge/lrfd/index.htm>.)

**Note:** OAR 437-003-0752 requires use of a site-specific erection plan.

- (b) The following additional requirements shall apply for multi-story structures:

- (1) The permanent floors shall be installed as the erection of structural members progresses, and there shall be not more than eight stories between the erection floor and the upper-most permanent floor, except where the structural integrity is maintained as a result of the design.
- (2) At no time shall there be more than four floors or 48 feet (14.6 m), whichever is less, of unfinished bolting or welding above the foundation or uppermost permanently secured floor, except where the structural integrity is maintained as a result of the design.
- (3) A fully planked or decked floor or nets shall be maintained within two stories or 30 feet (9.1 m), whichever is less, directly under any erection work being performed.

- (c) Walking/working surfaces – shear connectors and other similar devices.

- (1) Tripping hazards. Shear connectors (such as headed steel studs, steel bars or steel lugs), reinforcing bars, deformed anchors or threaded studs shall not be attached to the top flanges of beams, joists or beam attachments so that they project vertically from or horizontally across the top flange of the member until after the metal decking, or other walking/working surface, has been installed.
  - (2) Installation of shear connectors on composite floors, roofs and bridge decks. When shear connectors are used in construction of composite floors, roofs and bridge decks, employees shall lay out and install the shear connectors after the metal decking has been installed, using the metal decking as a working platform. Shear connectors shall not be installed from within a controlled decking zone (CDZ), as specified in 1926.760(c)(8).
- (d) Plumbing-up.
- (1) When deemed necessary by a competent person, plumbing-up equipment shall be installed in conjunction with the steel erection process to ensure the stability of the structure.
  - (2) When used, plumbing-up equipment shall be in place and properly installed before the structure is loaded with construction material such as loads of joists, bundles of decking or bundles of bridging.
  - (3) Plumbing-up equipment shall be removed only with the approval of a competent person.
- (e) Metal decking.
- (1) Hoisting, landing and placing of metal decking bundles.
    - (i) Bundle packaging and strapping shall not be used for hoisting unless specifically designed for that purpose.
    - (ii) If loose items such as dunnage, flashing, or other materials are placed on the top of metal decking bundles to be hoisted, such items shall be secured to the bundles.
    - (iii) Bundles of metal decking on joists shall be landed in accordance with 1926.757(e)(4).
    - (iv) Metal decking bundles shall be landed on framing members so that enough support is provided to allow the bundles to be unbanded without dislodging the bundles from the supports.
    - (v) At the end of the shift or when environmental or jobsite conditions require, metal decking shall be secured against displacement.

- (2) Roof and floor holes and openings. Metal decking at roof and floor holes and openings shall be installed as follows:
- (i) Framed metal deck openings shall have structural members turned down to allow continuous deck installation except where not allowed by structural design constraints or constructibility.

**Note:** Oregon-initiated rule 437-003-1754 replaces 1926.754(e)(2)(ii):

### ***437-003-1754 Roof and floor holes and openings***

*Roof and floor holes and openings shall be decked over. Where large size configuration or other structural design does not allow openings to be decked over (such as elevator shafts, stairwells, etc.) employees shall be protected by covers or guardrail systems erected around such openings as soon as the openings are created.*

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 8-2003, f. 12/30/03, ef. 1/1/04.

1926.754 (e)(2)(iii) Metal decking holes and openings shall not be cut until immediately prior to being permanently filled with the equipment or structure needed or intended to fulfill its specific use and which meets the strength requirements of paragraph (e)(3) of this section, or shall be immediately covered.

- (3) Covering roof and floor openings.
- (i) Covers for roof and floor openings shall be capable of supporting, without failure, twice the weight of the employees, equipment and materials that may be imposed on the cover at any one time.
  - (ii) All covers shall be secured when installed to prevent accidental displacement by the wind, equipment or employees.
  - (iii) All covers shall be painted with high-visibility paint or shall be marked with the word "HOLE" or "COVER" to provide warning of the hazard.
  - (iv) Smoke dome or skylight fixtures that have been installed, are not considered covers for the purpose of this section unless they meet the strength requirements of paragraph (e)(3)(i) of this section.
- (4) Decking gaps around columns. Wire mesh, exterior plywood, or equivalent, shall be installed around columns where planks or metal decking do not fit tightly. The materials used must be of sufficient strength to provide fall protection for personnel and prevent objects from falling through.

(5) Installation of metal decking.

- (i) Except as provided in 1926.760(c), metal decking shall be laid tightly and immediately secured upon placement to prevent accidental movement or displacement.
- (ii) During initial placement, metal decking panels shall be placed to ensure full support by structural members.

(6) Derrick floors.

- (i) A derrick floor shall be fully decked and/or planked and the steel member connections completed to support the intended floor loading.
- (ii) Temporary loads placed on a derrick floor shall be distributed over the underlying support members so as to prevent local overloading of the deck material.

[66 FR 5265, Jan. 18, 2001, as amended at 71 FR 2885, Jan. 18, 2006; 71 FR 16674, Apr. 3, 2006; 75 FR 27429, May 17, 2010]

OR-OSHA Admin. Order 4-2006, f. 7/24/06, ef. 7/24/06.

## 1926.755 Column Anchorage

(a) General requirements for erection stability.

- (1) All columns shall be anchored by a minimum of 4 anchor rods (anchor bolts).
- (2) Each column anchor rod (anchor bolt) assembly, including the column-to-base plate weld and the column foundation, shall be designed to resist a minimum eccentric gravity load of 300 pounds (136.2 kg) located 18 inches (.46m) from the extreme outer face of the column in each direction at the top of the column shaft.
- (3) Columns shall be set on level finished floors, pre-grouted leveling plates, leveling nuts, or shim packs which are adequate to transfer the construction loads.
- (4) All columns shall be evaluated by a competent person to determine whether guying or bracing is needed; if guying or bracing is needed, it shall be installed.

(b) Repair, replacement or field modification of anchor rods (anchor bolts).

- (1) Anchor rods (anchor bolts) shall not be repaired, replaced or field-modified without the approval of the project structural engineer of record.
- (2) Prior to the erection of a column, the controlling contractor shall provide written notification to the steel erector if there has been any repair, replacement or modification of the anchor rods (anchor bolts) of that column.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 3-2002, f. 4/15/02, ef. 4/18/02.

## 1926.756 Beams and Columns

### (a) General.

- (1) During the final placing of solid web structural members, the load shall not be released from the hoisting line until the members are secured with at least two bolts per connection, of the same size and strength as shown in the erection drawings, drawn up wrench-tight or the equivalent as specified by the project structural engineer of record, except as specified in paragraph (b) of this section.
- (2) A competent person shall determine if more than two bolts are necessary to ensure the stability of cantilevered members; if additional bolts are needed, they shall be installed.

(b) Diagonal bracing. Solid web structural members used as diagonal bracing shall be secured by at least one bolt per connection drawn up wrench-tight or the equivalent as specified by the project structural engineer of record.

### (c)

- (1) Double connections at columns and/or at beam webs over a column. When two structural members on opposite sides of a column web, or a beam web over a column, are connected sharing common connection holes, at least one bolt with its wrench-tight nut shall remain connected to the first member unless a shop-attached or field-attached seat or equivalent connection device is supplied with the member to secure the first member and prevent the column from being displaced (See Appendix H to this subpart for examples of equivalent connection devices).
- (2) If a seat or equivalent device is used, the seat (or device) shall be designed to support the load during the double connection process. It shall be adequately bolted or welded to both a supporting member and the first member before the nuts on the shared bolts are removed to make the double connection.

- (d) Column splices. Each column splice shall be designed to resist a minimum eccentric gravity load of 300 pounds (136.2 kg) located 18 inches (.46 m) from the extreme outer face of the column in each direction at the top of the column shaft.
- (e) Perimeter columns. Perimeter columns shall not be erected unless:
- (1) The perimeter columns extend a minimum of 48 inches (1.2 m) above the finished floor to permit installation of perimeter safety cables prior to erection of the next tier, except where constructibility does not allow (see Appendix F to this subpart);
  - (2) The perimeter columns have holes or other devices in or attached to perimeter columns at 42-45 inches (107-114 cm) above the finished floor and the midpoint between the finished floor and the top cable to permit installation of perimeter safety cables required by 1926.760(a)(2), except where constructibility does not allow. (See Appendix F to this subpart.)

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.

## 1926.757 Open Web Steel Joists

### (a) General.

- (1) Except as provided in paragraph (a)(2) of this section, where steel joists are used and columns are not framed in at least two directions with solid web structural steel members, a steel joist shall be field-bolted at the column to provide lateral stability to the column during erection. For the installation of this joist:
  - (i) A vertical stabilizer plate shall be provided on each column for steel joists. The plate shall be a minimum of 6 inch by 6 inch (152 mm by 152 mm) and shall extend at least 3 inches (76 mm) below the bottom chord of the joist with a 13/16 inch (21 mm) hole to provide an attachment point for guying or plumbing cables.
  - (ii) The bottom chords of steel joists at columns shall be stabilized to prevent rotation during erection.
  - (iii) Hoisting cables shall not be released until the seat at each end of the steel joist is field-bolted, and each end of the bottom chord is restrained by the column stabilizer plate.
- (2) Where constructibility does not allow a steel joist to be installed at the column:

- (i) an alternate means of stabilizing joists shall be installed on both sides near the column and shall:
    - (A) provide stability equivalent to paragraph (a)(1) of this section;
    - (B) be designed by a qualified person;
    - (C) be shop installed; and
    - (D) be included in the erection drawings.
  - (ii) hoisting cables shall not be released until the seat at each end of the steel joist is field-bolted and the joist is stabilized.
- (3) Where steel joists at or near columns span 60 feet (18.3 m) or less, the joist shall be designed with sufficient strength to allow one employee to release the hoisting cable without the need for erection bridging.
- (4) Where steel joists at or near columns span more than 60 feet (18.3 m), the joists shall be set in tandem with all bridging installed unless an alternative method of erection, which provides equivalent stability to the steel joist, is designed by a qualified person and is included in the site-specific erection plan.
- (5) A steel joist or steel joist girder shall not be placed on any support structure unless such structure is stabilized.
- (6) When steel joist(s) are landed on a structure, they shall be secured to prevent unintentional displacement prior to installation.
- (7) No modification that affects the strength of a steel joist or steel joist girder shall be made without the approval of the project structural engineer of record.
- (8) Field-bolted joists.
- (i) Except for steel joists that have been pre-assembled into panels, connections of individual steel joists to steel structures in bays of 40 feet (12.2 m) or more shall be fabricated to allow for field bolting during erection.
  - (ii) These connections shall be field-bolted unless constructibility does not allow.
- (9) Steel joists and steel joist girders shall not be used as anchorage points for a fall arrest system unless written approval to do so is obtained from a qualified person.

(10) A bridging terminus point shall be established before bridging is installed. (See Appendix C to this subpart.)

(b) Attachment of steel joists and steel joist girders.

- (1) Each end of "K" series steel joists shall be attached to the support structure with a minimum of two 1/8-inch (3 mm) fillet welds 1 inch (25 mm) long or with two 1/2-inch (13 mm) bolts, or the equivalent.
- (2) Each end of "LH" and "DLH" series steel joists and steel joist girders shall be attached to the support structure with a minimum of two 1/4-inch (6 mm) fillet welds 2 inches (51 mm) long, or with two 3/4-inch (19 mm) bolts, or the equivalent.
- (3) Except as provided in paragraph (b)(4) of this section, each steel joist shall be attached to the support structure, at least at one end on both sides of the seat, immediately upon placement in the final erection position and before additional joists are placed.
- (4) Panels that have been pre-assembled from steel joists with bridging shall be attached to the structure at each corner before the hoisting cables are released.

(c) Erection of steel joists.

- (1) Both sides of the seat of one end of each steel joist that requires bridging under Tables A and B shall be attached to the support structure before hoisting cables are released.
- (2) For joists over 60 feet, both ends of the joist shall be attached as specified in paragraph (b) of this section and the provisions of paragraph (d) of this section met before the hoisting cables are released.
- (3) On steel joists that do not require erection bridging under Tables A and B, only one employee shall be allowed on the joist until all bridging is installed and anchored.

Table A - Erection Bridging for Short Span Joists

20LH10	NM	28LH13	NM	36LH14	NM through 60-0
24LH03	35-0	32LH06	47-0 through 60-0	36LH15	NM through 60-0

NM = diagonal bolted bridging not mandatory for joists under 40 feet.

- (4) Employees shall not be allowed on steel joists where the span of the steel joist is equal to or greater than the span shown in Tables A and B except in accordance with 1926.757(d).
- (5) When permanent bridging terminus points cannot be used during erection, additional temporary bridging terminus points are required to provide stability. (See Appendix C of this Subpart.)

(d) Erection bridging.

- (1) Where the span of the steel joist is equal to or greater than the span shown in Tables A and B, the following shall apply:
  - (i) A row of bolted diagonal erection bridging shall be installed near the midspan of the steel joist;
  - (ii) Hoisting cables shall not be released until this bolted diagonal erection bridging is installed and anchored; and

- (iii) No more than one employee shall be allowed on these spans until all other bridging is installed and anchored.
- (2) Where the span of the steel joist is over 60 feet (18.3 m) through 100 feet (30.5 m), the following shall apply:
  - (i) All rows of bridging shall be bolted diagonal bridging;
  - (ii) Two rows of bolted diagonal erection bridging shall be installed near the third points of the steel joist;
  - (iii) Hoisting cables shall not be released until this bolted diagonal erection bridging is installed and anchored; and
  - (iv) No more than two employees shall be allowed on these spans until all other bridging is installed and anchored.
- (3) Where the span of the steel joist is over 100 feet (30.5 m) through 144 feet (43.9 m), the following shall apply:
  - (i) All rows of bridging shall be bolted diagonal bridging;
  - (ii) Hoisting cables shall not be released until all bridging is installed and anchored; and
  - (iii) No more than two employees shall be allowed on these spans until all bridging is installed and anchored.
- (4) For steel members spanning over 144 feet (43.9 m), the erection methods used shall be in accordance with 1926.756.
- (5) Where any steel joist specified in paragraphs (c)(2) and (d)(1), (d)(2), and (d)(3) of this section is a bottom chord bearing joist, a row of bolted diagonal bridging shall be provided near the support(s). This bridging shall be installed and anchored before the hoisting cable(s) is released.
- (6) When bolted diagonal erection bridging is required by this section, the following shall apply:
  - (i) The bridging shall be indicated on the erection drawing;
  - (ii) The erection drawing shall be the exclusive indicator of the proper placement of this bridging;
  - (iii) Shop-installed bridging clips, or functional equivalents, shall be used where the bridging bolts to the steel joists;

- (iv) When two pieces of bridging are attached to the steel joist by a common bolt, the nut that secures the first piece of bridging shall not be removed from the bolt for the attachment of the second; and
  - (v) Bridging attachments shall not protrude above the top chord of the steel joist.
- (e) Landing and placing loads.
- (1) During the construction period, the employer placing a load on steel joists shall ensure that the load is distributed so as not to exceed the carrying capacity of any steel joist.
  - (2) Except for paragraph (e)(4) of this section, no construction loads are allowed on the steel joists until all bridging is installed and anchored and all joist-bearing ends are attached.
  - (3) The weight of a bundle of joist bridging shall not exceed a total of 1,000 pounds (454 kg). A bundle of joist bridging shall be placed on a minimum of three steel joists that are secured at one end. The edge of the bridging bundle shall be positioned within 1 foot (.30 m) of the secured end.
  - (4) No bundle of decking may be placed on steel joists until all bridging has been installed and anchored and all joist bearing ends attached, unless all of the following conditions are met:
    - (i) The employer has first determined from a qualified person and documented in a site-specific erection plan that the structure or portion of the structure is capable of supporting the load;
    - (ii) The bundle of decking is placed on a minimum of three steel joists;
    - (iii) The joists supporting the bundle of decking are attached at both ends;
    - (iv) At least one row of bridging is installed and anchored;
    - (v) The total weight of the bundle of decking does not exceed 4,000 pounds (1816 kg); and
    - (vi) Placement of the bundle of decking shall be in accordance with paragraph (e)(5) of this section.
  - (5) The edge of the construction load shall be placed within 1 foot (.30 m) of the bearing surface of the joist end.

Stat. Auth.: ORS 654.025(2) and 656.726(4).

Stats. Implemented: ORS 654.001 through 654.295.

Hist: OR-OSHA Admin. Order 3-2002, f. 4/15/02, ef. 4/18/02.

OR-OSHA Admin. Order 8-2003, f. 12/30/03, ef. 1/1/04.

## 1926.758 Systems-Engineered Metal Buildings

- (a) All of the requirements of this subpart apply to the erection of systems-engineered metal buildings except 1926.755 (column anchorage) and 1926.757 (open web steel joists).
- (b) Each structural column shall be anchored by a minimum of four anchor rods (anchor bolts).
- (c) Rigid frames shall have 50 percent of their bolts or the number of bolts specified by the manufacturer (whichever is greater) installed and tightened on both sides of the web adjacent to each flange before the hoisting equipment is released.
- (d) Construction loads shall not be placed on any structural steel framework unless such framework is safely bolted, welded or otherwise adequately secured.
- (e) In girt and eave strut-to-frame connections, when girts or eave struts share common connection holes, at least one bolt with its wrench-tight nut shall remain connected to the first member unless a manufacturer-supplied, field-attached seat or similar connection device is present to secure the first member so that the girt or eave strut is always secured against displacement.
- (f) Both ends of all steel joists or cold-formed joists shall be fully bolted and/or welded to the support structure before:
  - (1) Releasing the hoisting cables;
  - (2) Allowing an employee on the joists; or
  - (3) Allowing any construction loads on the joists.
- (g) Purlins and girts shall not be used as an anchorage point for a fall arrest system unless written approval is obtained from a qualified person.
- (h) Purlins may only be used as a walking/working surface when installing safety systems, after all permanent bridging has been installed and fall protection is provided.
- (i) Construction loads may be placed only within a zone that is within 8 feet (2.5 m) of the center-line of the primary support member.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 3-2002, f. 4/15/02, ef. 4/18/02.

## 1926.759 Falling Object Protection

- (a) Securing loose items aloft. All materials, equipment, and tools, which are not in use while aloft, shall be secured against accidental displacement.
- (b) Protection from falling objects other than materials being hoisted. The controlling contractor shall bar other construction processes below steel erection unless overhead protection for the employees below is provided.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 3-2002, f. 4/15/02, ef. 4/18/02.

## 1926.760 Fall Protection

- (a) General requirements.
  - (1) Except as provided by paragraph (a)(3) of this section, each employee engaged in a steel erection activity who is on a walking/working surface with an unprotected side or edge more than 15 feet (4.6 m) above a lower level shall be protected from fall hazards by guardrail systems, safety net systems, personal fall arrest systems, positioning device systems or fall restraint systems.
  - (2) Perimeter safety cables. On multi-story structures, perimeter safety cables shall be installed at the final interior and exterior perimeters of the floors as soon as the metal decking has been installed.
  - (3) Connectors and employees working in controlled decking zones shall be protected from fall hazards as provided in paragraphs (b) and (c) of this section, respectively.
- (b) Connectors. Each connector shall:
  - (1) Be protected in accordance with paragraph (a)(1) of this section from fall hazards of more than two stories or 30 feet (9.1 m) above a lower level, whichever is less;
  - (2) Have completed connector training in accordance with 1926.761; and
  - (3) Be provided, at heights over 15 and up to 30 feet above a lower level, with a personal fall arrest system, positioning device system or fall restraint system and wear the equipment necessary to be able to be tied off; or be provided with other means of protection from fall hazards in accordance with paragraph (a)(1) of this section.

- (c) **Controlled Decking Zone (CDZ).** A controlled decking zone may be established in that area of the structure over 15 and up to 30 feet above a lower level where metal decking is initially being installed and forms the leading edge of a work area. In each CDZ, the following shall apply:
- (1) Each employee working at the leading edge in a CDZ shall be protected from fall hazards of more than two stories or 30 feet (9.1 m), whichever is less.
  - (2) Access to a CDZ shall be limited to only those employees engaged in leading edge work.
  - (3) The boundaries of a CDZ shall be designated and clearly marked. The CDZ shall not be more than 90 feet (27.4 m) wide and 90 (27.4 m) feet deep from any leading edge. The CDZ shall be marked by the use of control lines or the equivalent. Examples of acceptable procedures for demarcating CDZ's can be found in Appendix D to this Subpart.
  - (4) Each employee working in a CDZ shall have completed CDZ training in accordance with 1926.761.
  - (5) Unsecured decking in a CDZ shall not exceed 3,000 square feet (914.4 m<sup>2</sup>).
  - (6) Safety deck attachments shall be performed in the CDZ from the leading edge back to the control line and shall have at least two attachments for each metal decking panel.
  - (7) Final deck attachments and installation of shear connectors shall not be performed in the CDZ.
- (d) **Criteria for fall protection equipment.**
- Note to paragraphs (d)(1), (2) and (3):** In Oregon, please refer to Subdivision 3/M, Fall Protection.
- (1) Guardrail systems, safety net systems, personal fall arrest systems, positioning device systems and their components shall conform to the criteria in 1926.502 (see Appendix G to this subpart).
  - (2) Fall arrest system components shall be used in fall restraint systems and shall conform to the criteria in 1926.502 (see Appendix G). Either body belts or body harnesses shall be used in fall restraint systems.
  - (3) Perimeter safety cables shall meet the criteria for guardrail systems in 1926.502 (see Appendix G).
- (e) **Custody of fall protection.** Fall protection provided by the steel erector shall remain in the area where steel erection activity has been completed, to be used by other trades, only if the controlling contractor or its authorized representative:

- (1) Has directed the steel erector to leave the fall protection in place; and
- (2) Has inspected and accepted control and responsibility of the fall protection prior to authorizing persons other than steel erectors to work in the area.

Stat. Auth.: ORS 654.025(2) and 656.726(4).

Stats. Implemented: ORS 654.001 through 654.295.

OR-OSHA Admin. Order 6-2002, f. 7/19/02, ef. 7/19/02.

OR-OSHA Admin. Order 8-2003, f. 12/30/03, ef. 1/1/04.

## 1926.761 Training

The following provisions supplement the requirements of 1926.21 regarding the hazards addressed in this subpart.

- (a) Training personnel. Training required by this section shall be provided by a qualified person(s).
- (b) Fall hazard training. The employer shall train each employee exposed to a fall hazard in accordance with the requirements of this section. The employer shall institute a training program and ensure employee participation in the program.
- (c) Special training programs. In addition to the training required in paragraphs (a) and (b) of this section, the employer shall provide special training to employees engaged in the following activities.
  - (1) Multiple lift rigging procedure. The employer shall ensure that each employee who performs multiple lift rigging has been provided training in the following areas:
    - (i) The nature of the hazards associated with multiple lifts; and
    - (ii) The proper procedures and equipment to perform multiple lifts required by 1926.753(e).
  - (2) Connector procedures. The employer shall ensure that each connector has been provided training in the following areas:
    - (i) The nature of the hazards associated with connecting; and
    - (ii) The establishment, access, proper connecting techniques and work practices required by 1926.756(c) and 1926.760(b).
  - (3) Controlled Decking Zone Procedures. Where CDZs are being used, the employer shall assure that each employee has been provided training in the following areas:

- (i) The nature of the hazards associated with work within a controlled decking zone; and
- (ii) The establishment, access, proper installation techniques and work practices required by 1926.760(c) and 1926.754(e).

[66 FR 5265, Jan. 18, 2001, as amended at 73 FR 75589, Dec. 12, 2008]

OR-OSHA Admin. Order 5-2009, f. 5/29/09, ef. 5/29/09.

### **437-003-0761 Additional training requirements**

#### **(1) Certification of training.**

*(a) The employer shall verify compliance with this section by preparing a written certification record. The written certification record shall contain the name or other identity of the employee trained, the date(s) of the training, and the signature of the person who conducted the training or the signature of the employer. If the employer relies on training conducted by another employer or completed prior to the effective date of this section, the certification record shall indicate the date the employer determined the prior training was adequate rather than the date of actual training.*

*(b) The latest training certification shall be maintained.*

**(2) Retraining.** *When the employer has reason to believe that any affected employee who has already been trained does not have the understanding and skill required by this section, the employer shall retain each such employee. Circumstances where retaining is required include, but are not limited to, situations where:*

*(a) Changes in the workplace render previous training obsolete; or*

*(b) Changes in the types of fall protection systems or equipment to be used render previous training obsolete; or*

*(c) Inadequacies in an affected employee's knowledge or use of fall protection systems or equipment indicate that the employee has not retained the requisite understanding or skill.*

Stat. Auth.: ORS 654.025(2) and 656.726(4).

Stats. Implemented: ORS 654.001 through 654.295.

## **Appendix A to Subpart R – Guidelines for Establishing the Components of a Site-specific Erection Plan: Non-mandatory Guidelines for Complying with 1926.752(e)**

- (a) General. This appendix serves as a guideline to assist employers who elect to develop a site-specific erection plan in accordance with 1926.752(e) with alternate means and methods to provide employee protection in accordance with 1926.752(e), 1926.753(c)(5), 1926.757(a)(4) and 1926.757(e)(4).
- (b) Development of a site-specific erection plan. Pre-construction conference(s) and site inspection(s) are held between the erector and the controlling contractor, and others such as the project engineer and fabricator before the start of steel erection. The purpose of such conference(s) is to develop and review the site-specific erection plan that will meet the requirements of this section.
- (c) Components of a site-specific erection plan. In developing a site-specific erection plan, a steel erector considers the following elements:
  - (1) The sequence of erection activity, developed in coordination with the controlling contractor, that includes the following:
    - (i) Material deliveries;
    - (ii) Material staging and storage; and
    - (iii) Coordination with other trades and construction activities.
  - (2) A description of the crane and derrick selection and placement procedures, including the following:
    - (i) Site preparation;
    - (ii) Path for overhead loads; and
    - (iii) Critical lifts, including rigging supplies and equipment.
  - (3) A description of steel erection activities and procedures, including the following:
    - (i) Stability considerations requiring temporary bracing and guying;
    - (ii) Erection bridging terminus point;
    - (iii) Anchor rod (anchor bolt) notifications regarding repair, replacement and modifications;
    - (iv) Columns and beams (including joists and purlins);

- (v) Connections;
  - (vi) Decking; and
  - (vii) Ornamental and miscellaneous iron.
- (4) A description of the fall protection procedures that will be used to comply with 1926.760.
- (5) A description of the procedures that will be used to comply with 1926.759.
- (6) A description of the special procedures required for hazardous non-routine tasks.
- (7) A certification for each employee who has received training for performing steel erection operations as required by 1926.761.
- (8) A list of the qualified and competent persons.
- (9) A description of the procedures that will be utilized in the event of rescue or emergency response.
- (d) Other plan information. The plan:
- (1) Includes the identification of the site and project; and
  - (2) Is signed and dated by the qualified person(s) responsible for its preparation and modification.

## **Appendix D to Subpart R – Illustration of the Use of Control Lines to Demarcate Controlled Decking Zones (CDZs): Non-mandatory Guidelines for Complying with 1926.760(c)(3)**

- (1) When used to control access to areas where leading edge and initial securement of metal deck and other operations connected with leading edge work are taking place, the controlled decking zone (CDZ) is defined by a control line or by any other means that restricts access.
  - (i) A control line for a CDZ is erected not less than 6 feet (1.8 m) nor more than 90 feet (27.4 m) from the leading edge.
  - (ii) Control lines extend along the entire length of the unprotected or leading edge and are approximately parallel to the unprotected or leading edge.
  - (iii) Control lines are connected on each side to a guardrail system, wall, stanchion or other suitable anchorage.
- (2) Control lines consist of ropes, wires, tapes, or equivalent materials, and supporting stanchions as follows:
  - (i) Each line is rigged and supported in such a way that its lowest point (including sag) is not less than 39 inches (1.0 m) from the walking/working surface and its highest point is not more than 45 inches (1.3 m) from the walking/working surface.
  - (ii) Each line has a minimum breaking strength of 200 pounds (90.8 kg).

## **Appendix F to Subpart R – Perimeter Columns: Non-mandatory Guidelines for Complying with 1926.756(e) to Protect the Unprotected Side or Edge of a Walking/Working Surface**

In multi-story structures, when holes in the column web are used for perimeter safety cables, the column splice must be placed sufficiently high so as not to interfere with any attachments to the column necessary for the column splice. Column splices are recommended to be placed at every other or fourth levels as design allows. Column splices at third levels are detrimental to the erection process and should be avoided if possible.

## Appendix G to Subpart R – 1926.502(b)-(e) Fall Protection Systems Criteria and Practices

(b) “Guardrail systems.” Guardrail systems and their use shall comply with the following provisions:

- (1) Top edge height of top rails, or equivalent guardrail system members, shall be 42 inches (1.1 m) plus or minus 3 inches (8 cm) above the walking/working level. When conditions warrant, the height of the top edge may exceed the 45-inch height, provided the guardrail system meets all other criteria of this paragraph (1926.502(b)).

**Note:** When employees are using stilts, the top edge height of the top rail, or equivalent member, shall be increased an amount equal to the height of the stilts.

- (2) Midrails, screens, mesh, intermediate vertical members, or equivalent intermediate structural members shall be installed between the top edge of the guardrail system and the walking/working surface when there is no wall or parapet wall at least 21 inches (53 cm) high.
  - (i) Midrails, when used, shall be installed at a height midway between the top edge of the guardrail system and the walking/working level.
  - (ii) Screens and mesh, when used, shall extend from the top rail to the walking/working level and along the entire opening between top rail supports.
  - (iii) Intermediate members (such as balusters), when used between posts, shall be not more than 19 inches (48 cm) apart.
  - (iv) Other structural members (such as additional midrails and architectural panels) shall be installed such that there are no openings in the guardrail system that are more than 19 inches (.5 m) wide.
- (3) Guardrail systems shall be capable of withstanding, without failure, a force of at least 200 pounds (890 N) applied within 2 inches (5.1 cm) of the top edge, in any outward or downward direction, at any point along the top edge.
- (4) When the 200 pound (890 N) test load specified in paragraph (b)(3) of this section (1926.502) is applied in a downward direction, the top edge of the guardrail shall not deflect to a height less than 39 inches (1.0 m) above the walking/working level. Guardrail system components selected and constructed in accordance with the Appendix B to Subpart M of this part will be deemed to meet this requirement.

- (5) Midrails, screens, mesh, intermediate vertical members, solid panels, and equivalent structural members shall be capable of withstanding, without failure, a force of at least 150 pounds (666 N) applied in any downward or outward direction at any point along the midrail or other member.
  - (6) Guardrail systems shall be so surfaced as to prevent injury to an employee from punctures or lacerations, and to prevent snagging of clothing.
  - (7) The ends of all top rails and midrails shall not overhang the terminal posts, except where such overhang does not constitute a projection hazard.
  - (8) Steel banding and plastic banding shall not be used as top rails or midrails.
  - (9) Top rails and midrails shall be at least one-quarter inch (0.6 cm) nominal diameter or thickness to prevent cuts and lacerations. If wire rope is used for top rails, it shall be flagged at not more than 6-foot intervals with high-visibility material.
  - (10) When guardrail systems are used at hoisting areas, a chain, gate or removable guardrail section shall be placed across the access opening between guardrail sections when hoisting operations are not taking place.
  - (11) When guardrail systems are used at holes, they shall be erected on all unprotected sides or edges of the hole.
  - (12) When guardrail systems are used around holes used for the passage of materials, the hole shall have not more than two sides provided with removable guardrail sections to allow the passage of materials. When the hole is not in use, it shall be closed over with a cover, or a guardrail system shall be provided along all unprotected sides or edges.
  - (13) When guardrail systems are used around holes which are used as points of access (such as ladderways), they shall be provided with a gate, or be so offset that a person cannot walk directly into the hole.
  - (14) Guardrail systems used on ramps and runways shall be erected along each unprotected side or edge.
  - (15) Manila, plastic or synthetic rope being used for top rails or midrails shall be inspected as frequently as necessary to ensure that it continues to meet the strength requirements of paragraph (b)(3) of this section (1926.502).
- (c) Safety net systems. Safety net systems and their use shall comply with the following provisions:

- (1) Safety nets shall be installed as close as practicable under the walking/working surface on which employees are working, but in no case more than 30 feet (9.1 m) below such level. When nets are used on bridges, the potential fall area from the walking/working surface to the net shall be unobstructed.
- (2) Safety nets shall extend outward from the outermost projection of the work surface as follows:

<b>Vertical distance from working level to horizontal plane of net</b>	<b>Minimum required horizontal distance of outer edge of net from the edge of the working surface</b>
Up to 5 feet	8 feet
More than 5 feet up to 10 feet	10 feet
More than 10 feet	13 feet

- (3) Safety nets shall be installed with sufficient clearance under them to prevent contact with the surface or structures below when subjected to an impact force equal to the drop test specified in paragraph (4) of this section [1926.502].
- (4) Safety nets and their installations shall be capable of absorbing an impact force equal to that produced by the drop test specified in paragraph (c)(4)(i) of this section [1926.502].
- (i) Except as provided in paragraph (c)(4)(ii) of this section (1926.502), safety nets and safety net installations shall be drop-tested at the jobsite after initial installation and before being used as a fall protection system, whenever relocated, after major repair, and at 6-month intervals if left in one place. The drop-test shall consist of a 400 pound (180 kg) bag of sand 30+ or -2 inches (76+ or -5 cm) in diameter dropped into the net from the highest walking/working surface at which employees are exposed to fall hazards, but not from less than 42 inches (1.1 m) above that level.

- (ii) When the employer can demonstrate that it is unreasonable to perform the drop-test required by paragraph (c)(4)(i) of this section (1926.502), the employer (or a designated competent person) shall certify that the net and net installation is in compliance with the provisions of paragraphs (c)(3) and (c)(4)(i) of this section (1926.502) by preparing a certification record prior to the net being used as a fall protection system. The certification record must include an identification of the net and net installation for which the certification record is being prepared; the date that it was determined that the identified net and net installation were in compliance with paragraph (c)(3) of this section (1926.502) and the signature of the person making the determination and certification. The most recent certification record for each net and net installation shall be available at the jobsite for inspection.
- (5) Defective nets shall not be used. Safety nets shall be inspected at least once a week for wear, damage, and other deterioration. Defective components shall be removed from service. Safety nets shall also be inspected after any occurrence which could affect the integrity of the safety net system.
- (6) Materials, scrap pieces, equipment, and tools which have fallen into the safety net shall be removed as soon as possible from the net and at least before the next work shift.
- (7) The maximum size of each safety net mesh opening shall not exceed 36 square inches (230 cm) nor be longer than 6 inches (15 cm) on any side, and the opening, measured center-to-center of mesh ropes or webbing, shall not be longer than 6 inches (15 cm). All mesh crossings shall be secured to prevent enlargement of the mesh opening.
- (8) Each safety net (or section of it) shall have a border rope for webbing with a minimum breaking strength of 5,000 pounds (22.2 kN).
- (9) Connections between safety net panels shall be as strong as integral net components and shall be spaced not more than 6 inches (15 cm) apart.
- (d) "Personal fall arrest systems." Personal fall arrest systems and their use shall comply with the provisions set forth below. Effective January 1, 1998, body belts are not acceptable as part of a personal fall arrest system.

**Note:** The use of a body belt in a positioning device system is acceptable and is regulated under paragraph (e) of this section (1926.502).

- (1) Connectors shall be drop forged, pressed or formed steel, or made of equivalent materials.
- (2) Connectors shall have a corrosion-resistant finish, and all surfaces and edges shall be smooth to prevent damage to interfacing parts of the system.

- (3) Dee-rings and snaphooks shall have a minimum tensile strength of 5,000 pounds (22.2 kN).
- (4) Dee-rings and snaphooks shall be proof-tested to a minimum tensile load of 3,600 pounds (16 kN) without cracking, breaking, or taking permanent deformation.
- (5) Snaphooks shall be sized to be compatible with the member to which they are connected to prevent unintentional disengagement of the snaphook by depression of the snaphook keeper by the connected member, or shall be a locking type snaphook designed and used to prevent disengagement of the snaphook by the contact of the snaphook keeper by the connected member. Effective January 1, 1998, only locking type snaphooks shall be used.
- (6) Unless the snaphook is a locking type and designed for the following connections, snaphooks shall not be engaged:
  - (i) directly to webbing, rope or wire rope;
  - (ii) to each other;
  - (iii) to a dee-ring to which another snaphook or other connector is attached;
  - (iv) to a horizontal lifeline; or
  - (v) to any object which is incompatibly shaped or dimensioned in relation to the snaphook such that unintentional disengagement could occur by the connected object being able to depress the snaphook keeper and release itself.
- (7) On suspended scaffolds or similar work platforms with horizontal lifelines which may become vertical lifelines, the devices used to connect to a horizontal lifeline shall be capable of locking in both directions on the lifeline.
- (8) Horizontal lifelines shall be designed, installed, and used, under the supervision of a qualified person, as part of a complete personal fall arrest system, which maintains a safety factor of at least two.
- (9) Lanyards and vertical lifelines shall have a minimum breaking strength of 5,000 pounds (22.2 kN).
- (10)
  - (i) Except as provided in paragraph (d)(10)(ii) of this section [1926.502], when vertical lifelines are used, each employee shall be attached to a separate lifeline.

- (ii) During the construction of elevator shafts, two employees may be attached to the same lifeline in the hoistway, provided both employees are working atop a false car that is equipped with guardrails; the strength of the lifeline is 10,000 pounds [5,000 pounds per employee attached] (44.4 kN); and all other criteria specified in this paragraph for lifelines have been met.
- (11) Lifelines shall be protected against being cut or abraded.
  - (12) Self-retracting lifelines and lanyards which automatically limit free fall distance to 2 feet (0.61 m) or less shall be capable of sustaining a minimum tensile load of 3,000 pounds (13.3 kN) applied to the device with the lifeline or lanyard in the fully extended position.
  - (13) Self-retracting lifelines and lanyards which do not limit free fall distance to 2 feet (0.61 m) or less, ripstitch lanyards, and tearing and deforming lanyards shall be capable of sustaining a minimum tensile load of 5,000 pounds (22.2 kN) applied to the device with the lifeline or lanyard in the fully extended position.
  - (14) Ropes and straps (webbing) used in lanyards, lifelines, and strength components of body belts and body harnesses shall be made from synthetic fibers.
  - (15) Anchorages used for attachment of personal fall arrest equipment shall be independent of any anchorage being used to support or suspend platforms and capable of supporting at least 5,000 pounds (22.2 kN) per employee attached, or shall be designed, installed, and used as follows:
    - (i) as part of a complete personal fall arrest system which maintains a safety factor of at least two; and
    - (ii) under the supervision of a qualified person.
  - (16) Personal fall arrest systems, when stopping a fall, shall:
    - (i) limit maximum arresting force on an employee to 900 pounds (4 kN) when used with a body belt;
    - (ii) limit maximum arresting force on an employee to 1,800 pounds (8 kN) when used with a body harness;
    - (iii) be rigged such that an employee can neither free fall more than 6 feet (1.8 m), nor contact any lower level;
    - (iv) bring an employee to a complete stop and limit maximum deceleration distance an employee travels to 3.5 feet (1.07 m); and,

- (v) have sufficient strength to withstand twice the potential impact energy of an employee free falling a distance of 6 feet (1.8 m), or the free fall distance permitted by the system, whichever is less.

**Note:** If the personal fall arrest system meets the criteria and protocols contained in Appendix C to subpart M, and if the system is being used by an employee having a combined person and tool weight of less than 310 pounds (140 kg), the system will be considered to be in compliance with the provisions of paragraph (d)(16) of this section [1926.502]. If the system is used by an employee having a combined tool and body weight of 310 pounds (140 kg) or more, then the employer must appropriately modify the criteria and protocols of the Appendix to provide proper protection for such heavier weights, or the system will not be deemed to be in compliance with the requirements of paragraph (d)(16) of this section (1926.502).

- (17) The attachment point of the body belt shall be located in the center of the wearer's back. The attachment point of the body harness shall be located in the center of the wearer's back near shoulder level, or above the wearer's head.
  - (18) Body belts, harnesses, and components shall be used only for employee protection (as part of a personal fall arrest system or positioning device system) and not to hoist materials.
  - (19) Personal fall arrest systems and components subjected to impact loading shall be immediately removed from service and shall not be used again for employee protection until inspected and determined by a competent person to be undamaged and suitable for reuse.
  - (20) The employer shall provide for prompt rescue of employees in the event of a fall or shall assure that employees are able to rescue themselves.
  - (21) Personal fall arrest systems shall be inspected prior to each use for wear, damage and other deterioration, and defective components shall be removed from service.
  - (22) Body belts shall be at least one and five-eighths (1 5/8) inches (4.1 cm) wide.
  - (23) Personal fall arrest systems shall not be attached to guardrail systems, nor shall they be attached to hoists except as specified in other subparts of this Part.
  - (24) When a personal fall arrest system is used at hoist areas, it shall be rigged to allow the movement of the employee only as far as the edge of the walking/working surface.
- (e) Positioning device systems. Positioning device systems and their use shall conform to the following provisions:

- (1) Positioning devices shall be rigged such that an employee cannot free fall more than 2 feet (.9 m).
- (2) Positioning devices shall be secured to an anchorage capable of supporting at least twice the potential impact load of an employee's fall or 3,000 pounds (13.3 kN), whichever is greater.
- (3) Connectors shall be drop forged, pressed or formed steel, or made of equivalent materials.
- (4) Connectors shall have a corrosion-resistant finish, and all surfaces and edges shall be smooth to prevent damage to interfacing parts of this system.
- (5) Connecting assemblies shall have a minimum tensile strength of 5,000 pounds (22.2 kN).
- (6) Dee-rings and snaphooks shall be proof-tested to a minimum tensile load of 3,600 pounds (16 kN) without cracking, breaking, or taking permanent deformation.
- (7) Snaphooks shall be sized to be compatible with the member to which they are connected to prevent unintentional disengagement of the snaphook by depression of the snaphook keeper by the connected member, or shall be a locking type snaphook designed and used to prevent disengagement of the snaphook by the contact of the snaphook keeper by the connected member. As of January 1, 1998, only locking type snaphooks shall be used.
- (8) Unless the snaphook is a locking type and designed for the following connections, snaphooks shall not be engaged:
  - (i) directly to webbing, rope or wire rope;
  - (ii) to each other;
  - (iii) to a dee-ring to which another snaphook or other connector is attached;
  - (iv) to a horizontal lifeline; or to depress the snaphook keeper and release itself.
  - (v) to any object which is incompatibly shaped or dimensioned in relation to the snaphook such that unintentional disengagement could occur by the connected object being able to depress the snaphook keeper and release itself.
- (9) Positioning device systems shall be inspected prior to each use for wear, damage, and other deterioration, and defective components shall be removed from service.

(10) Body belts, harnesses, and components shall be used only for employee protection (as part of a personal fall arrest system or positioning device system) and not to hoist materials.

## Appendix H to Subpart R - Double Connections: Illustration of a Clipped End Connection and a Staggered Connection: Non-mandatory Guidelines for Complying with 1926.756(c)(1)

Figure 13

Clipped end connections are connection material on the end of a structural member which has a notch at the bottom and/or top to allow the bolt(s) of the first member placed on the opposite side of the central member to remain in place. The notch(es) fits around the nut or bolt head of the opposing member to allow the second member to be bolted up without removing the bolt(s) holding the first member.

Figure 14

Staggered connections are connection material on a structural member in which all of the bolt holes in the common member web are not shared by the two incoming members in the final connection. The extra hole in the column web allows the erector to maintain at least a one bolt connection at all times while making the double connection.

## Historical Notes for Subdivision R

**Note:** The Accident Prevention Division adopted Division 3, Construction federal standard 29 CFR 1926 by reference on a temporary basis effective May 1, 1989. It contained new and revised federal occupational safety and health rules for the Construction industry. APD is now announcing that these same rules have been duly filed for permanent adoption, effective July 1, 1989. Division 3, Construction, includes new federal rules which cover masonry and concrete construction standards, and limits the use of construction cranes and derricks as personnel hoists, and revised federal rules and reduce occupational exposures to asbestos, tremolite, anthophyllite, and actinolite. Hazard communication rules for construction are also now included in Division 3.

Division 3, Construction, replaces Oregon codes, Division 83, construction, and Division 84, Electrical transmission and distribution facilities. However, some individual rules from each of these divisions have been retained and adopted into the new Division 3, construction, as Oregon-initiated rules.

This is Oregon OSHA administrative order 8-1989, adopted and effective July 7, 1989.

**Note:** Oregon OSHA adopted by reference portions of the federal Steel Erection standard, 29 CFR 1926 Subpart R. In addition, Oregon OSHA adopted Oregon initiated rules, including notes which: (1) Mandate site specific steel erection plans, (2) more clearly define openings in floor, roofs, or other walking/working surfaces, (3) require that employees working near shear connectors must be protected against impalement hazards and falls to lower levels resulting from tripping, and (4) mandates fall protection for employees exposed to falls of 10 feet or more to lower levels. In the Oregon rules there will be no distinction in fall heights between connectors and others on steel erection sites. Oregon OSHA repealed other rules that were no longer needed because of the language in the new rules.

This is Oregon OSHA administrative order 3-2002, adopted April 15, 2002, effective April 18, 2002.

**Note:** Oregon OSHA adopted amendments to division 3, subdivisions M and R, portions were repealed and replaced with a series of Oregon initiated rules and notes which: (1) Provide consistency and uniformity in mandating a 10 foot tall protection trigger height for all construction trades in Oregon except for 6' for holes, wall openings, established floors, mezzanines, balconies, walkways, excavations, and working over dangerous equipment, (2) repealed the use of controlled decking zones, (3) define lower levels, walking/working surfaces, and certification, (4) mandate written notifications allowing commencement of steel erection be maintained on site, (5) require the use of tag lines except when they create a hazard as determined by a qualified rigger, and (6) require written certification of employee training and retraining.

This is Oregon OSHA administrative order 6-2002, adopted and effective July 19, 2002.

**Note:** The Department of Consumer and Business Services was directed to change its steel erection rules by the 2003 legislature's House Bill 3010, which amended ORS 654.035. Oregon OSHA cannot require the use of fall protection by workers engaged in steel erection at heights lower than the heights at which fall protection relating to steel erection is required by federal regulation. Oregon OSHA adopted, amended, and repealed rules in Division 3/R to comply with this ORS amendment.

This is Oregon OSHA administrative order 8-2003, adopted December 30, 2003, effective January 1, 2004.

**Note:** Oregon OSHA adopted the revocation of a provision in the structural steel assembly rule in Division 3/R, Construction/Steel Erection. Federal OSHA published in the January 18, 2006 Federal Register the revocation of this paragraph and appendix. The specific provision is 1926.754(c)(3), slip resistance of skeletal structural steel, and Appendix B that accompanies this rule. According to federal OSHA documents, there has been no significant progress regarding the suitability of the test methods referenced in the provision for testing slip resistance or the availability of coatings that would meet the slip resistant requirements of the provision. Most significantly, there is a high probability that the test methods would not be validated by the effective date (July 18, 2006). As a result, employers would be unable to comply with the provision.

This is Oregon OSHA administrative order 2-2006, adopted and effective April 28, 2006.

**Note:** Oregon OSHA adopted federal OSHA changes as they appear in the April 3, 2006 Federal Register. These revisions include updating references and removing obsolete effective dates and startup dates from existing rules in general industry, construction, and maritime activities. Two changes federal OSHA made that we do not include in this rulemaking are to remove effective dates in 1910.266 and 1926.1092, neither of which Oregon OSHA has adopted before.

This is Oregon OSHA Administrative Order 4-2006, Adopted and effective July 24, 2006.

**Note:** In this rulemaking, Oregon OSHA is amending its standards to add language clarifying that the personal protective equipment (PPE) and training requirements impose a compliance duty to each and every employee covered by the standards, and that noncompliance may expose the employer to liability on a per-employee basis. The amendments consist of new paragraphs added to the introductory sections of the affected rules and changes to the language of some existing respirator and training requirements. These federal OSHA changes are in general industry, construction, and maritime and were published in the December 12, 2008 Federal Register.

This is Oregon OSHA Administrative Order 5-2009, adopted and effective May 29, 2009.

**Note:** This rulemaking is to keep Oregon OSHA in harmony with recent changes to federal OSHA's standards. Oregon OSHA adopted most of the federal OSHA changes as they appear in the August 9, 2010 Federal Register. These changes revise the construction industry crane and derrick rules found in new Subpart CC of 29 CFR part 1926. The crane and derrick construction standard was revised to update and specify industry work practices necessary to protect employees. This final standard also addresses advances in the designs of cranes and derricks, related hazards, and the qualifications of employees needed to operate them safely. Under this final rule, employers must determine whether the ground is sufficient to support the anticipated weight and associated loads of hoisting equipment. The employer is also required to assess hazards within the work zone that would affect the safe operation of hoisting equipment, such as power lines and objects or personnel that would be within the work zone or swing radius of the hoisting equipment. Finally, the employer is required to ensure that the equipment is in safe operating condition through required inspections and that employees in the work zone are trained to recognize hazards associated with the use of the equipment and any related duties that they are assigned to perform.

Subdivision R, 1926.753 was amended by revising paragraphs (a) and (c)(4) to reflect provisions of Subpart CC.

This is Oregon OSHA administrative order 1-2011, adopted and effective February 9, 2011.

Administrative  
Order 3-2019

The Oregon Department of Consumer and Business Services adopted these rules pursuant to ORS 654.025(2).

The Secretary of State designated OAR Chapter 437 as the “Oregon Occupational Safety and Health Code.” Six general subject areas within this code are designated as “Divisions.”

- **Division 1** General Administrative Rules
- **Division 2** General Occupational Safety and Health Rules
- **Division 3** Construction
- **Division 4** Agriculture
- **Division 5** Maritime Activities
- **Division 7** Forest Activities
- **Oregon Revised Statutes (ORS) 654** The Oregon Safe Employment Act (OSEAct)

Oregon-initiated rules in this division of the Oregon Occupational Safety and Health Code are numbered in a uniform system developed by the Secretary of State. This system does not number the rules in sequence (001, 002, 003, etc.). Omitted numbers may be assigned to new rules at the time of their adoption.

**Oregon-initiated rules** are arranged in the following Basic Codification Structure adopted by the Secretary of State for Oregon Administrative Rules (OAR):

Chapter	Division	Rule	Section	Subsection	Paragraphs
437	002	0322	(1)	(a)	(A)(i)(I)

The majority of Oregon OSHA rules are adopted by reference from the Code of Federal Regulations (CFR), and are arranged in the following basic federal numbering system:

Chapter	Division	Part	Subpart (Subdivision)	Section	Paragraphs
437	002	1910	G	.303	(a)(1)(i)(A)(1)

The terms “subdivision” and “subpart” are synonymous within OAR 437, Oregon Occupational Safety and Health Code.

---

To obtain an order form or copies of these codes, address:

**Department of Consumer & Business Services**  
**Oregon Occupational Safety & Health Division (Oregon OSHA)**  
350 Winter St. NE  
Salem, OR 97301-3882

Or call the Oregon OSHA Resource Library at 503-378-3272

The rules referenced in this division are available for viewing in the Office of the Secretary of State, Oregon State Archives Building, Salem, Oregon, or the Central Office, Oregon Occupational Safety and Health Division of the Department of Consumer and Business Services, 350 Winter St. NE, Salem, Oregon, and on our website at [osha.oregon.gov](http://osha.oregon.gov).

## 1926.800 Underground Construction

### (a) Scope and application.

- (1) This section applies to the construction of underground tunnels, shafts, chambers, and passageways. This section also applies to cut-and-cover excavations which are both physically connected to ongoing underground construction operations within the scope of this section, and covered in such a manner as to create conditions characteristic of underground construction.

- (2) This section does not apply to the following:
- (i) Excavation and trenching operations covered by Subpart P of this part, such as foundation operations for above-ground structures that are not physically connected to underground construction operations, and surface excavation; nor
  - (ii) Underground electrical transmission and distribution lines, as addressed in Subpart V of this part.
- (b) Access and egress.
- (1) The employer shall provide and maintain safe means of access and egress to all work stations.
  - (2) The employer shall provide access and egress in such a manner that employees are protected from being struck by excavators, haulage machines, trains and other mobile equipment.
  - (3) The employer shall control access to all openings to prevent unauthorized entry underground. Unused chutes, manways, or other openings shall be tightly covered, bulkheaded, or fenced off, and shall be posted with warning signs indicating "Keep Out" or similar language. Completed or unused sections of the underground facility shall be barricaded.
- (c) Check-in/check-out. The employer shall maintain a check-in/check-out procedure that will ensure that above-ground personnel can determine an accurate count of the number of persons underground in the event of an emergency. However, this procedure is not required when the construction of underground facilities designed for human occupancy has been sufficiently completed so that the permanent environmental controls are effective, and when the remaining construction activity will not cause any environmental hazard or structural failure within the facilities.
- (d) Safety instruction. All employees shall be instructed in the recognition and avoidance of hazards associated with underground construction activities including, where appropriate, the following subjects:
- (1) Air monitoring;
  - (2) Ventilation;
  - (3) Illumination;
  - (4) Communications;
  - (5) Flood control;

- (6) Mechanical equipment;
- (7) Personal protective equipment;
- (8) Explosives;
- (9) Fire prevention and protection; and
- (10) Emergency procedures, including evacuation plans and check-in/check-out systems.

(e) Notification.

- (1) Oncoming shifts shall be informed of any hazardous occurrences or conditions that have affected or might affect employee safety, including liberation of gas, equipment failures, earth or rock slides, cave-ins, floodings, fires or explosions.
- (2) The employer shall establish and maintain direct communications for coordination of activities with other employers whose operations at the jobsite affect or may affect the safety of employees underground.

(f) Communications.

- (1) When natural unassisted voice communication is ineffective, a power-assisted means of voice communication shall be used to provide communication between the work face, the bottom of the shaft, and the surface.
- (2) Two effective means of communication, at least one of which shall be voice communication, shall be provided in all shafts which are being developed or used either for personnel access or for hoisting. Additional requirements for hoist operator communication are contained in paragraph (t)(3)(xiv) of this section.
- (3) Powered communication systems shall operate on an independent power supply, and shall be installed so that the use of or disruption of any one phone or signal location will not disrupt the operation of the system from any other location.
- (4) Communication systems shall be tested upon initial entry of each shift to the under- ground, and as often as necessary at later times, to ensure that they are in working order.
- (5) Any employee working alone underground in a hazardous location, who is both out of the range of natural unassisted voice communication and not under observation by other persons, shall be provided with an effective means of obtaining assistance in an emergency.

(g) Emergency provisions.

- (1) Hoisting capability. When a shaft is used as a means of egress, the employer shall make advance arrangements for power-assisted hoisting capability to be readily available in an emergency, unless the regular hoisting means can continue to function in the event of an electrical power failure at the jobsite. Such hoisting means shall be designed so that the load hoist drum is powered in both directions of rotation and so that the brake is automatically applied upon power release or failure.
- (2) Self-rescuers. The employer must provide self-rescuers approved by the National Institute for Occupational Safety and Health under 42 CFR part 84. The respirators must be immediately available to all employees at work stations in underground areas where employees might be trapped by smoke or gas. The selection, issuance, use, and care of respirators must be in accordance with 29 CFR 1926.103.
- (3) Designated person. At least one designated person shall be on duty above ground whenever any employee is working underground. This designated person shall be responsible for securing immediate aid and keeping an accurate count of employees underground in case of emergency. The designated person must not be so busy with other responsibilities that the counting function is encumbered.
- (4) Emergency lighting. Each employee underground shall have an acceptable portable hand lamp or cap lamp in his or her work area for emergency use, unless natural light or an emergency lighting system provides adequate illumination for escape.
- (5) Rescue teams.
  - (i) On jobsites where 25 or more employees work underground at one time, the employer shall provide (or make arrangements in advance with locally available rescue services to provide) at least two 5-person rescue teams, one on the jobsite or within one-half hour travel time from the entry point, and the other within 2 hours travel time.
  - (ii) On jobsites where less than 25 employees work underground at one time, the employer shall provide (or make arrangements in advance with locally available rescue services to provide) at least one 5-person rescue team to be either on the jobsite or within one-half hour travel time from the entry point.

- (iii) Rescue team members shall be qualified in rescue procedures, the use and limitations of breathing apparatus, and the use of fire-fighting equipment. Qualifications shall be reviewed not less than annually.
  - (iv) On jobsites where flammable or noxious gases are encountered or anticipated in hazardous quantities, rescue team members shall practice donning and using self-contained breathing apparatus monthly.
  - (v) The employer shall ensure that rescue teams are familiar with conditions at the jobsite.
- (h) Hazardous classifications.
- (1) Potentially gassy operations. Underground construction operations shall be classified as potentially gassy if either:
    - (i) Air monitoring discloses 10 percent or more of the lower explosive limit for methane or other flammable gases measured at 12 inches (304.8 mm)  $\pm$ 0.25 inch (6.35 mm) from the roof, face, floor or walls in any underground work area for more than a 24-hour period; or
    - (ii) The history of the geographical area or geological formation indicates that 10 percent or more of the lower explosive limit for methane or other flammable gases is likely to be encountered in such underground operations.
  - (2) Gassy operations. Underground construction operations shall be classified as gassy if:
    - (i) Air monitoring discloses 10 percent or more of the lower explosive limit for methane or other flammable gases measured at 12 inches (304.8 mm)  $\pm$ 0.25 inch (6.35 mm) from the roof, face, floor or walls in any underground work area for three consecutive days; or
    - (ii) There has been an ignition of methane or of other flammable gases emanating from the strata that indicates the presence of such gases; or
    - (iii) The underground construction operation is both connected to an underground work area which is currently classified as gassy and is also subject to a continuous course of air containing the flammable gas concentration.
  - (3) Declassification to potentially gassy operations. Underground construction gassy operations may be declassified to Potentially Gassy when air monitoring results remain under 10 percent of the lower explosive limit for methane or other flammable gases for three consecutive days.

(i) Gassy operations – additional requirements.

- (1) Only acceptable equipment, maintained in suitable condition, shall be used in gassy operations.
- (2) Mobile diesel-powered equipment used in gassy operations shall be either approved in accordance with the requirements of 30 CFR Part 36 (formerly Schedule 31) by MSHA, or shall be demonstrated by the employer to be fully equivalent to such MSHA-approved equipment, and shall be operated in accordance with that part.
- (3) Each entrance to a gassy operation shall be prominently posted with signs notifying all entrants of the gassy classification.
- (4) Smoking shall be prohibited in all gassy operations and the employer shall be responsible for collecting all personal sources of ignition, such as matches and lighters, from all persons entering a gassy operation.
- (5) A fire watch as described in 1926.352(e) shall be maintained when hot work is performed.
- (6) Once an operation has met the criteria in paragraph (h)(2) warranting classification as gassy, all operations in the affected area, except the following, shall be discontinued until the operation either is in compliance with all of the gassy operation requirements or has been declassified in accordance with paragraph (h)(3) of this section:
  - (i) Operations related to the control of the gas concentration;
  - (ii) Installation of new equipment, or conversion of existing equipment, to comply with this paragraph (i); and
  - (iii) Installation of above-ground controls for reversing the air flow.

(j) Air quality and monitoring.

- (1) General. Air quality limits and control requirements for construction are found in 1926.55, except as modified by this section.
  - (i)
    - (A) The employer shall assign a competent person who shall perform all air monitoring required by this section.
    - (B) Where this paragraph requires monitoring of airborne contaminants “as often as necessary,” the competent person shall make a reasonable determination as to which substances to monitor and how frequently to monitor, considering at least the following factors:

- (1) Location of jobsite: Proximity to fuel tanks, sewers, gas lines, old landfills, coal deposits, and swamps;
  - (2) Geology: Geological studies of the jobsite, particularly involving the soil type and its permeability;
  - (3) History: Presence of air contaminants in nearby jobsites, changes in levels of substances monitored on the prior shift; and
  - (4) Work practices and jobsite conditions: The use of diesel engines, use of explosives, use of fuel gas, volume and flow of ventilation, visible atmospheric conditions, decompression of the atmosphere, welding, cutting and hot work, and employees' physical reactions to working underground.
- (ii)
- (A) The atmosphere in all underground work areas shall be tested as often as necessary to assure that the atmosphere at normal atmospheric pressure contains at least 19.5 percent oxygen and no more than 22 percent oxygen.
  - (B) Tests for oxygen content shall be made before tests for air contaminants.
- (iii)
- (A) The atmosphere in all underground work areas shall be tested quantitatively for carbon monoxide, nitrogen dioxide, hydrogen sulfide, and other toxic gases, dusts, vapors, mists, and fumes as often as necessary to ensure that the permissible exposure limits prescribed in 1926.55 are not exceeded.
  - (B) The atmosphere in all underground work areas shall be tested quantitatively for methane and other flammable gases as often as necessary to determine:
    - (1) Whether action is to be taken under paragraphs (j)(1)(vii), (viii), and (ix), of this section; and
    - (2) Whether an operation is to be classified potentially gassy or gassy under paragraph (h) of this section.
  - (C) If diesel-engine or gasoline-engine driven ventilating fans or compressors are used, an initial test shall be made of the inlet air of the fan or compressor, with the engines operating, to ensure that the air supply is not contaminated by engine exhaust.

- (D) Testing shall be performed as often as necessary to ensure that the ventilation requirements of paragraph (k) of this section are met.
- (iv) When rapid excavation machines are used, a continuous flammable gas monitor shall be operated at the face with the sensor(s) placed as high and close to the front of the machine's cutter head as practicable.
- (v)
- (A) Whenever air monitoring indicates the presence of 5 ppm or more of hydrogen sulfide, a test shall be conducted in the affected underground work area(s), at least at the beginning and midpoint of each shift, until the concentration of hydrogen sulfide has been less than 5 ppm for 3 consecutive days.
- (B) Whenever hydrogen sulfide is detected in an amount exceeding 10 ppm, a continuous sampling and indicating hydrogen sulfide monitor shall be used to monitor the affected work area.
- (C) Employees shall be informed when a concentration of 10 ppm hydrogen sulfide is exceeded.
- (D) The continuous sampling and indicating hydrogen sulfide monitor shall be designed, installed, and maintained to provide a visual and aural alarm when the hydrogen sulfide concentration reaches 20 ppm to signal that additional measures, such as respirator use, increased ventilation, or evacuation, might be necessary to maintain hydrogen sulfide exposure below the permissible exposure limit.
- (vi) When the competent person determines, on the basis of air monitoring results or other information, that air contaminants may be present in sufficient quantity to be dangerous to life, the employer shall:
- (A) Prominently post a notice at all entrances to the underground jobsite to inform all entrants of the hazardous condition; and
- (B) Ensure that the necessary precautions are taken.
- (vii) Whenever five percent or more of the lower explosive limit for methane or other flammable gases is detected in any underground work area(s) or in the air return, steps shall be taken to increase ventilation air volume or otherwise control the gas concentration, unless the employer is operating in accordance with the potentially gassy or gassy operation requirements. Such additional ventilation controls may be discontinued when gas concentrations are reduced below five percent of the lower explosive limit, but shall be reinstated whenever the five percent level is exceeded.

- (viii) Whenever 10 percent or more of the lower explosive limit for methane or other flammable gases is detected in the vicinity of welding, cutting, or other hot work, such work shall be suspended until the concentration of such flammable gas is reduced to less than 10 percent of the lower explosive limit.
- (ix) Whenever 20 percent or more of the lower explosive limit for methane or other flammable gases is detected in any underground work area(s) or in the air return:
  - (A) All employees, except those necessary to eliminate the hazard, shall be immediately withdrawn to a safe location above ground; and
  - (B) Electrical power, except for acceptable pumping and ventilation equipment, shall be cut off to the area endangered by the flammable gas until the concentration of such gas is reduced to less than 20 percent of the lower explosive limit.
- (2) Additional monitoring for potentially gassy and gassy operations. Operations which meet the criteria for potentially gassy and gassy operations set forth in paragraph (h) of this section shall be subject to the additional monitoring requirements of this paragraph.
  - (i) A test for oxygen content shall be conducted in the affected underground work areas and work areas immediately adjacent to such areas at least at the beginning and midpoint of each shift.
  - (ii) When using rapid excavation machines, continuous automatic flammable gas monitoring equipment shall be used to monitor the air at the heading, on the rib, and in the return air duct. The continuous monitor shall signal the heading, and shut down electric power in the affected underground work area, except for acceptable pumping and ventilation equipment, when 20 percent or more of the lower explosive limit for methane or other flammable gases is encountered.
  - (iii) A manual flammable gas monitor shall be used as needed, but at least at the beginning and midpoint of each shift, to ensure that the limits prescribed in paragraphs (h) and (j) are not exceeded. In addition, a manual electrical shut down control shall be provided near the heading.
  - (iv) Local gas tests shall be made prior to and continuously during any welding, cutting, or other hot work.
  - (v) In underground operations driven by drill-and-blast methods, the air in the affected area shall be tested for flammable gas prior to re-entry after blasting, and continuously when employees are working underground.

- (3) Recordkeeping. A record of all air quality tests shall be maintained above ground at the worksite and be made available to the Secretary of Labor upon request. The record shall include the location, date, time, substance and amount monitored. Records of exposures to toxic substances shall be retained in accordance with 1910.1020 of this chapter. All other air quality test records shall be retained until completion of the project.

(k) Ventilation.

- (1)
  - (i) Fresh air shall be supplied to all underground work areas in sufficient quantities to prevent dangerous or harmful accumulation of dusts, fumes, mists, vapors or gases.
  - (ii) Mechanical ventilation shall be provided in all underground work areas except when the employer can demonstrate that natural ventilation provides the necessary air quality through sufficient air volume and air flow.
- (2) A minimum of 200 cubic feet (5.7 m<sup>3</sup>) of fresh air per minute shall be supplied for each employee underground.
- (3) The linear velocity of air flow in the tunnel bore, in shafts, and in all other underground work areas shall be at least 30 feet (9.15 m) per minute where blasting or rock drilling is conducted, or where other conditions likely to produce dust, fumes, mists, vapors, or gases in harmful or explosive quantities are present.
- (4) The direction of mechanical air flow shall be reversible.
- (5) Following blasting, ventilation systems shall exhaust smoke and fumes to the outside atmosphere before work is resumed in affected areas.
- (6) Ventilation doors shall be designed and installed so that they remain closed when in use, regardless of the direction of the air flow.
- (7) When ventilation has been reduced to the extent that hazardous levels of methane or flammable gas may have accumulated, a competent person shall test all affected areas after ventilation has been restored and shall determine whether the atmosphere is within flammable limits before any power, other than for acceptable equipment, is restored or work is resumed.

- (8) Whenever the ventilation system has been shut down with all employees out of the underground area, only competent persons authorized to test for air contaminants shall be allowed underground until the ventilation has been restored and all affected areas have been tested for air contaminants and declared safe.
- (9) When drilling rock or concrete, appropriate dust control measures shall be taken to maintain dust levels within limits set in 1926.55. Such measures may include, but are not limited to, wet drilling, the use of vacuum collectors, and water mix spray systems.
- (10)
- (i) Internal combustion engines, except diesel-powered engines on mobile equipment, are prohibited underground.
  - (ii) Mobile diesel-powered equipment used underground in atmospheres other than gassy operations.
    - (A) Shall comply with MSHA provisions in 30 CFR 57.5067; or
    - (B) If purchased on or before July 15, 2019, may alternatively comply with MSHA provisions under 30 CFR part 32 (revised as of July 1, 1996) (formerly Schedule 24) or be demonstrated by the employer to be fully equivalent to such MSHA-approved equipment, and shall be operated in accordance with that part.
  - (iii) For purposes of this paragraph (d)(10), when an applicable MSHA provision uses the term “mine,” use the phrase “underground construction site.” (Each brake horsepower of a diesel engine requires at least 100 cubic feet (2.832 m<sup>3</sup>) of air per minute for suitable operation in addition to the air requirements for personnel. Some engines may require a greater amount of air to ensure that the allowable levels of carbon monoxide, nitric oxide, and nitrogen dioxide are not exceeded.)
- (11) Potentially gassy or gassy operations shall have ventilation systems installed which shall:
- (i) Be constructed of fire-resistant materials; and
  - (ii) Have acceptable electrical systems, including fan motors.
- (12) Gassy operations shall be provided with controls located above ground for reversing the air flow of ventilation systems.

(13) In potentially gassy or gassy operations, wherever mine-type ventilation systems using an offset main fan installed on the surface are used, they shall be equipped with explosion-doors or a weak-wall having an area at least equivalent to the cross-sectional area of the airway.

(l) Illumination.

(1) Illumination requirements applicable to underground construction operations are found in Table D-3 of 1926.56 of this part.

(2) Only acceptable portable lighting equipment shall be used within 50 feet (15.24 m) of any underground heading during explosives handling.

(m) Fire prevention and control. Fire prevention and protection requirements applicable to underground construction operations are found in Subpart F of this part, except as modified by the following additional standards.

(1) Open flames and fires are prohibited in all underground construction operations except as permitted for welding, cutting and other hot work operations in paragraph (n) of this section.

(2)

(i) Smoking may be allowed only in areas free of fire and explosion hazards.

(ii) Readily visible signs prohibiting smoking and open flames shall be posted in areas having fire or explosion hazards.

(3) The employer may store underground no more than a 24-hour supply of diesel fuel for the underground equipment used at the worksite.

(4) The piping of diesel fuel from the surface to an underground location is permitted only if:

(i) Diesel fuel is contained at the surface in a tank whose maximum capacity is no more than the amount of fuel required to supply for a 24-hour period the equipment serviced by the underground fueling station; and

(ii) The surface tank is connected to the underground fueling station by an acceptable pipe or hose system that is controlled at the surface by a valve, and at the shaft bottom by a hose nozzle; and

(iii) The pipe is empty at all times except when transferring diesel fuel from the surface tank to a piece of equipment in use underground; and

(iv) Hoisting operations in the shaft are suspended during refueling operations if the supply piping in the shaft is not protected from damage.

- (5)
- (i) Gasoline shall not be carried, stored, or used underground.
  - (ii) Acetylene, liquefied petroleum gas, and Methylacetylene Propadiene Stabilized gas may be used underground only for welding, cutting and other hot work, and only in accordance with Subpart J of this part, and paragraphs (j), (k), (m), and (n) of this section.
- (6) Oil, grease, and diesel fuel stored underground shall be kept in tightly sealed containers in fire-resistant areas at least 300 feet (91.44 m) from underground explosive magazines, and at least 100 feet (30.48 m) from shaft stations and steeply inclined passageways. Storage areas shall be positioned or diked so that the contents of ruptured or overturned containers will not flow from the storage area.
- (7) Flammable or combustible materials shall not be stored above ground within 100 feet (30.48 m) of any access opening to any underground operation. Where this is not feasible because of space limitations at the jobsite, such materials may be located within the 100-foot limit, provided that:
- (i) They are located as far as practicable from the opening; and
  - (ii) Either a fire-resistant barrier of not less than one-hour rating is placed between the stored material and the opening, or additional precautions are taken which will protect the materials from ignition sources.
- (8) Fire-resistant hydraulic fluids shall be used in hydraulically-actuated underground machinery and equipment unless such equipment is protected by a fire suppression system or by multi-purpose fire extinguisher(s) rated at of sufficient capacity for the type and size of hydraulic equipment involved, but rated at least 4A:40B:C.
- (9)
- (i) Electrical installations in underground areas where oil, grease, or diesel fuel are stored shall be used only for lighting fixtures.
  - (ii) Lighting fixtures in storage areas, or within 25 feet (7.62 m) of underground areas where oil, grease, or diesel fuel are stored, shall be approved for Class I, Division 2 locations, in accordance with Subpart K of this part.
- (10) Leaks and spills of flammable or combustible fluids shall be cleaned up immediately.

- (11) A fire extinguisher of at least 4A:40B:C rating or other equivalent extinguishing means shall be provided at the head pulley and at the tail pulley of underground belt conveyors.
  - (12) Any structure located underground or within 100 feet (30.48 m) of an opening to the underground shall be constructed of material having a fire-resistance rating of at least one hour.
- (n) Welding, cutting, and other hot work. In addition to the requirements of Subpart J of this part, the following requirements shall apply to underground welding, cutting, and other hot work.
- (1) No more than the amount of fuel gas and oxygen cylinders necessary to perform welding, cutting, or other hot work during the next 24-hour period shall be permitted underground.
  - (2) Noncombustible barriers shall be installed below welding, cutting, or other hot work being done in or over a shaft or raise.
- (o) Ground support.
- (1) Portal areas. Portal openings and access areas shall be guarded by shoring, fencing, head walls, shotcreting or other equivalent protection to ensure safe access of employees and equipment. Adjacent areas shall be scaled or otherwise secured to prevent loose soil, rock, or fractured materials from endangering the portal and access area.
  - (2) Subsidence areas. The employer shall ensure ground stability in hazardous subsidence areas by shoring, by filling in, or by erecting barricades and posting warning signs to prevent entry.
  - (3) Underground areas.
    - (i)
      - (A) A competent person shall inspect the roof, face, and walls of the work area at the start of each shift and as often as necessary to determine ground stability.
      - (B) Competent persons conducting such inspections shall be protected from loose ground by location, ground support or equivalent means.
    - (ii) Ground conditions along haulageways and travelways shall be inspected as frequently as necessary to ensure safe passage.
    - (iii) Loose ground that might be hazardous to employees shall be taken down, scaled or supported.

(iv)

- (A) Torque wrenches shall be used wherever bolts that depend on torsionally applied force are used for ground support.
  - (B) A competent person shall determine whether rock bolts meet the necessary torque, and shall determine the testing frequency in light of the bolt system, ground conditions and the distance from vibration sources.
- (v) Suitable protection shall be provided for employees exposed to the hazard of loose ground while installing ground support systems.
- (vi) Support sets shall be installed so that the bottoms have sufficient anchorage to prevent ground pressures from dislodging the support base of the sets. Lateral bracing (collar bracing, tie rods, or spreaders) shall be provided between immediately adjacent sets to ensure added stability.
- (vii) Damaged or dislodged ground supports that create a hazardous condition shall be promptly repaired or replaced. When replacing supports, the new supports shall be installed before the damaged supports are removed.
- (viii) A shield or other type of support shall be used to maintain a safe travelway for employees working in dead-end areas ahead of any support replacement operation.

(4) Shafts.

- (i) Shafts and wells over 5 feet (1.53 m) in depth that employees must enter shall be supported by a steel casing, concrete pipe, timber, solid rock or other suitable material.
- (ii)
  - (A) The full depth of the shaft shall be supported by casing or bracing except where the shaft penetrates into solid rock having characteristics that will not change as a result of exposure. Where the shaft passes through earth into solid rock, or through solid rock into earth, and where there is potential for shear, the casing or bracing shall extend at least 5 feet (1.53 m) into the solid rock. When the shaft terminates in solid rock, the casing or bracing shall extend to the end of the shaft or 5 feet (1.53 m) into the solid rock, whichever is less.

- (B) The casing or bracing shall extend 42 inches (1.07 m) plus or minus 3 inches (8 cm) above ground level, except that the minimum casing height may be reduced to 12 inches (0.3 m), provided that a standard railing is installed; that the ground adjacent to the top of the shaft is sloped away from the shaft collar to prevent entry of liquids; and that effective barriers are used to prevent mobile equipment operating near the shaft from jumping over the 12 inch (0.3 m) barrier.
- (iii) After blasting operations in shafts, a competent person shall determine if the walls, ladders, timbers, blocking, or wedges have loosened. If so, necessary repairs shall be made before employees other than those assigned to make the repairs are allowed in or below the affected areas.
- (p) **Blasting.** This paragraph applies in addition to the requirements for blasting and explosives operations, including handling of misfires, which are found in Subpart U of this part.
- (1) Blasting wires shall be kept clear of electrical lines, pipes, rails, and other conductive material, excluding earth, to prevent explosives initiation or employee exposure to electric current.
  - (2) Following blasting, an employee shall not enter a work area until the air quality meets the requirements of paragraph (j) of this section.
- (q) **Drilling.**
- (1) A competent person shall inspect all drilling and associated equipment prior to each use. Equipment defects affecting safety shall be corrected before the equipment is used.
  - (2) The drilling area shall be inspected for hazards before the drilling operation is started.
  - (3) Employees shall not be allowed on a drill mast while the drill bit is in operation or the drill machine is being moved.
  - (4) When a drill machine is being moved from one drilling area to another, drill steel, tools, and other equipment shall be secured and the mast shall be placed in a safe position.
  - (5) Receptacles or racks shall be provided for storing drill steel located on jumbos.
  - (6) Employees working below jumbo decks shall be warned whenever drilling is about to begin.

- (7) Drills on columns shall be anchored firmly before starting drilling, and shall be retightened as necessary thereafter.
- (8)
- (i) The employer shall provide mechanical means on the top deck of a jumbo for lifting unwieldy or heavy material.
  - (ii) When jumbo jacks are over 10 feet (3.05 m) in height, the employer shall install stairs wide enough for two persons.
  - (iii) Jumbo decks more than 10 feet (3.05 m) in height shall be equipped with guardrails on all open sides, excluding access openings of platforms, unless an adjacent surface provides equivalent fall protection.
  - (iv)
    - (A) Only employees assisting the operator shall be allowed to ride on jumbos, unless the jumbo meets the requirements of paragraph (r)(6)(ii) of this section.
    - (B) Jumbos shall be chocked to prevent movement while employees are working on them.
  - (v)
    - (A) Walking and working surfaces of jumbos shall be maintained to prevent the hazards of slipping, tripping and falling.
    - (B) Jumbo decks and stair treads shall be designed to be slip-resistant and secured to prevent accidental displacement.
- (9) Scaling bars shall be available at scaling operations and shall be maintained in good condition at all times. Blunted or severely worn bars shall not be used.
- (10)
- (i) Blasting holes shall not be drilled through blasted rock (muck) or water.
  - (ii) Employees in a shaft shall be protected either by location or by suitable barrier(s) if powered mechanical loading equipment is used to remove muck containing unfired explosives.
- (11) A caution sign reading "Buried Line," or similar wording shall be posted where air lines are buried or otherwise hidden by water or debris.
- (r) Haulage.
- (1)

- (i) A competent person shall inspect haulage equipment before each shift.
- (ii) Equipment defects affecting safety and health shall be corrected before the equipment is used.
- (2) Powered mobile haulage equipment shall have suitable means of stopping.
- (3)
  - (i) Power mobile haulage equipment, including trains, shall have audible warning devices to warn employees to stay clear. The operator shall sound the warning device before moving the equipment and whenever necessary during travel.
  - (ii) The operator shall assure that lights which are visible to employees at both ends of any mobile equipment, including a train, are turned on whenever the equipment is operating.
- (4) In those cabs where glazing is used, the glass shall be safety glass, or its equivalent, and shall be maintained and cleaned so that vision is not obstructed.
- (5) Anti-roll back devices or brakes shall be installed on inclined conveyor drive units to prevent conveyors from inadvertently running in reverse.
- (6)
  - (i)
    - (A) Employees shall not be permitted to ride a power-driven chain, belt, or bucket conveyor unless the conveyor is specifically designed for the transportation of persons.
    - (B) Endless belt-type manlifts are prohibited in underground construction.
    - (C) General requirements also applicable to underground construction for use of conveyors in construction are found in 1926.555 of this part.
  - (ii) No employee shall ride haulage equipment unless it is equipped with seating for each passenger and protects passengers from being struck, crushed, or caught between other equipment or surfaces. Members of train crews may ride on a locomotive if it is equipped with handholds and nonslip steps or footboards. Requirements applicable to Underground Construction for motor vehicle transportation of employees are found in 1926.601 of this part.

- (7) Powered mobile haulage equipment, including trains, shall not be left unattended unless the master switch or motor is turned off; operating controls are in neutral or park position; and the brakes are set, or equivalent precautions are taken to prevent rolling.
- (8) Whenever rails serve as a return for a trolley circuit, both rails shall be bonded at every joint and crossbonded every 200 feet (60.96 m).
- (9) When dumping cars by hand, the car dumps shall have tiedown chains, bumper blocks, or other locking or holding devices to prevent the cars from overturning.
- (10) Rocker-bottom or bottom-dump cars shall be equipped with positive locking devices to prevent unintended dumping.
- (11) Equipment to be hauled shall be loaded and secured to prevent sliding or dislodgement.
- (12)
  - (i) Mobile equipment, including rail-mounted equipment, shall be stopped for manual connecting or service work.
  - (ii) Employees shall not reach between moving cars during coupling operations.
  - (iii) Couplings shall not be aligned, shifted or cleaned on moving cars or locomotives.
- (13)
  - (i) Safety chains or other connections shall be used in addition to couplers to connect man cars or powder cars whenever the locomotive is uphill of the cars.
  - (ii) When the grade exceeds one percent and there is a potential for runaway cars, safety chains or other connections shall be used in addition to couplers to connect haulage cars or, as an alternative, the locomotive must be downhill of the train.
  - (iii) Such safety chains or other connections shall be capable of maintaining connection between cars in the event of either coupler disconnect, failure or breakage.
- (14) Parked rail equipment shall be chocked, blocked, or have brakes set to prevent inadvertent movement.

- (15) Berms, bumper blocks, safety hooks, or equivalent means shall be provided to prevent overtravel and overturning of haulage equipment at dumping locations.
- (16) Bumper blocks or equivalent stopping devices shall be provided at all track dead ends.
- (17)
- (i) Only small hand tools, lunch pails or similar small items may be transported with employees in man-cars, or on top of a locomotive.
  - (ii) When small hand tools or other small items are carried on top of a locomotive, the top shall be designed or modified to retain them while traveling.
- (18)
- (i) Where switching facilities are available, occupied personnel-cars shall be pulled, not pushed. If personnel-cars must be pushed and visibility of the track ahead is hampered, then a qualified person shall be stationed in the lead car to give signals to the locomotive operator.
  - (ii) Crew trips shall consist of personnel-loads only.
- (s) Electrical safety. This paragraph applies in addition to the general requirements for electrical safety which are found in Subpart K of this part.
- (1) Electric power lines shall be insulated or located away from water lines, telephone lines, air lines, or other conductive materials so that a damaged circuit will not energize the other systems.
  - (2) Lighting circuits shall be located so that movement of personnel or equipment will not damage the circuits or disrupt service.
  - (3) Oil-filled transformers shall not be used underground unless they are located in a fire-resistant enclosure suitably vented to the outside and surrounded by a dike to retain the contents of the transformers in the event of rupture.
- (t) Hoisting unique to underground construction. Except as modified by this paragraph (t), employers must: Comply with the requirements of subpart CC of this part, except that the limitation in 1926.1431(a) does not apply to the routine access of employees to an underground worksite via a shaft; ensure that material hoists comply with 1926.552(a) and (b) of this part; and ensure that personnel hoists comply with the personnel-hoists requirements of 1926.552(a) and (c) of this part and the elevator requirements of 1926.552(a) and (d) of this part.
- (1) General requirements for cranes and hoists.

- (i) Materials, tools, and supplies being raised or lowered, whether within a cage or otherwise, shall be secured or stacked in a manner to prevent the load from shifting, snagging or falling into the shaft.
- (ii) A warning light suitably located to warn employees at the shaft bottom and subsurface shaft entrances shall flash whenever a load is above the shaft bottom or subsurface entrances, or the load is being moved in the shaft. This paragraph does not apply to fully enclosed hoistways.
- (iii) Whenever a hoistway is not fully enclosed and employees are at the shaft bottom, conveyances or equipment shall be stopped at least 15 feet (4.57 m) above the bottom of the shaft and held there until the signalman at the bottom of the shaft directs the operator to continue lowering the load, except that the load may be lowered without stopping if the load or conveyance is within full view of a bottom signalman who is in constant voice communication with the operator.
- (iv)
  - (A) Before maintenance, repairs, or other work is commenced in the shaft served by a cage, skip, or bucket, the operator and other employees in the area shall be informed and given suitable instructions.
  - (B) A sign warning that work is being done in the shaft shall be installed at the shaft collar, at the operator's station, and at each underground landing.
- (v) Any connection between the hoisting rope and the cage or skip shall be compatible with the type of wire rope used for hoisting.
- (vi) Spin-type connections, where used, shall be maintained in a clean condition and protected from foreign matter that could affect their operation.
- (vii) Cage, skip, and load connections to the hoist rope shall be made so that the force of the hoist pull, vibration, misalignment, release of lift force, or impact will not disengage the connection. Moused or latched openthroat hooks do not meet this requirement.
- (viii) When using wire rope wedge sockets, means shall be provided to prevent wedge escapement and to ensure that the wedge is properly seated.

- (2) Additional requirements for cranes. Cranes shall be equipped with a limit switch to prevent overtravel at the boom tip. Limit switches are to be used only to limit travel of loads when operational controls malfunction and shall not be used as a substitute for other operational controls.
- (3) Additional requirements for hoists.
- (i) Hoists shall be designed so that the load hoist drum is powered in both directions of rotation, and so that brakes are automatically applied upon power release or failure.
  - (ii) Control levers shall be of the "deadman type" which return automatically to their center (neutral) position upon release.
  - (iii) When a hoist is used for both personnel hoisting and material hoisting, load and speed ratings for personnel and for materials shall be assigned to the equipment.
  - (iv) Material hoisting may be performed at speeds higher than the rated speed for personnel hoisting if the hoist and components have been designed for such higher speeds and if shaft conditions permit.
  - (v) Employees shall not ride on top of any cage, skip or bucket except when necessary to perform inspection or maintenance of the hoisting system, in which case they shall be protected by a body belt/harness system to prevent falling.
  - (vi) Personnel and materials (other than small tools and supplies secured in a manner that will not create a hazard to employees) shall not be hoisted together in the same conveyance. However, if the operator is protected from the shifting of materials, then the operator may ride with materials in cages or skips which are designed to be controlled by an operator within the cage or skip.
  - (vii) Line speed shall not exceed the design limitations of the systems.
  - (viii) Hoists shall be equipped with landing level indicators at the operator's station. Marking the hoist rope does not satisfy this requirement.
  - (ix) Whenever glazing is used in the hoist house, it shall be safety glass, or its equivalent, and be free of distortions and obstructions.
  - (x) A fire extinguisher that is rated at least 2A:10B:C (multi-purpose, dry chemical) shall be mounted in each hoist house.

- (xi) Hoist controls shall be arranged so that the operator can perform all operating cycle functions and reach the emergency power cutoff without having to reach beyond the operator's normal operating position.
- (xii) Hoists shall be equipped with limit switches to prevent overtravel at the top and bottom of the hoistway.
- (xiii) Limit switches are to be used only to limit travel of loads when operational controls malfunction and shall not be used as a substitute for other operational controls.
- (xiv) Hoist operators shall be provided with a closed-circuit voice communication system to each landing station, with speaker microphones so located that the operator can communicate with individual landing stations during hoist use.
- (xv) When sinking shafts 75 feet (22.86 m) or less in depth, cages, skips, and buckets that may swing, bump, or snag against shaft sides or other structural protrusions shall be guided by fenders, rails, ropes, or a combination of those means.
- (xvi) When sinking shafts more than 75 feet (22.86 m) in depth, all cages, skips, and buckets shall be rope or rail guided to within a rail length from the sinking operation.
- (xvii) Cages, skips, and buckets in all completed shafts, or in all shafts being used as completed shafts, shall be rope or rail-guided for the full length of their travel.
- (xviii) Wire rope used in load lines of material hoists shall be capable of supporting, without failure, at least five times the maximum intended load or the factor recommended by the rope manufacturer, whichever is greater. Refer to 1926.552(c)(14)(iii) of this part for design factors for wire rope used in personnel hoists. The design factor shall be calculated by dividing the breaking strength of wire rope, as reported in the manufacturer's rating tables, by the total static load, including the weight of the wire rope in the shaft when fully extended.
- (xix) A competent person shall visually check all hoisting machinery, equipment, anchorages, and hoisting rope at the beginning of each shift and during hoist use, as necessary.
- (xx) Each safety device shall be checked by a competent person at least weekly during hoist use to ensure suitable operation and safe condition.

- (xxi) In order to ensure suitable operation and safe condition of all functions and safety devices, each hoist assembly shall be inspected and load-tested to 100 percent of its rated capacity: at the time of installation; after any repairs or alterations affecting its structural integrity; after the operation of any safety device; and annually when in use. The employer shall prepare a certification record which includes the date each inspection and load-test was performed; the signature of the person who performed the inspection and test; and a serial number or other identifier for the hoist that was inspected and tested. The most recent certification record shall be maintained on file until completion of the project.
- (xxii) Before hoisting personnel or material, the operator shall perform a test run of any cage or skip whenever it has been out of service for one complete shift, and whenever the assembly or components have been repaired or adjusted.
- (xxiii) Unsafe conditions shall be corrected before using the equipment.
- (4) Additional requirements for personnel hoists.
- (i) Hoist drum systems shall be equipped with at least two means of stopping the load, each of which shall be capable of stopping and holding 150 percent of the hoist's rated line pull. A broken-rope safety, safety catch, or arrestment device is not a permissible means of stopping under this paragraph (t).
- (ii) The operator shall remain within sight and sound of the signals at the operator's station.
- (iii) All sides of personnel cages shall be enclosed by one-half inch (12.70 mm) wire mesh (not less than No. 14 gauge or equivalent) to a height of not less than 6 feet (1.83 m). However, when the cage or skip is being used as a work platform, its sides may be reduced in height to 42 inches (1.07 m) when the conveyance is not in motion.
- (iv) All personnel cages shall be provided with a positive locking door that does not open outward.
- (v) All personnel cages shall be provided with a protective canopy. The canopy shall be made of steel plate, at least 3/16-inch (4.763 mm) in thickness, or material of equivalent strength and impact resistance. The canopy shall be sloped to the outside, and so designed that a section may be readily pushed upward to afford emergency egress. The canopy shall cover the top in such a manner as to protect those inside from objects falling in the shaft.

- (vi) Personnel platforms operating on guide rails or guide ropes shall be equipped with broken-rope safety devices, safety catches or arrestment devices that will stop and hold 150 percent of the weight of the personnel platform and its maximum rated load.
- (vii) During sinking operations in shafts where guides and safeties are not yet used, the travel speed of the personnel platform shall not exceed 200 feet (60.96 m) per minute. Governor controls set for 200 feet (60.96 m) per minute shall be installed in the control system and shall be used during personnel hoisting.
- (viii) The personnel platform may travel over the controlled length of the hoistway at rated speeds up to 600 feet (182.88 m) per minute during sinking operations in shafts where guides and safeties are used.
- (ix) The personnel platform may travel at rated speeds greater than 600 feet (182.88 m) per minute in completed shafts.

(u) Definitions.

**Accept** – Any device, equipment, or appliance that is either approved by MSHA and maintained in permissible condition, or is listed or labeled for the class and location under Subpart K of this part.

**Rapid Excavation Machine** – Tunnel boring machines, shields, roadheaders, or any other similar excavation machine.

## 1926.801 Caissons

- (a) Wherever, in caisson work in which compressed air is used, and the working chamber is less than 11 feet in length, and when such caissons are at any time suspended or hung while work is in progress so that the bottom of the excavation is more than 9 feet below the deck of the working chamber, a shield shall be erected therein for the protection of the employees.

- (b) Shafts shall be subjected to a hydrostatic or air-pressure test, at which pressure they shall be tight. The shaft shall be stamped on the outside shell about 12 inches from each flange to show the pressure to which they have been subjected.
- (c) Whenever a shaft is used, it shall be provided, where space permits, with a safe, proper, and suitable staircase for its entire length, including landing platforms, not more than 20 feet apart. Where this is impracticable, suitable ladders shall be installed with landing platforms located about 20 feet apart to break the climb.
- (d) All caissons having a diameter or side greater than 10 feet shall be provided with a man lock and shaft for the exclusive use of employees.
- (e) In addition to the gauge in the locks, an accurate gauge shall be maintained on the outer and inner side of each bulkhead. These gauges shall be accessible at all times and kept in accurate working order.
- (f) In caisson operations where employees are exposed to compressed air working environments, the requirements contained in 1926.803 shall be complied with.

Stat. Auth.: ORS 654.025(2) and 656.726(3).

## 1926.802 Cofferdams

- (a) If overtopping of the cofferdam by high waters is possible, means shall be provided for controlled flooding of the work area.
- (b) Warning signals for evacuation of employees in case of emergency shall be developed and posted.
- (c) Cofferdam walkways, bridges, or ramps with at least two means of rapid exit shall be provided with guardrails as specified in Subpart M of this part.
- (d) Cofferdams located close to navigable shipping channels shall be protected from vessels in transit, where possible.

Stat. Auth.: ORS 654.025(2) and 656.726(3).

Hist: APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).

## 1926.803 Compressed Air

- (a) General provisions.

- (1) There shall be present, at all times, at least one competent person designated by and representing the employer, who shall be familiar with this subpart in all respects, and responsible for full compliance with these and other applicable subparts.
  - (2) Every employee shall be instructed in the rules and regulations which concern his safety or the safety of others.
- (b) Medical attendance, examination, and regulations.
- (1) There shall be retained one or more licensed physicians familiar with and experienced in the physical requirements and the medical aspects of compressed air work and the treatment of decompression illness. He shall be available at all times while work is in progress in order to provide medical supervision of employees employed in compressed air work. He shall himself be physically qualified and be willing to enter a pressurized environment.
  - (2) No employee shall be permitted to enter a compressed air environment until he has been examined by the physician and reported by him to be physically qualified to engage in such work.
  - (3) In the event an employee is absent from work for 10 days, or is absent due to sickness or injury, he shall not resume work until he is reexamined by the physician, and his physical condition reported, as provided in this paragraph, to be such as to permit him to work in compressed air.
  - (4) After an employee has been employed continuously in compressed air for a period designated by the physician, but not to exceed 1 year, he shall be reexamined by the physician to determine if he is still physically qualified to engage in compressed air work.
  - (5) Such physician shall at all times keep a complete and full record of examinations made by him. The physician shall also keep an accurate record of any decompression illness or other illness or injury incapacitating any employee for work, and of all loss of life that occurs in the operation of a tunnel, caisson, or other compartment in which compressed air is used.
  - (6) Records shall be available for the inspection of the Secretary or his representatives, and a copy thereof shall be forwarded to OSHA within 48 hours following the occurrence of the accident, death, injury, or decompression illness. It shall state as fully as possible the cause of said death or decompression illness, and the place where the injured or sick employee was taken, and such other relative information as may be required by the Secretary.

- (7) A fully equipped first aid station shall be provided at each tunnel project regardless of the number of persons employed. An ambulance or transportation suitable for a litter case shall be at each project.
- (8) Where tunnels are being excavated from portals more than 5 road miles apart, a first aid station and transportation facilities shall be provided at each portal.
- (9) A medical lock shall be established and maintained in immediate working order whenever air pressure in the working chamber is increased above the normal atmosphere.
- (10) The medical lock shall:
  - (i) Have at least 6 feet of clear headroom at the center, and be subdivided into not less than two compartments;
  - (ii) Be readily accessible to employees working under compressed air;
  - (iii) Be kept ready for immediate use for at least 5 hours subsequent to the emergence of any employee from the working chamber;
  - (iv) Be properly heated, lighted and ventilated;
  - (v) Be maintained in a sanitary condition;
  - (vi) Have a nonshatterable port through which the occupant(s) may be kept under constant observation;
  - (vii) Be designed for a working pressure of 75 p.s.i.g.
  - (viii) Be equipped with internal controls which may be overridden by external controls;
  - (ix) Be provided with air pressure gauges to show the air pressure within each compartment to observers inside and outside the medical lock.
  - (x) Be equipped with a manual type sprinkler system that can be activated inside the lock or by the outside lock tender.
  - (xi) Be provided with oxygen lines and fittings leading into external tanks. The lines shall be fitted with check valves to prevent reverse flow. The oxygen system inside the chamber shall be of a closed circuit design and be so designed as to automatically shut off the oxygen supply whenever the fire system is activated.

(xii) Be in constant charge of an attendant under the direct control of the retained physician. The attendant shall be trained in the use of the lock and suitably instructed regarding steps to be taken in the treatment of employee exhibiting symptoms compatible with a diagnosis of decompression illness;

(xiii) Be adjacent to an adequate emergency medical facility;

(xiv) The medical facility shall be equipped with demand-type oxygen inhalation equipment approved by the U.S. Bureau of Mines;

(xv) Be capable of being maintained at a temperature, in use, not to exceed 90° F. nor be less than 70° F.; and

(xvi) Be provided with sources of air, free of oil and carbon monoxide, for normal and emergency use, which are capable of raising the air pressure in the lock from 0 to 75 p.s.i.g. in 5 minutes.

(11) Identification badges shall be furnished to all employees, indicating that the wearer is a compressed air worker. A permanent record shall be kept of all identification badges issued. The badge shall give the employee's name, address of the medical lock, the telephone number of the licensed physician for the compressed air project, and contain instructions that in case of emergency of unknown or doubtful cause or illness, the wearer shall be rushed to the medical lock. The badge shall be worn at all times-off the job, as well as on the job.

(c) Telephone and signal communication.

(1) Effective and reliable means of communication, such as bells, whistles, or telephones, shall be maintained, at all times between all the following locations:

(i) The working chamber face;

(ii) The working chamber side of the man lock near the door;

(iii) The interior of the man lock;

(iv) Lock attendant's station;

(v) The compressor plant;

(vi) The first-aid station;

(vii) The emergency lock (if one is required); and

(viii) The special decompression chamber (if one is required).

(d) Signs and records.

(1) The time of decompression shall be posted in each man lock as follows:

---

**Time of Decompression for this Lock**

\_\_\_\_\_ pounds to \_\_\_\_\_ pounds in \_\_\_\_\_ minutes.

\_\_\_\_\_ pounds to \_\_\_\_\_ pounds in \_\_\_\_\_ minutes.

(Signed by).....(Superintendent)

---

This form shall be posted in the Man Lock at all times.

- (2) Any code of signals used shall be conspicuously posted near workplace entrances and such other locations as may be necessary to bring them to the attention of all employees concerned.
- (3) For each 8-hour shift, a record of employees employed under air pressure shall be kept by an employee who shall remain outside the lock near the entrance. This record shall show the period each employee spends in the air chamber and the time taken from decompression. A copy shall be submitted to the appointed physician after each shift.

(e) Compression.

- (1) Every employee going under air pressure for the first time shall be instructed on how to avoid excessive discomfort.
- (2) During the compression of employees, the pressure shall not be increased to more than 3 p.s.i.g. within the first minute. The pressure shall be held at 3 p.s.i.g. and again at 7 p.s.i.g. sufficiently long to determine if any employees are experiencing discomfort.
- (3) After the first minute the pressure shall be raised uniformly and at a rate not to exceed 10 p.s.i. per minute.
- (4) If any employee complains of discomfort, the pressure shall be held to determine if the symptoms are relieved. If, after 5 minutes the discomfort does not disappear, the lock attendant shall gradually reduce the pressure until the employee signals that the discomfort has ceased. If he does not indicate that the discomfort has disappeared, the lock attendant shall reduce the pressure to atmospheric and the employee shall be released from the lock.

(5) No employee shall be subjected to pressure exceeding 50 pounds per square inch except in emergency.

(f) Decompression.

- (1) Decompression to normal condition shall be in accordance with the Decompression Tables in Appendix A of this subpart.
- (2) In the event it is necessary for an employee to be in compressed air more than once in a 24-hour period, the appointed physician shall be responsible for the establishment of methods and procedures of decompression applicable to repetitive exposures.
- (3) If decanting is necessary, the appointed physician shall establish procedures before any employee is permitted to be decompressed by decanting methods. The period of time that the employees spend at atmospheric pressure between the decompression following the shift and recompression shall not exceed 5 minutes.

(g) Man locks and special decompression chambers.

(1) Man locks.

- (i) Except in emergency, no employees employed in compressed air shall be permitted to pass from the working chamber to atmospheric pressure until after decompression, in accordance with the procedures in this subpart.
- (ii) The lock attendant in charge of a man lock shall be under the direct supervision of the appointed physician. He shall be stationed at the lock controls on the free air side during the period of compression and decompression and shall remain at the lock control station whenever there are men in the working chamber or in the man lock.
- (iii) Except where air pressure in the working chamber is below 12 p.s.i.g., each man lock shall be equipped with automatic controls which, through taped programs, cams, or similar apparatus, shall automatically regulate decompressions. It shall also be equipped with manual controls to permit the lock attendant to override the automatic mechanism in the event of an emergency, as provided in paragraph (g)(1)(viii) of this section.
- (iv) A manual control, which can be used in the event of an emergency, shall be placed inside the man lock.

- (v) A clock, thermometer, and continuous recording pressure gauge with a 4-hour graph shall be installed outside of each man lock and shall be changed prior to each shift's decompression. The chart shall be of sufficient size to register a legible record of variations in pressure within the man lock and shall be visible to the lock attendant. A copy of each graph shall be submitted to the appointed physician after each shift. In addition, a pressure gauge, clock, and thermometer shall also be installed in each man lock. Additional fittings shall be provided so that test gauges may be attached whenever necessary.
- (vi) Except where air pressure is below 12 p.s.i.g. and there is no danger of rapid flooding, all caissons having a working area greater than 150 square feet, and each bulkhead in tunnels of 14 feet or more in diameter, or equivalent area, shall have at least two locks in perfect working condition, one of which shall be used exclusively as a man lock, the other, as a materials lock.
- (vii) Where only a combination man-and-materials lock is required, this single lock shall be of sufficient capacity to hold the employees constituting two successive shifts.
- (viii) Emergency locks shall be large enough to hold an entire heading shift and a limit maintained of 12 p.s.i.g. There shall be a chamber available for oxygen decompression therapy to 28 p.s.i.g.
- (ix) The man lock shall be large enough so that those using it are not compelled to be in a cramped position, and shall not have less than 5 feet clear head room at the center and a minimum of 30 cubic feet of air space per occupant.
- (x) Locks on caissons shall be so located that the bottom door shall be not less than 3 feet above the water level surrounding the caisson on the outside. (The water level, where it is affected by tides, is construed to mean high tide.)
- (xi) In addition to the pressure gauge in the locks, an accurate pressure gauge shall be maintained on the outer and inner side of each bulkhead. These gauges shall be accessible at all times and shall be kept in accurate working order.
- (xii) Man locks shall have an observation port at least 4 inches in diameter located in such a position that all occupants of the man lock may be observed from the working chamber and from the free air side of the lock.

- (xiii) Adequate ventilation in the lock shall be provided.
  - (xiv) Man locks shall be maintained at a minimum temperature of 70° F.
  - (xv) When locks are not in use and employees are in the working chamber, lock doors shall be kept open to the working chamber, where practicable.
  - (xvi) Provision shall be made to allow for rescue parties to enter the tunnel if the working force is disabled.
  - (xvii) A special decompression chamber of sufficient size to accommodate the entire force of employees being decompressed at the end of a shift shall be provided whenever the regularly established working period requires a total time of decompression exceeding 75 minutes.
- (2) Special decompression chamber.
- (i) The headroom in the special decompression chamber shall be not less than a minimum 7 feet and the cubical content shall provide at least 50 cubic feet of airspace for each employee. For each occupant, there shall be provided 4 square feet of free walking area and 3 square feet of seating space, exclusive of area required for lavatory and toilet facilities. The rated capacity shall be based on the stated minimum space per employee and shall be posted at the chamber entrance. The posted capacity shall not be exceeded, except in case of emergency.
  - (ii) Each special decompression chamber shall be equipped with the following:
    - (A) A clock or clocks suitably placed so that the attendant and the chamber occupants can readily ascertain the time;
    - (B) Pressure gauges which will indicate to the attendants and to the chamber occupants the pressure in the chamber;
    - (C) Valves to enable the attendant to control the supply and discharge of compressed air into and from the chamber;
    - (D) Valves and pipes, in connection with the air supply and exhaust, arranged so that the chamber pressure can be controlled from within and without;
    - (E) Effective means of oral inter-communication between the attendant, occupants of the chamber, and the air compressor plant; and
    - (F) An observation port at the entrance to permit observation of the chamber occupants.

- (iii) Seating facilities in special decompression chambers shall be so arranged as to permit a normal sitting posture without cramping. Seating space, not less than 18 inches by 24 inches wide, shall be provided per occupant.
  - (iv) Adequate toilet and washing facilities, in a screened or enclosed recess, shall be provided. Toilet bowls shall have a built-in protector on the rim so that an air space is created when the seat lid is closed.
  - (v) Fresh and pure drinking water shall be available. This may be accomplished by either piping water into the special decompression chamber and providing drinking fountains, or by providing individual canteens, or by some other sanitary means. Community drinking vessels are prohibited.
  - (vi) No refuse or discarded material of any kind shall be permitted to accumulate, and the chamber shall be kept clean.
  - (vii) Unless the special decompression chamber is serving as the man lock to atmospheric pressure, the special decompression chamber shall be situated, where practicable, adjacent to the man lock on the atmospheric pressure side of the bulkhead. A passageway shall be provided, connecting the special chamber with the man lock, to permit employees in the process of decompression to move from the man lock to the special chamber without a reduction in the ambient pressure from that designated for the next stage of decompression. The passageway shall be so arranged as to not interfere with the normal operation of the man lock, nor with the release of the occupants of the special chamber to atmospheric pressure upon the completion of the decompression procedure.
- (h) Compressor plant and air supply.
- (1) At all times there shall be a thoroughly experienced, competent, and reliable person on duty at the air control valves as a gauge tender who shall regulate the pressure in the working areas. During tunneling operations, one gauge tender may regulate the pressure in not more than two headings: Provided, That the gauge and controls are all in one location. In caisson work, there shall be a gauge tender for each caisson.
  - (2) The low air compressor plant shall be of sufficient capacity to not only permit the work to be done safely, but shall also provide a margin to meet emergencies and repairs.

- (3) Low air compressor units shall have at least two independent and separate sources of power supply and each shall be capable of operating the entire low air plant and its accessory systems.
  - (4) The capacity, arrangement, and number of compressors shall be sufficient to maintain the necessary pressure without overloading the equipment and to assure maintenance of such pressure in the working chamber during periods of breakdown, repair, or emergency.
  - (5) Switching from one independent source of power supply to the other shall be done periodically to ensure the workability of the apparatus in an emergency.
  - (6) Duplicate low-pressure air feedlines and regulating valves shall be provided between the source of air supply and a point beyond the locks with one of the lines extending to within 100 feet of the working face.
  - (7) All high- and low-pressure air supply lines shall be equipped with check valves.
  - (8) Low-pressure air shall be regulated automatically. In addition, manually operated valves shall be provided for emergency conditions.
  - (9) The air intakes for all air compressors shall be located at a place where fumes, exhaust, gases, and other air contaminants will be at a minimum.
  - (10) Gauges indicating the pressure in the working chamber shall be installed in the compressor building, the lock attendant's station, and at the employer's field office.
- (i) Ventilation and air quality.
- (1) Exhaust valves and exhaust pipes shall be provided and operated so that the working chamber shall be well ventilated, and there shall be no pockets of dead air. Outlets may be required at intermediate points along the main low-pressure air supply line to the heading to eliminate such pockets of dead air. Ventilating air shall be not less than 30 cubic feet per minute.
  - (2) The air in the workplace shall be analyzed by the employer not less than once each shift, and records of such tests shall be kept on file at the place where the work is in progress. The test results shall be within the threshold limit values specified in Subpart D of this part, for hazardous gases, and within 10 percent of the lower explosive limit of flammable gases. If these limits are not met, immediate action to correct the situation shall be taken by the employer.

- (3) The temperature of all working chambers which are subjected to air pressure shall, by means of after-coolers or other suitable devices, be maintained at a temperature not to exceed 85° F.
- (4) Forced ventilation shall be provided during decompression. During the entire decompression period, forced ventilation through chemical or mechanical air purifying devices that will ensure a source of fresh air shall be provided.
- (5) Whenever heat-producing machines (moles, shields) are used in compressed air tunnel operations, a positive means of removing the heat build-up at the heading shall be provided.

(j) Electricity.

- (1) All lighting in compressed-air chambers shall be by electricity exclusively, and two independent electric-lighting systems with independent sources of supply shall be used. The emergency source shall be arranged to become automatically operative in the event of failure of the regularly used source.
- (2) The minimum intensity of light on any walkway, ladder, stairway, or working level shall be not less than 10 foot-candles, and in all workplaces the lighting shall at all times be such as to enable employees to see clearly.
- (3) All electrical equipment and wiring for light and power circuits shall comply with the requirements of Subpart K of this part for use in damp, hazardous, high temperature, and compressed air environments.
- (4) External parts of lighting fixtures and all other electrical equipment, when within 8 feet of the floor, shall be constructed of noncombustible, non-absorptive, insulating materials, except that metal may be used if it is effectively grounded.
- (5) Portable lamps shall be equipped with non-combustible, nonabsorptive, insulating sockets, approved handles, basket guards, and approved cords.
- (6) The use of worn or defective portable and pendant conductors is prohibited.

(k) Sanitation.

- (1) Sanitary, heated, lighted, and ventilated dressing rooms and drying rooms shall be provided for all employees engaged in compressed air work. Such rooms shall contain suitable benches and lockers. Bathing accommodations (showers at the ratio of one to 10 employees per shift), equipped with running hot and cold water, and suitable and adequate toilet accommodations, shall be provided. One toilet for each 15 employees, or fractional part thereof, shall be provided.

- (2) When the toilet bowl is shut by a cover, there should be an air space so that the bowl or bucket does not implode when pressure is increased.
  - (3) All parts of caissons and other working compartments shall be kept in a sanitary condition.
- (l) Fire prevention and protection.
- (1) Firefighting equipment shall be available at all times and shall be maintained in working condition.
  - (2) While welding or flame-cutting is being done in compressed air, a firewatch with a fire hose or approved extinguisher shall stand by until such operation is completed.
  - (3) Shafts and caissons containing flammable material of any kind, either above or below ground, shall be provided with a waterline and a fire hose connected thereto, so arranged that all points of the shaft or caisson are within reach of the hose stream.
  - (4) Fire hose shall be at least 1-1/2 inches in nominal diameter; the water pressure shall at all times be adequate for efficient operation of the type of nozzle used; and the water supply shall be such as to ensure an uninterrupted flow. Fire hose, when not in use, shall be located or guarded to prevent injury thereto.
  - (5) The power house, compressor house, and all buildings housing ventilating equipment, shall be provided with at least one hose connection in the water line, with a fire hose connected thereto. A fire hose shall be maintained within reach of structures of wood over or near shafts.
  - (6) Tunnels shall be provided with a 2-inch minimum diameter water line extending into the working chamber and to within 100 feet of the working face. Such line shall have hose outlets with 100 feet of fire hose attached and maintained as follows: One at the working face; one immediately inside of the bulkhead of the working chamber; and one immediately outside such bulkhead. In addition, hose outlets shall be provided at 200 foot intervals throughout the length of the tunnel, and 100 feet of fire hose shall be attached to the outlet nearest to any location where flammable material is being kept or stored or where any flame is being used.

- (7) In addition to fire hose protection required by this subpart, on every floor of every building not under compressed air, but used in connection with the compressed air work, there shall be provided at least one approved fire extinguisher of the proper type for the hazard involved. At least two approved fire extinguishers shall be provided in the working chamber as follows: One at the working face and one immediately inside the bulkhead (pressure side). Extinguishers in the working chamber shall use water as the primary extinguishing agent and shall not use any extinguishing agent which could be harmful to the employees in the working chamber. The fire extinguisher shall be protected from damage.
  - (8) Highly combustible materials shall not be used or stored in the working chamber. Wood, paper, and similar combustible material shall not be used in the working chamber in quantities which could cause a fire hazard. The compressor building shall be constructed of non-combustible material.
  - (9) Man locks shall be equipped with a manual type fire extinguisher system that can be activated inside the man lock and also by the outside lock attendant. In addition, a fire hose and portable fire extinguisher shall be provided inside and outside the man lock. The portable fire extinguisher shall be the dry chemical type.
  - (10) Equipment, fixtures, and furniture in man locks and special decompression chambers shall be constructed of noncombustible materials. Bedding, etc., shall be chemically treated so as to be fire resistant.
  - (11) Head frames shall be constructed of structural steel or open frame-work fireproofed timber. Head houses and other temporary surface buildings or structures within 100 feet of the shaft, caisson, or tunnel opening shall be built of fire-resistant materials.
  - (12) No oil, gasoline, or other combustible material shall be stored within 100 feet of any shaft, caisson, or tunnel opening, except that oils may be stored in suitable tanks in isolated fireproof buildings, provided such buildings are not less than 50 feet from any shaft, caisson, or tunnel opening, or any building directly connected thereto.
  - (13) Positive means shall be taken to prevent leaking flammable liquids from flowing into the areas specifically mentioned in the preceding paragraph.
  - (14) All explosives used in connection with compressed air work shall be selected, stored, transported, and used as specified in Subpart U of this part.
- (m) Bulkheads and safety screens.

- (1) Intermediate bulkheads with locks, or intermediate safety screens or both, are required where there is the danger of rapid flooding.
- (2) In tunnels 16 feet or more in diameter, hanging walkways shall be provided from the face to the man lock as high in the tunnel as practicable, with at least 6 feet of head room. Walkways shall be constructed of noncombustible material. Standard railings shall be securely installed throughout the length of all walkways on open sides in accordance with Subpart M of this part. Where walkways are ramped under safety screens, the walkway surface shall be skidproofed by cleats or by equivalent means.
- (3) Bulkheads used to contain compressed air shall be tested, where practicable, to prove their ability to resist the highest air pressure which may be expected to be used.

### 1926.804 Definitions Applicable to this Subdivision

- (a) **Bulkhead** – An airtight structure separating the working chamber from free air or from another chamber under a lesser pressure than the working pressure.
- (b) **Caisson** – A wood, steel, concrete or reinforced concrete, air- and water-tight chamber in which it is possible for men to work under air pressure greater than atmospheric pressure to excavate material below water level.
- (c) **Decanting** – A method used for decompressing under emergency circumstances. In this procedure, the employees are brought to atmospheric pressure with a very high gas tension in the tissues and then immediately recompressed in a second and separate chamber or lock.
- (d) **Emergency locks** – A lock designed to hold and permit the quick passage of an entire shift of employees.
- (e) **High air** – Air pressure used to supply power to pneumatic tools and devices.
- (f) **Low air** – Air supplied to pressurize working chambers and locks.
- (g) **Man lock** – A chamber through which men pass from one air pressure environment into another.
- (h) **Materials lock** – A chamber through which materials and equipment pass from one air pressure environment into another.

- (i) **Medical lock** – A special chamber in which employees are treated for decompression illness. It may also be used in preemployment physical examinations to determine the adaptability of the prospective employee to changes in pressure.
- (j) **Normal condition** – One during which exposure to compressed air is limited to a single continuous working period followed by a single decompression in any given 24-hour period; the total time of exposure to compressed air during the single continuous working period is not interrupted by exposure to normal atmospheric pressure, and a second exposure to compressed air does not occur until at least 12 consecutive hours of exposure to normal atmospheric pressure has elapsed since the employee has been under pressure.
- (k) **Pressure** – A force acting on a unit area. Usually shown as pounds per square inch (p.s.i.).
- (l) **Absolute pressure (p.s.i.a.)** – The sum of the atmospheric pressure and gauge pressure (p.s.i.g.).
- (m) **Atmospheric pressure** – The pressure of air at sea level, usually 14.7 p.s.i.a. (1 atmosphere), or 0 p.s.i.g.
- (n) **Gauge pressure (p.s.i.g.)** – Pressure measured by a gauge and indicating the pressure exceeding atmospheric.
- (o) **Safety screen** – An air- and water-tight diaphragm placed across the upper part of a compressed air tunnel between the face and bulkhead, in order to prevent flooding the crown of the tunnel between the safety screen and the bulkhead, thus providing a safe means of refuge and exit from a flooding or flooded tunnel.
- (p) **Special decompression chamber** – A chamber to provide greater comfort of employees when the total decompression time exceeds 75 minutes.
- (q) **Working chamber** – The space or compartment under air pressure in which the work is being done.

Stat. Auth.: ORS 654.025(2) and 656.726(3).  
Hist: APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89.

## Appendix A to Subpart S – Decompression Tables

1. Explanation. The decompression tables are computed for working chamber pressures from 0 to 14 pounds, and from 14 to 50 pounds per square inch gauge inclusive by 2 pound increments and for exposure times for each pressure extending from one-half to over 8 hours inclusive. Decompressions will be conducted by two or more stages with a maximum of four stages, the latter for a working chamber pressure of 40 pounds per square inch gauge or over.

Stage 1 consists of a reduction in ambient pressure ranging from 10 to a maximum of 16 pounds per square inch, but in no instance will the pressure be reduced below 4 pounds at the end of stage 1. This reduction in pressure in stage 1 will always take place at a rate not greater than 5 pounds per minute.

Further reduction in pressure will take place during stage 2 and subsequent stages as required at a slower rate, but in no event at a rate greater than 1 pound per minute.

Decompression Table No. 1 indicates in the body of the table the total decompression time in minutes for various combinations of working chamber pressure and exposure time.

Decompression Table No. 2 indicates for the same various combinations of working chamber pressure and exposure time the following:

- a. The number of stages required;
- b. The reduction in pressure and the terminal pressure for each required stage;
- c. The time in minutes through which the reduction in pressure is accomplished for each required stage;
- d. The pressure reduction rate in minutes per pound for each required stage;

**Important Note:** The Pressure Reduction in Each Stage is Accomplished at a Uniform Rate. Do Not Interpolate Between Values Shown on the Tables. Use the Next Higher Value of Working Chamber Pressure or Exposure Time Should the Actual Working Chamber Pressure or the Actual Exposure Time, Respectively, Fall Between Those for Which Calculated Values Are Shown in the Body of the Tables.

<b>Examples</b>	<b>Minutes</b>
Example No. 1: 4 hours working period at 20 pounds gauge.	
Decompression Table No. 1: 20 pounds for 4 hours, total decompression time	43
Decompression Table No. 2:	
Stage 1: Reduce pressure from 20 pounds to 4 pounds at the uniform rate of 5 pounds per minute.	
Elapsed time stage 1: 16/5	3
Stage 2 (final stage): Reduce pressure at a uniform rate from 4 pounds to 0-pound gage over a period of 40 minutes.	
Rate—0.10 pound per minute or 10 minutes per pound.	
Stage 2 (final) elapsed time	40
Total time	43
Example No. 2: 5-hour working period at 24 pounds gage.	
Decompression Table No. 1: 24 pounds for 5 hours, total decompression time	117
Decompression Table No. 2:	
Stage 1: Reduce pressure from 24 pounds to 8 pounds at the uniform rate of 5 pounds per minute.	
Elapsed time stage 1: 16/5	3
Stage 2: Reduce pressure at a uniform rate from 8 pounds to 4 pounds over a period of 4 minutes.	
Rate, 1 pound per minute	
Elapsed time, stage 2	4
Transfer men to special decompression chamber maintaining the 4-pound pressure during the transfer operation.	
Stage 3 (final stage): In the special decompression chamber, reduce the pressure at a uniform rate from 4 pounds to 0-pound gage over a period of 110 minutes.	
Rate, 0.037 pound per minute or 27.5 minutes per pound.	
Stage 3 (final) elapsed time	110
Total time	117

Hist: APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89.

## Historical Notes for Subdivision S

**Note:** The Accident Prevention Division adopted Division 3, Construction on a temporary basis effective May 1, 1989. It contained new and revised federal occupational safety and health rules for the Construction industry. APD is now announcing that these same rules have been duly filed for permanent adoption. Division 3, Construction replaced Oregon codes Division 83 and 84. Some individual rules from each of these divisions have been retained and adopted into the new Division 3 as Oregon initiated rules.

This is Oregon OSHA Administrative Order 8-1989, filed and effective July 7, 1989.

**Note:** This rulemaking is because the federal occupational safety and health administration recently adopted new rules for underground construction, including tunneling. The state is required to provide equivalent protection for Oregon workers. The new federal rules clarify the 17-year old standard and cover hazards not effectively addressed previously. The rules incorporate current technology and methods used in underground construction, and are expected to significantly reduce the accident rate resulting from workers unknowingly following unsafe or improper work procedures.

This is Oregon OSHA Administrative Order 15-1989, filed and effective September 13, 1989.

**Note:** Federal OSHA published in the Federal Register the new respiratory protection standard. The new standard replaces respiratory protection standards that were adopted in 1971 by OSHA. The new respiratory protection text is in general industry, 29 CFR 1910.134. The text previously in 1910.134 has been re-designated as 1910.139, Respiratory Protection for M. Tuberculosis. Four subdivisions in the Construction standard have also been amended. This new standard requires employers to establish or maintain a respiratory protection program to protect workers that wear respirators. Other provisions include requirements for program administration, work site-specific procedures, respirator selection, employee training, fit testing, medical evaluation, respirator use, and respirator cleaning, maintenance, and repair. Addressed for the first time are atmospheres that are Immediately Dangerous to Life or Health, including interior structural firefighting. The standard also simplifies and updates previous respiratory protection requirements.

This is Oregon OSHA Administrative Order 3-1998, filed and effective July 7, 1998.

**Note:** Oregon OSHA adopted federal OSHA changes as they appear in the April 3, 2006 Federal Register. These revisions include updating references and removing obsolete effective dates and startup dates from existing rules in General Industry, Construction, and Maritime Activities. Two changes federal OSHA made that we do not include in this rulemaking are to remove effective dates in 1910.266 and 1926.1092, neither of which Oregon OSHA had adopted before.

This is Oregon OSHA Administrative Order 4-2006, filed and effective July 24, 2006.

**Note:** This rulemaking is to keep Oregon OSHA in harmony with recent changes to federal OSHA's standards. Oregon OSHA adopted most of the federal OSHA changes as they appeared in the August 9, 2010 federal register. These changes revise the construction industry crane and derrick rules found in Subpart CC. 1926.600 was amended by revising paragraph (a)(6). Oregon OSHA is not adopting 1926.600(a)(6)(i), (a)(6)(ii), and (a)(6)(v), but adopted new rule OAR 437-003-3600 Equipment, to replace federal OSHA language of "crane" with "equipment" in the three paragraphs.

This is Oregon OSHA Administrative Order 1-2011, filed and effective February 9, 2011.

**Note:** This rulemaking is to keep Oregon OSHA in harmony with recent changes to federal OSHA's standards. Oregon OSHA amended 1926.800, Underground Construction, in Division 3/S, 1926.856, Removal of walls, floors, and material with equipment, in Division 3/T, and 1926.858, Removal of steel construction, also in Division 3/T, with changes as published in the April 23, 2013 Federal Register. With this rulemaking, federal OSHA has clarified text in the demolition standard and applies the cranes and derricks standard to underground construction work and demolition work. Oregon OSHA repealed 437-003-0080 Wind Velocity Device. We inadvertently left this rule in the former Division 3/DD. Subdivision 3/DD was removed in Oregon earlier this year with rulemaking from the August 17, 2012 Federal Register. The substance of 437-003-0080 is addressed now in Cranes and Derricks in Construction, Subdivision 3/CC.

This is Oregon OSHA Administrative Order 6-2013, filed and effective October 9, 2013.

**Note:** Oregon OSHA is adopting changes to their administrative (recordkeeping), general industry, and construction standards, and updating references in the maritime activity standards in response to federal OSHA's adoption of final rules published in the May 14, 2019 Federal Register. This is Phase IV of federal OSHA's Standards Improvement Project (SIP-IV), the fourth in a series of rulemakings to improve and streamline workplace safety and health standards. Oregon's response removes or revises rules or requirements within our corresponding rules that are outdated, duplicative, or inconsistent. This rulemaking is anticipated to reduce regulatory burden and compliance costs while maintaining or enhancing worker safety and health as well as worker privacy protections.

In Division 3S, Oregon OSHA adopted updates to references about diesel engines in underground construction.

This is Oregon OSHA Administrative Order 3-2019, filed and effective October 29, 2019.

CONSTRUCTION**

**CONSTRUCTION**

**Subdivision T  
Demolition**

Oregon Occupational Safety and Health Division (Oregon OSHA)  
Department of Consumer and Business Services  
Salem, Oregon 97301-3882

AO 6-2013

The Oregon Department of Consumer and Business Services adopted these rules pursuant to ORS 654.025(2).

The Secretary of State Designated OAR Chapter 437 as the “Oregon Occupational Safety and Health Code.” Six general subject areas within this code are designated as “Divisions.”

- **Division 1** General Administrative Rules
- **Division 2** General Occupational Safety and Health Rules
- **Division 3** Construction
- **Division 4** Agriculture
- **Division 5** Maritime Activities
- **Division 7** Forest Activities
- **Oregon Revised Statutes (ORS) 654** The Oregon Safe Employment Act (OSEAct)

Oregon-initiated rules in this division of the Oregon Occupational Safety and Health Code are numbered in a uniform system developed by the Secretary of State. This system does not number the rules in sequence (001, 002, 003, etc.). Omitted numbers may be assigned to new rules at the time of their adoption.

**Oregon-initiated rules** are arranged in the following Basic Codification Structure adopted by the Secretary of State for Oregon Administrative Rules (OAR):

Chapter	Division	Rule	Section	Subsection	Paragraphs
437	003	1760	(1)	(a)	(A)(i)(I)

The majority of Oregon OSHA codes are adopted by reference from the Code of Federal Regulations (CFR), and are arranged in the following basic federal numbering system:

Chapter	Division	Part	Subpart (Subdivision)	Section	Paragraphs
437	003	1926	M	.502	(a)

The terms “subdivision” and “subpart” are synonymous within OAR 437, Oregon Occupational Safety and Health Code.

---

To obtain an order form or copies of these codes, address:

**Department of Consumer & Business Services  
Oregon Occupational Safety & Health Division (Oregon OSHA)  
350 Winter St. NE, Room 430  
Salem, OR 97301-3882**

Or call the Oregon OSHA Resource Library at 503-378-3272

The rules referenced in this division are available for viewing in the Office of the Secretary of State, Administrative Rules and Office Document Section, Oregon State Archives Building, Salem, Oregon 97310, or the Central Office, Oregon Occupational Safety and Health Division of the Department of Consumer and Business Services, Room 430, 350 Winter St. NE Salem, OR 97301-3882. ## SUBDIVISION T

### DEMOLITION

**Authority:** 40 U.S.C. 3701; 29 U.S.C. 653, 655, 657; and Secretary of Labor's Orders 12-71 (36 FR 8754), 8-76 (41 FR 25059), 9-83(48 FR 35736), 1-90 (55 FR 9033), 6-96 (62FR 111), 5-2007 (72 FR 31159), or 1-2012 (77FR 3912), as applicable.

[75 FR 48135, Aug. 9, 2010; 77 FR 49730, Aug. 17, 2012; 78 FR 23843, April 23, 2013]

#### **§1926.850 Preparatory Operations.**

(a) Prior to permitting employees to start demolition operations, an engineering survey shall be made, by a competent person, of the structure to determine the condition of the framing, floors, and walls, and possibility of unplanned collapse of any portion of the structure. Any adjacent structure where employees may be exposed shall also be similarly checked. The employer shall have in writing evidence that such a survey has been performed.

(b) When employees are required to work within a structure to be demolished which has been damaged by fire, flood, explosion, or other cause, the walls or floor shall be shored or braced.

(c) All electric, gas, water, steam, sewer, and other service lines shall be shut off, capped, or otherwise controlled, outside the building line before demolition work is started. In each case, any utility company which is involved shall be notified in advance.

(d) If it is necessary to maintain any power, water or other utilities during demolition, such lines shall be temporarily relocated, as necessary, and protected.

(e) It shall also be determined if any type of hazardous chemicals, gases, explosives, flammable materials, or similarly dangerous substances have been used in any pipes, tanks, or other equipment on the property. When the presence of any such substances is apparent or suspected, testing and purging shall be performed and the hazard eliminated before demolition is started.

(f) Where a hazard exists from fragmentation of glass, such hazards shall be removed.

(g) Where a hazard exists to employees falling through wall openings, the opening shall be protected to a height of approximately 42 inches.

(h) When debris is dropped through holes in the floor without the use of chutes, the area onto which the material is dropped shall be completely enclosed with barricades not less than 42 inches high and not less than 6 feet back from the projected edge of the opening above. Signs, warning of the hazard of falling materials, shall be posted at each level. Removal shall not be permitted in this lower area until debris handling ceases above.

# **T PREPARATORY OPERATIONS/ STAIRS, PASSAGEWAYS, AND LADDERS**

---

(i) All floor openings, not used as material drops, shall be covered over with material substantial enough to support the weight of any load which may be imposed. Such material shall be properly secured to prevent its accidental movement.

(j) Except for the cutting of holes in floors for chutes, holes through which to drop materials, preparation of storage space, and similar necessary preparatory work, the demolition of exterior walls and floor construction shall begin at the top of the structure and proceed downward. Each story of exterior wall and floor construction shall be removed and dropped into the storage space before commencing the removal of exterior walls and floors in the story next below.

(k) Employee entrances to multistory structures being demolished shall be completely protected by sidewalk sheds or canopies, or both, providing protection from the face of the building for a minimum of 8 feet. All such canopies shall be at least 2 feet wider than the building entrances or openings (1 foot wider on each side thereof), and shall be capable of sustaining a load of 150 pounds per square foot.

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

## **§1926.851 Stairs, Passageways, and Ladders.**

(a) Only those stairways, passageways, and ladders, designated as means of access to the structure of a building, shall be used. Other access ways shall be entirely closed at all times.

(b) All stairs, passageways, ladders and incidental equipment thereto, which are covered by this section, shall be periodically inspected and maintained in a clean safe condition.

(c) In a multistory building, when a stairwell is being used, it shall be properly illuminated by either natural or artificial means, and completely and substantially covered over at a point not less than two floors below the floor on which work is being performed, and access to the floor where the work is in progress shall be through a properly lighted, protected, and separate passageway.

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

# CHUTES / REMOVAL OF MATERIALS THROUGH FLOOR OPENINGS

T

## §1926.852 Chutes.

(a) No material shall be dropped to any point lying outside the exterior walls of the structure unless the area is effectively protected.

(b) All materials chutes, or sections thereof, at an angle of more than 45° from the horizontal, shall be entirely enclosed, except for openings equipped with closures at or about floor level for the insertion of materials. The openings shall not exceed 48 inches in height measured along the wall of the chute. At all stories below the top floor, such openings shall be kept closed when not in use.

(c) A substantial gate shall be installed in each chute at or near the discharge end. A competent employee shall be assigned to control the operation of the gate, and the backing and loading of trucks.

(d) When operations are not in progress, the area surrounding the discharge end of a chute shall be securely closed off.

(e) Any chute opening, into which workmen dump debris, shall be protected by a substantial guardrail approximately 42 inches above the floor or other surface on which the men stand to dump the material. Any space between the chute and the edge of openings in the floors through which it passes shall be solidly covered over.

(f) Where the material is dumped from mechanical equipment or wheelbarrows, a securely attached toeboard or bumper, not less than 4 inches thick and 6 inches high, shall be provided at each chute opening.

(g) Chutes shall be designed and constructed of such strength as to eliminate failure due to impact of materials or debris loaded therein.

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

## §1926.853 Removal of Materials Through Floor Openings.

Any openings cut in a floor for the disposal of materials shall be no larger in size than 25 percent of the aggregate of the total floor area, unless the lateral supports of the removed flooring remain in place.

Floors weakened or otherwise made unsafe by demolition operations shall be shored to carry safely the intended imposed load from demolition operations.

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

# **T** REMOVAL OF WALLS, MASONRY SECTIONS, & CHIMNEYS

## **§1926.854 Removal of Walls, Masonry Sections, and Chimneys.**

(a) Masonry walls, or other sections of masonry, shall not be permitted to fall upon the floors of the building in such masses as to exceed the safe carrying capacities of the floors.

(b) No wall section, which is more than one story in height, shall be permitted to stand alone without lateral bracing, unless such wall was originally designed and constructed to stand without such lateral support, and is in a condition safe enough to be self-supporting. All walls shall be left in a stable condition at the end of each shift.

(c) Employees shall not be permitted to work on the top of a wall when weather conditions constitute a hazard.

(d) Structural or load-supporting members on any floor shall not be cut or removed until all stories above such a floor have been demolished and removed. This provision shall not prohibit the cutting of floor beams for the disposal of materials or for the installation of equipment, provided that the requirements of §§1926.853 and 1926.855 are met.

(e) Floor openings within 10 feet of any wall being demolished shall be planked solid, except when employees are kept out of the area below.

(f) In buildings of "skeleton-steel" construction, the steel framing may be left in place during the demolition of masonry. Where this is done, all steel beams, girders, and similar structural supports shall be cleared of all loose material as the masonry demolition progresses downward.

(g) Walkways or ladders shall be provided to enable employees to safely reach or leave any scaffold or wall.

(h) Walls, which serve as retaining walls to support earth or adjoining structures, shall not be demolished until such earth has been properly braced or adjoining structures have been properly underpinned.

(i) Walls, which are to serve as retaining walls against which debris will be piled, shall not be so used unless capable of safely supporting the imposed load.

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).

APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

# MANUAL REMOVAL OF FLOORS/ REMOVAL OF WALLS, FLOORS, & T MATERIAL WITH EQUIPMENT

---

## §1926.855 Manual Removal of Floors.

- (a) Openings cut in a floor shall extend the full span of the arch between supports.
- (b) Before demolishing any floor arch, debris and other material shall be removed from such arch and other adjacent floor area. Planks not less than 2 inches by 10 inches in cross section, full size undressed, shall be provided for, and shall be used by employees to stand on while breaking down floor arches between beams. Such planks shall be so located as to provide a safe support for the workmen should the arch between the beams collapse. The open space between planks shall not exceed 16 inches.
- (c) Safe walkways, not less than 18 inches wide, formed of planks not less than 2 inches thick if wood, or of equivalent strength if metal, shall be provided and used by workmen when necessary to enable them to reach any point without walking upon exposed beams.
- (d) Stringers of ample strength shall be installed to support the flooring planks, and the ends of such stringers shall be supported by floor beams or girders, and not by floor arches alone.
- (e) Planks shall be laid together over solid bearings with the ends overlapping at least 1 foot.
- (f) When floor arches are being removed, employees shall not be allowed in the area directly underneath, and such an area shall be barricaded to prevent access to it.
- (g) Demolition of floor arches shall not be started until they, and the surrounding floor area for a distance of 20 feet, have been cleared of debris and any other unnecessary materials.

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

## §1926.856 Removal of Walls, Floors, and Material with Equipment.

- (a) Mechanical equipment shall not be used on floors or working surfaces unless such floors or surfaces are of sufficient strength to support the imposed load.
- (b) Floor openings shall have curbs or stop-logs to prevent equipment from running over the edge.
- (c) Cranes, derricks, and other mechanical equipment. Employees must meet the requirements specified in subparts N, O, and CC of this part.

**Stat. Auth.:** ORS 654.025(2) and 656.726(4).

**Stats. Implemented:** ORS 654.001 through 654.295.

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).  
OR-OSHA Admin. Order 1-2011, f. 2/9/11, ef. 2/9/11.  
OR-OSHA Admin. Order 6-2013, f. 10/9/13, ef. 10/9/13.

**§1926.857 Storage.**

- (a) The storage of waste material and debris on any floor shall not exceed the allowable floor loads.
- (b) In buildings having wooden floor construction, the flooring boards may be removed from not more than one floor above grade to provide storage space for debris, provided falling material is not permitted to endanger the stability of the structure.
- (c) When wood floor beams serve to brace interior walls or free-standing exterior walls, such beams shall be left in place until other equivalent support can be installed to replace them.
- (d) Floor arches, to an elevation of not more than 25 feet above grade, may be removed to provide storage area for debris: Provided, That such removal does not endanger the stability of the structure.
- (e) Storage space into which material is dumped shall be blocked off, except for openings necessary for the removal of material. Such openings shall be kept closed at all times when material is not being removed.

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

**§1926.858 Removal of Steel Construction.**

- (a) When floor arches have been removed, planking in accordance with §1926.855(b) shall be provided for the workers engaged in razing the steel framing.
- (b) Cranes, derricks, and other hoisting equipment. Employers must meet the requirements specified in subparts N and CC of this part.
- (c) Steel construction shall be dismantled column length by column length, and tier by tier (columns may be in two-story lengths).
- (d) Any structural member being dismembered shall not be overstressed.

**Stat. Auth.:** ORS 654.025(2) and 656.726(4).

**Stats. Implemented:** ORS 654.001 through 654.295.

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).  
OR-OSHA Admin. Order 1-2011, f. 2/9/11, ef. 2/9/11.  
OR-OSHA Admin. Order 6-2013, f. 10/9/13, ef. 10/9/13.

**§1926.859 Mechanical Demolition.**

(a) No workers shall be permitted in any area, which can be adversely affected by demolition operations, when balling or clamming is being performed. Only those workers necessary for the performance of the operations shall be permitted in this area at any other time.

(b) The weight of the demolition ball shall not exceed 50 percent of the crane's rated load, based on the length of the boom and the maximum angle of operation at which the demolition ball will be used, or it shall not exceed 25 percent of the nominal breaking strength of the line by which it is suspended, whichever results in a lesser value.

(c) The crane boom and loadline shall be as short as possible.

(d) The ball shall be attached to the loadline with a swivel-type connection to prevent twisting of the loadline, and shall be attached by positive means in such manner that the weight cannot become accidentally disconnected.

(e) When pulling over walls or portions thereof, all steel members affected shall have been previously cut free.

(f) All roof cornices or other such ornamental stonework shall be removed prior to pulling walls over.

(g) During demolition, continuing inspections by a competent person shall be made as the work progresses to detect hazards resulting from weakened or deteriorated floors, or walls, or loosened material. No employee shall be permitted to work where such hazards exist until they are corrected by shoring, bracing, or other effective means.

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

**§1926.860 Selective Demolition by Explosives.**

Selective demolition by explosives shall be conducted in accordance with the applicable sections of Subpart U of this part.

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Hist:** APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89.

- END OF DOCUMENT -

**OREGON OCCUPATIONAL  
SAFETY AND HEALTH STANDARDS**

Oregon Administrative Rules, Chapter 437

**DIVISION 3 (29 CFR 1926)  
CONSTRUCTION**

**Oregon Occupational Safety and Health Division (Oregon OSHA)  
Department of Consumer and Business Services  
Salem, Oregon 97301-3882**

AO 3-2000

The Oregon Department of Consumer and Business Services adopted these rules pursuant to ORS 654.025(2).

The Secretary of State Designated OAR Chapter 437 as the “Oregon Occupational Safety and Health Code.” Six general subject areas within this code are designated as “Divisions.”

- **Division 1** General Administrative Rules
- **Division 2** General Occupational Safety and Health Rules
- **Division 3** Construction
- **Division 4** Agriculture
- **Division 5** Maritime Activities
- **Division 7** Forest Activities
- **Oregon Revised Statutes (ORS) 654** The Oregon Safe Employment Act (OSEAct)

Oregon-initiated rules in this division of the Oregon Occupational Safety and Health Code are numbered in a uniform system developed by the Secretary of State. This system does not number the rules in sequence (001, 002, 003, etc.). Omitted numbers may be assigned to new rules at the time of their adoption.

**Oregon-initiated rules** are arranged in the following Basic Codification Structure adopted by the Secretary of State for Oregon Administrative Rules (OAR):

Chapter	Division	Rule	Section	Subsection	Paragraphs
437	003	1760	(1)	(a)	(A)(i)(I)

The majority of Oregon OSHA codes are adopted by reference from the Code of Federal Regulations (CFR), and are arranged in the following basic federal numbering system:

Chapter	Division	Part	Subpart (Subdivision)	Section	Paragraphs
437	003	1926	M	.502	(a)

The terms “subdivision” and “subpart” are synonymous within OAR 437, Oregon Occupational Safety and Health Code.

---

To obtain an order form or copies of these codes, address:

**Department of Consumer & Business Services  
Oregon Occupational Safety & Health Division (Oregon OSHA)  
350 Winter St. NE, Room 430  
Salem, OR 97301-3882**

Or call the Oregon OSHA Resource Library at 503-378-3272

The rules referenced in this division are available for viewing in the Office of the Secretary of State, Administrative Rules and Office Document Section, Oregon State Archives Building, Salem, Oregon 97310, or the Central Office, Oregon Occupational Safety and Health Division of the Department of Consumer and Business Services, Room 430, 350 Winter St. NE Salem, OR 97301-3882. ## OAR 437, DIVISION 3

### CONSTRUCTION

#### SUBDIVISION U – BLASTING AND USE OF EXPLOSIVES

**437-003-0001 Adoption by Reference.** *In addition to, and not in lieu of, any other safety and health codes contained in OAR Chapter 437, the Department adopts by reference the following federal regulations printed as part of the Code of Federal Regulations, in the Federal Register:*

**(21) Subdivision U – Blasting and Use of Explosives.**

- (a) 29 CFR 1926.900 **General provisions**, published 4/6/79, FR vol. 44, p. 20940.
- (b) 29 CFR 1926.901 **Blaster qualifications**, published 4/6/79, FR vol. 44, p. 20940.
- (c) 29 CFR 1926.902 **Surface transportation of explosives**, published 6/30/93, FR vol. 58, no. 124, p. 35311.
- (d) 29 CFR 1926.903 **Underground transportation of explosives**, published 4/6/79, FR vol. 44, p. 20940.
- (e) 29 CFR 1926.904 **Storage of explosives and blasting agents**, published 6/30/93, FR vol. 58, no. 124, p. 35311.
- (f) 29 CFR 1926.905 **Loading of explosives or blasting agents**, published 6/30/93, FR vol. 58, no. 124, p. 35184.
- (g) 29 CFR 1926.906 **Initiation of explosive charges – electric blasting**, published 6/18/98, FR vol. 63, no. 117, p. 33469.
- (h) 29 CFR 1926.907 **Use of safety fuse**, published 4/6/79, FR vol. 44, p. 20940.
- (i) 29 CFR 1926.908 **Use of detonating cord**, published 4/6/79, FR vol. 44, p. 20940.
- (j) 29 CFR 1926.909 **Firing the blast**, published 4/6/79, FR vol. 44, p. 20940.
- (k) 29 CFR 1926.910 **Inspection after blasting**, published 4/6/79, FR vol. 44, p. 20940.
- (l) 29 CFR 1926.911 **Misfires**, published 4/6/79, FR vol. 44, p. 20940.
- (m) 29 CFR 1926.912 **Underwater blasting**, published 4/6/79, FR vol. 44, p. 20940.
- (n) 29 CFR 1926.913 **Blasting in excavation work under compressed air**, published 4/6/79, FR vol. 44, p. 20940.
- (o) 29 CFR 1926.914 **Definitions applicable to this subpart**, published 6/30/93, FR vol. 58, no. 124, p. 35184, 35311.

*These standards are available at the Oregon Occupational Safety and Health Division, Oregon Department of Consumer and Business Services, and the United States Government Printing Office.*

**Stat. Auth.:** ORS 654.025(2) and 656.726(4).

## SUBDIVISION U

### BLASTING AND THE USE OF EXPLOSIVES

**Authority:** Sec. 107, Contract Work Hours and Safety Standards Act (Construction Safety Act) (40 U.S.C. 333); secs. 4, 6, 8, Occupational Safety and Health Act of 1970 (29 U.S.C. 653, 655, 657); Secretary of Labor's Order No. 12-71 (36 FR 8754), 8-76 (41 FR 25059), or 9-83 (48 FR 35736), as applicable.

#### **§1926.900 General Provisions.**

- (a)** The employer shall permit only authorized and qualified persons to handle and use explosives.
- (b)** Smoking, firearms, matches, open flame lamps, and other fires, flame or heat producing devices and sparks shall be prohibited in or near explosive magazines or while explosives are being handled, transported or used.
- (c)** No person shall be allowed to handle or use explosives while under the influence of intoxicating liquors, narcotics, or other dangerous drugs.
- (d)** All explosives shall be accounted for at all times. Explosives not being used shall be kept in a locked magazine, unavailable to persons not authorized to handle them. The employer shall maintain an inventory and use record of all explosives. Appropriate authorities shall be notified of any loss, theft, or unauthorized entry into a magazine.
- (e)** No explosives or blasting agents shall be abandoned.
- (f)** No fire shall be fought where the fire is in imminent danger of contact with explosives. All employees shall be removed to a safe area and the fire area guarded against intruders.
- (g)** Original containers, or Class II magazines, shall be used for taking detonators and other explosives from storage magazines to the blasting area.
- (h)** When blasting is done in congested areas or in proximity to a structure, railway, or highway, or any other installation that may be damaged, the blaster shall take special precautions in the loading, delaying, initiation, and confinement of each blast with mats or other methods so as to control the throw of fragments, and thus prevent bodily injury to employees.
- (i)** Employees authorized to prepare explosive charges or conduct blasting operations shall use every reasonable precaution including, but not limited to, visual and audible warning signals, flags, or barricades, to ensure employee safety.

# U GENERAL PROVISIONS

(j) Insofar as possible, blasting operations above ground shall be conducted between sunup and sundown.

(k) Due precautions shall be taken to prevent accidental discharge of electric blasting caps from current induced by radar, radio transmitters, lightning, adjacent powerlines, dust storms, or other sources of extraneous electricity. These precautions shall include:

(1) Detonators shall be short-circuited in holes which have been primed and shunted until wired into the blasting circuit.

(2) The suspension of all blasting operations and removal of persons from the blasting area during the approach and progress of an electric storm;

(3)

(i) The prominent display of adequate signs, warning against the use of mobile radio transmitters, on all roads within 1,000 feet of blasting operations. Whenever adherence to the 1,000-foot distance would create an operational handicap, a competent person shall be consulted to evaluate the particular situation, and alternative provisions may be made which are adequately designed to prevent any premature firing of electric blasting caps. A description of any such alternatives shall be reduced to writing and shall be certified as meeting the purposes of this subdivision by the competent person consulted. The description shall be maintained at the construction site during the duration of the work, and shall be available for inspection by representatives of the Secretary of Labor.

(ii) Specimens of signs which would meet the requirements of paragraph (k)(3) of this section are the following:

About 48" x 48"

About 42" x 36"

**(4)** Ensuring that mobile radio transmitters which are less than 100 feet away from electric blasting caps, in other than original containers, shall be deenergized and effectively locked;

**(5)** Compliance with the recommendations of The Institute of the Makers of Explosives with regard to blasting in the vicinity of radio transmitters as stipulated in Radio Frequency Energy – A Potential Hazard in the Use of Electric Blasting Caps, IME Publication No. 20, March 1971.

**(l)** Empty boxes and paper and fiber packing materials, which have previously contained high explosives, shall not be used again for any purpose, but shall be destroyed by burning at an approved location.

**(m)** Explosives, blasting agents, and blasting supplies that are obviously deteriorated or damaged shall not be used.

**(n)** Delivery and issue of explosives shall only be made by and to authorized persons and into authorized magazines or approved temporary storage or handling areas.

**(o)** Blasting operations in the proximity of overhead power lines, communication lines, utility services, or other services and structures shall not be carried on until the operators and/or owners have been notified and measures for safe control have been taken.

**(p)** The use of black powder shall be prohibited.

**(q)** All loading and firing shall be directed and supervised by competent persons thoroughly experienced in this field.

**(r)** All blasts shall be fired electrically with an electric blasting machine or properly designed electric power source, except as provided in §1926.906(a) and (r).

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

# **U BLASTER QUALIFICATIONS/ SURFACE TRANSPORTATION OF EXPLOSIVES**

---

## **§1926.901 Blaster Qualifications.**

- (a)** A blaster shall be able to understand and give written and oral orders.
- (b)** A blaster shall be in good physical condition and not be addicted to narcotics, intoxicants, or similar types of drugs.
- (c)** A blaster shall be qualified, by reason of training, knowledge, or experience, in the field of transporting, storing, handling, and use of explosives, and have a working knowledge of State and local laws and regulations which pertain to explosives.
- (d)** Blasters shall be required to furnish satisfactory evidence of competency in handling explosives and performing in a safe manner the type of blasting that will be required.
- (e)** The blaster shall be knowledgeable and competent in the use of each type of blasting method used.

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

## **§1926.902 Surface Transportation of Explosives.**

- (a)** Transportation of explosives shall meet the provisions of Department of Transportation regulations contained in 46 CFR Parts 146-149, Water Carriers; 49 CFR Parts 171-179, Highways and Railways; 49 CFR Part 195, Pipelines; and 49 CFR Parts 390-397, Motor Carriers.
- (b)** Motor vehicles or conveyances transporting explosives shall only be driven by, and be in the charge of, a licensed driver who is physically fit. He shall be familiar with the local, State, and Federal regulation governing the transportation of explosives.
- (c)** No person shall smoke, or carry matches or any other flame-producing device, nor shall firearms or loaded cartridges be carried while in or near a motor vehicle or conveyance transporting explosives.
- (d)** Explosives, blasting agents, and blasting supplies shall not be transported with other materials or cargoes. Blasting caps (including electric) shall not be transported in the same vehicle with other explosives.
- (e)** Vehicles used for transporting explosives shall be strong enough to carry the load without difficulty, and shall be in good mechanical condition.
- (f)** When explosives are transported by a vehicle with an open body, a Class II magazine or original manufacturer's container shall be securely mounted on the bed to contain the cargo.

# SURFACE TRANSPORTATION OF EXPLOSIVES / UNDERGROUND TRANSPORTATION OF EXPLOSIVES

U

(g) All vehicles used for the transportation of explosives shall have tight floors and any exposed spark-producing metal on the inside of the body shall be covered with wood, or other nonsparking material, to prevent contact with containers of explosives.

(h) Every motor vehicle or conveyance used for transporting explosives shall be marked or placarded on both sides, the front, and the rear with the word "Explosives" in red letters, not less than 4 inches in height, on white background. In addition to such marking or placarding, the motor vehicle or conveyance may display, in such a manner that it will be readily visible from all directions, a red flag 18 inches by 30 inches, with the word "**Explosives**" painted, stamped, or sewed thereon, in white letters, at least 6 inches in height.

(i) Each vehicle used for transportation of explosives shall be equipped with a fully charged fire extinguisher, in good condition. An Underwriters Laboratory-approved extinguisher of not less than 10-ABC rating will meet the minimum requirement. The driver shall be trained in the use of the extinguisher on his vehicle.

(j) Motor vehicles or conveyances carrying explosives, blasting agents, or blasting supplies, shall not be taken inside a garage or shop for repairs or servicing.

(k) No motor vehicle transporting explosives shall be left unattended.

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Stats. Implemented:** ORS 654.001 through 654.295.

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).

APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

OR-OSHA Admin. Order 3-2000, f. 2/8/00, ef. 2/8/00.

## §1926.903 Underground Transportation of Explosives.

(a) All explosives or blasting agents in transit underground shall be taken to the place of use or storage without delay.

(b) The quantity of explosives or blasting agents taken to an underground loading area shall not exceed the amount estimated to be necessary for the blast.

(c) Explosives in transit shall not be left unattended.

(d) The hoist operator shall be notified before explosives or blasting agents are transported in a shaft conveyance.

(e) Trucks used for the transportation of explosives underground shall have the electrical system checked weekly to detect any failures which may constitute an electrical hazard. A certification record which includes the date of the inspection; the signature of the person who performed the inspection; and a serial number, or other identifier, of the truck inspected shall be prepared and the most recent certification record shall be maintained on file.

# U

## UNDERGROUND TRANSPORTATION OF EXPLOSIVES

Oregon Administrative Rules  
Oregon Occupational Safety  
and Health Division

- (f) The installation of auxiliary lights on truck beds, which are powered by the truck's electrical system, shall be prohibited.
- (g) Explosives and blasting agents shall be hoisted, lowered, or conveyed in a powder car. No other materials, supplies, or equipment shall be transported in the same conveyance at the same time.
- (h) No one, except the operator, his helper, and the powderman, shall be permitted to ride on a conveyance transporting explosives and blasting agents.
- (i) No person shall ride in any shaft conveyance transporting explosives and blasting agents.
- (j) No explosives or blasting agents shall be transported on any locomotive. At least two car lengths shall separate the locomotive from the powder car.
- (k) No explosives or blasting agents shall be transported on a man haul trip.
- (l) The car or conveyance containing explosives or blasting agents shall be pulled, not pushed, whenever possible.
- (m) The powder car or conveyance especially built for the purpose of transporting explosives or blasting agents shall bear a reflectorized sign on each side with the word "Explosives" in letters, not less than 4 inches in height; upon a background of sharply contrasting color.
- (n) Compartments for transporting detonators and explosives in the same car or conveyance shall be physically separated by a distance of 24 inches or by a solid partition at least 6 inches thick.
- (o) Detonators and other explosives shall not be transported at the same time in any shaft conveyance.
- (p) Explosives, blasting agents, or blasting supplies shall not be transported with other materials.
- (q) Explosives or blasting agents, not in original containers, shall be placed in a suitable container when transported manually.
- (r) Detonators, primers, and other explosives shall be carried in separate containers when transported manually.

(44 FR 8577, Feb. 9, 1979; 44 FR 20940, Apr. 6, 1979, as amended at 52 FR 36382, Sept. 28, 1987)

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

# STORAGE OF EXPLOSIVES & BLASTING AGENTS / LOADING OF EXPLOSIVES OR BLASTING AGENTS

U

## §1926.904 Storage of Explosives and Blasting Agents.

(a) Explosives and related materials shall be stored in approved facilities required under the applicable provisions of the Bureau of Alcohol, Tobacco and Firearms regulations contained in 27 CFR part 55.

(b) Blasting caps, electric blasting caps, detonating primers, and primed cartridges shall not be stored in the same magazine with other explosives or blasting agents.

(c) Smoking and open flames shall not be permitted within 50 feet of explosives and detonator storage magazine.

(d) No explosives or blasting agents shall be permanently stored in any underground operation until the operation has been developed to the point where at least two modes of exit have been provided.

(e) Permanent underground storage magazines shall be at least 300 feet from any shaft, adit, or active underground working area.

(f) Permanent underground magazines containing detonators shall not be located closer than 50 feet to any magazine containing other explosives or blasting agents.

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Stats. Implemented:** ORS 654.001 through 654.295.

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).

APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

OR-OSHA Admin. Order 3-2000, f. 2/8/00, ef. 2/8/00.

## §1926.905 Loading of Explosives or Blasting Agents.

(a) Procedures that permit safe and efficient loading shall be established before loading is started.

(b) All drill holes shall be sufficiently large to admit freely the insertion of the cartridges of explosives.

(c) Tamping shall be done only with wood rods or plastic tamping poles without exposed metal parts, but nonsparking metal connectors may be used for jointed poles. Violent tamping shall be avoided. The primer shall never be tamped.

(d) No holes shall be loaded except those to be fired in the next round of blasting. After loading, all remaining explosives and detonators shall be immediately returned to an authorized magazine.

(e) Drilling shall not be started until all remaining butts of old holes are examined for unexploded charges, and if any are found, they shall be refired before work proceeds.

# U

## LOADING OF EXPLOSIVES OR BLASTING AGENTS

Oregon Administrative Rules  
Oregon Occupational Safety  
and Health Division

- (f) No person shall be allowed to deepen drill holes which have contained explosives or blasting agents.
- (g) No explosives or blasting agents shall be left unattended at the blast site.
- (h) Machines and all tools not used for loading explosives into bore holes shall be removed from the immediate location of holes before explosives are delivered. Equipment shall not be operated within 50 feet of loaded holes.
- (i) No activity of any nature other than that which is required for loading holes with explosives shall be permitted in a blast area.
- (j) Powerlines and portable electric cables for equipment being used shall be kept a safe distance from explosives or blasting agents being loaded into drill holes. Cables in the proximity of the blast area shall be deenergized and locked out by the blaster.
- (k) Holes shall be checked prior to loading to determine depth and conditions. Where a hole has been loaded with explosives but the explosives have failed to detonate, there shall be no drilling within 50 feet of the hole.
- (l) When loading a long line of holes with more than one loading crew, the crews shall be separated by practical distance consistent with efficient operation and supervision of crews.
- (m) No explosive shall be loaded or used underground in the presence of combustible gases or combustible dusts.
- (n) No explosives other than those in Fume Class 1, as set forth by the Institute of Makers of Explosives, shall be used; however, explosives complying with the requirements of Fume Class 2 and Fume Class 3 may be used if adequate ventilation has been provided.
- (o) All blast holes in open work shall be stemmed to the collar or to a point which will confine the charge.
- (p) Warning signs, indicating a blast area, shall be maintained at all approaches to the blast area. The warning sign lettering shall not be less than 4 inches in height on a contrasting background.
- (q) A bore hole shall never be sprung when it is adjacent to or near a hole that is loaded. Flashlight batteries shall not be used for springing holes.
- (r) Drill holes which have been sprung or chambered, and which are not water-filled, shall be allowed to cool before explosives are loaded.
- (s) No loaded holes shall be left unattended or unprotected.
- (t) The blaster shall keep an accurate, up-to-date record of explosives, blasting agents, and blasting supplies used in a blast and shall keep an accurate running inventory of all explosives and blasting agents stored on the operation.

# LOADING OF EXPLOSIVES OR BLASTING AGENTS / INITIATION OF EXPLOSIVE CHARGES – ELECTRIC BLASTING

U

(u) When loading blasting agents pneumatically over electric blasting caps, semi-conductive delivery hose shall be used and the equipment shall be bonded and grounded.

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Stats. Implemented:** ORS 654.001 through 654.295.

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).  
OR-OSHA Admin. Order 3-2000, f. 2/8/00, ef. 2/8/00.

## §1926.906 Initiation of Explosive Charges – Electric Blasting.

(a) Electric blasting caps shall not be used where sources of extraneous electricity make the use of electric blasting caps dangerous. Blasting cap leg wires shall be kept short-circuited (shunted) until they are connected into the circuit for firing.

(b) Before adopting any system of electrical firing, the blaster shall conduct a thorough survey for extraneous currents, and all dangerous currents shall be eliminated before any holes are loaded.

(c) In any single blast using electric blasting caps, all caps shall be of the same style or function, and of the same manufacture.

(d) Electric blasting shall be carried out by using blasting circuits or power circuits in accordance with the electric blasting cap manufacturer's recommendations, or an approved contractor or his designated representative.

(e) When firing a circuit of electric blasting caps, care must be exercised to ensure that an adequate quantity of delivered current is available, in accordance with the manufacturer's recommendations.

(f) Connecting wires and lead wires shall be insulated single solid wires of sufficient current-carrying capacity.

(g) Bus wires shall be solid single wires of sufficient current-carrying capacity.

(h) When firing electrically, the insulation on all firing lines shall be adequate and in good condition.

(i) A power circuit used for firing electric blasting caps shall not be grounded.

(j) In underground operations when firing from a power circuit, a safety switch shall be placed in the permanent firing line at intervals. This switch shall be made so it can be locked only in the "Off" position and shall be provided with a short-circuiting arrangement of the firing lines to the cap circuit.

# U

## INITIATION OF EXPLOSIVE CHARGES – ELECTRIC BLASTING

Oregon Administrative Rules  
Oregon Occupational Safety  
and Health Division

**(k)** In underground operations there shall be a “lightning” gap of at least 5 feet in the firing system ahead of the main firing switch; that is, between this switch and the source of power. This gap shall be bridged by a flexible jumper cord just before firing the blast.

**(l)** When firing from a power circuit, the firing switch shall be locked in the open or “Off” position at all times, except when firing. It shall be so designed that the firing lines to the cap circuit are automatically short-circuited when the switch is in the “Off” position. Keys to this switch shall be entrusted only to the blaster.

**(m)** Blasting machines shall be in good condition and the efficiency of the machine shall be tested periodically to make certain that it can deliver power at its rated capacity.

**(n)** When firing with blasting machines, the connections shall be made as recommended by the manufacturer of the electric blasting caps used.

**(o)** The number of electric blasting caps connected to a blasting machine shall not be in excess of its rated capacity. Furthermore, in primary blasting, a series circuit shall contain no more caps than the limits recommended by the manufacturer of the electric blasting caps in use.

**(p)** The blaster shall be in charge of the blasting machines, and no other person shall connect the leading wires to the machine.

**(q)** Blasters, when testing circuits to charged holes, shall use only blasting galvanometers or other instruments that are specifically designed for this purpose.

**(r)** Whenever the possibility exists that a leading line or blasting wire might be thrown over a live powerline by the force of an explosion, care shall be taken to see that the total length of wires are kept too short to hit the lines, or that the wires are securely anchored to the ground. If neither of these requirements can be satisfied, a nonelectric system shall be used.

**(s)** In electrical firing, only the man making leading wire connections shall fire the shot. All connections shall be made from the bore hole back to the source of firing current, and the leading wires shall remain shorted and not be connected to the blasting machine or other source of current until the charge is to be fired.

**(t)** After firing an electric blast from a blasting machine, the leading wires shall be immediately disconnected from the machine and short-circuited.

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Stats. Implemented:** ORS 654.001 through 654.295.

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).  
OR-OSHA Admin. Order 4-1999, f. 4/30/99, ef. 4/30/99.

## §1926.907 Use of Safety Fuse.

- (a) Safety fuse shall only be used where sources of extraneous electricity make the use of electric blasting caps dangerous. The use of a fuse that has been hammered or injured in any way shall be forbidden.
- (b) The hanging of a fuse on nails or other projections which will cause a sharp bend to be formed in the fuse is prohibited.
- (c) Before capping safety fuse, a short length shall be cut from the end of the supply reel so as to assure a fresh cut end in each blasting cap.
- (d) Only a cap crimper of approved design shall be used for attaching blasting caps to safety fuse. Crimpers shall be kept in good repair and accessible for use.
- (e) No unused cap or short capped fuse shall be placed in any hole to be blasted; such unused detonators shall be removed from the working place and destroyed.
- (f) No fuse shall be capped, or primers made up, in any magazine or near any possible source of ignition.
- (g) No one shall be permitted to carry detonators or primers of any kind on his person.
- (h) The minimum length of safety fuse to be used in blasting shall be as required by State law, but shall not be less than 30 inches.
- (i) At least two men shall be present when multiple cap and fuse blasting is done by hand lighting methods.
- (j) Not more than 12 fuses shall be lighted by each blaster when hand lighting devices are used. However, when two or more safety fuses in a group are lighted as one by means of igniter cord, or other similar fuse-lighting devices, they may be considered as one fuse.
- (k) The so-called "drop fuse" method of dropping or pushing a primer or any explosive with a lighted fuse attached is forbidden.
- (l) Cap and fuse shall not be used for firing mudcap charges unless charges are separated sufficiently to prevent one charge from dislodging other shots in the blast.
- (m) When blasting with safety fuses, consideration shall be given to the length and burning rate of the fuse. Sufficient time, with a margin of safety, shall always be provided for the blaster to reach a place of safety.

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

# U USE OF DETONATING CORD

## §1926.908 Use of Detonating Cord.

- (a) Care shall be taken to select a detonating cord consistent with the type and physical condition of the bore hole and stemming and the type of explosives used.
- (b) Detonating cord shall be handled and used with the same respect and care given other explosives.
- (c) The line of detonating cord extending out of a bore hole or from a charge shall be cut from the supply spool before loading the remainder of the bore hole or placing additional charges.
- (d) Detonating cord shall be handled and used with care to avoid damaging or severing the cord during and after loading and hooking-up.
- (e) Detonating cord connections shall be competent and positive in accordance with approved and recommended methods. Knot-type or other cord-to-cord connections shall be made only with detonating cord in which the explosive core is dry.
- (f) All detonating cord trunklines and branchlines shall be free of loops, sharp kinks, or angles that direct the cord back toward the oncoming line of detonation.
- (g) All detonating cord connections shall be inspected before firing the blast.
- (h) When detonating cord millisecond-delay connectors or short-interval-delay electric blasting caps are used with detonating cord, the practice shall conform strictly to the manufacturer's recommendations.
- (i) When connecting a blasting cap or an electric blasting cap to detonating cord, the cap shall be taped or otherwise attached securely along the side or the end of the detonating cord, with the end of the cap containing the explosive charge pointed in the direction in which the detonation is to proceed.
- (j) Detonators for firing the trunkline shall not be brought to the loading area nor attached to the detonating cord until everything else is in readiness for the blast.

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).

APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

# FIRING THE BLAST/ INSPECTION AFTER BLASTING

U

## §1926.909 Firing the Blast.

(a) A code of blasting signals equivalent to Table U-1, shall be posted on one or more conspicuous places at the operation, and all employees shall be required to familiarize themselves with the code and conform to it. Danger signs shall be placed at suitable locations.

(b) Before a blast is fired, a loud warning signal shall be given by the blaster in charge, who has made certain that all surplus explosives are in a safe place and all employees, vehicles, and equipment are at a safe distance, or under sufficient cover.

(c) Flagmen shall be safely stationed on highways which pass through the danger zone so as to stop traffic during blasting operations.

(d) It shall be the duty of the blaster to fix the time of blasting.

(e) Before firing an underground blast, warning shall be given, and all possible entries into the blasting area, and any entrances to any working place where a drift, raise, or other opening is about to hole through, shall be carefully guarded. The blaster shall make sure that all employees are out of the blast area before firing a blast.

Table U-1

<b>Warning Signal</b> .....	A 1-minute series of long blasts 5 minutes prior to blast signal.
<b>Blast Signal</b> .....	A series of short blasts 1 minute prior to the shot.
<b>All Clear Signal</b> .....	A prolonged blast following the inspection of blast area.

Stat. Auth.: ORS 654.025(2) and 656.726(3).

Hist: APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

## §1926.910 Inspection After Blasting.

(a) Immediately after the blast has been fired, the firing line shall be disconnected from the blasting machine, or where power switches are used, they shall be locked open or in the off position.

(b) Sufficient time shall be allowed, not less than 15 minutes in tunnels, for the smoke and fumes to leave the blasted area before returning to the shot. An inspection of the area and the surrounding rubble shall be made by the blaster to determine if all charges have been exploded before employees are allowed to return to the operation, and in tunnels, after the muck pile has been wetted down.

Stat. Auth.: ORS 654.025(2) and 656.726(3).

Hist: APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

**§1926.911 Misfires.**

- (a) If a misfire is found, the blaster shall provide proper safeguards for excluding all employees from the danger zone.
- (b) No other work shall be done except that necessary to remove the hazard of the misfire and only those employees necessary to do the work shall remain in the danger zone.
- (c) No attempt shall be made to extract explosives from any charged or misfired hole; a new primer shall be put in and the hole reblasted. If refiring of the misfired hole presents a hazard, the explosives may be removed by washing out with water or, where the misfire is under water, blown out with air.
- (d) If there are any misfires while using cap and fuse, all employees shall remain away from the charge for at least 1 hour. Misfires shall be handled under the direction of the person in charge of the blasting. All wires shall be carefully traced and a search made for unexploded charges.
- (e) No drilling, digging, or picking shall be permitted until all missed holes have been detonated or the authorized representative has approved that work can proceed.

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

## §1926.912 Underwater Blasting.

- (a) A blaster shall conduct all blasting operations, and no shot shall be fired without his approval.
- (b) Loading tubes and casings of dissimilar metals shall not be used because of possible electric transient currents from galvanic action of the metals and water.
- (c) Only water-resistant blasting caps and detonating cords shall be used for all marine blasting. Loading shall be done through a nonsparking metal loading tube when tube is necessary.
- (d) No blast shall be fired while any vessel under way is closer than 1,500 feet to the blasting area. Those on board vessels or craft moored or anchored within 1,500 feet shall be notified before a blast is fired.
- (e) No blast shall be fired while any swimming or diving operations are in progress in the vicinity of the blasting area. If such operations are in progress, signals and arrangements shall be agreed upon to assure that no blast shall be fired while any person is in the water.
- (f) Blasting flags shall be displayed.
- (g) The storage and handling of explosives aboard vessels used in underwater blasting operations shall be according to provisions outlined herein on handling and storing explosives.
- (h) When more than one charge is placed under water, a float device shall be attached to an element of each charge in such manner that it will be released by the firing. Misfires shall be handled in accordance with the requirements of §1926.911.

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

# **U BLASTING IN EXCAVATION WORK UNDER COMPRESSED AIR**

## **§1926.913 Blasting in Excavation Work Under Compressed Air.**

- (a) Detonators and explosives shall not be stored or kept in tunnels, shafts, or caissons. Detonators and explosives for each round shall be taken directly from the magazines to the blasting zone and immediately loaded. Detonators and explosives left over after loading a round shall be removed from the working chamber before the connecting wires are connected up.
- (b) When detonators or explosives are brought into an air lock, no employee except the powderman, blaster, lock tender and the employees necessary for carrying, shall be permitted to enter the air lock. No other material, supplies, or equipment shall be locked through with the explosives.
- (c) Detonators and explosives shall be taken separately into pressure working chambers.
- (d) The blaster or powderman shall be responsible for the receipt, unloading, storage, and on-site transportation of explosives and detonators.
- (e) All metal pipes, rails, air locks, and steel tunnel lining shall be electrically bonded together and grounded at or near the portal or shaft, and such pipes and rails shall be cross-bonded together at not less than 1,000-foot intervals throughout the length of the tunnel. In addition, each low air supply pipe shall be grounded at its delivery end.
- (f) The explosives suitable for use in wet holes shall be water-resistant and shall be Fume Class 1.
- (g) When tunnel excavation in rock face is approaching mixed face, and when tunnel excavation is in mixed face, blasting shall be performed with light charges and with light burden on each hole. Advance drilling shall be performed as tunnel excavation in rock face approaches mixed face, to determine the general nature and extent of rock cover and the remaining distance ahead to soft ground as excavation advances.

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Hist:** APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).  
APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

## DEFINITIONS APPLICABLE TO THIS SUBDIVISION

# U

### §1926.914 Definitions Applicable to This Subdivision.

- (a) American Table of Distances** (also known as Quantity Distance Tables) means American Table of Distances for Storage of Explosives as revised and approved by the Institute of the Makers of Explosives, June 5, 1964.
- (b) Approved storage facility.** A facility for the storage of explosive materials conforming to the requirements of this part and covered by a license or permit issued under authority of the Bureau of Alcohol, Tobacco and Firearms. (See 27 CFR part 55.)
- (c) Blast area.** The area in which explosives loading and blasting operations are being conducted.
- (d) Blaster.** The person or persons authorized to use explosives for blasting purposes and meeting the qualifications contained in §1926.901.
- (e) Blasting agent.** A blasting agent is any material or mixture consisting of a fuel and oxidizer used for blasting, but not classified an explosive and in which none of the ingredients is classified as an explosive provided the furnished (mixed) product cannot be detonated with a No. 8 test blasting cap when confined. A common blasting agent presently in use is a mixture of ammonium nitrate ( $\text{NH}_4\text{NO}_3$ ) and carbonaceous combustibles, such as fuel oil or coal, and may either be procured, premixed and packaged from explosives companies or mixed in the field.
- (f) Blasting cap.** A metallic tube closed at one end, containing a charge of one or more detonating compounds, and designed for and capable of detonation from the sparks or flame from a safety fuse inserted and crimped into the open end.
- (g) Block holing.** The breaking of boulders by firing a charge of explosives that has been loaded in a drill hole.
- (h) Conveyance.** Any unit for transporting explosives or blasting agents, including but not limited to trucks, trailers, rail cars, barges, and vessels.
- (i) Detonating cord.** A flexible cord containing a center core of high explosives which when detonated, will have sufficient strength to detonate other cap-sensitive explosives with which it is in contact.
- (j) Detonator.** Blasting caps, electric blasting caps, delay electric blasting caps, and nonelectric delay blasting caps.
- (k) Electric blasting cap.** A blasting cap designed for and capable of detonation by means of an electric current.

# U

## DEFINITIONS APPLICABLE TO THIS SUBDIVISION

### (l) Electric blasting circuitry.

(1) **Bus wire.** An expendable wire, used in parallel or series, in parallel circuits, to which are connected the leg wires of electric blasting caps.

(2) **Connecting wire.** An insulated expendable wire used between electric blasting caps and the leading wires or between the bus wire and the leading wires.

(3) **Leading wire.** An insulated wire used between the electric power source and the electric blasting cap circuit.

(4) **Permanent blasting wire.** A permanently mounted insulated wire used between the electric power source and the electric blasting cap circuit.

(m) **Electric delay blasting caps.** Caps designed to detonate at a predetermined period of time after energy is applied to the ignition system.

### (n) Explosives.

(1) Any chemical compound, mixture, or device, the primary or common purpose of which is to function by explosion; that is, with substantially instantaneous release of gas and heat, unless such compound, mixture or device is otherwise specifically classified by the U.S. Department of Transportation.

(2) All material which is classified as Class A, Class B, and Class C Explosives by the U.S. Department of Transportation.

(3) Classification of explosives by the U.S. Department of Transportation is as follows:

**Class A Explosives.** Possessing detonating hazard, such as dynamite, nitroglycerin, picric acid, lead azide, fulminate of mercury, black powder, blasting caps, and detonating primers.

**Class B Explosives.** Possessing flammable hazard, such as propellant explosives, including some smokeless propellants.

**Class C Explosives.** Include certain types of manufactured articles which contain Class A or Class B explosives, or both, as components, but in restricted quantities.

(o) **Fuse lighters.** Special devices for the purpose of igniting safety fuse.

(p) **Magazine.** Any building or structure, other than an explosives manufacturing building, used for the storage of explosives.

(q) **Misfire.** An explosive charge which failed to detonate.

## DEFINITIONS APPLICABLE TO THIS SUBDIVISION

# U

**(r) Mud-capping** (sometimes known as bulldozing, adobe blasting, or dobying). The blasting of boulders by placing a quantity of explosives against a rock, boulder, or other object without confining the explosives in a drill hole.

**(s) Nonelectric delay blasting cap.** A blasting cap with an integral delay element in conjunction with and capable of being detonated by a detonation impulse or signal from miniaturized detonating cord.

**(t) Primary blasting.** The blasting operation by which the original rock formation is dislodged from its natural location.

**(u) Primer.** A cartridge or container of explosives into which a detonator or detonating cord is inserted or attached.

**(v) Safety fuse.** A flexible cord containing an internal burning medium by which fire is conveyed at a continuous and uniform rate for the purpose of firing blasting caps.

**(w) Secondary blasting.** The reduction of oversize material by the use of explosives to the dimension required for handling, including mud-capping and blockholing.

**(x) Stemming.** A suitable inert incombustible material or device used to confine or separate explosives in a drill hole, or to cover explosives in mud-capping.

**(y) Springing.** The creation of a pocket in the bottom of a drill hole by the use of a moderate quantity of explosives in order that larger quantities or explosives may be inserted therein.

**(z) Water gels, or slurry explosives.** A wide variety of materials used for blasting. They all contain substantial proportions of water and high proportions of ammonium nitrate, some of which is in solution in the water. Two broad classes of water gels are:

**(1)** Those which are sensitized by a material classed as an explosive, such as TNT or smokeless powder; and

**(2)** Those which contain no ingredient classified as an explosive; these are sensitized with metals such as aluminum or with other fuels. Water gels may be premixed at an explosives plant or mixed at the site immediately before delivery into the bore hole.

**(aa) Semiconductive hose.** A hose with an electrical resistance high enough to limit flow of stray electric currents to safe levels, yet not so high as to prevent drainage of static electric charges to ground; hose of not more than 2 megohms resistance over its entire length and of not less than 5,000 ohms per foot meets the requirement.

**Stat. Auth.:** ORS 654.025(2) and 656.726(3).

**Stats. Implemented:** ORS 654.001 through 654.295.

**Hist:** APD Admin. Order 8-1989, f. 7/7/89, ef. 7/7/89 (perm).

# Rollover Protective Structures: Overhead Protection

Subdivision

**W**

Administrative  
Order 3-2019

The Oregon Department of Consumer and Business Services adopted these rules pursuant to ORS 654.025(2).

The Secretary of State designated OAR Chapter 437 as the “Oregon Occupational Safety and Health Code.” Six general subject areas within this code are designated as “Divisions.”

- **Division 1** General Administrative Rules
- **Division 2** General Occupational Safety and Health Rules
- **Division 3** Construction
- **Division 4** Agriculture
- **Division 5** Maritime Activities
- **Division 7** Forest Activities
- **Oregon Revised Statutes (ORS) 654** The Oregon Safe Employment Act (OSEAct)

Oregon-initiated rules in this division of the Oregon Occupational Safety and Health Code are numbered in a uniform system developed by the Secretary of State. This system does not number the rules in sequence (001, 002, 003, etc.). Omitted numbers may be assigned to new rules at the time of their adoption.

**Oregon-initiated rules** are arranged in the following Basic Codification Structure adopted by the Secretary of State for Oregon Administrative Rules (OAR):

Chapter	Division	Rule	Section	Subsection	Paragraphs
437	002	0322	(1)	(a)	(A)(i)(I)

The majority of Oregon OSHA rules are adopted by reference from the Code of Federal Regulations (CFR), and are arranged in the following basic federal numbering system:

Chapter	Division	Part	Subpart (Subdivision)	Section	Paragraphs
437	002	1910	G	.303	(a)(1)(i)(A)(1)

The terms “subdivision” and “subpart” are synonymous within OAR 437, Oregon Occupational Safety and Health Code.

---

To obtain an order form or copies of these codes, address:

**Department of Consumer & Business Services**  
**Oregon Occupational Safety & Health Division (Oregon OSHA)**  
350 Winter St. NE  
Salem, OR 97301-3882

Or call the Oregon OSHA Resource Library at 503-378-3272

The rules referenced in this division are available for viewing in the Office of the Secretary of State, Oregon State Archives Building, Salem, Oregon, or the Central Office, Oregon Occupational Safety and Health Division of the Department of Consumer and Business Services, 350 Winter St. NE, Salem, Oregon, and on our website at [osha.oregon.gov](http://osha.oregon.gov).

**437-003-0001 Adoption by Reference**

*In addition to, and not in lieu of, any other safety and health codes contained in OAR Chapter 437, the Department adopts by reference the following federal regulations printed as part of the Code of Federal Regulations, in the Federal Register:*

(23) Subdivision W – Rollover Protective Structures: Overhead Protection.

- (a) 29 CFR 1926.1000 Rollover protective structures (ROPS) for material handling equipment, published 4/6/79, FR vol. 44, p. 20940, amended 5/14/19, FR vol. 84, no. 93, p. 21576.
- (b) 29 CFR 1926.1001 Minimum performance criteria for rollover protective structure for designated scrapers, loaders, dozers, graders, and crawler tractors, published 4/6/79, FR vol. 44, p. 20940, amended 5/14/19, FR vol. 84, no. 93, p. 21576.
- (c) 29 CFR 1926.1002 Protective frame (ROPS) test procedures and performance requirements for wheel-type agricultural and industrial tractors used in construction, published 7/20/06, FR vol. 71, no. 139, p. 41127, amended 5/14/2019, FR vol. 84, no. 93, p. 21576.
- (d) 29 CFR 1926.1003 Overhead protection for operators of agricultural and industrial tractors, published 2/28/06, FR vol. 71, no. 39, p. 9909, amended 5/14/19, FR vol. 84, no. 93, p. 21576.

*These standards are available at the Oregon Occupational Safety and Health Division, Oregon Department of Consumer and Business Services, and the United States Government Printing Office.*

Stat. Auth.: ORS 654.025(2) and 656.726(4).

Stats. Implemented: ORS 654.001 through 654.295.

## 1926.1000 Scope

- (a) Coverage. This section applies to the following types of material handling equipment: To all rubber-tired, self-propelled scrapers, rubber-tired front-end loaders, rubber-tired dozers, wheel-type agricultural and industrial tractors, crawler tractors, crawler-type loaders, and motor graders, with or without attachments, that are used in construction work. This Subpart also applies to compactors and rubber-tired skid-steer equipment, with or without attachments, manufactured after July 15, 2019, that are used in construction work. This requirement does not apply to side-boom pipelaying tractors.
- (b) Equipment manufactured before July 15, 2019. Material handling machinery described in paragraph (a) of this section (excluding compactors and rubber-tired skid-steer equipment) manufactured before July 15, 2019, shall be equipped with rollover protective structures that meet the minimum performance standards prescribed in 1926.1001(b), as applicable. Agricultural and industrial tractors used in construction shall be equipped with rollover protective structures that meet the minimum performance standards prescribed in 1926.1002(b), as applicable. When overhead protection is provided on agricultural and industrial tractors, the overhead protection shall meet the minimum performance standards prescribed in 1926.1003(b), as applicable.
- (c) Equipment manufactured on or after July 15, 2019. Material handling machinery described in paragraph (a) of this section manufactured on or after July 15, 2019, shall be equipped with rollover protective structures that meet the minimum performance standards prescribed in 1926.1001(c). Agricultural and industrial tractors used in construction shall be equipped with rollover protective structures that meet the minimum performance standards prescribed in 1926.1002(c). When overhead protection is provided on agricultural and industrial tractors, the overhead protection shall meet the minimum performance standards prescribed in 1926.1003(c).

Stat. Auth.: ORS 654.025(2) and 656.726(4).

Stats. Implemented: ORS 654.001 through 654.295.

Hist: APD Admin. Order 4-1989, f. 3/31/89, ef. 5/1/89 (temp).

## **1926.1001 Minimum Performance Criteria for Rollover Protective Structures for Designated Scrapers, Loaders, Dozers, Graders, Crawler Tractors, Compactors, and Rubber-Tired Skid Steer Equipment**

- (a) General. This section prescribes minimum performance criteria for rollover protective structures (ROPS) for rubber-tired self-propelled scrapers; rubber-tired front-end loaders and rubber-tired dozers; crawler tractors, and crawler-type loaders, motor graders, compactors, and rubber-tired skid steer equipment.
- (b) Equipment manufactured before July 15, 2019. For equipment listed in paragraph (a) of this section (excluding compactors and rubber-tired skid steer equipment) manufactured before July 15, 2019, the protective frames shall conform to the following Society of Automotive Engineers Recommended Practices as applicable: SAE J320a, Minimum Performance Criteria for Roll-Over Protective Structure for Rubber-Tired, Self-Propelled Scrapers; SAE J394, Minimum Performance Criteria for Roll-Over Protective Structure for Rubber-Tired Front End Loaders and Rubber-Tired Dozers; SAE J395, Minimum Performance Criteria for Roll-Over Protective Structure for Crawler Tractors and Crawler-Type Loaders; SAE J396, Minimum Performance Criteria for Roll-Over Protective Structure for Motor Graders; and SAE J397, Critical Zone Characteristics and Dimensions for Operators of Construction and Industrial Machinery, as applicable (each incorporated by reference, see 1926.6), or comply with the consensus standard (ISO 3471:2008) listed in paragraph (c) of this section.
- (c) Equipment manufactured on or after July 15, 2019. For equipment listed in paragraph (a) of this section manufactured on or after July 15, 2019, the protective frames shall meet the test and performance requirements of the International Organization for Standardization (ISO) standard ISO 3471:2008 Earth-Moving Machinery—Roll-over protective structures—Laboratory tests and performance requirements (incorporated by reference, see 1926.6).

Stat. Auth.: ORS 654.025(2) and 656.726(4).

Stats. Implemented: ORS 654.001 through 654.295.

## 1926.1002 Protective Frame (Roll-Over Protective Structures, Known as ROPS) for Wheel-type Agricultural and Industrial Tractors Used in Construction

- (a) General. This section sets forth requirements for frames used to protect operators of wheel-type agricultural and industrial tractors used in construction work that will minimize the possibility of operator injury resulting from accidental upsets during normal operation. See paragraph (e) of this section for definitions of agricultural and industrial tractors.
- (b) Equipment manufactured before July 15, 2019. For equipment manufactured before July 15, 2019, the protective frames shall meet the test and performance requirements of the Society of Automotive Engineers Standard J334a, Protective Frame Test Procedures and Performance Requirements and J168, Protective enclosures-test procedures and performance requirements, as applicable (incorporated by reference, see 1926.6), or comply with the consensus standard (ISO 5700:2013) listed in paragraph (c) of this section.
- (c) Equipment manufactured on or after July 15, 2019. For equipment manufactured on or after July 15, 2019, the protective frames shall meet the test and performance requirements of the International Organization for Standardization (ISO) standard ISO 5700:2013, Tractors for agriculture and forestry—Roll-over protective structures—static test method and acceptance conditions or ISO 3471:2008 Earth-Moving Machinery—Roll-over protective structures— Laboratory tests and performance requirements (incorporated by reference, see 1926.6).
- (d) Overhead protection requirements. For overhead protection requirements, see 1926.1003.
- (e) Definitions applicable to this section.
- (1) **“Agricultural tractor”** means a wheel-type vehicle of more than 20 engine horsepower, used in construction work, that is designed to furnish the power to pull, propel, or drive implements. (SAE standard J333a-1970) “Operator protection for wheel-type agricultural and industrial tractors”) defines “agricultural tractor” as a “wheel-type vehicle of more than 20 engine horsepower designed to furnish the power to pull, carry, propel, or drive implements that are designed for agricultural usage.” Since this part 1926 applies only to construction work, the SAE definition of “agricultural tractor” is adopted for purposes of this subpart.
  - (2) **“Industrial tractor”** means that class of wheel type tractors of more than 20 engine horsepower (other than rubber-tired loaders and dozers described in 29 CFR 1926.1001), used in operations such as landscaping, construction services, loading, digging, grounds keeping, and highway maintenance.

[61 FR 9227, March 7, 1996; 70 FR 76985, Dec. 29, 2005, as amended at 71 FR 41129, July 20, 2006; 84 FR 21416, May 14, 2019.]

## **1926.1003 Overhead Protection for Operators of Agricultural and Industrial Tractors Used in Construction**

- (a) General. This section sets forth requirements for overhead protection used to protect operators of wheel-type agricultural and industrial tractors used in construction work that will minimize the possibility of operator injury resulting from overhead hazards such as flying and falling objects, and from the cover itself in the event of accidental upset.
- (b) Equipment manufactured before July 15, 2019. When overhead protection is provided on wheel-type agricultural and industrial tractors manufactured before July 15, 2019, the overhead protection shall be designed and installed according to the requirements contained in the test and performance requirements of Society of Automotive Engineers Standard J167, Protective Frame with Overhead Protection-Test Procedures and Performance Requirements, which pertains to overhead protection requirements (incorporated by reference, see 1926.6) or comply with the consensus standard (ISO 27850:2013) listed in paragraph (c) of this section.
- (c) Equipment manufactured on or after July 15, 2019. When overhead protection is provided on wheel-type agricultural and industrial tractors manufactured on or after July 15, 2019, the overhead protection shall be designed and installed according to the requirements contained in the test and performance requirements of the International Organization for Standardization (ISO) standard ISO 27850:2013, Tractors for agriculture and forestry—Falling object protective structures—Test procedures and performance requirements, which pertains to overhead protection requirements (incorporated by reference, see 1926.6).
- (d) Site clearing. In the case of machines to which 1926.604 (relating to site clearing) also applies, the overhead protection may be either the type of protection provided in 1926.604, or the type of protection provided by this section.

[61 FR 9227, March 7, 1996; 70 FR 76987, Dec. 29, 2005; 84 FR 21578, May 14, 2019]

## Historical Notes for Subdivision W

**Note:** The Accident Prevention Division adopted Division 3, Construction on a temporary basis effective May 1, 1989. It contained new and revised federal occupational safety and health rules for the Construction industry. APD is now announcing that these same rules have been duly filed for permanent adoption. Division 3, Construction replaced Oregon codes Division 83 and 84. Some individual rules from each of these divisions have been retained and adopted into the new Division 3 as Oregon initiated rules.

This is Oregon OSHA Administrative Order 8-1989, filed and effective July 7, 1989.

**Note:** Oregon OSHA adopts by reference corrections and technical amendments issued by federal OSHA. OSHA made simple corrections, deleted redundant provisions, and clarified and reorganized various other provisions throughout the standards. Thirteen similar standards for carcinogenic chemicals are consolidated under one single rule in General Industry and Maritime Activities. This action does not change the substantive requirements of the standards. These rule changes effect General Industry, Construction, and Maritime Activities standards.

This is Oregon OSHA Administrative Order 4-1997, filed and effective April 2, 1997.

**Note:** Oregon OSHA adopted federal amendments to roll-over protective structures (ROPS) in Construction as they appear in the Federal Registers dated December 29, 2005, February 28, 2006, and July 20, 2006 (minor corrections and technical amendments). This rulemaking reinstates the original construction standards that had been replaced in 1996 with references to national consensus standards for testing ROPS. This is in Oregon's Division 3/W, effecting 1926.1002, 1926.1003, and adds a new Appendix A that contains the graphics. The rule restores impact testing for protective frames on wheel-type tractors and an additional cold-temperature testing option under the construction standard. This rule also contains minor plain language revisions that will improve comprehension and compliance with the standards.

There is a delayed effective date in Oregon of January 1, 2007.

This is Oregon OSHA Administrative Order 5-2006, filed August 7, 2006, effective January 1, 2007.

**Note:** Oregon OSHA is adopting changes to their administrative (recordkeeping), general industry, and construction standards, and updating references in the maritime activity standards in response to federal OSHA's adoption of final rules published in the May 14, 2019 Federal Register. This is Phase IV of federal OSHA's Standards Improvement Project (SIP-IV), the fourth in a series of rulemakings to improve and streamline workplace safety and health standards. Oregon's response removes or revises rules or requirements within our corresponding rules that are outdated, duplicative, or inconsistent. This rulemaking is anticipated to reduce regulatory burden and compliance costs while maintaining or enhancing worker safety and health as well as worker privacy protections.

In Division 3S, Oregon OSHA adopted requirements to harmonize OSHA rule requirements with more recent consensus standards, both for signs and devices used to protect employees working near traffic, and for roll-over protective structures on certain equipment. This rulemaking gets rid of the Appendix A to Division 3/W.

This is Oregon OSHA Administrative Order 3-2019, filed and effective October 29, 2019.

Oregon Administrative Rules  
Chapter 437

Division 3  
Construction

---

# Stairways and Ladders

Subdivision

**X**

Administrative  
Order 3-2015

The Oregon Department of Consumer and Business Services adopted these rules pursuant to ORS 654.025(2).

The Secretary of State designated OAR Chapter 437 as the “Oregon Occupational Safety and Health Code.” Six general subject areas within this code are designated as “Divisions.”

- **Division 1** General Administrative Rules
- **Division 2** General Occupational Safety and Health Rules
- **Division 3** Construction
- **Division 4** Agriculture
- **Division 5** Maritime Activities
- **Division 7** Forest Activities
- **Oregon Revised Statutes (ORS) 654** The Oregon Safe Employment Act (OSEAct)

Oregon-initiated rules in this division of the Oregon Occupational Safety and Health Code are numbered in a uniform system developed by the Secretary of State. This system does not number the rules in sequence (001, 002, 003, etc.). Omitted numbers may be assigned to new rules at the time of their adoption.

**Oregon-initiated rules** are arranged in the following Basic Codification Structure adopted by the Secretary of State for Oregon Administrative Rules (OAR):

Chapter	Division	Rule	Section	Subsection	Paragraphs
437	002	0322	(1)	(a)	(A)(i)(I)

The majority of Oregon OSHA rules are adopted by reference from the Code of Federal Regulations (CFR), and are arranged in the following basic federal numbering system:

Chapter	Division	Part	Subpart (Subdivision)	Section	Paragraphs
437	002	1910	G	.303	(a)(1)(i)(A)(1)

The terms “subdivision” and “subpart” are synonymous within OAR 437, Oregon Occupational Safety and Health Code.

---

To obtain an order form or copies of these codes, address:

**Department of Consumer & Business Services**  
**Oregon Occupational Safety & Health Division (Oregon OSHA)**  
350 Winter St. NE  
Salem, OR 97301-3882

Or call the Oregon OSHA Resource Library at 503-378-3272

The rules referenced in this division are available for viewing in the Office of the Secretary of State, Oregon State Archives Building, Salem, Oregon, or the Central Office, Oregon Occupational Safety and Health Division of the Department of Consumer and Business Services, 350 Winter St. NE, Salem, Oregon, and on our web site at [osha.oregon.gov](http://osha.oregon.gov).

OR-OSHA Admin. Order 3-2015, f. 10/9/15, ef. 1/1/16.

## 1926.1050 Scope, Application, and Definitions Applicable to this Subdivision

(a) **Scope and Application.** This Subpart applies to all stairways and ladders used in construction, alteration, repair (including painting and decorating), and demolition workplaces covered under 29 CFR part 1926, and also sets forth, in specified circumstances, when ladders and stairways are required to be provided. Additional requirements for ladders used on or with scaffolds are contained in Subpart L – Scaffolds. This Subpart does not apply to integral components of equipment covered by Subpart CC. Subpart CC exclusively sets forth the circumstances when ladders and stairways must be provided on equipment covered by Subpart CC.

(b) **Definitions.**

**Cleat** means a ladder crosspiece of rectangular cross section placed on edge upon which a person may step while ascending or descending a ladder.

**Double-cleat ladder** means a ladder similar in construction to a single-cleat ladder, but with a center rail to allow simultaneous two-way traffic for employees ascending or descending.

**Equivalent** means alternative designs, materials, or methods that the employer can demonstrate will provide an equal or greater degree of safety for employees than the method or item specified in the standard.

**Extension trestle ladder** means a self-supporting portable ladder, adjustable in length, consisting of a trestle ladder base and a vertically adjustable extension section, with a suitable means for locking the ladders together.

**Failure** means load refusal, breakage, or separation of component parts. Load refusal is the point where the structural members lose their ability to carry the loads.

**Fixed ladder** means a ladder that cannot be readily moved or carried because it is an integral part of a building or structure. A side-step fixed ladder is a fixed ladder that requires a person getting off at the top to step to the side of the ladder side rails to reach the landing. A through fixed ladder is a fixed ladder that requires a person getting off at the top to step between the side rails of the ladder to reach the landing.

**Handrail** means a rail used to provide employees with a handhold for support.

**Individual-rung/step ladders** means ladders without a side rail or center rail support. Such ladders are made by mounting individual steps or rungs directly to the side or wall of the structure.

**Job-made ladder** means a ladder that is fabricated by employees, typically at the construction site, and is not commercially manufactured. This definition does not apply to any individual-rung/step ladders.

**Ladder stand.** A mobile fixed size self-supporting ladder consisting of a wide flat tread ladder in the form of stairs. The assembly may include handrails.

**Lower levels** means those areas to which an employee can fall from a stairway or ladder. Such areas include ground levels, floors, roofs, ramps, runways, excavations, pits, tanks, material, water, equipment, and similar surfaces. It does not include the surface from which the employee falls.

**Maximum intended load** means the total load of all employees, equipment, tools, materials, transmitted loads, and other loads anticipated to be applied to a ladder component at any one time.

**Nosing** means that portion of a tread projecting beyond the face of the riser immediately below.

**Point of access** means all areas used by employees for work-related passage from one area or level to another. Such open areas include doorways, passageways, stairway openings, studded walls, and various other permanent or temporary openings used for such travel.

**Portable ladder** means a ladder that can be readily moved or carried.

**Riser height** means the vertical distance from the top of a tread to the top of the next higher tread or platform/landing or the distance from the top of a platform/landing to the top of the next higher tread or platform/landing.

**Side-step fixed ladder.** See "Fixed ladder."

**Single-cleat ladder** means a ladder consisting of a pair of side rails, connected together by cleats, rungs, or steps.

**Single-rail ladder** means a portable ladder with rungs, cleats, or steps mounted on a single rail instead of the normal two rails used on most other ladders.

**Spiral stairway** means a series of steps attached to a vertical pole and progressing upward in a winding fashion within a cylindrical space.

**Stairrail system** means a vertical barrier erected along the unprotected sides and edges of a stairway to prevent employees from falling to lower levels. The top surface of a stairrail system may also be a “handrail.”

**Step stool (ladder type)** means a self-supporting, foldable, portable ladder, nonadjustable in length, 32 inches or less in overall size, with flat steps and without a pail shelf, designed to be climbed on the ladder top cap as well as all steps. The side rails may continue above the top cap.

**Through fixed ladder.** See “Fixed ladder.”

**Tread depth** means the horizontal distance from front to back of a tread (excluding nosing, if any).

**Unprotected sides and edges** means any side or edge (except at entrances to points of access) of a stairway where there is no stairrail system or wall 36 inches (.9 m) or more in height, and any side or edge (except at entrances to points of access) of a stairway landing, or ladder platform where there is no wall or guardrail system 39 inches (1 m) or more in height.

[55 FR 47687, Nov. 14, 1990; 56 FR 2585, Jan. 23, 1991, as amended at 58 FR 35184, June 30, 1993; 75 FR 48135, Aug. 9, 2010]

Stat. Auth.: ORS 654.025(2) and 656.726(4).

Stats. Implemented: ORS 654.001 through 654.295.

OR-OSHA Admin. Order 3-2000, f. 2/8/00, ef. 2/8/00.

OR-OSHA Admin. Order 1-2011, f. 2/9/11, ef. 2/9/11.

## 1926.1051 General Requirements

- (a) A stairway or ladder shall be provided at all personnel points of access where there is a break in elevation of 19 inches (48 cm) or more, and no ramp, runway, sloped embankment, or personnel hoist is provided.
- (1) Employees shall not use any spiral stairways that will not be a permanent part of the structure on which construction work is being performed.
  - (2) A double-cleated ladder or two or more separate ladders shall be provided when ladders are the only mean of access or exit from a working area for 25 or more employees, or when a ladder is to serve simultaneous two-way traffic.
  - (3) When a building or structure has only one point of access between levels, that point of access shall be kept clear to permit free passage of employees. When work must be performed or equipment must be used such that free passage at that point of access is restricted, a second point of access shall be provided and used.

- (4) When a building or structure has two or more points of access between levels, at least one point of access shall be kept clear to permit free passage of employees.
- (b) Employers shall provide and install all stairway and ladder fall protection systems required by this Subdivision and shall comply with all other pertinent requirements of this Subdivision before employees begin the work that necessitates the installation and use of stairways, ladders, and their respective fall protection systems.

Stat. Auth.: ORS 654.025(2) and 656.726(3).  
Hist: OR-OSHA Admin. Order 6-1991, f. 3/18/91, ef. 4/15/91.

## 1926.1052 Stairways

- (a) General. The following requirements apply to all stairways as indicated:
- (1) Stairways that will not be a permanent part of the structure on which construction work is being performed shall have landings of not less than 30 inches (76 cm) in the direction of travel and extend at least 22 inches (56 cm) in width at every 12 feet (3.7 m) or less of vertical rise.
  - (2) Stairs shall be installed between 30° and 50° from horizontal.
  - (3) Riser height and tread depth shall be uniform within each flight of stairs, including any foundation structure used as one or more treads of the stairs. Variations in riser height or tread depth shall not be over 1/4-inch (0.6 cm) in any stairway system.
  - (4) Where doors or gates open directly on a stairway, a platform shall be provided, and the swing of the door shall not reduce the effective width of the platform to less than 20 inches (51 cm).
  - (5) Metal pan landings and metal pan treads, when used, shall be secured in place before filling with concrete or other material.
  - (6) All parts of stairways shall be free of hazardous projections, such as protruding nails.
  - (7) Slippery conditions on stairways shall be eliminated before the stairways are used to reach other levels.
- (b) Temporary service. The following requirements apply to all stairways as indicated:

- (1) Except during stairway construction, foot traffic is prohibited on stairways with pan stairs where the treads and/or landings are to be filled in with concrete or other material at a later date, unless the stairs are temporarily fitted with wood or other solid material at least to the top edge of each pan. Such temporary treads and landings shall be replaced when worn below the level of the top edge of the pan.
  - (2) Except during stairway construction, foot traffic is prohibited on skeleton metal stairs where permanent treads and/or landings are to be installed at a later date, unless the stairs are fitted with secured temporary treads and landings long enough to cover the entire tread and/or landing area.
  - (3) Treads for temporary service shall be made of wood or other solid material, and shall be installed the full width and depth of the stair.
- (c) Stairrails and handrails. The following requirements apply to all stairways as indicated:

- (1) Stairways having four or more risers or rising more than 30 inches (76 cm), whichever is less, shall be equipped with:

**Oregon Note:** Count each vertical distance of the overall vertical height to determine the total number of risers.

- (i) At least one handrail; and
- (ii) One stairrail system along each unprotected side or edge.

**Note:** When the top edge of a stairrail system also serves as a handrail, paragraph (c)(7) of this section applies.

- (2) Winding and spiral stairways shall be equipped with a handrail offset sufficiently to prevent walking on those portions of the stairways where the tread width is less than 6 inches (15 cm).
- (3) The height of stairrails shall be as follows:

- (i) Stairrails installed after March 15, 1991, shall be not less than 36 inches (91.5 cm) from the upper surface of the stairrail system to the surface of the tread, in line with the face of the riser at the forward edge of the tread.
  - (ii) Stairrails installed before March 15, 1991, shall be not less than 30 inches (76 cm) nor more than 34 inches (88 cm) from the upper surface of the stairrail system to the surface of the tread, in line with the face of the riser at the forward edge of the tread.
- (4) Midrails, screens, mesh, intermediate vertical members, or equivalent intermediate structural members, shall be provided between the top rail of the stairrail system and the stairway steps.
- (i) Midrails, when used, shall be located at a height midway between the top edge of the stairrail system and the stairway steps.
  - (ii) Screens or mesh, when used, shall extend from the top rail to the stairway step, and along the entire opening between top rail supports.
  - (iii) When intermediate vertical members, such as balusters, are used between posts, they shall be not more than 19 inches (48 cm) apart.
  - (iv) Other structural members, when used, shall be installed such that there are no openings in the stairrail system that are more than 19 inches (48 cm) wide.
- (5) Handrails and the top rails of stairrail systems shall be capable of withstanding, without failure, a force of at least 200 pounds (890 n) applied within 2 inches (5 cm) of the top edge, in any downward or outward direction, at any point along the top edge.
- (6) The height of handrails shall be not more than 37 inches (94 cm) nor less than 30 inches (76 cm) from the upper surface of the handrail to the surface of the tread, in line with the face of the riser at the forward edge of the tread.
- (7) When the top edge of a stairrail system also serves as a handrail, the height of the top edge shall be not more than 37 inches (94 cm) nor less than 36 inches (91.5 cm) from the upper surface of the stairrail system to the surface of the tread, in line with the face of the riser at the forward edge of the tread.
- (8) Stairrail systems and handrails shall be so surfaced as to prevent injury to employees from punctures or lacerations, and to prevent snagging of clothing.

- (9) Handrails shall provide an adequate handhold for employees grasping them to avoid falling.
- (10) The ends of stairrail systems and handrails shall be constructed so as not to constitute a projection hazard.
- (11) Handrails that will not be a permanent part of the structure being built shall have a minimum clearance of 3 inches (8 cm) between the handrail and walls, stairrail systems, and other objects.
- (12) Unprotected sides and edges of stairway landings shall be provided with guardrail systems. Guardrail system criteria are contained in Subdivision M of this part.

[55 FR 47687, Nov. 14, 1990; 56 FR 2585, Jan. 23, 1991; 56 FR 5061, Feb. 7, 1991; 56 FR 41794, Aug. 23, 1991]

Stat. Auth.: ORS 654.025(2) and 656.726(3).

Hist: OR-OSHA Admin. Order 6-1991, f. 3/18/91, ef. 4/15/91.

## 1926.1053 Ladders

- (a) General. The following requirements apply to all ladders as indicated, including job-made ladders.
  - (1) Ladders shall be capable of supporting the following loads without failure:
    - (i) Each self-supporting portable ladder: At least four times the maximum intended load, except that each extra-heavy-duty type 1A metal or plastic ladder shall sustain at least 3.3 times the maximum intended load. The ability of a ladder to sustain the loads indicated in this paragraph shall be determined by applying or transmitting the requisite load to the ladder in a downward vertical direction. Ladders built and tested in conformance with the applicable provisions of Appendix A of this Subdivision will be deemed to meet this requirement.
    - (ii) Each portable ladder that is not self-supporting: At least four times the maximum intended load, except that each extra-heavy-duty type 1A metal or plastic ladders shall sustain at least 3.3 times the maximum intended load. The ability of a ladder to sustain the loads indicated in this paragraph shall be determined by applying or transmitting the requisite load to the ladder in a downward vertical direction when the ladder is placed at an angle of 75 1/2 degrees from the horizontal. Ladders built and tested in conformance with the applicable provisions of Appendix A will be deemed to meet this requirement.

- (iii) Each fixed ladder: At least two loads of 250 pounds (114 kg) each, concentrated between any two consecutive attachments (the number and position of additional concentrated loads of 250 pounds (114 kg) each, determined from anticipated usage of the ladder, shall also be included), plus anticipated loads caused by ice buildup, winds, rigging, and impact loads resulting from the use of ladder safety devices. Each step or rung shall be capable of supporting a single concentrated load of at least 250 pounds (114 kg) applied in the middle of the step or rung. Ladders built in conformance with the applicable provisions of Appendix A will be deemed to meet this requirement.
- (2) Ladder rungs, cleats, and steps shall be parallel, level, and uniformly spaced when the ladder is in position for use.
- (3)
- (i) Rungs, cleats, and steps of portable ladders (except as provided below) and fixed ladders (including individual rung/step ladders) shall be spaced not less than 10 inches (25 cm) apart, nor more than 14 inches (36 cm) apart, as measured between center lines of the rungs, cleats and steps.
  - (ii) Rungs, cleats, and steps of step stools shall be not less than 8 inches (20 cm) apart, nor more than 12 inches (31 cm) apart, as measured between center lines of the rungs, cleats, and steps.
  - (iii) Rungs, cleats, and steps of the base section of extension trestle ladders shall be not less than 8 inches (20 cm) nor more than 18 inches (46 cm) apart, as measured between center lines of the rungs, cleats, and steps. The rung spacing on the extension section of the extension trestle ladder shall be not less than 6 inches (15 cm) nor more than 12 inches (31 cm), as measured between center lines of the rungs, cleats and steps.
- (4)
- (i) The minimum clear distance between the sides of individual-rung/step ladders and the minimum clear distance between the side rails of other fixed ladders shall be 16 inches (41 cm).
  - (ii) The minimum clear distance between side rails for all portable ladders shall be 11-1/2 inches (29 cm).
- (5) The rungs of individual-rung/step ladders shall be shaped such that employees' feet cannot slide off the end of the rungs.

- (6)
- (i) The rungs and steps of fixed metal ladders manufactured after March 15, 1991, shall be corrugated, knurled, dimpled, coated with skid-resistant material, or otherwise treated to minimize slipping.
  - (ii) The rungs and steps of portable metal ladders shall be corrugated, knurled, dimpled, coated with skid-resistant material, or otherwise treated to minimize slipping.
- (7) Ladders shall not be tied or fastened together to provide longer sections unless they are specifically designed for such use.
- (8) A metal spreader or locking device shall be provided on each stepladder to hold the front and back sections in an open position when the ladder is being used.
- (9) When splicing is required to obtain a given length of side rail, the resulting side rail must be at least equivalent in strength to a one-piece side rail made of the same material.
- (10) Except when portable ladders are used to gain access to fixed ladders (such as those on utility towers, billboards, and other structures where the bottom of the fixed ladder is elevated to limit access), when two or more separate ladders are used to reach an elevated work area, the ladders shall be offset with a platform or landing between the ladders. (The requirements to have guardrail systems with toeboards for falling object and overhead protection on platforms and landings are set forth in Subdivision M of this part.)
- (11) Ladder components shall be surfaced so as to prevent injury to an employee from punctures or lacerations, and to prevent snagging of clothing.
- (12) Wood ladders shall not be coated with any opaque covering, except for identification or warning labels which may be placed on one face only of a side rail.
- (13) The minimum perpendicular clearance between fixed ladder rungs, cleats, and steps, and any obstruction behind the ladder shall be 7 inches (18 cm), except in the case of an elevator pit ladder, for which a minimum perpendicular clearance of 4 1/2 inches (11 cm) is required.
- (14) The minimum perpendicular clearance between the center line of fixed ladder rungs, cleats, and steps, and any obstruction on the climbing side of the ladder shall be 30 inches (76 cm), except as provided in paragraph (a)(15) of this section.

- (15) When unavoidable obstructions are encountered, the minimum perpendicular clearance between the centerline of fixed ladder rungs, cleats, and steps, and the obstruction on the climbing side of the ladder may be reduced to 24 inches (61 cm), provided that a deflection device is installed to guide employees around the obstruction.
- (16) Through fixed ladders at their point of access/egress shall have a step-across distance of not less than 7 inches (18 cm) nor more than 12 inches (30 cm) as measured from the centerline of the steps or rungs to the nearest edge of the landing area. If the normal step-across distance exceeds 12 inches (30 cm), a landing platform shall be provided to reduce the distance to the specified limit.
- (17) Fixed ladders without cages or wells shall have a clear width to the nearest permanent object of at least 15 inches (38 cm) on each side of the centerline of the ladder.
- (18) Fixed ladders shall be provided with cages, wells, ladder safety devices, or self-retracting lifelines where the length of climb is less than 24 feet (7.3 m) but the top of the ladder is at a distance greater than 24 feet (7.3 m) above lower levels.
- (19) Where the total length of a climb equals or exceeds 24 feet (7.3 m), fixed ladders shall be equipped with one of the following:
- (i) Ladder safety devices; or
  - (ii) Self-retracting lifelines, and rest platforms at intervals not to exceed 150 feet (45.7 m); or
  - (iii) A cage or well, and multiple ladder sections, each ladder section not to exceed 50 feet (15.2 m) in length. Ladder sections shall be offset from adjacent sections, and landing platforms shall be provided at maximum intervals of 50 feet (15.2 m).
- (20) Cages for fixed ladders shall conform to all of the following:
- (i) Horizontal bands shall be fastened to the side rails of rail ladders, or directly to the structure, building, or equipment for individual-rung ladders;
  - (ii) Vertical bars shall be on the inside of the horizontal bands and shall be fastened to them;
  - (iii) Cages shall extend not less than 27 inches (68 cm), or more than 30 inches (76 cm) from the centerline of the step or rung (excluding the flare at the bottom of the cage), and shall not be less than 27 inches (68 cm) in width;

- (iv) The inside of the cage shall be clear of projections;
  - (v) Horizontal bands shall be spaced not more than 4 feet (1.2 m) on center vertically;
  - (vi) Vertical bars shall be spaced at intervals not more than 9-1/2 inches (24 cm) on center horizontally;
  - (vii) The bottom of the cage shall be at a level not less than 7 feet (2.1 m) nor more than 8 feet (2.4 m) above the point of access to the bottom of the ladder. The bottom of the cage shall be flared not less than 4 inches (10 cm) all around within the distance between the bottom horizontal band and the next higher band;
  - (viii) The top of the cage shall be a minimum of 42 inches (1.1 m) above the top of the platform, or the point of access at the top of the ladder, with provision for access to the platform or other point of access.
- (21) Wells for fixed ladders shall conform to all of the following:
- (i) They shall completely encircle the ladder;
  - (ii) They shall be free of projections;
  - (iii) Their inside face on the climbing side of the ladder shall extend not less than 27 inches (68 cm) nor more than 30 inches (76 cm) from the centerline of the step or rung;
  - (iv) The inside clear width shall be at least 30 inches (76 cm);
  - (v) The bottom of the wall on the access side shall start at a level not less than 7 feet (2.1 m) nor more than 8 feet (2.4 m) above the point of access to the bottom of the ladder.
- (22) Ladder safety devices, and related support systems, for fixed ladders shall conform to all of the following:
- (i) They shall be capable of withstanding without failure a drop test consisting of an 18-inch (41 cm) drop of a 500-pound (226 kg) weight;
  - (ii) They shall permit the employee using the device to ascend or descend without continually having to hold, push or pull any part of the device, leaving both hands free for climbing;
  - (iii) They shall be activated within 2 feet (.61 m) after a fall occurs, and limit the descending velocity of an employee to 7 feet/sec. (2.1 m/sec.) or less;
  - (iv) The connection between the carrier or lifeline and the point of attachment to the body belt or harness shall not exceed 9 inches (23 cm) in length.

- (23) The mounting of ladder safety devices for fixed ladders shall conform to the following:
- (i) Mountings for rigid carriers shall be attached at each end of the carrier, with intermediate mountings, as necessary, spaced along the entire length of the carrier, to provide the strength necessary to stop employees' falls.
  - (ii) Mountings for flexible carriers shall be attached at each end of the carrier. When the system is exposed to wind, cable guides for flexible carriers shall be installed at a minimum spacing of 25 feet (7.6 m) and maximum spacing of 40 feet (12.2 m) along the entire length of the carrier, to prevent wind damage to the system.
  - (iii) The design and installation of mountings and cable guides shall not reduce the design strength of the ladder.
- (24) The side rails of through or side-step fixed ladders shall extend 42 inches (1.1 m) above the top of the access level or landing platform served by the ladder. For a parapet ladder, the access level shall be the roof if the parapet is cut to permit passage through the parapet; if the parapet is continuous, the access level shall be the top of the parapet.
- (25) For through-fixed-ladder extensions, the steps or rungs shall be omitted from the extension and the extension of the side rails shall be flared to provide not less than 24 inches (61 cm) nor more than 30 inches (76 cm) clearance between side rails. Where ladder safety devices are provided, the maximum clearance between side rails of the extensions shall not exceed 36 inches (91 cm).
- (26) For side-step fixed ladders, the side rails and the steps or rungs shall be continuous in the extension.
- (27) Individual-rung/step ladders, except those used where their access openings are covered with manhole covers or hatches, shall extend at least 42 inches (1.1 m) above an access level or landing platform either by the continuation of the rung spacings as horizontal grab bars or by providing vertical grab bars that shall have the same lateral spacing as the vertical legs of the rungs.
- (b) Use. The following requirements apply to the use of all ladders, including job-made ladders, except as otherwise indicated:

- (1) When portable ladders are used for access to an upper landing surface, the ladder side rails shall extend at least 3 feet (.9 m) above the upper landing surface to which the ladder is used to gain access; or, when such an extension is not possible because of the ladder's length, then the ladder shall be secured at its top to a rigid support that will not deflect, and a grasping device, such as a grabrail, shall be provided to assist employees in mounting and dismounting the ladder. In no case shall the extension be such that ladder deflection under a load would, by itself, cause the ladder to slip off its support.
- (2) Ladders shall be maintained free of oil, grease, and other slipping hazards.
- (3) Ladders shall not be loaded beyond the maximum intended load for which they were built, nor beyond their manufacturer's rated capacity.
- (4) Ladders shall be used only for the purpose for which they were designed.
- (5)
  - (i) Non-self-supporting ladders shall be used at an angle such that the horizontal distance from the top support to the foot of the ladder is approximately one-quarter of the working length of the ladder (the distance along the ladder between the foot and the top support).
  - (ii) Wood job-made ladders with spliced side rails shall be used at an angle such that the horizontal distance is one-eighth the working length of the ladder.
  - (iii) Fixed ladders shall be used at a pitch no greater than 90 degrees from the horizontal, as measured to the back side of the ladder.
- (6) Ladders shall be used only on stable and level surfaces unless secured to prevent accidental displacement.
- (7) Ladders shall not be used on slippery surfaces unless secured or provided with slip-resistant feet to prevent accidental displacement. Slip-resistant feet shall not be used as a substitute for care in placing, lashing, or holding a ladder that is used upon slippery surfaces including, but not limited to, flat metal or concrete surfaces that are constructed so they cannot be prevented from becoming slippery.
- (8) Ladders placed in any location where they can be displaced by workplace activities or traffic, such as in passageways, doorways, or driveways, shall be secured to prevent accidental displacement, or a barricade shall be used to keep the activities or traffic away from the ladder.
- (9) The area around the top and bottom of ladders shall be kept clear.

- (10) The top of a non-self-supporting ladder shall be placed with the two rails supported equally unless it is equipped with a single support attachment.
- (11) Ladders shall not be moved, shifted, or extended while occupied.
- (12) Ladders shall have nonconductive siderails if they are used where the employee or the ladder could contact exposed energized electrical equipment, except as provided in OAR 437-002-2307 in Division 2/RR.
- (13) The top or top step of a stepladder shall not be used as a step.
- (14) Cross-bracing on the rear section of stepladders shall not be used for climbing unless the ladders are designed and provided with steps for climbing on both front and rear sections.
- (15) Ladders shall be inspected by a competent person for visible defects on a periodic basis and after any occurrence that could affect their safe use.
- (16) Portable ladders with structural defects, such as, but not limited to, broken or missing rungs, cleats, or steps, broken or split rails, corroded components, or other faulty or defective components, shall either be immediately marked in a manner that readily identifies them as defective, or be tagged with "Do Not Use" or similar language, and shall be withdrawn from service until repaired.
- (17) Fixed ladders with structural defects, such as, but not limited to, broken or missing rungs, cleats, or steps, broken or split rails, or corroded components, shall be withdrawn from service until repaired. The requirement to withdraw a defective ladder from service is satisfied if the ladder is either:
  - (i) Immediately tagged with "Do Not Use" or similar language,
  - (ii) Marked in a manner that readily identifies it as defective;
  - (iii) Or blocked (such as with a plywood attachment that spans several rungs).
- (18) Ladder repairs shall restore the ladder to a condition meeting its original design criteria, before the ladder is returned to use.
- (19) Single-rail ladders shall not be used.
- (20) When ascending or descending a ladder, the user shall face the ladder.
- (21) Each employee shall use at least one hand to grasp the ladder when progressing up and/or down the ladder.
- (22) An employee shall not carry any object or load that could cause the employee to lose balance and fall.

OR-OSHA Admin. Order 6-1991, f. 12/16/91, ef. 1/1/92.

## **1926.1054 – 1926.1059 (RESERVED)**

### **1926.1060 Training Requirements**

The following training provisions clarify the requirements of 1926.21(b)(2), regarding the hazards addressed in Subdivision X.

- (a) The employer shall provide a training program for each employee using ladders and stairways, as necessary. The program shall enable each employee to recognize hazards related to ladders and stairways, and shall train each employee in the procedures to be followed to minimize these hazards.
  - (1) The employer shall ensure that each employee has been trained by a competent person in the following areas, as applicable:
    - (i) The nature of fall hazards in the work area;
    - (ii) The correct procedures for erecting, maintaining, and disassembling the fall protection systems to be used;
    - (iii) The proper construction, use, placement, and care in handling of all stairways and ladders;
    - (iv) The maximum intended load-carrying capacities of ladders used; and
    - (v) The standards contained in this Subdivision.

(b) Retraining shall be provided for each employee as necessary so that the employee maintains the understanding and knowledge acquired through compliance with this section.

Stat. Auth.: ORS 654.025(2) and 656.726(3).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 6-1991, f. 3/18/91, ef. 4/15/91.

## Appendix A to Subdivision X – Ladders

This appendix serves as a non-mandatory guideline to assist employers in complying with the ladder loading and strength requirements of 1926.1053(a)(1). A ladder designed and built in accordance with the applicable national consensus standards, as set forth below, will be considered to meet the requirements of 1926.1053(a)(1):

- Manufactured portable wood ladders: American National Standards Institute (ANSI) A14.1-1982 – American National Standard for Ladders – Portable Wood – Safety Requirements.
- Manufactured portable metal ladders: ANSI A14.2-1982 – American National Standard for Ladders – Portable Metal – Safety Requirements.
- Manufactured fixed ladders: ANSI A14.3-1984 – American National Standard for Ladders – Fixed – Safety Requirements.
- Job-made ladders: ANSI A14.4-1979 – Safety Requirements for Job-Made Ladders.
- Plastic ladders: ANSI A14.5-1982 – American National Standard for Ladders – Portable Reinforced Plastic – Safety Requirements.

Stat. Auth.: ORS 654.025(2) and 656.726(3).

Hist: OR-OSHA Admin. Order 6-1991, f. 3/18/91, ef. 4/15/91.

## Historical Notes for Subdivision X

**Note:** The Accident Prevention Division adopted Division 3, Construction federal standard 29 CFR 1926 by reference on a temporary basis effective May 1, 1989. It contained new and revised federal occupational safety and health rules for the Construction industry. APD is now announcing that these same rules have been duly filed for permanent adoption, effective July 1, 1989. Division 3, Construction, includes new federal rules which cover masonry and concrete construction standards, and limits the use of construction cranes and derricks as personnel hoists, and revised federal rules and reduce occupational exposures to asbestos, tremolite, anthophyllite, and actinolite. Hazard communication rules for construction are also now included in Division 3.

Division 3, Construction, replaces Oregon codes, Division 83, construction, and Division 84, Electrical transmission and distribution facilities. However, some individual rules from each of these divisions have been retained and adopted into the new Division 3, construction, as Oregon-initiated rules.

This is Oregon OSHA administrative order 8-1989, adopted and effective July 7, 1989.

**Note:** Federal OSHA adopted amendments to their construction standard on lift-slab operations and stairways and ladders, Oregon OSHA has now adopted these federal amendments by reference into Division 3, Construction. The amendments to rules on lift-slab operations ensure that all non-essential personnel are off the jobsite during the lifting operation, unless an independent registered professional engineer has determined the building's structural integrity. These rules are nearly identical to ANSI A10.9-1983, Safety Requirements for Concrete Construction & Masonry Word.

The amendments to Stairways & Ladders rules include a reorganization into a more logical grouping of topics. Subdivision X is now entitled "Stairways & Ladders", and the revisions eliminate unnecessary and redundant provisions, and focus on the principal hazards involved when working on stairways and ladders.

This is Oregon OSHA administrative order 6-1991, adopted March 18, 1991, and effective April 15, 1991.

**Note:** On June 30, 1993, federal OSHA incorporated a large number of its 1910 general industry standards into its 1926 construction standard in order to consolidate all standards actually applicable to the construction industry in one place. This was done at the request of both employers and employees in construction work in order to facilitate compliance with all the applicable standards from general industry. Oregon OSHA adopted most of the applicable general industry standards into Division 3, Construction. This will help achieve more uniform reporting information and compliance, with a safer work environment for construction workers.

1926.501(b)(13), which was originally adopted from the federal construction standard, is being repealed because of confusion between this rule for residential construction and the other fall protection rules governing specific activities such as roofing or leading edge work. The more specific standards in 1926.501 will now be used for all industries. The current residential exceptions will be retained.

This is Oregon OSHA administrative order 3-2000, adopted and effective February 8, 2000.

Oregon Administrative Rules  
Chapter 437

Division 3  
Construction

---

Toxic and Hazardous  
Substances

Subdivision

**Z**

Administrative  
Order 11-2021

The Oregon Department of Consumer and Business Services adopted these rules pursuant to ORS 654.025(2). The Secretary of State designated OAR Chapter 437 as the “Oregon Occupational Safety and Health Code.” Six general subject areas within this code are designated as “Divisions.”

- **Division 1** General Administrative Rules
- **Division 2** General Occupational Safety and Health Rules
- **Division 3** Construction
- **Division 4** Agriculture
- **Division 5** Maritime Activities
- **Division 7** Forest Activities
- **Oregon Revised Statutes (ORS) 654** The Oregon Safe Employment Act (OSEAct)

Oregon-initiated rules in this division of the Oregon Occupational Safety and Health Code are numbered in a uniform system developed by the Secretary of State. This system does not number the rules in sequence (001, 002, 003, etc.). Omitted numbers may be assigned to new rules at the time of their adoption.

**Oregon-initiated rules** are arranged in the following Basic Codification Structure adopted by the Secretary of State for Oregon Administrative Rules (OAR):

Chapter <i>437</i>	Division <i>002</i>	Rule <i>0322</i>	Section <i>(1)</i>	Subsection <i>(a)</i>	Paragraphs <i>(A)(i)(I)</i>
-----------------------	------------------------	---------------------	-----------------------	--------------------------	--------------------------------

The majority of Oregon OSHA rules are adopted by reference from the Code of Federal Regulations (CFR), and are arranged in the following basic federal numbering system:

Chapter  437	Division  002	Part  1910	Subpart (Subdivision)  G	Section  .303	Paragraphs  (a)(1)(i)(A)(1)
--------------------	---------------------	------------------	-----------------------------------	---------------------	-----------------------------------

The terms “subdivision” and “subpart” are synonymous within OAR 437, Oregon Occupational Safety and Health Code.

To obtain an order form or copies of these codes, address:

**Department of Consumer & Business Services**  
**Oregon Occupational Safety & Health Division (Oregon OSHA)**  
**350 Winter St. NE**  
**Salem, OR 97301-3882**

Or call the Oregon OSHA Resource Library at 503-378-3272

The rules referenced in this division are available for viewing in the Office of the Secretary of State, Oregon State Archives Building, Salem, Oregon, or the Central Office, Oregon Occupational Safety and Health Division of the Department of Consumer and Business Services, 350 Winter St. NE, Salem, Oregon, and on our website at [osha.oregon.gov](http://osha.oregon.gov).

OR OSHA Administrative Order 11-2021, filed 9/1/21, effective 9/1/21 (air contaminants).

**437-003-1000 Oregon Rules for Air Contaminants**

An employee's exposure to any substance listed in Oregon Tables Z-1, Z-2, or Z-3 of this section shall be limited in accordance with the requirements of the following paragraphs of this section.

- (1) Oregon Table Z-1.
  - (a) *Substances with limits preceded by "C" – Ceiling Values.* An employee's exposure to any substance in Oregon Table Z-1, the exposure limit of which is preceded by a "C", shall at no time exceed the exposure limit given for that substance. If instantaneous monitoring is not feasible, then the ceiling shall be assessed as a 15-minute time weighted average exposure which shall not be exceeded at any time during the working day.
  - (b) *Other substances – 8-hour Time Weighted Averages.* An employee's exposure to any substance in Oregon Table Z-1, the exposure limit of which is not preceded by a "C", shall not exceed the 8-hour Time Weighted Average given for that substance in any 8-hour work shift of a 40-hour work week.
  - (c) *Other Substances – Excursion Limits.* Excursions in worker exposure levels may exceed 3 times the PEL-TWA for no more than a total of 30 minutes during a workday, and under no circumstances should they exceed 5 times the PEL-TWA, provided that the PEL-TWA is not exceeded.
  - (d) *Skin Designation.* To prevent or reduce skin absorption, an employee's skin exposure to substances listed in Oregon Table Z-1 with an "X" in the Skin Designation column following the substance name shall be prevented or reduced to the extent necessary in the circumstances through the use of gloves, coveralls, goggles, or other appropriate personal protective equipment, engineering controls or work practices.
- (2) Oregon Table Z-2. An employee's exposure to any substance listed in Oregon Table Z-2 shall not exceed the exposure limits specified as follows:
  - (a) *8-hour time weighted averages.* An employee's exposure to any substance listed in Oregon Table Z-2, in any 8-hour work shift of a 40-hour work week, shall not exceed the 8-hour time weighted average limit given for that substance in Oregon Table Z-2.
  - (b) *Acceptable ceiling concentrations.* An employee's exposure to a substance listed in Oregon Table Z-2 shall not exceed the acceptable ceiling concentration for the given substance in the table at any time during an 8-hour shift except:

(A) *Acceptable maximum peak above the acceptable ceiling concentration for an 8-hour shift. An employee’s exposure to a substance listed in Oregon Table Z-2 shall not exceed the acceptable maximum peak above the acceptable ceiling concentration, and shall not exceed the maximum duration for the given substance during an 8-hour shift.*

(c) *Example.*

*During an 8-hour work shift, an employee exposed to benzene may be exposed to an 8-hour time weighted average (TWA) of 10 ppm. Concentrations of benzene during the 8-hour work shift may not exceed 25 ppm, unless that exposure is no more than 50 ppm and does not exceed 10 minutes during an 8-hour work shift. Such exposures must be compensated by exposures to concentrations below 10 ppm so that the 8-hour time-weighted average is less than 10 ppm.*

**Oregon Table Z-2**

Substance	8-Hour Time-Weighted Average	Acceptable Ceiling Concentration	Acceptable Max. Peak Above the Acceptable Ceiling Concentration for an 8-hour Shift		
			Concentration	Maximum Duration	Skin
Benzene (a) (Z87.4-1969)	10 ppm	25 ppm	50 ppm	10 min.	
Beryllium and beryllium compounds (Z37.17-1970)	2 µg/m <sup>3</sup>	5 µg/m <sup>3</sup>	25 µg/m <sup>3</sup>	30 min.	
Carbon disulfide (Z37.3-1968)	20 ppm	30 ppm	100 ppm	30 min.	X
Carbon tetrachloride (Z37.19-1967)	10 ppm	25 ppm	200 ppm	5 min. in any 4 hours	

(d) *Skin Designation. To prevent or reduce skin absorption, an employee’s skin exposure to substances listed in Oregon Table Z-2 with an “X” in the Skin Designation column following the substance name shall be prevented or reduced to the extent necessary in the circumstances through the use of gloves, coveralls, goggles, or other appropriate personal protective equipment, engineering controls or work practices.*

(3) *Oregon Table Z-3. An employee's exposure to any substance listed in Oregon Table Z 3, in any 8-hour work shift of a 40-hour work week, shall not exceed the 8-hour time weighted average limit given for that substance in the table.*

- (4) *Computation formulae. The computation formula which shall apply to employee exposure to more than one substance for which 8-hour time weighted averages are included in OAR 437, Division 2/Z, Toxic and Hazardous Substances, in order to determine whether an employee is exposed over the regulatory limit is as follows:*
- (a) *Cumulative exposures.*
- (A) *The cumulative exposure for an 8-hour work shift shall be computed as follows:*
- $$E = (C_a T_a + C_b T_b + \dots C_n T_n) \div 8$$
- Where:*
- E is the equivalent exposure for the working shift.*
- C is the concentration during any period of time T where the concentration remain constant.*
- T is the duration in hours of the exposure at the concentration C.*
- The value of E shall not exceed the 8-hour time weighted average specified in subpart Z of 29 CFR part 1910 for the substance involved.*
- (B) *To illustrate the formula prescribed in paragraph (4)(a)(i) of this section, assume that Substance A has an 8-hour time weighted average limit of 100 ppm (Oregon Table Z-1). Assume that an employee is subject to the following exposure:*
- Two hours exposure at 150 ppm*
- Two hours exposure at 75 ppm*
- Four hours exposure at 50 ppm*
- Substituting this information in the formula, we have*
- $$(2 \times 150) + (2 \times 75) + (4 \times 50) \div 8 = 81.25 \text{ ppm}$$
- Since 81.25 ppm is less than 100 ppm, the 8-hour time weighted average limit, the exposure is acceptable.*
- (b) *Mixtures.*
- (A) *In case of a mixture of air contaminants an employer shall compute the equivalent exposure as follows:*
- $$E_m = (C_1 \div L_1) + (C_2 \div L_2) + \dots (C_n \div L_n)$$
- Where:*
- E<sub>m</sub> is the equivalent exposure for the mixture.*

*C is the concentration of a particular contaminant.*

*L is the exposure limit for that substance specified in Subpart Z of 29 CFR Part 1910.*

*The value of  $E_m$  shall not exceed unity (1).*

- (B) *To illustrate the formula prescribed in paragraph (4)(b)(i) of this section, consider the following exposures:*

<b>Substance</b>	<b>Actual concentration of 8-hour exposure</b>	<b>8-hour time weighted average exposure limits</b>
<i>B</i>	<i>500 ppm</i>	<i>1,000 ppm</i>
<i>C</i>	<i>45 ppm</i>	<i>200 ppm</i>
<i>D</i>	<i>40 ppm</i>	<i>200 ppm</i>

*Substituting in the formula, we have:*

$$E_m = (500 \div 1000) + (45 \div 200) + (40 \div 200)$$

$$E_m = 0.500 + 0.225 + 0.200$$

$$E_m = 0.925$$

*Since  $E_m$  is less than unity (1), the exposure combination is within acceptable limits.*

- (5) *To achieve compliance with paragraphs (1) through (4) of this section, administrative or engineering controls must first be determined and implemented whenever feasible. When such controls are not feasible to achieve full compliance, protective equipment or any other protective measures shall be used to keep the exposure of employees to air contaminants within the limits prescribed in this section. Any equipment and/or technical measures used for this purpose must be approved for each particular use by a competent industrial hygienist or other technically qualified person. Whenever respirators are used, their use shall comply with 1910.134.*

**Oregon Table Z-1 – Adopted Values (In Alphabetical Order)**

<b>Substance</b>	<b>CAS No. (c)</b>	<b>Ppm (a)</b>	<b>Mg/m<sup>3</sup> (b)</b>	<b>Skin</b>

**Note:** Bold print identifies substances for which the Oregon Permissible Exposure Limits (PELs) are different than the federal Limits.

**Note:** PNOR means "particles not otherwise regulated."

**FOOTNOTES:**

- (a) *Parts of vapor or gas per million parts of contaminated air by volume at 25°C and 760 torr.*
- (b) *Milligrams of substance per cubic meter of air. When entry is in this column only, the value is exact; when listed with a ppm entry, it is approximate.*
- (c) *The CAS number is for information only. Enforcement is based on the substance name. For an entry covering more than one metal compound, measured as the metal, the CAS number for the metal is given – not CAS numbers for the individual compounds.*
- (d) *The final benzene standard in 1910.1028 applies to all occupational exposures to benzene except in some circumstances the distribution and sale of fuels, sealed containers and pipelines, coke production, oil and gas drilling and production, natural gas processing, and the percentage exclusion for liquid mixtures; for the excepted subsegments, the benzene limits in Oregon Table Z-2 apply. See 1910.1028 for specific circumstances.*
- (e) *This 8-hour TWA applies to respirable dust as measured by a vertical elutriator cotton dust sampler or equivalent instrument. The time weighted average applies to the cotton waste processing operations of waste recycling (sorting, blending, cleaning, and willowing) and garnetting. See also 1910.1043 for cotton dust limits applicable to other sectors.*
- (f) *All inert or nuisance dusts, whether mineral, inorganic, or organic, not listed specifically by substance name are covered by the Particulates Not Otherwise Regulated (PNOR) limit which is the same as the inert or nuisance dust limit of Oregon Table Z-3.*
- (g) *Usually a mixture, in general the aromatic hydrocarbon content will determine which TWA applies.*
- (h) *If the exposure limit in 1926.1126 is stayed or is otherwise not in effect, the exposure limit is a ceiling of 0.1 mg/m<sup>3</sup>.*
- (i) *If the exposure limit in 1926.1126 is stayed or is otherwise not in effect, the exposure limit is 0.1 mg/m<sup>3</sup> (as CrO<sub>3</sub>) as an 8-hour TWA.*
- (j) *See Table Z-3 for the exposure limit for any operations or sectors where the exposure limit in Division 2/Z-Silica is stayed or is otherwise not in effect.*
- (k) *This standard applies to any operations or sectors for which the beryllium standard, Division 2/Z Beryllium, is stayed or otherwise is not in effect.*

Table Z-2 Air contaminants

Substance	8-Hour Time Weighted Average	Acceptable Ceiling Concentration	Acceptable Max. Peak Above the Acceptable Ceiling Concentration for an 8-Hour Shift		Skin
			Concentration	Maximum Duration

Substance	8-Hour Time Weighted Average	Acceptable Ceiling Concentration	Acceptable Max. Peak Above the Acceptable Ceiling Concentration for an 8-Hour Shift		Skin
			Concentration	Maximum Duration	
<b>Toluene (Z37.12-1967)</b>	<b>100 ppm</b>	<b>300 ppm</b>	<b>500 ppm</b>	<b>10 min.</b>	
Trichloroethylene (Z37.19-1967)	100 ppm	200 ppm	300 ppm	5 min. in any 2 hrs	
Diisocyanates					
Dicyclohexylmethane 4,4'-diisocyanate (hydrogenated MDI)	.055 mg/m <sup>3</sup> .005 ppm	.210 mg/m <sup>3</sup> .02 ppm			
Diphenylmethane diisocyanate (MDI)	.050 mg/m <sup>3</sup> .005 ppm	.200 mg/m <sup>3</sup> .02 ppm			
Hexamethylene diisocyanate (HDI)	.035 mg/m <sup>3</sup> .005 ppm	.140 mg/m <sup>3</sup> .02 ppm			
1,6 Hexamethylene diisocyanated Based Adduct (includes HDI-Biuret trimer, and other polymeric forms of HDI, including isocyanurates)	0.5 mg/m <sup>3</sup>	1.0 mg/m <sup>3</sup>			
Isophorone diisocyanate (IPDI)	.045 mg/m <sup>3</sup> .005 ppm	.180 mg/m <sup>3</sup> .02 ppm			
Napthalene diisocyanate (NDI)	.040 mg/m <sup>3</sup> .005 ppm	.170 mg/m <sup>3</sup> .02 ppm			
Toluene diisocyanate (TDI)	.035 mg/m <sup>3</sup> .005 ppm	.140 mg/m <sup>3</sup> .02 ppm			

**Note:** Bold print identifies substances for which the Oregon Permissible Exposure Limits (PELs) are different than the federal limits.

**FOOTNOTES:**

- (a) This standard applies to the industry segments exempt from the 1 ppm 8-hour TWA and 5 ppm STEL of the Benzene Standard, 1910.1028.
- (b) This standard applies to any operations on sectors for which the Cadmium Standard, 1910.1027, is stayed or otherwise not in effect.
- (c) This standard applies to any operations or sectors for which the exposure limit in the Chromium (VI) standard, 1926.1126, is stayed or is otherwise not in effect.

**Table Z-3 - Oregon Table – Mineral Dust**

Substance	mppcf <sup>(a)</sup>	mg/m <sup>3</sup>
Silica:		
Crystalline		
Quartz (respirable)		0.1 mg/m <sup>3</sup>
Quartz (total dust)		$\frac{30 \text{ mg/m}^3}{\% \text{SiO}_2 + 2}$
Cristobalite (respirable) Tridymite: Use 1/2 the value calculated from the formulae for quartz.		0.05 mg/m <sup>3</sup>
Amorphous, including natural diatomaceous earth	20	$\frac{80 \text{ mg/m}^3}{\% \text{SiO}_2}$
Silicates (less than 1% crystalline silica):		
Mica	20	
Soapstone	20	
Talc (not containing asbestos)	20 <sup>(c)</sup>	
Talc (containing asbestos) Use asbestos limit; see 1926.1101.	20	
Tremolite, asbestiform (see OAR 437, Div. 2/Z, 1910.1001 and 1926.1101, Asbestos).		
Portland cement	50	
Graphite (Natural)		5 mg/m <sup>3</sup>
Coal Dust:		
Respirable fraction less than 5% SiO <sub>2</sub>		2.4 mg/m <sup>3(e)(f)</sup>
Coal Dust:		
Respirable fraction greater than 5% SiO <sub>2</sub>		0.1 mg/m <sup>3(e)</sup>
<b>Inert or Nuisance Dust:</b> <sup>(d)</sup>		
<b>Respirable fraction</b>		5 mg/m <sup>3</sup>
<b>Total dust</b>		10 mg/m <sup>3</sup>

**Note:** Bold print identifies substances for which the Oregon Permissible Exposure Limits (PELs) are different than the federal limits.

**Note:** Conversion factors - mppcf x 35.3 = million particles per cubic meter = particles per c.c.

**FOOTNOTES:**

- (a) Millions of particles per cubic foot of air, based on impinger samples counted by light-field techniques.
- (b) The percentage of crystalline silica in the formula is the amount determined from airborne samples, except in those instances in which other methods have been shown to be applicable.
- (c) Containing less than 1% quartz; if 1% quartz or more, use quartz limit.
- (d) All inert or nuisance dusts, whether mineral, inorganic, or organic, not listed specifically by substance name are covered by this limit, which is the same as the Particulates Not Otherwise Regulated (PNOR) limit in Oregon Table Z-1.

- (e) Silica sampling methods must conform to OSHA or NIOSH sampling methods for respirable quartz silica.
- (f) The measurements under this note refer to the use of an AEC (now NRC) instrument. If the respirable fraction of coal dust is determined with a MRE the figure corresponding to that of 2.4 mg/m<sup>3</sup> in the table for coal dust is 4.5 mg/m<sup>3</sup>.

Statutory/Other Authority: ORS 654.025(2), 654.035 and 656.726(4)

Statutes Implemented: ORS 654.001 through 654.295.

## 1926.1101 Asbestos

- (a) Scope and application. This section regulates asbestos exposure in all work as defined in 29 CFR 1910.12(b), including but not limited to the following:
- (1) Demolition or salvage of structures where asbestos is present;
  - (2) Removal or encapsulation of materials containing asbestos;
  - (3) Construction, alteration, repair, maintenance, or renovation of structures, substrates, or portions thereof, that contain asbestos;
  - (4) Installation of products containing asbestos;
  - (5) Asbestos spill/emergency cleanup; and
  - (6) Transportation, disposal, storage, or containment of and housekeeping activities involving asbestos or products containing asbestos, on the site or location at which construction activities are performed.
  - (7) Coverage under this standard shall be based on the nature of the work operation involving asbestos exposure.
  - (8) This section does not apply to asbestos-containing asphalt roof coatings, cements and mastics.

### (b) Definitions.

**Aggressive method** means removal or disturbance of building material by sanding, abrading, grinding or other method that breaks, crumbles, or disintegrates intact ACM.

**Amended water** means water to which surfactant (wetting agent) has been added to increase the ability of the liquid to penetrate ACM.

**Asbestos** includes chrysotile, amosite, crocidolite, tremolite asbestos, anthophyllite asbestos, actinolite asbestos, and any of these minerals that has been chemically treated and/or altered. For purposes of this standard, "asbestos" includes PACM, as defined below.

**Asbestos-containing material (ACM)** means any material containing more than one percent asbestos.

**Assistant Secretary** means the Assistant Secretary of Labor for Occupational Safety and Health, U.S. Department of Labor, or designee.

**Authorized person** means any person authorized by the employer and required by work duties to be present in regulated areas.

**Building/facility owner** is the legal entity, including a lessee, which exercises control over management and record keeping functions relating to a building and/or facility in which activities covered by this standard take place.

**Certified Industrial Hygienist (CIH)** means one certified in the practice of industrial hygiene by the American Board of Industrial Hygiene.

**Class I asbestos work** means activities involving the removal of TSI and surfacing ACM and PACM.

**Class II asbestos work** means activities involving the removal of ACM which is not thermal system insulation or surfacing material. This includes, but is not limited to, the removal of asbestos-containing wallboard, floor tile and sheeting, roofing and siding shingles, and construction mastics.

**Class III asbestos work** means repair and maintenance operations, where "ACM", including TSI and surfacing ACM and PACM, is likely to be disturbed.

**Class IV asbestos work** means maintenance and custodial activities during which employees contact but do not disturb ACM or PACM and activities to clean up dust, waste and debris resulting from Class I, II, and III activities.

**Clean room** means an uncontaminated room having facilities for the storage of employees' street clothing and uncontaminated materials and equipment.

**Closely resemble** means that the major workplace conditions which have contributed to the levels of historic asbestos exposure, are no more protective than conditions of the current workplace.

**Competent person** means, in addition to the definition in 29 CFR 1926.32(f), one who is capable of identifying existing asbestos hazards in the workplace and selecting the appropriate control strategy for asbestos exposure, who has the authority to take prompt corrective measures to eliminate them, as specified in 29 CFR 1926.32(f): in addition, for Class I and Class II work who is specially trained in a training course which meets the criteria of EPA's Model Accreditation Plan (40 CFR Part 763) for supervisor, or its equivalent and, for Class III and Class IV work, who is trained in a manner consistent with EPA requirements for training of local education agency maintenance and custodial staff as set forth at 40 CFR 763.92(a)(2).

**Critical barrier** means one or more layers of plastic sealed over all openings into a work area or any other similarly placed physical barrier sufficient to prevent airborne asbestos in a work area from migrating to an adjacent area.

**Decontamination area** means an enclosed area adjacent and connected to the regulated area and consisting of an equipment room, shower area, and clean room, which is used for the decontamination of workers, materials, and equipment contaminated with asbestos.

**Demolition** means the wrecking or taking out of any load-supporting structural member and any related razing, removing, or stripping of asbestos products.

**Director** means the Director, National Institute for Occupational Safety and Health, U.S. Department of Health and Human Services, or designee.

**Disturbance** means activities that disrupt the matrix of ACM or PACM, crumble or pulverize ACM or PACM, or generate visible debris from ACM or PACM. Disturbance includes cutting away small amounts of ACM and PACM, no greater than the amount which can be contained in one standard sized glove bag or waste bag in order to access a building component. In no event shall the amount of ACM or PACM so disturbed exceed that which can be contained in one glove bag or waste bag which shall not exceed 60 inches in length and width.

**Employee exposure** means that exposure to airborne asbestos that would occur if the employee were not using respiratory protective equipment.

**Equipment room (change room)** means a contaminated room located within the decontamination area that is supplied with impermeable bags or containers for the disposal of contaminated protective clothing and equipment.

**Fiber** means a particulate form of asbestos, 5 micrometers or longer, with a length-to-diameter ratio of at least 3 to 1.

**Glovebag** means not more than a 60 x 60 inch impervious plastic bag-like enclosure affixed around an asbestos-containing material, with glove-like appendages through which material and tools may be handled.

**High-efficiency particulate air (HEPA) filter** means a filter capable of trapping and retaining at least 99.97 percent of all mono-dispersed particles of 0.3 micrometers in diameter.

**Homogeneous area** means an area of surfacing material or thermal system insulation that is uniform in color and texture.

**Industrial hygienist** means a professional qualified by education, training, and experience to anticipate, recognize, evaluate and develop controls for occupational health hazards.

**Intact** means that the ACM has not crumbled, been pulverized, or otherwise deteriorated so that the asbestos is no longer likely to be bound with its matrix.

**Modification** for purposes of paragraph (g)(6)(ii) means a changed or altered procedure, material or component of a control system, which replaces a procedure, material or component of a required system. Omitting a procedure or component, or reducing or diminishing the stringency or strength of a material or component of the control system is not a "modification" for purposes of paragraph (g)(6) of this section.

**Negative Initial Exposure Assessment** means a demonstration by the employer, which complies with the criteria in paragraph (f)(2)(iii) of this section, that employee exposure during an operation is expected to be consistently below the PELs.

**PACM** means "presumed asbestos containing material".

**Presumed Asbestos Containing Material** means thermal system insulation and surfacing material found in buildings constructed no later than 1980. The designation of a material as "PACM" may be rebutted pursuant to paragraph (k)(5) of this section.

**Project Designer** means a person who has successfully completed the training requirements for an abatement project designer established by 40 U.S.C. 763.90(g).

**Regulated area** means an area established by the employer to demarcate areas where Class I, II, and III asbestos work is conducted, and any adjoining area where debris and waste from such asbestos work accumulate; and a work area within which airborne concentrations of asbestos exceed or there is a reasonable possibility they may exceed the permissible exposure limit. Requirements for regulated areas are set out in paragraph (e) of this section.

**Removal** means all operations where ACM and/or PACM is taken out or stripping from structures or substrates, and includes demolition operations.

**Renovation** means the modifying of any existing structure, or portion thereof.

**Repair** means overhauling, rebuilding, reconstructing, or reconditioning of structures or substrates, including encapsulations or other repair of ACM or PACM attached to structures or substrates.

**Surfacing material** means material that is sprayed, troweled-on or otherwise applied to surfaces (such as acoustical plaster on ceilings and fireproofing materials on structural members, or other materials on surfaces for acoustical, fireproofing, and other purposes).

**Surfacing ACM** means surfacing material which contains more than 1% asbestos.

**Thermal system insulation (TSI)** means ACM applied to pipes, fittings, boilers, breeching, tanks, ducts or other structural components to prevent heat loss or gain.

**Thermal system insulation ACM** is thermal system insulation which contains more than 1% asbestos.

(c) Permissible exposure limits (PELS).

- (1) Time-weighted average limit (TWA). The employer shall ensure that no employee is exposed to an airborne concentration of asbestos in excess of 0.1 fiber per cubic centimeter of air as an eight (8) hour time-weighted average (TWA), as determined by the method prescribed in Appendix A to this section, or by an equivalent method.
- (2) Excursion limit. The employer shall ensure that no employee is exposed to an airborne concentration of asbestos in excess of 1.0 fiber per cubic centimeter of air (1 f/cc) as averaged over a sampling period of thirty (30) minutes, as determined by the method prescribed in Appendix A to this section, or by an equivalent method.

(d) Multi-employer worksites.

- (1) On multi-employer worksites, an employer performing work requiring the establishment of a regulated area shall inform other employers on the site of the nature of the employer's work with asbestos and/or PACM, of the existence of and requirements pertaining to regulated areas, and the measures taken to ensure that employees of such other employers are not exposed to asbestos.
- (2) Asbestos hazards at a multi-employer work site shall be abated by the contractor who created or controls the source of asbestos contamination. For example, if there is a significant breach of an enclosure containing Class I work, the employer responsible for erecting the enclosure shall repair the breach immediately.
- (3) In addition, all employers of employees exposed to asbestos hazards shall comply with applicable protective provisions to protect their employees. For example, if employees working immediately adjacent to a Class I asbestos job are exposed to asbestos due to the inadequate containment of such job, their employer shall either remove the employees from the area until the enclosure breach is repaired; or perform an initial exposure assessment pursuant to (f) of this section.

- (4) All employers of employees working adjacent to regulated areas established by another employer on a multi-employer work-site, shall take steps on a daily basis to ascertain the integrity of the enclosure and/or the effectiveness of the control method relied on by the primary asbestos contractor to assure that asbestos fibers do not migrate to such adjacent areas.
  - (5) All general contractors on a construction project which includes work covered by this standard shall be deemed to exercise general supervisory authority over the work covered by this standard, even though the general contractor is not qualified to serve as the asbestos "competent person" as defined by paragraph (b) of this section. As supervisor of the entire project, the general contractor shall ascertain whether the asbestos contractor is in compliance with this standard, and shall require such contractor to come into compliance with this standard when necessary.
- (e) Regulated areas.
- (1) All Class I, II and III asbestos work shall be conducted within regulated areas. All other operations covered by this standard shall be conducted within a regulated area where airborne concentrations of asbestos exceed, or there is a reasonable possibility they may exceed a PEL. Regulated areas shall comply with the requirements of paragraphs (2), (3), (4) and (5) of this section.
  - (2) Demarcation. The regulated area shall be demarcated in any manner that minimizes the number of persons within the area and protects persons outside the area from exposure to airborne asbestos. Where critical barriers or negative pressure enclosures are used, they may demarcate the regulated area. Signs shall be provided and displayed pursuant to the requirements of paragraph (k)(7) of this section.
  - (3) Access. Access to regulated areas shall be limited to authorized persons and to persons authorized by the Act or regulations issued pursuant thereto.
  - (4) Respirators. All persons entering a regulated area where employees are required pursuant to paragraph (h)(1) of this section to wear respirators shall be supplied with a respirator selected in accordance with paragraph (h)(2) of this section.
  - (5) Prohibited activities. The employer shall ensure that employees do not eat, drink, smoke, chew tobacco or gum, or apply cosmetics in the regulated area.
  - (6) Competent Persons. The employer shall ensure that all asbestos work performed within regulated areas is supervised by a competent person, as defined in paragraph (b) of this section. The duties of the competent person are set out in paragraph (o) of this section.
- (f) Exposure assessments and monitoring.

(1) General monitoring criteria.

- (i) Each employer who has a workplace or work operation where exposure monitoring is required under this section shall perform monitoring to determine accurately the airborne concentrations of asbestos to which employees may be exposed.
- (ii) Determinations of employee exposure shall be made from breathing zone air samples that are representative of the 8-hour TWA and 30-minute short-term exposures of each employee.
- (iii) Representative 8-hour TWA employee exposure shall be determined on the basis of one or more samples representing full-shift exposure for employees in each work area. Representative 30-minute short-term employee exposures shall be determined on the basis of one or more samples representing 30-minute exposures associated with operations that are most likely to produce exposures above the excursion limit for employees in each work area.

(2) Initial Exposure Assessment.

- (i) Each employer who has a workplace or work operation covered by this standard shall ensure that a “competent person” conducts an exposure assessment immediately before or at the initiation of the operation to ascertain expected exposures during that operation or workplace. The assessment must be completed in time to comply with requirements which are triggered by exposure data or the lack of a “negative exposure assessment,” and to provide information necessary to assure that all control systems planned are appropriate for that operation and will work properly.
- (ii) Basis of Initial Exposure Assessment: Unless a negative exposure assessment has been made pursuant to paragraph (f)(2)(iii) of this section, the initial exposure assessment shall, if feasible, be based on monitoring conducted pursuant to paragraph (f)(1)(iii) of this section. The assessment shall take into consideration both the monitoring results and all observations, information or calculations which indicate employee exposure to asbestos, including any previous monitoring conducted in the workplace, or of the operations of the employer which indicate the levels of airborne asbestos likely to be encountered on the job. For Class I asbestos work, until the employer conducts exposure monitoring and documents that employees on that job will not be exposed in excess of the PELs, or otherwise makes a negative exposure assessment pursuant to paragraph (f)(2)(iii) of this section, the employer shall presume that employees are exposed in excess of the TWA and excursion limit.

- (iii) Negative Exposure Assessment: For any one specific asbestos job which will be performed by employees who have been trained in compliance with the standard, the employer may demonstrate that employee exposures will be below the PELs by data which conform to the following criteria;
  - (A) Objective data demonstrating that the product or material containing asbestos minerals or the activity involving such product or material cannot release airborne fibers in concentrations exceeding the TWA and excursion limit under those work conditions having the greatest potential for releasing asbestos; or
  - (B) Where the employer has monitored prior asbestos jobs for the PEL and the excursion limit within 12 months of the current or projected job, the monitoring and analysis were performed in compliance with the asbestos standard in effect; and the data were obtained during work operations conducted under workplace conditions “closely resembling” the processes, type of material, control methods, work practices, and environmental conditions used and prevailing in the employer’s current operations, the operations were conducted by employees whose training and experience are no more extensive than that of employees performing the current job, and these data show that under the conditions prevailing and which will prevail in the current workplace there is a high degree of certainty that employee exposures will not exceed the TWA and excursion limit; or
  - (C) The results of initial exposure monitoring of the current job made from breathing zone air samples that are representative of the 8-hour TWA and 30 minute short-term exposures of each employee covering operations which are most likely during the performance of the entire asbestos job to result in exposures over the PELs.
- (3) Periodic monitoring.
  - (i) Class I and II operations. The employer shall conduct daily monitoring that is representative of the exposure of each employee who is assigned to work within a regulated area who is performing Class I or II work, unless the employer pursuant to (f)(2)(iii) of this section, has made a negative exposure assessment for the entire operation.
  - (ii) All operations under the standard other than Class I and II operations. The employer shall conduct periodic monitoring of all work where exposures are expected to exceed a PEL, at intervals sufficient to document the validity of the exposure prediction.

- (iii) Exception: When all employees required to be monitored daily are equipped with supplied-air respirators operated in the pressure demand mode, or other positive pressure mode respirator, the employer may dispense with the daily monitoring required by this paragraph. However, employees performing Class I work using a control method which is not listed in paragraph (g)(4)(i), (ii), or (iii) of this section or using a modification of a listed control method, shall continue to be monitored daily even if they are equipped with supplied-air respirators.
- (4) Termination of monitoring.
- (i) If the periodic monitoring required by paragraph (f)(3) of this section reveals that employee exposures, as indicated by statistically reliable measurements, are below the permissible exposure limit and excursion limit the employer may discontinue monitoring for those employees whose exposures are represented by such monitoring.
  - (ii) Additional monitoring. Notwithstanding the provisions of paragraph (f)(2) and (3), and (f)(4) of this section, the employer shall institute the exposure monitoring required under paragraph (f)(3) of this section whenever there has been a change in process, control equipment, personnel or work practices that may result in new or additional exposures above the permissible exposure level and/or excursion limit or when the employer has any reason to suspect that a change may result in new or additional exposures above the permissible exposure level and/or excursion limit. Such additional monitoring is required regardless of whether a “negative exposure assessment” was previously produced for a specific job.
- (5) Employee notification of monitoring results. The employer must, as soon as possible but no later than 5 working days after the receipt of the results of any monitoring performed under this section, notify each affected employee of these results either individually in writing or by posting the results in an appropriate location that is accessible to employees.
- (i) The employer shall notify affected employees of the monitoring results that represent that employee’s exposure as soon as possible following receipt of monitoring results.
  - (ii) The employer shall notify affected employees of the results of monitoring representing the employee’s exposure in writing either individually or by posting at a centrally located place that is accessible to affected employees.
- (6) Observation of monitoring.

- (i) The employer shall provide affected employees and their designated representatives an opportunity to observe any monitoring of employee exposure to asbestos conducted in accordance with this section.
  - (ii) When observation of the monitoring of employee exposure to asbestos requires entry into an area where the use of protective clothing or equipment is required, the observer shall be provided with and be required to use such clothing and equipment and shall comply with all other applicable safety and health procedures.
- (g) Methods of compliance.
- (1) Engineering controls and work practices for all operations covered by this section. The employer shall use the following engineering controls and work practices in all operations covered by this section, regardless of the levels of exposure:
    - (i) Vacuum cleaners equipped with HEPA filters to collect all debris and dust containing ACM or PACM, except as provided in paragraph (g)(8)(ii) of this section in the case of roofing material.
    - (ii) Wet methods, or wetting agents, to control employee exposures during asbestos handling, mixing, removal, cutting, application, and cleanup, except where employers demonstrate that the use of wet methods is infeasible due to for example, the creation of electrical hazards, equipment malfunction, and, in roofing, except as provided in paragraph (g)(8)(ii) of this section; and
    - (iii) Prompt clean-up and disposal of wastes and debris contaminated with asbestos in leak-tight containers, except in roofing operations, where the procedures specified in paragraph (g)(8)(ii) of this section apply.
  - (2) In addition to the requirements of paragraph (g)(1) of this section, the employer shall use the following control methods to achieve compliance with the TWA permissible exposure limit and excursion limit prescribed by paragraph (c) of this section;
    - (i) Local exhaust ventilation equipped with HEPA filter dust collection systems;
    - (ii) Enclosure or isolation of processes producing asbestos dust;
    - (iii) Ventilation of the regulated area to move contaminated air away from the breathing zone of employees and toward a filtration or collection device equipped with a HEPA filter;
    - (iv) Use of other work practices and engineering controls that the Assistant Secretary can show to be feasible.

- (v) Wherever the feasible engineering and work practice controls described above are not sufficient to reduce employee exposure to or below the permissible exposure and/or excursion limit prescribed in paragraph (c), of this section, the employer shall use them to reduce employee exposure to the lowest levels attainable by these controls and shall supplement them by the use of respiratory protection that complies with the requirements of paragraph (h) of this section.
- (3) Prohibitions. The following work practices and engineering controls shall not be used for work related to asbestos or for work which disturbs ACM or PACM, regardless of measured levels of asbestos exposure or the results of initial exposure assessments:
- (i) High-speed abrasive disc saws that are not equipped with point of cut ventilator or enclosures with HEPA filtered exhaust air.
  - (ii) Compressed air used to remove asbestos, or materials containing asbestos, unless the compressed air is used in conjunction with an enclosed ventilation system designed to capture the dust cloud created by the compressed air.
  - (iii) Dry sweeping, shoveling or other dry clean-up of dust and debris containing ACM and PACM.
  - (iv) Employee rotation as a means of reducing employee exposure to asbestos.
- (4) Class I Requirements. In addition to the provisions of paragraphs (g)(1) and (2) of this section, the following engineering controls and work practices and procedures shall be used.
- (i) All Class I work, including the installation and operation of the control system shall be supervised by a competent person as defined in paragraph (b) of this section;
  - (ii) For all Class I jobs involving the removal of more than 25 linear or 10 square feet of thermal system insulation or surfacing material; for all other Class I jobs, where the employer cannot produce a negative exposure assessment pursuant to paragraph (f)(2)(iii) of this section, or where employees are working in areas adjacent to the regulated area, while the Class I work is being performed, the employer shall use one of the following methods to ensure that airborne asbestos does not migrate from the regulated area:
    - (A) Critical barriers shall be placed over all the openings to the regulated area, except where activities are performed outdoors; or

- (B) The employer shall use another barrier or isolation method which prevents the migration of airborne asbestos from the regulated area, as verified by perimeter area surveillance during each work shift at each boundary of the regulated area, showing no visible asbestos dust; and perimeter area monitoring showing that clearance levels contained in 40 CFR Part 763, Subpart E, of the EPA Asbestos in Schools Rule are met, or that perimeter area levels, measured by Phase Contrast Microscopy (PCM) are no more than background levels representing the same area before the asbestos work began. The results of such monitoring shall be made known to the employer no later than 24 hours from the end of the work shift represented by such monitoring.
- Exception: For work completed outdoors where employees are not working in areas adjacent to the regulated areas, this paragraph (g)(4)(ii) is satisfied when the specific control methods in paragraph (g)(5) of this section are used.
- (iii) For all Class I jobs, HVAC systems shall be isolated in the regulated area by sealing with a double layer of 6 mil plastic or the equivalent;
- (iv) For all Class I jobs, impermeable drop cloths shall be placed on surfaces beneath all removal activity;
- (v) For all Class I jobs, all objects within the regulated area shall be covered with impermeable drop cloths or plastic sheeting which is secured by duct tape or an equivalent.
- (vi) For all Class I jobs where the employer cannot produce a negative exposure assessment, or where exposure monitoring shows that a PEL is exceeded, the employer shall ventilate the regulated area to move contaminated air away from the breathing zone of employees toward a HEPA filtration or collection device.
- (5) Specific control methods for Class I work. In addition, Class I asbestos work shall be performed using one or more of the following control methods pursuant to the limitations stated below:
- (i) Negative Pressure Enclosure (NPE) systems: NPE systems may be used where the configuration of the work area does not make the erection of the enclosure infeasible, with the following specifications and work practices.
- (A) Specifications:
- (1) The negative pressure enclosure (NPE) may be of any configuration,
- (2) At least 4 air changes per hour shall be maintained in the NPE,

- (3) A minimum of -0.02 column inches of water pressure differential, relative to outside pressure, shall be maintained within the NPE as evidenced by manometric measurements,
  - (4) The NPE shall be kept under negative pressure throughout the period of its use, and
  - (5) Air movement shall be directed away from employees performing asbestos work within the enclosure, and toward a HEPA filtration or a collection device.
- (B) Work Practices:
- (1) Before beginning work within the enclosure and at the beginning of each shift, the NPE shall be inspected for breaches and smoke-tested for leaks, and any leaks sealed.
  - (2) Electrical circuits in the enclosure shall be deactivated, unless equipped with ground-fault circuit interrupters.
- (ii) Glovebag systems may be used to remove PACM and/or ACM from straight runs of piping and elbows and other connections with the following specifications and work practices:
- (A) Specifications:
- (1) Glovebags shall be made of 6 mil thick plastic and shall be seamless at the bottom.
  - (2) Glovebags used on elbows and other connections must be designed for that purpose and used without modifications.
- (B) Work Practices:
- (1) Each glovebag shall be installed so that it completely covers the circumference of pipe or other structure where the work is to be done.
  - (2) Glovebags shall be smoke-tested for leaks and any leaks sealed prior to use.
  - (3) Glovebags may be used only once and may not be moved.
  - (4) Glovebags shall not be used on surfaces whose temperature exceeds 150° F.
  - (5) Prior to disposal, glovebags shall be collapsed by removing air within them using a HEPA vacuum.

- (6) Before beginning the operation, loose and friable material adjacent to the glovebag/box operation shall be wrapped and sealed in two layers of six mil plastic or otherwise rendered intact,
  - (7) Where system uses attached waste bag, such bag shall be connected to collection bag using hose or other material which shall withstand pressure of ACM waste and water without losing its integrity:
  - (8) Sliding valve or other device shall separate waste bag from hose to ensure no exposure when waste bag is disconnected:
  - (9) At least two persons shall perform Class I glovebag removal operations.
- (iii) Negative Pressure Glove Bag Systems. Negative pressure glove bag systems may be used to remove ACM or PACM from piping.
- (A) Specifications: In addition to specifications for glove bag systems above, negative pressure glove bag systems shall attach HEPA vacuum systems or other devices to bag to prevent collapse during removal.
  - (B) Work Practices:
    - (1) The employer shall comply with the work practices for glove bag systems in paragraph (g)(5)(ii)(B)(4) of this section.
    - (2) The HEPA vacuum cleaner or other device used to prevent collapse of bag during removal shall run continually during the operation until it is completed, at which time the bag shall be collapsed prior to removal of the bag from the pipe.
    - (3) Where a separate waste bag is used along with a collection bag and discarded after one use, the collection bag may be reused if rinsed clean with amended water before reuse.
- (iv) Negative Pressure Glove Box Systems: Negative pressure glove boxes may be used to remove ACM or PACM from pipe runs with the following specifications and work practices.
- (A) Specifications:
    - (1) Glove boxes shall be constructed with rigid sides and made from metal or other material which can withstand the weight of the ACM and PACM and water used during removal:

- (2) A negative pressure generator shall be used to create negative pressure in the system:
  - (3) An air filtration unit shall be attached to the box:
  - (4) The box shall be fitted with gloved apertures:
  - (5) An aperture at the base of the box shall serve as a bagging outlet for waste ACM and water:
  - (6) A back-up generator shall be present on site:
  - (7) Waste bags shall consist of 6 mil thick plastic double-bagged before they are filled or plastic thicker than 6 mil.
- (B) Work practices:
- (1) At least two persons shall perform the removal:
  - (2) The box shall be smoke-tested for leaks and any leaks sealed prior to each use.
  - (3) Loose or damaged ACM adjacent to the box shall be wrapped and sealed in two layers of 6 mil plastic prior to the job, or otherwise made intact prior to the job.
  - (4) A HEPA filtration system shall be used to maintain pressure barrier in box.
- (v) Water Spray Process System. A water spray process system may be used for removal of ACM and PACM from cold line piping if, employees carrying out such process have completed a 40-hour separate training course in its use, in addition to training required for employees performing Class I work. The system shall meet the following specifications and shall be performed by employees using the following work practices.
- (A) Specifications:
- (1) Piping shall be surrounded on 3 sides by rigid framing.
  - (2) A 360 degree water spray, delivered through nozzles supplied by a high pressure separate water line, shall be formed around the piping.
  - (3) The spray shall collide to form a fine aerosol which provides a liquid barrier between workers and the ACM and PACM.
- (B) Work Practices:

- (1) The system shall be run for at least 10 minutes before removal begins.
  - (2) All removal shall take place within the water barrier.
  - (3) The system shall be operated by at least three persons, one of whom shall not perform removal, but shall check equipment, and ensure proper operation of the system.
  - (4) After removal, the ACM and PACM shall be bagged while still inside the water barrier.
- (vi) A small walk-in enclosure which accommodates no more than two persons (mini-enclosure) may be used if the disturbance or removal can be completely contained by the enclosure with the following specifications and work practices.
  - (A) Specifications:
    - (1) The fabricated or job-made enclosure shall be constructed of 6 mil plastic or equivalent:
    - (2) The enclosure shall be placed under negative pressure by means of a HEPA filtered vacuum or similar ventilation unit:
  - (B) Work practices:
    - (1) Before use, the mini-enclosure shall be inspected for leaks and smoke-tested to detect breaches, and any breaches sealed.
    - (2) Before reuse, the interior shall be completely washed with amended water and HEPA-vacuumed.
    - (3) During use, air movement shall be directed away from the employee's breathing zone within the mini-enclosure.
- (6) Alternative control methods for Class I work. Class I work may be performed using a control method which is not referenced in paragraph (g)(5) of this section, or which modifies a control method referenced in paragraph (g)(5) of this section, if the following provisions are complied with:
  - (i) The control method shall enclose, contain or isolate the processes or source of airborne asbestos dust, or otherwise capture or redirect such dust before it enters the breathing zone of employees.

- (ii) A certified industrial hygienist or licensed professional engineer who is also qualified as a project designer as defined in paragraph (b) of this section, shall evaluate the work area, the projected work practices and the engineering controls and shall certify in writing that the planned control method is adequate to reduce direct and indirect employee exposure to below the PELs under worst-case conditions of use, and that the planned control method will prevent asbestos contamination outside the regulated area, as measured by clearance sampling which meets the requirements of EPA's Asbestos in Schools rule issued under AHERA, or perimeter monitoring which meets the criteria in paragraph (g)(4)(ii)(B) of this section.
  - (A) Where the TSI or surfacing material to be removed is 25 linear or 10 square feet or less, the evaluation required in paragraph (g)(6) of this section may be performed by a "competent person", and may omit consideration of perimeter or clearance monitoring otherwise required.
  - (B) The evaluation of employee exposure required in paragraph (g)(6) of this section, shall include and be based on sampling and analytical data representing employee exposure during the use of such method under worst-case conditions and by employees whose training and experience are equivalent to employees who are to perform the current job.
- (7) Work Practices and Engineering Controls for Class II work.
  - (i) All Class II work shall be supervised by a competent person as defined in paragraph (b) of this section.
  - (ii) For all indoor Class II jobs, where the employer has not produced a negative exposure assessment pursuant to paragraph (f)(2)(iii) of this section, or where during the job, changed conditions indicate there may be exposure above the PEL or where the employer does not remove the ACM in a substantially intact state, the employer shall use one of the following methods to ensure that airborne asbestos does not migrate from the regulated area;
    - (A) Critical barriers shall be placed over all openings to the regulated area; or,
    - (B) The employer shall use another barrier or isolation method which prevents the migration of airborne asbestos from the regulated area, as verified by perimeter area monitoring or clearance monitoring which meets the criteria set out in paragraph (g)(4)(ii)(B) of this section.
    - (C) Impermeable dropcloths shall be placed on surfaces beneath all removal activity;

- (iii) Reserved
  - (iv) All Class II asbestos work shall be performed using the work practices and requirements set out above in paragraph (g)(1)(i) through (g)(1)(iii) of this section.
- (8) Additional Controls for Class II work. Class II asbestos work shall also be performed by complying with the work practices and controls designated for each type of asbestos work to be performed, set out in this paragraph. Where more than one control method may be used for a type of asbestos work, the employer may choose one or a combination of designated control methods. Class II work also may be performed using a method allowed for Class I work, except that glove bags and glove boxes are allowed if they fully enclose the Class II material to be removed.
- (i) For removing vinyl and asphalt flooring materials which contain ACM or for which in buildings constructed no later than 1980, the employer has not verified the absence of ACM pursuant to paragraph (g)(8)(i)(I) of this section. The employer shall ensure that employees comply with the following work practices and that employees are trained in these practices pursuant to paragraph (k)(9):
    - (A) Flooring or its backing shall not be sanded.
    - (B) Vacuums equipped with HEPA filter, disposable dust bag, and metal floor tool (no brush) shall be used to clean floors.
    - (C) Resilient sheeting shall be removed by cutting with wetting of the snip point and wetting during delamination. Rip-up of resilient sheet floor material is prohibited.
    - (D) All scraping of residual adhesive and/or backing shall be performed using wet methods.
    - (E) Dry sweeping is prohibited.
    - (F) Mechanical chipping is prohibited unless performed in a negative pressure enclosure which meets the requirements of paragraph (g)(5)(i) of this section.
    - (G) Tiles shall be removed intact, unless the employer demonstrates that intact removal is not possible.
    - (H) When tiles are heated and can be removed intact, wetting may be omitted.

- (I) Resilient flooring material including associated mastic and backing shall be assumed to be asbestos-containing unless an industrial hygienist determines that it is asbestos-free using recognized analytical techniques.
- (ii) For removing roofing material which contains ACM the employer shall ensure that the following work practices are followed:
  - (A) Roofing material shall be removed in an intact state to the extent feasible.
  - (B) Wet methods shall be used to remove roofing materials that are not intact, or that will be rendered not intact during removal, unless such wet methods are not feasible or will create safety hazards.
  - (C) Cutting machines shall be continuously misted during use, unless a competent person determines that misting substantially decreases worker safety.
  - (D) When removing built-up roofs with asbestos-containing roofing felts and an aggregate surface using a power roof cutter, all dust resulting from the cutting operation shall be collected by a HEPA dust collector, or shall be HEPA vacuumed by vacuuming along the cut line. When removing built-up roofs with asbestos-containing roofing felts and a smooth surface using a power roof cutter, the dust resulting from the cutting operation shall be collected either by a HEPA dust collector or HEPA vacuuming along the cut line, or by gently sweeping and then carefully and completely wiping up the still-wet dust and debris left along the cut line. The dust and debris shall be immediately bagged or placed in covered containers.
  - (E) Asbestos-containing material that has been removed from a roof shall not be dropped or thrown to the ground. Unless the material is carried or passed to the ground by hand, it shall be lowered to the ground via covered, dust-tight chute, crane or hoist:
    - (1) Any ACM that is not intact shall be lowered to the ground as soon as is practicable, but in any event no later than the end of the work shift. While the material remains on the roof it shall either be kept wet, placed in an impermeable waste bag, or wrapped in plastic sheeting.
    - (2) Intact ACM shall be lowered to the ground as soon as is practicable, but in any event no later than the end of the work shift.

- (F) Upon being lowered, unwrapped material shall be transferred to a closed receptacle in such manner so as to preclude the dispersion of dust.
  - (G) Roof level heating and ventilation air intake sources shall be isolated or the ventilation system shall be shut down.
  - (H) Notwithstanding any other provision of this section, removal or repair of sections of intact roofing less than 25 square feet in area does not require use of wet methods or HEPA vacuuming as long as manual methods which do not render the material non-intact are used to remove the material and no visible dust is created by the removal method used. In determining whether a job involves less than 25 square feet, the employer shall include all removal and repair work performed on the same roof on the same day.
- (iii) When removing cementitious asbestos-containing siding and shingles or transite panels containing ACM on building exteriors (other than roofs, where paragraph (g)(8)(ii) of this section applies), the employer shall ensure that the following work practices are followed:
- (A) Cutting, abrading or breaking siding, shingles, or transite panels, shall be prohibited unless the employer can demonstrate that methods less likely to result in asbestos fiber release cannot be used.
  - (B) Each panel or shingle shall be sprayed with amended water prior to removal.
  - (C) Unwrapped or unbagged panels or shingles shall be immediately lowered to the ground via covered dust-tight chute, crane or hoist, or placed in an impervious waste bag or wrapped in plastic sheeting and lowered to the ground no later than the end of the work shift.
  - (D) Nails shall be cut with flat, sharp instruments.
- (iv) When removing gaskets containing ACM, the employer shall ensure that the following work practices are followed:
- (A) If a gasket is visibly deteriorated and unlikely to be removed intact, removal shall be undertaken within a glovebag as described in paragraph (g)(5)(ii) of this section.
  - (B) Reserved
  - (C) The gasket shall be immediately placed in a disposal container.
  - (D) Any scraping to remove residue must be performed wet.

- (v) When performing any other Class II removal of asbestos containing material for which specific controls have not been listed in paragraph (g)(8)(iv)(A) through (D) of this section, the employer shall ensure that the following work practices are complied with.
  - (A) The material shall be thoroughly wetted with amended water prior to and during its removal.
  - (B) The material shall be removed in an intact state unless the employer demonstrates that intact removal is not possible.
  - (C) Cutting, abrading or breaking the material shall be prohibited unless the employer can demonstrate that methods less likely to result in asbestos fiber release are not feasible.
  - (D) Asbestos-containing material removed, shall be immediately bagged or wrapped, or kept wetted until transferred to a closed receptacle, no later than the end of the work shift.
- (vi) Alternative Work Practices and Controls. Instead of the work practices and controls listed in paragraph (g)(8)(i) through (v) of this section, the employer may use different or modified engineering and work practice controls if the following provisions are complied with.
  - (A) The employer shall demonstrate by data representing employee exposure during the use of such method under conditions which closely resemble the conditions under which the method is to be used, that employee exposure will not exceed the PELs under any anticipated circumstances.
  - (B) A competent person shall evaluate the work area, the projected work practices and the engineering controls, and shall certify in writing, that the different or modified controls are adequate to reduce direct and indirect employee exposure to below the PELs under all expected conditions of use and that the method meets the requirements of this standard. The evaluation shall include and be based on data representing employee exposure during the use of such method under conditions which closely resemble the conditions under which the method is to be used for the current job, and by employees whose training and experience are equivalent to employees who are to perform the current job.

- (9) Work Practices and Engineering Controls for Class III asbestos work. Class III asbestos work shall be conducted using engineering and work practice controls which minimize the exposure to employees performing the asbestos work and to bystander employees.
- (i) The work shall be performed using wet methods.
  - (ii) To the extent feasible, the work shall be performed using local exhaust ventilation.
  - (iii) Where the disturbance involves drilling, cutting, abrading, sanding, chipping, breaking, or sawing of thermal system insulation or surfacing material, the employer shall use impermeable dropcloths, and shall isolate the operation using mini-enclosures or glovebag systems pursuant to paragraph (g)(5) of this section or another isolation method.
  - (iv) Where the employer does not produce a “negative exposure assessment” for a job, or where monitoring results show the PEL has been exceeded, the employer shall contain the area using impermeable dropcloths and plastic barriers or their equivalent, or shall isolate the operation using a control system listed in and in compliance with paragraph (g)(5) of this section.
  - (v) Employees performing Class III jobs, which involve the disturbance of thermal system insulation or surfacing material, or where the employer does not produce a “negative exposure assessment” or where monitoring results show a PEL has been exceeded, shall wear respirators which are selected, used and fitted pursuant to provisions of paragraph (h) of this section.
- (10) Class IV asbestos work. Class IV asbestos jobs shall be conducted by employees trained pursuant to the asbestos awareness training program set out in paragraph (k)(9) of this section. In addition, all Class IV jobs shall be conducted in conformity with the requirements set out in paragraph (g)(1) of this section, mandating wet methods, HEPA vacuums, and prompt clean up of debris containing ACM or PACM.
- (i) Employees cleaning up debris and waste in a regulated area where respirators are required shall wear respirators which are selected, used and fitted pursuant to provisions of paragraph (h) of this section.
  - (ii) Employers of employees who clean up waste and debris in, and employers in control of, areas where friable thermal system insulation or surfacing material is accessible, shall assume that such waste and debris contain asbestos.

- (11) Alternative methods of compliance for installation, removal, repair, and maintenance of certain roofing and pipeline coating materials. Notwithstanding any other provision of this section, an employer who complies with all provisions of this paragraph (g)(11) when installing, removing, repairing, or maintaining intact pipeline asphaltic wrap, or roof flashings which contain asbestos fibers encapsulated or coated by bituminous or resinous compounds shall be deemed to be in compliance with this section. If an employer does not comply with all provisions of this paragraph (g)(11), or if during the course of the job the material does not remain intact, the provisions of paragraph (g)(8) of this section apply instead of this paragraph (g)(11).
- (i) Before work begins and as needed during the job, a competent person who is capable of identifying asbestos hazards in the workplace and selecting the appropriate control strategy for asbestos exposure, and who has the authority to take prompt corrective measures to eliminate such hazards, shall conduct an inspection of the worksite and determine that the roofing material is intact and will likely remain intact.
  - (ii) All employees performing work covered by paragraph (g)(11) shall be trained in a training program that meets the requirements of paragraph (k)(9)(viii) of this section.
  - (iii) The material shall not be sanded, abraded, or ground. Manual methods which do not render the material non-intact shall be used.
  - (iv) Material that has been removed from a roof shall not be dropped or thrown to the ground. Unless the material is carried or passed to the ground by hand, it shall be lowered to the ground via covered, dust-tight chute, crane or hoist. All such material shall be removed from the roof as soon as practicable, but in any event no later than the end of the work shift.
  - (v) Where roofing products which have been labeled as containing asbestos pursuant to paragraph (k)(8) of this section are installed on non-residential roofs during operations covered by this paragraph (g)(11), the employer shall notify the building owner of the presence and location of such materials no later than the end of the job.
  - (vi) All removal or disturbance of pipeline asphaltic wrap shall be performed using wet methods.
- (h) Respiratory protection.
- (1) General. For employees who use respirators required by this section, the employer must provide each employee an appropriate respirator that complies with the requirements of this paragraph. Respirators must be used during:

- (i) Class I asbestos work.
  - (ii) Class II asbestos work when ACM is not removed in a substantially intact state.
  - (iii) Class II and III asbestos work that is not performed using wet methods, except for removal of ACM from sloped roofs when a negative-exposure assessment has been conducted and ACM is removed in an intact state.
  - (iv) Class II and III asbestos work for which a negative-exposure assessment has not been conducted.
  - (v) Class III asbestos work when TSI or surfacing ACM or PACM is being disturbed.
  - (vi) Class IV asbestos work performed within regulated areas where employees who are performing other work are required to use respirators.
  - (vii) Work operations covered by this section for which employees are exposed above the TWA or excursion limit.
  - (viii) Emergencies.
- (2) Respirator program.

**Note:** Oregon OSHA repealed 1926.1101(h)(2)(i). In Oregon, OAR 437-003-1101 applies.

### **437-003-1101 Asbestos Respiratory Protection Program**

*The employer must implement a respiratory protection program in accordance with Division 2/I, 1910.134(b) through (d) (except (d)(1)(iii)), and (e) through (m) and (o), which covers each employee required by Division 3/Z, 1926.1101 Asbestos, to use a respirator.*

**Note:** *This is in addition to other respiratory protection and medical surveillance requirements specified in these Asbestos rules.*

Stat. Auth.: ORS 654.025(2) and 656.726(4).

Stats. Implemented: ORS 654.001 through 654.295.

Hist: OR-OSHA Administrative Order 5-2011, filed 12/8/11, effective 7/1/12.

1926.1101 (h)(2)(ii) No employee shall be assigned to asbestos work that requires respirator use if, based on their most recent medical examination, the examining physician determines that the employee will be unable to function normally while using a respirator, or that the safety or health of the employee or other employees will be impaired by the employee's respirator use. Such employees must be assigned to another job or given the opportunity to transfer to a different position that they can perform. If such a transfer position is available, it must be with the same employer, in the same geographical area, and with the same seniority, status, rate of pay, and other job benefits the employee had just prior to such transfer.

(3) Respirator selection.

(i) Employers must:

(A) Select, and provide to employees, the appropriate respirators specified in paragraph (d)(3)(i)(A) of 29 CFR 1910.134; however, employers must not select or use filtering facepiece respirators for use against asbestos fibers.

(B) Provide HEPA filters for powered and non-powered air-purifying respirators.

(ii) Employers must provide an employee with tight-fitting, powered air-purifying respirator (PAPR) instead of a negative pressure respirator selected according to paragraph (h)(3)(i)(A) of this standard when the employee chooses to use a PAPR and it provides adequate protection to the employee.

(iii) Employers must provide employees with an air-purifying half mask respirator, other than a filtering facepiece respirator, whenever the employees perform:

(A) Class II or Class III asbestos work for which no negative exposure assessment is available.

(B) Class III asbestos work involving disturbance of TSI or surfacing ACM or PACM.

(iv) Employers must provide employees with:

- (A) A tight-fitting powered air-purifying respirator or a full facepiece, supplied-air respirator operated in the pressure-demand mode and equipped with either HEPA egress cartridges or an auxiliary positive-pressure, self-contained breathing apparatus (SCBA) whenever the employees are in a regulated area performing Class I asbestos work for which a negative exposure assessment is not available and the exposure assessment indicates that the exposure level will be at or below 1 f/cc as an 8-hour time-weighted average (TWA).
  - (B) A full facepiece supplied-air respirator operated in the pressure-demand mode and equipped with an auxiliary positive-pressure SCBA whenever the employees are in a regulated area performing Class I asbestos work for which a negative exposure assessment is not available and the exposure assessment indicates that the exposure level will be above 1 f/cc as an 8-hour TWA.
- (i) Protective clothing.
- (1) General. The employer shall provide or require the use of protective clothing, such as coveralls or similar whole-body clothing, head coverings, gloves, and foot coverings for any employee exposed to airborne concentrations of asbestos that exceed the TWA or excursion limit prescribed in paragraph (c) of this section, or for which a required negative exposure assessment is not produced, or for any employee performing Class I operations which involve the removal of over 25 linear or 10 square feet of TSI or surfacing ACM and PACM.
  - (2) Laundering.
    - (i) The employer shall ensure that laundering of contaminated clothing is done as to prevent the release of airborne asbestos in excess of the TWA and/or excursion limit prescribed in paragraph (c) of this section.
    - (ii) Any employer who gives contaminated clothing to another person for laundering shall inform such person of the requirement in paragraph (i)(2)(i) of this section to effectively prevent the release of airborne asbestos in excess of the TWA and excursion limit prescribed in paragraph (c) of this section.
  - (3) Contaminated clothing. Contaminated clothing shall be transported in sealed impermeable bags, or other closed, impermeable containers, and be labeled in accordance with paragraph (k) of this section.
  - (4) Inspection of protective clothing.

- (i) The competent person shall examine worksuits worn by employees at least once per workshift for rips or tears that may occur during performance of work.
  - (ii) When rips or tears are detected while an employee is working, rips and tears shall be immediately mended, or the worksuit shall be immediately replaced.
- (j) Hygiene facilities and practices for employees.
- (1) Requirements for employees performing Class I asbestos jobs involving over 25 linear or 10 square feet of TSI or surfacing ACM and PACM.
    - (i) Decontamination areas: the employer shall establish a decontamination area that is adjacent and connected to the regulated area for the decontamination of such employees. The decontamination area shall consist of an equipment room, shower area, and clean room in series. The employer shall ensure that employees enter and exit the regulated area through the decontamination area.
      - (A) Equipment room. The equipment room shall be supplied with impermeable, labeled bags and containers for the containment and disposal of contaminated protective equipment.
      - (B) Shower area. Shower facilities shall be provided which comply with 29 CFR 1910.141(d)(3), unless the employer can demonstrate that they are not feasible. The showers shall be adjacent both to the equipment room and the clean room, unless the employer can demonstrate that this location is not feasible. Where the employer can demonstrate that it is not feasible to locate the shower between the equipment room and the clean room, or where the work is performed outdoors, the employers shall ensure that employees:
        - (1) Remove asbestos contamination from their worksuits in the equipment room using a HEPA vacuum before proceeding to a shower that is not adjacent to the work area; or
        - (2) Remove their contaminated worksuits in the equipment room, then don clean work suits, and proceed to a shower that is not adjacent to the work area.

- (C) Clean change room. The clean room shall be equipped with a locker or appropriate storage container for each employee's use. When the employer can demonstrate that it is not feasible to provide a clean change area adjacent to the work area or where the work is performed outdoors, the employer may permit employees engaged in Class I asbestos jobs to clean their protective clothing with a portable HEPA-equipped vacuum before such employees leave the regulated area. Following showering, such employees however must then change into street clothing in clean change areas provided by the employer which otherwise meet the requirements of this section.
- (ii) Decontamination area entry procedures. The employer shall ensure that employees:
  - (A) Enter the decontamination area through the clean room;
  - (B) Remove and deposit street clothing within a locker provided for their use; and
  - (C) Put on protective clothing and respiratory protection before leaving the clean room.
  - (D) Before entering the regulated area, the employer shall ensure that employees pass through the equipment room.
- (iii) Decontamination area exit procedures. The employer shall ensure that:
  - (A) Before leaving the regulated area, employees shall remove all gross contamination and debris from their protective clothing.
  - (B) Employees shall remove their protective clothing in the equipment room and deposit the clothing in labeled impermeable bags or containers.
  - (C) Employees shall not remove their respirators in the equipment room.
  - (D) Employees shall shower prior to entering the clean room.
  - (E) After showering, employees shall enter the clean room before changing into street clothes.
- (iv) Lunch Areas. Whenever food or beverages are consumed at the worksite where employees are performing Class I asbestos work, the employer shall provide lunch areas in which the airborne concentrations of asbestos are below the permissible exposure limit and/or excursion limit.

- (2) Requirements for Class I work involving less than 25 linear or 10 square feet of TSI or surfacing ACM and PACM, and for Class II and Class III asbestos work operations where exposures exceed a PEL or where there is no negative exposure assessment produced before the operation.
    - (i) The employer shall establish an equipment room or area that is adjacent to the regulated area for the decontamination of employees and their equipment which is contaminated with asbestos which shall consist of an area covered by a impermeable drop cloth on the floor or horizontal working surface.
    - (ii) The area must be of sufficient size as to accommodate cleaning of equipment and removing personal protective equipment without spreading contamination beyond the area (as determined by visible accumulations).
    - (iii) Work clothing must be cleaned with a HEPA vacuum before it is removed.
    - (iv) All equipment and surfaces of containers filled with ACM must be cleaned prior to removing them from the equipment room or area.
    - (v) The employer shall ensure that employees enter and exit the regulated area through the equipment room or area.
  - (3) Requirements for Class IV work. Employers shall ensure that employees performing Class IV work within a regulated area comply with the hygiene practice required of employees performing work which has a higher classification within that regulated area. Otherwise employers of employees cleaning up debris and material which is TSI or surfacing ACM or identified as PACM shall provide decontamination facilities for such employees which are required by paragraph (j)(2) of this section.
  - (4) Smoking in work areas. The employer shall ensure that employees do not smoke in work areas where they are occupationally exposed to asbestos because of activities in that work area.
- (k) Communication of hazards.
- (1) Hazard communication.

- (i) This section applies to the communication of information concerning asbestos hazards in construction activities to facilitate compliance with this standard. Most asbestos-related construction activities involve previously installed building materials. Building owners often are the only and/or best sources of information concerning them. Therefore, they, along with employers of potentially exposed employees, are assigned specific information conveying and retention duties under this section. Installed Asbestos Containing Building Material. Employers and building owners shall identify TSI and sprayed or troweled on surfacing materials in buildings as asbestos-containing, unless they determine in compliance with paragraph (k)(5) of this section that the material is not asbestos-containing. Asphalt and vinyl flooring material installed no later than 1980 must also be considered as asbestos containing unless the employer, pursuant to paragraph (g)(8)(i)(I) of this section determines that it is not asbestos-containing. If the employer/building owner has actual knowledge, or should have known through the exercise of due diligence, that other materials are asbestos-containing, they too must be treated as such. When communicating information to employees pursuant to this standard, owners and employers shall identify "PACM" as ACM. Additional requirements relating to communication of asbestos work on multi-employer worksites are set out in paragraph (d) of this section.
  - (ii) The employer shall include asbestos in the program established to comply with the Hazard Communication Standard (HCS) (1910.1200). The employer shall ensure that each employee has access to labels on containers of asbestos and safety data sheets, and is trained in accordance with the provisions of HCS and paragraphs (k)(9) and (10) of this section. The employer shall provide information on at least the following hazards: cancer and lung effects.
- (2) Duties of building and facility owners.
- (i) Before work subject to this standard is begun, building and facility owners shall determine the presence, location, and quantity of ACM and/or PACM at the work site pursuant to paragraph (k)(1)(i) of this section.
  - (ii) Building and/or facility owners shall notify the following persons of the presence, location and quantity of ACM or PACM, at the work sites in their buildings and facilities. Notification either shall be in writing, or shall consist of a personal communication between the owner and the person to whom notification must be given or their authorized representatives:

- (A) Prospective employers applying or bidding for work whose employees reasonably can be expected to work in or adjacent to areas containing such material;
  - (B) Employees of the owner who will work in or adjacent to areas containing such material;
  - (C) On multi-employer worksites, all employers of employees who will be performing work within or adjacent to areas containing such materials;
  - (D) Tenants who will occupy areas containing such material.
- (3) Duties of employers whose employees perform work subject to this standard in or adjacent to areas containing ACM and PACM. Building/facility owners whose employees perform such work shall comply with these provisions to the extent applicable.
- (i) Before work in areas containing ACM and PACM is begun; employers shall identify the presence, location, and quantity of ACM, and/or PACM therein pursuant to paragraph (k)(1)(i) of this section.
  - (ii) Before work under this standard is performed employers of employees who will perform such work shall inform the following persons of the location and quantity of ACM and/or PACM present in the area and the precautions to be taken to insure that airborne asbestos is confined to the area.
    - (A) Owners of the building/facility;
    - (B) Employees who will perform such work and employers of employees who work and/or will be working in adjacent areas.
  - (iii) Within 10 days of the completion of such work, the employer whose employees have performed work subject to this standard, shall inform the building/facility owner and employers of employees who will be working in the area of the current location and quantity of PACM and/or ACM remaining in the area and final monitoring results, if any.
- (4) In addition to the above requirements, all employers who discover ACM and/or PACM on a worksite shall convey information concerning the presence, location and quantity of such newly discovered ACM and/or PACM to the owner and to other employers of employees working at the work site, within 24 hours of the discovery.
- (5) Criteria to rebut the designation of installed material as PACM.

- (i) At any time, an employer and/or building owner may demonstrate, for purposes of this standard, that PACM does not contain asbestos. Building owners and/or employers are not required to communicate information about the presence of building material for which such a demonstration pursuant to the requirements of paragraph (k)(5)(ii) of this section has been made. However, in all such cases, the information, data and analysis supporting the determination that PACM does not contain asbestos, shall be retained pursuant to paragraph (n) of this section.
  - (ii) An employer or owner may demonstrate that PACM does not contain more than 1% asbestos by the following:
    - (A) Having a completed inspection conducted pursuant to the requirements of AHERA (40 CFR Part 763, Subpart E) which demonstrates that the material is not ACM; or
    - (B) Performing tests of the material containing PACM which demonstrate that no ACM is present in the material. Such tests shall include analysis of bulk samples collected in the manner described in 40 CFR 763.86. The tests, evaluation and sample collection shall be conducted by an accredited inspector or by a CIH. Analysis of samples shall be performed by persons or laboratories with proficiency demonstrated by current successful participation in a nationally recognized testing program such as the National Voluntary Laboratory Accreditation Program (NVLAP) or the National Institute for Standards and Technology (NIST) or the Round Robin for bulk samples administered by the American Industrial Hygiene Association (AIHA) or an equivalent nationally-recognized round robin testing program.
  - (iii) The employer and/or building owner may demonstrate that flooring material including associated mastic and backing does not contain asbestos, by a determination of an industrial hygienist based upon recognized analytical techniques showing that the material is not ACM.
- (6) At the entrance to mechanical rooms/areas in which employees reasonably can be expected to enter and which contain ACM and/or PACM, the building owner shall post signs which identify the material which is present, its location, and appropriate work practices which, if followed, will ensure that ACM and/or PACM will not be disturbed. The employer shall ensure, to the extent feasible, that employees who come in contact with these signs can comprehend them. Means to ensure employee comprehension may include the use of foreign languages, pictographs, graphics, and awareness training.
- (7) Signs.

- (i) Warning signs that demarcate the regulated area shall be provided and displayed at each location where a regulated area is required to be established by paragraph (e) of this section. Signs shall be posted at such a distance from such a location that an employee may read the signs and take necessary protective steps before entering the area marked by the signs.
- (ii)
- (A) The warning signs required by paragraph (k)(7) of this section shall bear the following information:

**DANGER**  
**ASBESTOS**  
**MAY CAUSE CANCER**  
**CAUSES DAMAGE TO LUNGS**  
**AUTHORIZED PERSONNEL ONLY**

- (B) In addition, where the use of respirators and protective clothing is required in the regulated area under this section, the warning signs shall include the following:

**WEAR RESPIRATORY PROTECTION AND**  
**PROTECTIVE CLOTHING IN THIS AREA**

- (C) Prior to June 1, 2016, employers may use the following legend in lieu of that specified in paragraph (k)(7)(ii)(A) of this section:

**DANGER**  
**ASBESTOS**  
**CANCER AND LUNG DISEASE HAZARD**  
**AUTHORIZED PERSONNEL ONLY**

- (D) Prior to June 1, 2016, employers may use the following legend in lieu of that specified in paragraph (k)(7)(ii)(B) of this section:

**RESPIRATORS AND PROTECTIVE CLOTHING**  
**ARE REQUIRED IN THIS AREA**

- (iii) The employer shall ensure that employees working in and contiguous to regulated areas comprehend the warning signs required to be posted by paragraph (k)(7)(i) of this section. Means to ensure employee comprehension may include the use of foreign languages, pictographs and graphics.
- (8) Labels.
- (i) Labels shall be affixed to all products containing asbestos and to all containers containing such products, including waste containers. Where feasible, installed asbestos products shall contain a visible label.
  - (ii) The employer shall ensure that such labels comply with paragraph (k) of this section.
  - (iii) The employer shall ensure that labels of bags or containers of protective clothing and equipment, scrap, waste, and debris containing asbestos fibers bear the following information:

**DANGER**  
**CONTAINS ASBESTOS FIBERS**  
**MAY CAUSE CANCER**  
**CAUSES DAMAGE TO LUNGS**  
**DO NOT BREATHE DUST**  
**AVOID CREATING DUST**

- (iv)
  - (A) Prior to June 1, 2015, employers may include the following information on raw materials, mixtures or labels of bags or containers of protective clothing and equipment, scrap, waste, and debris containing asbestos fibers in lieu of the labeling requirements in paragraphs (k)(8)(ii) and (k)(8)(iii) of this section.

**DANGER**  
**CONTAINS ASBESTOS FIBERS**  
**AVOID CREATING DUST**  
**CANCER AND LUNG DISEASE HAZARD**

- (B) Labels shall also contain a warning statement against breathing asbestos fibers.

- (v) Reserved.
  - (vi) The provisions for labels required by paragraphs (k)(8)(i) through (k)(8)(iii) do not apply where:
    - (A) Asbestos fibers have been modified by a bonding agent, coating, binder, or other material, provided that the manufacturer can demonstrate that, during any reasonably foreseeable use, handling, storage, disposal, processing, or transportation, no airborne concentrations of asbestos fibers in excess of the permissible exposure limit and/or excursion limit will be released, or
    - (B) Asbestos is present in a product in concentrations less than 1.0 percent.
  - (vii) When a building owner or employer identifies previously installed PACM and/or ACM, labels or signs shall be affixed or posted so that employees will be notified of what materials contain PACM and/or ACM. The employer shall attach such labels in areas where they will clearly be noticed by employees who are likely to be exposed, such as at the entrance to mechanical room/areas. Signs required by paragraph (k)(6) of this section may be posted in lieu of labels so long as they contain information required for labelling. The employer shall ensure, to the extent feasible, that employees who come in contact with these signs or labels can comprehend them. Means to ensure employee comprehension may include the use of foreign languages, pictographs, graphics, and awareness training.
- (9) Employee Information and Training.
- (i) The employer shall train each employee who is likely to be exposed in excess of a PEL, and each employee who performs Class I through IV asbestos operations, in accordance with the requirements of this section. Such training shall be conducted at no cost to the employee. The employer shall institute a training program and ensure employee participation in the program.
  - (ii) Training shall be provided prior to or at the time of initial assignment and at least annually thereafter.
  - (iii) Training for Class I operations and for Class II operations that require the use of critical barriers (or equivalent isolation methods) and/or negative pressure enclosures under this section shall be the equivalent in curriculum, training method and length to the EPA Model Accreditation Plan (MAP) asbestos abatement workers training (40 CFR Part 763, Subpart E, Appendix C).
  - (iv) Training for Class II work.

- (A) For work with asbestos containing roofing materials, flooring materials, siding materials, ceiling tiles, or transite panels, training shall include at a minimum all the elements included in paragraph (k)(9)(viii) of this section and in addition, the specific work practices and engineering controls set forth in paragraph (g) of this section which specifically relate to that category. Such course shall include “hands-on” training and shall take at least 8 hours.
- (B) An employee who works with more than one of the categories of material specified in paragraph (k)(9)(iv)(A) of this section shall receive training in the work practices applicable to each category of material that the employee removes and each removal method that the employee uses.
- (C) For Class II operations not involving the categories of material specified in paragraph (k)(9)(iv)(A) of this section, training shall be provided which shall include at a minimum all the elements included in paragraph (k)(9)(viii) of this section and in addition, the specific work practices and engineering controls set forth in paragraph (g) of this section which specifically relate to the category of material being removed, and shall include “hands-on” training in the work practices applicable to each category of material that the employee removes and each removal method that the employee uses.
- (v) Training for Class III employees shall be consistent with EPA requirements for training of local education agency maintenance and custodial staff as set forth at 40 CFR 763.92(a)(2). Such a course shall also include “hands-on” training and shall take at least 16 hours. Exception: For Class III operations for which the competent person determines that the EPA curriculum does not adequately cover the training needed to perform that activity, training shall include as a minimum all the elements included in paragraph (k)(9)(viii) of this section and in addition, the specific work practices and engineering controls set forth in paragraph (g) of this section which specifically relate to that activity, and shall include “hands-on” training in the work practices applicable to each category of material that the employee disturbs.

- (vi) Training for employees performing Class IV operations shall be consistent with EPA requirements for training of local education agency maintenance and custodial staff as set forth at 40 CFR 763.92(a)(1). Such a course shall include available information concerning the locations of thermal system insulation and surfacing ACM/PACM, and asbestos-containing flooring material, or flooring material where the absence of asbestos has not yet been certified; and instruction in recognition of damage, deterioration, and delamination of asbestos containing building materials. Such course shall take at least 2 hours.
- (vii) Training for employees who are likely to be exposed in excess of the PEL and who are not otherwise required to be trained under paragraph (k)(9)(iii) through (vi) of this section, shall meet the requirements of paragraph (k)(9)(viii) of this section.
- (viii) The training program shall be conducted in a manner that the employee is able to understand. In addition to the content required by provisions in paragraph (k)(9)(iii) through (vi) of this section, the employer shall ensure that each such employee is informed of the following:
  - (A) Methods of recognizing asbestos, including the requirement in paragraph (k)(1) of this section to presume that certain building materials contain asbestos;
  - (B) The health effects associated with asbestos exposure;
  - (C) The relationship between smoking and asbestos in producing lung cancer;
  - (D) The nature of operations that could result in exposure to asbestos, the importance of necessary protective controls to minimize exposure including, as applicable, engineering controls, work practices, respirators, housekeeping procedures, hygiene facilities, protective clothing, decontamination procedures, emergency procedures, and waste disposal procedures, and any necessary instruction in the use of these controls and procedures; where Class III and IV work will be or is performed, the contents of EPA 20T-2003, "Managing Asbestos In-Place" July 1990 or its equivalent in content;
  - (E) The purpose, proper use, fitting instructions, and limitations of respirators as required by 29 CFR 1910.134;
  - (F) The appropriate work practices for performing the asbestos job;
  - (G) Medical surveillance program requirements;

- (H) The content of this standard including appendices;
  - (I) The names, addresses and phone numbers of public health organizations which provide information, materials and/or conduct programs concerning smoking cessation. The employer may distribute the list of such organizations contained in Appendix J to this section, to comply with this requirement; and
  - (J) The requirements for posting signs and affixing labels and the meaning of the required legends for such signs and labels.
- (10) Access to training materials.
- (i) The employer shall make readily available to affected employees without cost, written materials relating to the employee training program, including a copy of this regulation.
  - (ii) The employer shall provide to the Assistant Secretary and the Director, upon request, all information and training materials relating to the employee information and training program.
  - (iii) The employer shall inform all employees concerning the availability of self-help smoking cessation program material. Upon employee request, the employer shall distribute such material, consisting of NIH Publication No. 89-1647, or equivalent self-help material, which is approved or published by a public health organization listed in Appendix J to this section.
- (l) Housekeeping.
- (1) Vacuuming. Where vacuuming methods are selected, HEPA filtered vacuuming equipment must be used. The equipment shall be used and emptied in a manner that minimizes the reentry of asbestos into the workplace.
  - (2) Waste disposal. Asbestos waste, scrap, debris, bags, containers, equipment, and contaminated clothing consigned for disposal shall be collected and disposed of in sealed, labeled, impermeable bags or other closed, labeled, impermeable containers except in roofing operations, where the procedures specified in paragraph (g)(8)(ii) of this section apply.
  - (3) Care of asbestos-containing flooring material.
    - (i) All vinyl and asphalt flooring material shall be maintained in accordance with this paragraph unless the building/facility owner demonstrates, pursuant to paragraph (g)(8)(i)(l) of this section that the flooring does not contain asbestos.
    - (ii) Sanding of flooring material is prohibited.

- (iii) Stripping of finishes shall be conducted using low abrasion pads at speeds lower than 300 rpm and wet methods.
- (iv) Burnishing or dry buffing may be performed only on flooring which has sufficient finish so that the pad cannot contact the flooring material.
- (4) Waste and debris and accompanying dust in an area containing accessible thermal system insulation or surfacing ACM/PACM or visibly deteriorated ACM:
  - (i) Shall not be dusted or swept dry, or vacuumed without using a HEPA filter;
  - (ii) Shall be promptly cleaned up and disposed of in leak tight containers.
- (m) Medical surveillance.
  - (1) General.
    - (i) Employees covered.
      - (A) The employer shall institute a medical surveillance program for all employees who for a combined total of 30 or more days per year are engaged in Class I, II and III work or are exposed at or above a permissible exposure limit. For purposes of this paragraph, any day in which a worker engages in Class II or Class III operations or a combination thereof on intact material for one hour or less (taking into account the entire time spent on the removal operation, including cleanup) and, while doing so, adheres fully to the work practices specified in this standard, shall not be counted.
      - (B) For employees otherwise required by this standard to wear a negative pressure respirator, employers shall ensure employees are physically able to perform the work and use the equipment. This determination shall be made under the supervision of a physician.
    - (ii) Examination.
      - (A) The employer shall ensure that all medical examinations and procedures are performed by or under the supervision of a licensed physician, and are provided at no cost to the employee and at a reasonable time and place.
      - (B) Persons other than such licensed physicians who administer the pulmonary function testing required by this section shall complete a training course in spirometry sponsored by an appropriate academic or professional institution.
  - (2) Medical examinations and consultations.

- (i) Frequency. The employer shall make available medical examinations and consultations to each employee covered under paragraph (m)(1)(i) of this section on the following schedules:
  - (A) Prior to assignment of the employee to an area where negative-pressure respirators are worn;
  - (B) When the employee is assigned to an area where exposure to asbestos may be at or above the permissible exposure limit for 30 or more days per year, or engage in Class I, II, or III work for a combined total of 30 or more days per year, a medical examination must be given within 10 working days following the thirtieth day of exposure;
  - (C) And at least annually thereafter.
  - (D) If the examining physician determines that any of the examinations should be provided more frequently than specified, the employer shall provide such examinations to affected employees at the frequencies specified by the physician.
  - (E) Exception: No medical examination is required of any employee if adequate records show that the employee has been examined in accordance with this paragraph within the past 1-year period.
- (ii) Content. Medical examinations made available pursuant to paragraphs (m)(2)(i)(A) through (m)(2)(i)(C) of this section shall include:
  - (A) A medical and work history with special emphasis directed to the pulmonary, cardiovascular, and gastrointestinal systems.
  - (B) On initial examination, the standardized questionnaire contained in Part 1 of Appendix D to this section, and, on annual examination, the abbreviated standardized questionnaire contained in Part 2 of Appendix D to this section.
  - (C) A physical examination directed to the pulmonary and gastrointestinal systems, including a 14- by 17-inch or other reasonably-sized standard film or digital posterior-anterior chest X-ray to be administered at the discretion of the physician, and pulmonary function tests of forced vital capacity (FVC) and forced expiratory volume at one second (FEV(1)). Classification of all chest X-rays shall be conducted in accordance with Appendix E to this section.
  - (D) Any other examinations or tests deemed necessary by the examining physician.

- (3) Information provided to the physician. The employer shall provide the following information to the examining physician:
  - (i) A copy of this standard and Appendices D, E, and I to this section;
  - (ii) A description of the affected employee's duties as they relate to the employee's exposure;
  - (iii) The employee's representative exposure level or anticipated exposure level;
  - (iv) A description of any personal protective and respiratory equipment used or to be used; and
  - (v) Information from previous medical examinations of the affected employee that is not otherwise available to the examining physician.
- (4) Physician's written opinion.
  - (i) The employer shall obtain a written opinion from the examining physician. This written opinion shall contain the results of the medical examination and shall include:
    - (A) The physician's opinion as to whether the employee has any detected medical conditions that would place the employee at an increased risk of material health impairment from exposure to asbestos;
    - (B) Any recommended limitations on the employee or on the use of personal protective equipment such as respirators; and
    - (C) A statement that the employee has been informed by the physician of the results of the medical examination and of any medical conditions that may result from asbestos exposure.
    - (D) A statement that the employee has been informed by the physician of the increased risk of lung cancer attributable to the combined effect of smoking and asbestos exposure.
  - (ii) The employer shall instruct the physician not to reveal in the written opinion given to the employer specific findings or diagnoses unrelated to occupational exposure to asbestos.
  - (iii) The employer shall provide a copy of the physician's written opinion to the affected employee within 30 days from its receipt.
- (n) Recordkeeping.
  - (1) Objective data relied on pursuant to paragraph (f) of this section.

- (i) Where the employer has relied on objective data that demonstrates that products made from or containing asbestos or the activity involving such products or material are not capable of releasing fibers of asbestos in concentrations at or above the permissible exposure limit and/or excursion limit under the expected conditions of processing, use, or handling to satisfy the requirements of paragraph (f), the employer shall establish and maintain an accurate record of objective data reasonably relied upon in support of the exemption.
  - (ii) The record shall include at least the following information:
    - (A) The product qualifying for exemption;
    - (B) The source of the objective data;
    - (C) The testing protocol, results of testing, and/or analysis of the material for the release of asbestos;
    - (D) A description of the operation exempted and how the data support the exemption; and
    - (E) Other data relevant to the operations, materials, processing, or employee exposures covered by the exemption.
  - (iii) The employer shall maintain this record for the duration of the employer's reliance upon such objective data.
- (2) Exposure measurements.
- (i) The employer shall keep an accurate record of all measurements taken to monitor employee exposure to asbestos as prescribed in paragraph (f) of this section.

**Note:** The employer may utilize the services of competent organizations such as industry trade associations and employee associations to maintain the records required by this section.

- (ii) This record shall include at least the following information:
  - (A) The date of measurement;
  - (B) The operation involving exposure to asbestos that is being monitored;
  - (C) Sampling and analytical methods used and evidence of their accuracy;
  - (D) Number, duration, and results of samples taken;
  - (E) Type of protective devices worn, if any; and
  - (F) Name and exposure of the employees whose exposures are represented.

- (iii) The employer shall maintain this record for at least thirty (30) years, in accordance with 29 CFR 1910.1020.
- (3) Medical surveillance.
  - (i) The employer shall establish and maintain an accurate record for each employee subject to medical surveillance by paragraph (m) of this section, in accordance with 29 CFR 1910.1020.
  - (ii) The record shall include at least the following information:
    - (A) The name of the employee;
    - (B) A copy of the employee's medical examination results, including the medical history, questionnaire responses, results of any tests, and physician's recommendations.
    - (C) Physician's written opinions;
    - (D) Any employee medical complaints related to exposure to asbestos; and
    - (E) A copy of the information provided to the physician as required by paragraph (m) of this section.
  - (iii) The employer shall ensure that this record is maintained for the duration of employment plus thirty (30) years, in accordance with 29 CFR 1910.1020.
- (4) Training records. The employer shall maintain all employee training records for one (1) year beyond the last date of employment by that employer.
- (5) Data to Rebut PACM. Where the building owner and employer have relied on data to demonstrate that PACM is not asbestos-containing, such data shall be maintained for as long as they are relied upon to rebut the presumption.
- (6) Records of Required Notifications. Where the building owner has communicated and received information concerning the identification, location and quantity of ACM and PACM, written records of such notifications and their content shall be maintained by the building owner for the duration of ownership and shall be transferred to successive owners of such buildings/facilities.
- (7) Availability.
  - (i) The employer, upon written request, shall make all records required to be maintained by this section available to the Assistant Secretary and the Director for examination and copying.
  - (ii) The employer must comply with the requirements concerning availability of records set forth in 29 CFR 1910.1020.

- (8) Transfer of records. The employer must comply with the requirements concerning transfer of records set forth in 29 CFR 1910.1020(h).
- (o) Competent person.
- (1) General. On all construction worksites covered by this standard, the employer shall designate a competent person, having the qualifications and authorities for ensuring worker safety and health required by Subpart C, General Safety and Health Provisions for Construction (29 CFR 1926.20 through 1926.32).
- (2) Required Inspections by the Competent Person. Section 1926.20(b)(2) which requires health and safety prevention programs to provide for frequent and regular inspections of the job sites, materials, and equipment to be made by competent persons, is incorporated.
- (3) Additional Inspections. In addition, the competent person shall make frequent and regular inspections of the job sites, in order to perform the duties set out below in paragraph (o)(3)(i) of this section. For Class I jobs, on-site inspections shall be made at least once during each work shift, and at any time at employee request. For Class II, III and IV jobs, on-site inspections shall be made at intervals sufficient to assess whether conditions have changed, and at any reasonable time at employee request.
- (i) On all worksites where employees are engaged in Class I or II asbestos work, the competent person designated in accordance with paragraph (e)(6) of this section shall perform or supervise the following duties, as applicable:
- (A) Set up the regulated area, enclosure, or other containment;
  - (B) Ensure (by on-site inspection) the integrity of the enclosure or containment;
  - (C) Set up procedures to control entry to and exit from the enclosure and/or area;
  - (D) Supervise all employee exposure monitoring required by this section and ensure that it is conducted as required by paragraph (f) of this section;
  - (E) Ensure that employees working within the enclosure and/or using glovebags wear respirators and protective clothing as required by paragraphs (h) and (i) of this section;
  - (F) Ensure through on-site supervision, that employees set up, use, and remove engineering controls, use work practices and personal protective equipment in compliance with all requirements;

- (G) Ensure that employees use the hygiene facilities and observe the decontamination procedures specified in paragraph (j) of this section;
  - (H) Ensure that through on-site inspection, engineering controls are functioning properly and employees are using proper work practices; and,
  - (I) Ensure that notification requirement in paragraph (k) of this section are met.
- (ii) Reserved
- (4) Training for the competent person.
- (i) For Class I and II asbestos work the competent person shall be trained in all aspects of asbestos removal and handling, including: abatement, installation, removal and handling; the contents of this standard; the identification of asbestos; removal procedures, where appropriate; and other practices for reducing the hazard. Such training shall be obtained in a comprehensive course for supervisors that meets the criteria of EPA's Model Accreditation Plan (40 CFR Part 763, Subpart E, Appendix C), such as a course conducted by an EPA-approved or state-approved training provider, certified by EPA or a state, or a course equivalent in stringency, content and length.
  - (ii) For Class III and IV asbestos work, the competent person shall be trained in aspects of asbestos handling appropriate for the nature of the work, to include procedures for setting up glove bags and mini-enclosures, practices for reducing asbestos exposures, use of wet methods, the contents of this standard, and the identification of asbestos. Such training shall include successful completion of a course that is consistent with EPA requirements for training of local education agency maintenance and custodial staff as set forth at 40 CFR 763.92(a)(2), or its equivalent in stringency, content, and length. Competent persons for Class III and IV work, may also be trained pursuant to the requirements of paragraph (o)(4)(i) of this section.
- (p) Appendices.
- (1) Appendices A, C, D, and E to this section are incorporated as part of this section and the contents of these appendices are mandatory.
  - (2) Appendices B, F, H, I, J, and K to this section are informational and are not intended to create any additional obligations not otherwise imposed or to detract from any existing obligations.

**Appendix A to 1926.1101 — OSHA Reference Method — Mandatory**

This mandatory appendix specifies the procedure for analyzing air samples for asbestos and specifies quality control procedures that must be implemented by laboratories performing the analysis. The sampling and analytical methods described below represent the elements of the available monitoring methods (such as Appendix B of this regulation, the most current version of the OSHA method ID-160, or the most current version of the NIOSH method 7400). All employers who are required to conduct air monitoring under paragraph (f) of the standard are required to utilize analytical laboratories that use this procedure, or an equivalent method, for collecting and analyzing samples.

**Sampling and Analytical Procedure**

1. The sampling medium for air samples shall be mixed cellulose ester filter membranes. These shall be designated by the manufacturer as suitable for asbestos counting. See below for rejection of blanks.
2. The preferred collection device shall be the 25-mm diameter cassette with an open-faced 50-mm electrically conductive extension cowl. The 37-mm cassette may be used if necessary but only if written justification for the need to use the 37-mm filter cassette accompanies the sample results in the employee's exposure monitoring record. Do not reuse or reload cassettes for asbestos sample collection.
3. An air flow rate between 0.5 liter/min and 2.5 liters/min shall be selected for the 25/mm cassette. If the 37-mm cassette is used, an air flow rate between 1 liter/min and 2.5 liters/min shall be selected.
4. Where possible, a sufficient air volume for each air sample shall be collected to yield between 100 and 1,300 fibers per square millimeter on the membrane filter. If a filter darkens in appearance or if loose dust is seen on the filter, a second sample shall be started.
5. Ship the samples in a rigid container with sufficient packing material to prevent dislodging the collected fibers. Packing material that has a high electrostatic charge on its surface (e.g., expanded polystyrene) cannot be used because such material can cause loss of fibers to the sides of the cassette.
6. Calibrate each personal sampling pump before and after use with a representative filter cassette installed between the pump and the calibration devices.
7. Personal samples shall be taken in the "breathing zone" of the employee (i.e., attached to or near the collar or lapel near the worker's face).

8. Fiber counts shall be made by positive phase contrast using a microscope with an 8 to 10x eyepiece and a 40 to 45x objective for a total magnification of approximately 400x and a numerical aperture of 0.65 to 0.75. The microscope shall also be fitted with a green or blue filter.
9. The microscope shall be fitted with a Walton-Beckett eyepiece graticule calibrated for a field diameter of 100 micrometers ( $\pm 2$  micrometers).
10. The phase-shift detection limit of the microscope shall be about 3 degrees measured using the HSE phase shift test slide as outlined below.
  - a. Place the test slide on the microscope stage and center it under the phase objective.
  - b. Bring the blocks of grooved lines into focus.

**Note:** The slide consists of seven sets of grooved lines (ca. 20 grooves to each block) in descending order of visibility from sets 1 to 7, seven being the least visible. The requirements for asbestos counting are that the microscope optics must resolve the grooved lines in set 3 completely, although they may appear somewhat faint, and that the grooved lines in sets 6 and 7 must be invisible. Sets 4 and 5 must be at least partially visible but may vary slightly in visibility between microscopes. A microscope that fails to meet these requirements has either too low or too high a resolution to be used for asbestos counting.

- c. If the image deteriorates, clean and adjust the microscope optics. If the problem persists, consult the microscope manufacturer.
11. Each set of samples taken will include 10% field blanks or a minimum of 2 field blanks. These blanks must come from the same lot as the filters used for sample collection. The field blank results shall be averaged and subtracted from the analytical results before reporting. A set consists of any sample or group of samples for which an evaluation for this standard must be made. Any samples represented by a field blank having a fiber count in excess of the detection limit of the method being used shall be rejected.
12. The samples shall be mounted by the acetone/triacetin method or a method with an equivalent index of refraction and similar clarity.
13. Observe the following counting rules.
  - a. Count only fibers equal to or longer than 5 micrometers. Measure the length of curved fibers along the curve.
  - b. In the absence of other information, count all particles as asbestos that have a length-to-width ratio (aspect ratio) of 3:1 or greater.

- c. Fibers lying entirely within the boundary of the Walton-Beckett graticule field shall receive a count of 1. Fibers crossing the boundary once, having one end within the circle, shall receive the count of one half (1/2). Do not count any fiber that crosses the graticule boundary more than once. Reject and do not count any other fibers even though they may be visible outside the graticule area.
  - d. Count bundles of fibers as one fiber unless individual fibers can be identified by observing both ends of an individual fiber.
  - e. Count enough graticule fields to yield 100 fibers. Count a minimum of 20 fields; stop counting at 100 fields regardless of fiber count.
14. Blind recounts shall be conducted at the rate of 10 percent.

#### **Quality Control Procedures**

1. Intralaboratory program. Each laboratory and/or each company with more than one microscopist counting slides shall establish a statistically designed quality assurance program involving blind recounts and comparisons between microscopists to monitor the variability of counting by each microscopist and between microscopists. In a company with more than one laboratory, the program shall include all laboratories, and shall also evaluate the laboratory-to-laboratory variability.
2.
  - a. Interlaboratory program. Each laboratory analyzing asbestos samples for compliance determination shall implement an interlaboratory quality assurance program that, as a minimum, includes participation of at least two other independent laboratories. Each laboratory shall participate in round robin testing at least once every 6 months with at least all the other laboratories in its interlaboratory quality assurance group. Each laboratory shall submit slides typical of its own workload for use in this program. The round robin shall be designed and results analyzed using appropriate statistical methodology.
  - b. All laboratories should also participate in a national sample testing scheme such as the Proficiency Analytical Testing Program (PAT), or the Asbestos Registry sponsored by the American Industrial Hygiene Association (AIHA).
3. All individuals performing asbestos analysis must have taken the NIOSH course for sampling and evaluating airborne asbestos dust or an equivalent course.
4. When the use of different microscopes contributes to differences between counters and laboratories, the effect of the different microscope shall be evaluated and the microscope shall be replaced, as necessary.
5. Current results of these quality assurance programs shall be posted in each laboratory to keep the microscopists informed.

**Appendix B to 1926.1101 — Sampling and Analysis (Non-Mandatory)**

<b>Matrix</b>	
<b>OSHA Permissible Exposure Limits:</b>	
<b>Time Weighted Average</b>	0.1 fiber/cc
<b>Excursion Level (30 minutes)</b>	1.0 fiber/cc
<b>Collection Procedure:</b>	
A known volume of air is drawn through a 25-mm diameter cassette containing a mixed-cellulose ester filter. The cassette must be equipped with an electrically conductive 50 mm extension cowl. The sampling time and rate are chosen to give a fiber density of between 100 to 1,300 fibers/mm <sup>2</sup> on the filter.	
<b>Recommended Sampling Rate</b>	0.5 to 5.0 liters/minute (L/min)
<b>Recommended Air Volumes:</b>	
<b>Minimum</b>	25 L
<b>Maximum</b>	2,400 L

**Analytical Procedure:** A portion of the sample filter is cleared and prepared for asbestos fiber counting by Phase Contrast Microscopy (PCM) at 400X.

Commercial manufacturers and products mentioned in this method are for descriptive use only and do not constitute endorsements by USDOL-OSHA. Similar products from other sources can be substituted.

### 1. Introduction

This method describes the collection of airborne asbestos fibers using calibrated sampling pumps with mixed-cellulose ester (MCE) filters and analysis by phase contrast microscopy (PCM). Some terms used are unique to this method and are defined below:

**Asbestos:** A term for naturally occurring fibrous minerals. Asbestos includes chrysotile, crocidolite, amosite (cummingtonite-grunerite asbestos), tremolite asbestos, actinolite asbestos, anthophyllite asbestos, and any of these minerals that have been chemically treated and/or altered. The precise chemical formulation of each species will vary with the location from which it was mined. Nominal compositions are listed:

Chrysotile	$Mg_3Si_2O_5(OH)_4$
Crocidolite	$Na_2Fe_3^{2+}Fe_2^{3+}Si_8O_{22}(OH)_2$
Amosite	$(Mg,Fe)_7Si_8O_{22}(OH)_2$
Tremolite-actinolite	$Ca_2(Mg,Fe)_5Si_8O_{22}(OH)_2$
Anthophyllite	$(Mg,Fe)_7Si_8O_{22}(OH)_2$

**Asbestos Fiber:** A fiber of asbestos which meets the criteria specified below for a fiber.

**Aspect Ratio:** The ratio of the length of a fiber to its diameter (e.g. 3:1, 5:1 aspect ratios).

**Cleavage Fragments:** Mineral particles formed by comminution of minerals, especially those characterized by parallel sides and a moderate aspect ratio (usually less than 20:1).

**Detection Limit:** The number of fibers necessary to be 95% certain that the result is greater than zero.

**Differential Counting:** The term applied to the practice of excluding certain kinds of fibers from the fiber count because they do not appear to be asbestos.

**Fiber:** A particle that is 5  $\mu\text{m}$  or longer, with a length-to-width ratio of 3 to 1 or longer.

**Field:** The area within the graticule circle that is superimposed on the microscope image.

**Set:** The samples which are taken, submitted to the laboratory, analyzed, and for which, interim or final result reports are generated.

**Tremolite, Anthophyllite, and Actinolite:** The non-asbestos form of these minerals which meet the definition of a fiber. It includes any of these minerals that have been chemically treated and/or altered.

**Walton-Beckett Graticule:** An eyepiece graticule specifically designed for asbestos fiber counting. It consists of a circle with a projected diameter of  $100 \pm 2 \mu\text{m}$  (area of about  $0.00785 \text{ mm}^2$ ) with a crosshair having tic-marks at 3- $\mu\text{m}$  intervals in one direction and 5- $\mu\text{m}$  in the orthogonal direction. There are marks around the periphery of the circle to demonstrate the proper sizes and shapes of fibers. This design is reproduced in Figure 1. The disk is placed in one of the microscope eyepieces so that the design is superimposed on the field of view.

### 1.1. History

Early surveys to determine asbestos exposures were conducted using impinger counts of total dust with the counts expressed as million particles per cubic foot. The British Asbestos Research Council recommended filter membrane counting in 1969. In July 1969, the Bureau of Occupational Safety and Health published a filter membrane method for counting asbestos fibers in the United States. This method was refined by NIOSH and published as P & CAM 239. On May 29, 1971, OSHA specified filter membrane sampling with phase contrast counting for evaluation of asbestos exposures at work sites in the United States. The use of this technique was again required by OSHA in 1986. Phase contrast microscopy has continued to be the method of choice for the measurement of occupational exposure to asbestos.

## 1.2. Principle

Air is drawn through a MCE filter to capture airborne asbestos fibers. A wedge shaped portion of the filter is removed, placed on a glass microscope slide and made transparent. A measured area (field) is viewed by PCM. All the fibers meeting defined criteria for asbestos are counted and considered a measure of the airborne asbestos concentration.

## 1.3. Advantages and Disadvantages

There are four main advantages of PCM over other methods:

- (1) The technique is specific for fibers. Phase contrast is a fiber counting technique which excludes non-fibrous particles from the analysis.
- (2) The technique is inexpensive and does not require specialized knowledge to carry out the analysis for total fiber counts.
- (3) The analysis is quick and can be performed on-site for rapid determination of air concentrations of asbestos fibers.
- (4) The technique has continuity with historical epidemiological studies so that estimates of expected disease can be inferred from long-term determinations of asbestos exposures.

The main disadvantage of PCM is that it does not positively identify asbestos fibers. Other fibers which are not asbestos may be included in the count unless differential counting is performed. This requires a great deal of experience to adequately differentiate asbestos from non-asbestos fibers. Positive identification of asbestos must be performed by polarized light or electron microscopy techniques. A further disadvantage of PCM is that the smallest visible fibers are about 0.2  $\mu\text{m}$  in diameter while the finest asbestos fibers may be as small as 0.02  $\mu\text{m}$  in diameter. For some exposures, substantially more fibers may be present than are actually counted.

## 1.4. Workplace Exposure

Asbestos is used by the construction industry in such products as shingles, floor tiles, asbestos cement, roofing felts, insulation and acoustical products. Non-construction uses include brakes, clutch facings, paper, paints, plastics, and fabrics. One of the most significant exposures in the workplace is the removal and encapsulation of asbestos in schools, public buildings, and homes. Many workers have the potential to be exposed to asbestos during these operations.

About 95% of the asbestos in commercial use in the United States is chrysotile. Crocidolite and amosite make up most of the remainder. Anthophyllite and tremolite or actinolite are likely to be encountered as contaminants in various industrial products.

### 1.5. Physical Properties

Asbestos fiber possesses a high tensile strength along its axis, is chemically inert, non-combustible, and heat resistant. It has a high electrical resistance and good sound absorbing properties. It can be weaved into cables, fabrics or other textiles, and also matted into asbestos papers, felts, or mats.

## 2. Range and Detection Limit

- 2.1. The ideal counting range on the filter is 100 to 1,300 fibers/mm<sup>2</sup>. With a Walton-Beckett graticule this range is equivalent to 0.8 to 10 fibers/field. Using NIOSH counting statistics, a count of 0.8 fibers/field would give an approximate coefficient of variation (CV) of 0.13.
- 2.2. The detection limit for this method is 4.0 fibers per 100 fields or 5.5 fibers/mm<sup>2</sup>. This was determined using an equation to estimate the maximum CV possible at a specific concentration (95% confidence) and a Lower Control Limit of zero. The CV value was then used to determine a corresponding concentration from historical CV vs fiber relationships. As an example:

$$\text{Lower Control Limit (95\% Confidence)} = AC - 1.645(CV)(AC)$$

Where:

AC = Estimate of the airborne fiber concentration (fibers/cc) Setting the Lower Control Limit = 0 and solving for CV:

$$0 = AC - 1.645(CV)(AC)$$

$$CV = 0.61$$

This value was compared with CV vs. count curves. The count at which CV = 0.61 for Leidel-Busch counting statistics or for an OSHA Salt Lake Technical Center (OSHA-SLTC) CV curve (see Appendix A for further information) was 4.4 fibers or 3.9 fibers per 100 fields, respectively. Although a lower detection limit of 4 fibers per 100 fields is supported by the OSHA-SLTC data, both data sets support the 4.5 fibers per 100 fields value.

3. Method Performance – Precision and Accuracy

Precision is dependent upon the total number of fibers counted and the uniformity of the fiber distribution on the filter. A general rule is to count at least 20 and not more than 100 fields. The count is discontinued when 100 fibers are counted, provided that 20 fields have already been counted. Counting more than 100 fibers results in only a small gain in precision. As the total count drops below 10 fibers, an accelerated loss of precision is noted.

At this time, there is no known method to determine the absolute accuracy of the asbestos analysis. Results of samples prepared through the Proficiency Analytical Testing (PAT) Program and analyzed by the OSHA-SLTC showed no significant bias when compared to PAT reference values. The PAT samples were analyzed from 1987 to 1989 (N=36) and the concentration range was from 120 to 1,300 fibers/mm<sup>2</sup>.

4. Interferences

Fibrous substances, if present, may interfere with asbestos analysis.

Some common fibers are:

Fiberglass	Membrane structures
Anhydrite	Sponge spicules
Plant fibers	Diatoms
Perlite veins	Microorganisms
Gypsum	Wollastonite
Some synthetic fibers	

The use of electron microscopy or optical tests such as polarized light, and dispersion staining may be used to differentiate these materials from asbestos when necessary.

5. Sampling

5.1. Equipment

- 5.1.1. Sample assembly (The assembly is shown in Figure 3). Conductive filter holder consisting of a 25-mm diameter, 3-piece cassette having a 50-mm long electrically conductive extension cowl. Backup pad, 25-mm, cellulose. Membrane filter, mixed-cellulose ester (MCE), 25-mm, plain, white, 0.4 to 1.2  $\mu\text{m}$  pore size.

**Notes:**

- (a) DO NOT RE-USE CASSETTES.
- (b) Fully conductive cassettes are required to reduce fiber loss to the sides of the cassette due to electrostatic attraction.
- (c) Purchase filters which have been selected by the manufacturer for asbestos counting or analyze representative filters for fiber background before use. Discard the filter lot if more than 4 fibers/100 fields are found.
- (d) To decrease the possibility of contamination, the sampling system (filter-backup pad-cassette) for asbestos is usually preassembled by the manufacturer.
- (e) Other cassettes, such as Bell-mouth, may be used within the limits of their validation.

5.1.2. Gel bands for sealing cassettes.

5.1.3. Sampling pump.

Each pump must be a battery operated, self-contained unit small enough to be placed on the monitored employee and not interfere with the work being performed. The pump must be capable of sampling at the collection rate for the required sampling time.

5.1.4. Flexible tubing, 6-mm bore.

5.1.5. Pump calibration.

Stopwatch and bubble tube/burette or electronic meter.

**5.2. Sampling Procedure**

5.2.1. Seal the point where the base and cowl of each cassette meet with a gel band or tape.

5.2.2. Charge the pumps completely before beginning.

5.2.3. Connect each pump to a calibration cassette with an appropriate length of 6 mm bore plastic tubing. Do not use luer connectors – the type of cassette specified above has built-in adapters.

- 5.2.4. Select an appropriate flow rate for the situation being monitored. The sampling flow rate must be between 0.5 and 5.0 L/min for personal sampling and is commonly set between 1 and 2 L/min. Always choose a flow rate that will not produce overloaded filters.
- 5.2.5. Calibrate each sampling pump before and after sampling with a calibration cassette in-line (Note: This calibration cassette should be from the same lot of cassettes used for sampling). Use a primary standard (e.g. bubble burette) to calibrate each pump. If possible, calibrate at the sampling site.

**Note:** If sampling site calibration is not possible, environmental influences may affect the flow rate. The extent is dependent on the type of pump used. Consult with the pump manufacturer to determine dependence on environmental influences. If the pump is affected by temperature and pressure changes, correct the flow rate using the formula shown in the section "Sampling Pump Flow Rate Corrections" at the end of this appendix.

- 5.2.6. Connect each pump to the base of each sampling cassette with flexible tubing. Remove the end cap of each cassette and take each air sample open face. Assure that each sample cassette is held open side down in the employee's breathing zone during sampling. The distance from the nose/mouth of the employee to the cassette should be about 10 cm. Secure the cassette on the collar or lapel of the employee using spring clips or other similar devices.
- 5.2.7. A suggested minimum air volume when sampling to determine TWA compliance is 25 L. For Excursion Limit (30 min sampling time) evaluations, a minimum air volume of 48 L is recommended.
- 5.2.8. The most significant problem when sampling for asbestos is overloading the filter with non-asbestos dust. Suggested maximum air sample volumes for specific environments are:

Environment	Air vol. (L)
Asbestos removal operations (visible dust)	100
Asbestos removal operations (little dust)	240
Office environments	400 to 2,400

**CAUTION:** Do not overload the filter with dust. High levels of non-fibrous dust particles may obscure fibers on the filter and lower the count or make counting impossible. If more than about 25 to 30% of the field area is obscured with dust, the result may be biased low. Smaller air volumes may be necessary when there is excessive non-asbestos dust in the air.

While sampling, observe the filter with a small flashlight. If there is a visible layer of dust on the filter, stop sampling, remove and seal the cassette, and replace with a new sampling assembly. The total dust loading should not exceed 1 mg.

- 5.2.9. Blank samples are used to determine if any contamination has occurred during sample handling. Prepare two blanks for the first 1 to 20 samples. For sets containing greater than 20 samples, prepare blanks as 10% of the samples. Handle blank samples in the same manner as air samples with one exception: Do not draw any air through the blank samples. Open the blank cassette in the place where the sample cassettes are mounted on the employee. Hold it open for about 30 seconds. Close and seal the cassette appropriately. Store blanks for shipment with the sample cassettes.
- 5.2.10. Immediately after sampling, close and seal each cassette with the base and plastic plugs. Do not touch or puncture the filter membrane as this will invalidate the analysis.
- 5.2.11. Attach and secure a sample seal around each sample cassette in such a way as to assure that the end cap and base plugs cannot be removed without destroying the seal. Tape the ends of the seal together since the seal is not long enough to be wrapped end-to-end. Also wrap tape around the cassette at each joint to keep the seal secure.

### 5.3. Sample Shipment

- 5.3.1. Send the samples to the laboratory with paperwork requesting asbestos analysis. List any known fibrous interferences present during sampling on the paperwork. Also, note the workplace operation(s) sampled.
- 5.3.2. Secure and handle the samples in such that they will not rattle during shipment nor be exposed to static electricity. Do not ship samples in expanded polystyrene peanuts, vermiculite, paper shreds, or excelsior. Tape sample cassettes to sheet bubbles and place in a container that will cushion the samples in such a manner that they will not rattle.
- 5.3.3. To avoid the possibility of sample contamination, always ship bulk samples in separate mailing containers.

## 6. Analysis

### 6.1. Safety Precautions

- 6.1.1. Acetone is extremely flammable and precautions must be taken not to ignite it. Avoid using large containers or quantities of acetone. Transfer the solvent in a ventilated laboratory hood. Do not use acetone near any open flame. For generation of acetone vapor, use a spark free heat source.
- 6.1.2. Any asbestos spills should be cleaned up immediately to prevent dispersal of fibers. Prudence should be exercised to avoid contamination of laboratory facilities or exposure of personnel to asbestos. Asbestos spills should be cleaned up with wet methods and/or a High Efficiency Particulate-Air (HEPA) filtered vacuum.

**CAUTION:** Do not use a vacuum without a HEPA filter – It will disperse fine asbestos fibers in the air.

## 6.2. Equipment

- 6.2.1. Phase contrast microscope with binocular or trinocular head.
- 6.2.2. Widefield or Huygenian 10X eyepieces (Note: The eyepiece containing the graticule must be a focusing eyepiece. Use a 40X phase objective with a numerical aperture of 0.65 to 0.75).
- 6.2.3. Kohler illumination (if possible) with green or blue filter.
- 6.2.4. Walton-Beckett Graticule, type G-22 with  $100 \pm 2$   $\mu\text{m}$  projected diameter.
- 6.2.5. Mechanical stage. A rotating mechanical stage is convenient for use with polarized light.
- 6.2.6. Phase telescope.
- 6.2.7. Stage micrometer with 0.01-mm subdivisions.
- 6.2.8. Phase-shift test slide, mark II (Available from PTR optics Ltd., and also McCrone).
- 6.2.9. Precleaned glass slides, 25 mm x 75 mm. One end can be frosted for convenience in writing sample numbers, etc., or paste-on labels can be used.
- 6.2.10. Cover glass #1 1/2.
- 6.2.11. Scalpel (#10, curved blade).
- 6.2.12. Fine tipped forceps.
- 6.2.13. Aluminum block for clearing filter (see Appendix D).
- 6.2.14. Automatic adjustable pipette, 100- to 500-  $\mu\text{L}$ .

6.2.15. Micropipette, 5  $\mu$ L.

### 6.3. Reagents

6.3.1. Acetone (HPLC grade).

6.3.2. Triacetin (glycerol triacetate).

6.3.3. Lacquer or nail polish.

### 6.4. Standard Preparation

A way to prepare standard asbestos samples of known concentration has not been developed. It is possible to prepare replicate samples of nearly equal concentration. This has been performed through the PAT program. These asbestos samples are distributed by the AIHA to participating laboratories.

Since only about one-fourth of a 25-mm sample membrane is required for an asbestos count, any PAT sample can serve as a "standard" for replicate counting.

### 6.5. Sample Mounting

**Note:** See Safety Precautions in Section 6.1. before proceeding. The objective is to produce samples with a smooth (non-grainy) background in a medium with a refractive index of approximately 1.46. The technique below collapses the filter for easier focusing and produces permanent mounts which are useful for quality control and interlaboratory comparison.

An aluminum block or similar device is required for sample preparation

6.5.1. Heat the aluminum block to about 70° C. The hot block should not be used on any surface that can be damaged by either the heat or from exposure to acetone.

6.5.2. Ensure that the glass slides and cover glasses are free of dust and fibers.

6.5.3. Remove the top plug to prevent a vacuum when the cassette is opened. Clean the outside of the cassette if necessary. Cut the seal and/or tape on the cassette with a razor blade. Very carefully separate the base from the extension cowl, leaving the filter and backup pad in the base.

6.5.4. With a rocking motion cut a triangular wedge from the filter using the scalpel. This wedge should be one-sixth to one-fourth of the filter. Grasp the filter wedge with the forceps on the perimeter of the filter which was clamped between the cassette pieces. DO NOT TOUCH the filter with your finger. Place the filter on the glass slide sample side up. Static electricity will usually keep the filter on the slide until it is cleared.

- 6.5.5. Place the tip of the micropipette containing about 200  $\mu\text{L}$  acetone into the aluminum block. Insert the glass slide into the receiving slot in the aluminum block. Inject the acetone into the block with slow, steady pressure on the plunger while holding the pipette firmly in place. Wait 3 to 5 seconds for the filter to clear, then remove the pipette and slide from the aluminum block.
- 6.5.6. Immediately (less than 30 seconds) place 2.5 to 3.5  $\mu\text{L}$  of triacetin on the filter (Note: Waiting longer than 30 seconds will result in increased index of refraction and decreased contrast between the fibers and the preparation. This may also lead to separation of the cover slip from the slide).
- 6.5.7. Lower a cover slip gently onto the filter at a slight angle to reduce the possibility of forming air bubbles. If more than 30 seconds have elapsed between acetone exposure and triacetin application, glue the edges of the cover slip to the slide with lacquer or nail polish.
- 6.5.8. If clearing is slow, warm the slide for 15 min on a hot plate having a surface temperature of about  $50^{\circ}\text{C}$  to hasten clearing. The top of the hot block can be used if the slide is not heated too long.
- 6.5.9. Counting may proceed immediately after clearing and mounting are completed.

## 6.6. Sample Analysis

Completely align the microscope according to the manufacturer's instructions. Then, align the microscope using the following general alignment routine at the beginning of every counting session and more often if necessary.

### 6.6.1. Alignment

- (1) Clean all optical surfaces. Even a small amount of dirt can significantly degrade the image.
- (2) Rough focus the objective on a sample.
- (3) Close down the field iris so that it is visible in the field of view. Focus the image of the iris with the condenser focus. Center the image of the iris in the field of view.
- (4) Install the phase telescope and focus on the phase rings. Critically center the rings. Misalignment of the rings results in astigmatism which will degrade the image.

- (5) Place the phase-shift test slide on the microscope stage and focus on the lines. The analyst must see line set 3 and should see at least parts of 4 and 5 but, not see line set 6 or 6. A microscope/microscopist combination which does not pass this test may not be used.

#### 6.6.2. Counting Fibers

- (1) Place the prepared sample slide on the mechanical stage of the microscope. Position the center of the wedge under the objective lens and focus upon the sample.
- (2) Start counting from one end of the wedge and progress along a radial line to the other end (count in either direction from perimeter to wedge tip). Select fields randomly, without looking into the eyepieces, by slightly advancing the slide in one direction with the mechanical stage control.
- (3) Continually scan over a range of focal planes (generally the upper 10 to 15  $\mu\text{m}$  of the filter surface) with the fine focus control during each field count. Spend at least 5 to 15 seconds per field.
- (4) Most samples will contain asbestos fibers with fiber diameters less than 1  $\mu\text{m}$ . Look carefully for faint fiber images. The small diameter fibers will be very hard to see. However, they are an important contribution to the total count.
- (5) Count only fibers equal to or longer than 5  $\mu\text{m}$ . Measure the length of curved fibers along the curve.
- (6) Count fibers which have a length to width ratio of 3:1 or greater.
- (7) Count all the fibers in at least 20 fields. Continue counting until either 100 fibers are counted or 100 fields have been viewed; whichever occurs first. Count all the fibers in the final field.
- (8) Fibers lying entirely within the boundary of the Walton-Beckett graticule field shall receive a count of 1. Fibers crossing the boundary once, having one end within the circle shall receive a count of 1/2. Do not count any fiber that crosses the graticule boundary more than once. Reject and do not count any other fibers even though they may be visible outside the graticule area. If a fiber touches the circle, it is considered to cross the line.
- (9) Count bundles of fibers as one fiber unless individual fibers can be clearly identified and each individual fiber is clearly not connected to another counted fiber. See Figure 1 for counting conventions.

- (10) Record the number of fibers in each field in a consistent way such that filter non-uniformity can be assessed.
- (11) Regularly check phase ring alignment.
- (12) When an agglomerate (mass of material) covers more than 25% of the field of view, reject the field and select another. Do not include it in the number of fields counted.
- (13) Perform a "blind recount" of 1 in every 10 filter wedges (slides). Re-label the slides using a person other than the original counter.

#### 6.7. Fiber Identification

As previously mentioned in Section 1.3., PCM does not provide positive confirmation of asbestos fibers. Alternate differential counting techniques should be used if discrimination is desirable. Differential counting may include primary discrimination based on morphology, polarized light analysis of fibers, or modification of PCM data by Scanning Electron or Transmission Electron Microscopy.

A great deal of experience is required to routinely and correctly perform differential counting. It is discouraged unless it is legally necessary. Then, only if a fiber is obviously not asbestos should it be excluded from the count. Further discussion of this technique can be found in reference 8.10.

If there is a question whether a fiber is asbestos or not, follow the rule:

"WHEN IN DOUBT, COUNT."

#### 6.8. Analytical Recommendations – Quality Control System

- 6.8.1. All individuals performing asbestos analysis must have taken the NIOSH course for sampling and evaluating airborne asbestos or an equivalent course.
- 6.8.2. Each laboratory engaged in asbestos counting shall set up a slide trading arrangement with at least two other laboratories in order to compare performance and eliminate inbreeding of error. The slide exchange occurs at least semiannually. The round robin results shall be posted where all analysts can view individual analyst's results.
- 6.8.3. Each laboratory engaged in asbestos counting shall participate in the Proficiency Analytical Testing Program, the Asbestos Analyst Registry or equivalent.

6.8.4. Each analyst shall select and count prepared slides from a “slide bank”. These are quality assurance counts. The slide bank shall be prepared using uniformly distributed samples taken from the workload. Fiber densities should cover the entire range routinely analyzed by the laboratory. These slides are counted blind by all counters to establish an original standard deviation. This historical distribution is compared with the quality assurance counts. A counter must have 95% of all quality control samples counted within three standard deviations of the historical mean. This count is then integrated into a new historical mean and standard deviation for the slide.

The analyses done by the counters to establish the slide bank may be used for an interim quality control program if the data are treated in a proper statistical fashion.

## 7. Calculations

7.1. Calculate the estimated airborne asbestos fiber concentration on the filter sample using the following formula:

$$AC = \frac{\left[ \left( \frac{FB}{FL} \right) - \left( \frac{BFB}{BFL} \right) \right] \times ECA}{1000 \times FR \times T \times MFA}$$

Where:

AC = Airborne fiber concentration

FB = Total number of fibers greater than 5 µm counted

FL = Total number of fields counted on the filter

BFB = Total number of fibers greater than 5 µm counted in the blank

BFL = Total number of fields counted on the blank

ECA = Effective collecting area of filter (385 mm<sup>2</sup> nominal for a 25-mm filter.)

FR = Pump flow rate (L/min)

MFA = Microscope count field area (mm<sup>2</sup>). This is 0.00785 mm<sup>2</sup> for a Walton-Beckett Graticule.

T = Sample collection time (min)

1,000 = Conversion of L to cc

**NOTE:** The collection area of a filter is seldom equal to 385 mm<sup>2</sup>. It is appropriate for laboratories to routinely monitor the exact diameter using an inside micrometer. The collection area is calculated according to the formula:

$$\text{Area} = \pi(d/2)^2$$

## 7.2. Short-cut Calculation

Since a given analyst always has the same interpupillary distance, the number of fields per filter for a particular analyst will remain constant for a given size filter. The field size for that analyst is constant (i.e. the analyst is using an assigned microscope and is not changing the reticle).

For example, if the exposed area of the filter is always 385 mm<sup>2</sup> and the size of the field is always 0.00785 mm<sup>2</sup>, the number of fields per filter will always be 49,000. In addition it is necessary to convert liters of air to cc. These three constants can then be combined such that  $ECA/(1,000 \times MFA)=49$ . The previous equation simplifies to:

$$AC = \frac{\left(\frac{FB}{FL}\right) - \left(\frac{BFB}{BFL}\right) \times 49}{FR \times T}$$

## 7.3. Recount Calculations

As mentioned in step 13 of Section 6.6.2., a “blind recount” of 10% of the slides is performed. In all cases, differences will be observed between the first and second counts of the same filter wedge. Most of these differences will be due to chance alone, that is, due to the random variability (precision) of the count method. Statistical recount criteria enables one to decide whether observed differences can be explained due to chance alone or are probably due to systematic differences between analysts, microscopes, or other biasing factors.

The following recount criterion is for a pair of counts that estimate AC in fibers/cc. The criterion is given at the type-I error level. That is, there is 5% maximum risk that we will reject a pair of counts for the reason that one might be biased, when the large observed difference is really due to chance.

Reject a pair of counts if:

$$\left| \sqrt{AC_2} - \sqrt{AC_1} \right| > 2.78 \times \left( \sqrt{AC_{avg}} \right) \times CV_{FB}$$

Where:

AC<sub>1</sub>= lower estimated airborne fiber concentration

AC<sub>2</sub>= higher estimated airborne fiber concentration

$AC_{avg}$  = average of the two concentration estimates

$CV_{FB}$  = CV for the average of the two concentration estimates

If a pair of counts are rejected by this criterion then, recount the rest of the filters in the submitted set. Apply the test and reject any other pairs failing the test. Rejection shall include a memo to the industrial hygienist stating that the sample failed a statistical test for homogeneity and the true air concentration may be significantly different than the reported value.

#### 7.4. Reporting Results

Report results to the industrial hygienist as fibers/cc. Use two significant figures. If multiple analyses are performed on a sample, an average of the results is to be reported unless any of the results can be rejected for cause.

#### Quality Control

The OSHA asbestos regulations require each laboratory to establish a quality control program. The following is presented as an example of how the OSHA-SLTC constructed its internal CV curve as part of meeting this requirement. Data is from 395 samples collected during OSHA compliance inspections and analyzed from October 1980 through April 1986.

Each sample was counted by 2 to 5 different counters independently of one another. The standard deviation and the CV statistic was calculated for each sample. This data was then plotted on a graph of CV vs. fibers/mm<sup>2</sup>. A least squares regression was performed using the following equation:

$$CV = \text{antilog}_{10}[(\log_{10}(x))^2 + B(\log_{10}(x)) + C]$$

where:

x = the number of fibers/mm<sup>2</sup>

Application of least squares gave:

$$A = 0.182205$$

$$B = 0.973343$$

$$C = 0.327499$$

Using these values, the equation becomes:

$$CV = \text{antilog}_{10}[0.182205(\log_{10}(x))^2 - 0.973343(\log_{10}(x)) + 0.327499]$$

#### Sampling Pump Flow Rate Corrections

This correction is used if a difference greater than 5% in ambient temperature and/or pressure is noted between calibration and sampling sites and the pump does not compensate for the differences.

$$Q_{\text{act}} = Q_{\text{cal}} \times \sqrt{\left(\frac{P_{\text{cal}}}{P_{\text{act}}}\right) \times \left(\frac{T_{\text{act}}}{T_{\text{cal}}}\right)}$$

Where:

$Q_{\text{(act)}}$  = actual flow rate

$Q_{\text{(cal)}}$  = calibrated flow rate (if a rotameter was used, the rotameter value)

$P_{\text{(cal)}}$  = uncorrected air pressure at calibration

$P_{\text{(act)}}$  = uncorrected air pressure at sampling site

$T_{\text{(act)}}$  = temperature at sampling site (K)

$T_{\text{(cal)}}$  = temperature at calibration (K)

#### Walton-Beckett Graticule

When ordering the Graticule for asbestos counting, specify the exact disc diameter needed to fit the ocular of the microscope and the diameter (mm) of the circular counting area. Instructions for measuring the dimensions necessary are listed:

- (1) Insert any available graticule into the focusing eyepiece and focus so that the graticule lines are sharp and clear.
- (2) Align the microscope.
- (3) Place a stage micrometer on the microscope object stage and focus the microscope on the graduated lines.
- (4) Measure the magnified grid length, PL ( $\mu\text{m}$ ), using the stage micrometer.
- (5) Remove the graticule from the microscope and measure its actual grid length, AL (mm). This can be accomplished by using a mechanical stage fitted with verniers, or a jeweler's loupe with a direct reading scale.
- (6) Let  $D=100 \mu\text{m}$ . Calculate the circle diameter,  $d_c(\text{mm})$ , for the Walton-Beckett graticule and specify the diameter when making a purchase:

$$d_c = \frac{AL \times D}{P L}$$

Example: If  $PL = 108 \mu\text{m}$ ,  $AL = 2.93 \text{ mm}$  and  $D = 100 \mu\text{m}$ , then,

$$d_c = \frac{2.93 \times 100}{108} = 2.71 \text{ mm}$$

- (7) Each eyepiece-objective-reticle combination on the microscope must be calibrated. Should any of the three be changed (by zoom adjustment, disassembly, replacement, etc.), the combination must be recalibrated. Calibration may change if interpupillary distance is changed.

Measure the field diameter, D (acceptable range:  $100 \pm 2 \mu\text{m}$ ) with a stage micrometer upon receipt of the graticule from the manufacturer. Determine the field area ( $\text{mm}^2$ ).

$$\text{Field Area} = \pi(D/2)^2$$

If  $D = 100 \mu\text{m} = 0.1 \text{ mm}$ , then

$$\text{Field Area} = \pi(0.1 \text{ mm}/2)^2 = 0.00785 \text{ mm}^2$$

The Graticule is available from: Graticules Ltd., Morley Road, Tonbridge TN9 1RN, Kent, England (Telephone 011-44-732-359061). Also available from PTR Optics Ltd., 145 Newton Street, Waltham, MA 02154 [telephone (617) 891-6000] or McCrone Accessories and Components, 2506 S. Michigan Ave., Chicago, IL 60616 [phone (312)-842-7100]. The graticule is custom made for each microscope.

Figure 1: Walton-Beckett Graticule with some explanatory fibers.

**Table 4 – Counts for the Fibers in the Figure**

<b>Structure No.</b>	<b>Count</b>	<b>Explanation</b>
1 to 6	1	Single fibers all contained within the circle.
7	1/2	Fiber crosses circle once.
8	0	Fiber too short.
9	2	Two crossing fibers.
10	0	Fiber outside graticule.
11	0	Fiber crosses graticule twice.
12	1/2	Although split, fiber only crosses once.

**Appendix C to 1926.1101 — Reserved**

**Appendix D to 1926.1101 — Medical Questionnaires — Mandatory**

This mandatory appendix contains the medical questionnaires that must be administered to all employees who are exposed to asbestos above the permissible exposure limit, and who will therefore be included in their employer's medical surveillance program. Part 1 of the appendix contains the Initial Medical Questionnaire, which must be obtained for all new hires who will be covered by the medical surveillance requirements. Part 2 includes the abbreviated Periodical Medical Questionnaire, which must be administered to all employees who are provided periodic medical examinations under the medical surveillance provisions of the standard.

Part 1

INITIAL MEDICAL QUESTIONNAIRE

1. NAME \_\_\_\_\_

2. CLOCK NUMBER \_\_\_\_\_

3. PRESENT OCCUPATION \_\_\_\_\_

4. PLANT \_\_\_\_\_

5. ADDRESS \_\_\_\_\_

6. \_\_\_\_\_

(Zip Code)

7. TELEPHONE NUMBER \_\_\_\_\_

8. INTERVIEWER \_\_\_\_\_

9. DATE \_\_\_\_\_

10. Date of Birth \_\_\_\_\_

Month Day Year

11. Place of Birth \_\_\_\_\_

12. Sex 1. Male \_\_\_ 2. Female \_\_\_

13. What is your marital status? 1. Single \_\_\_ 2. Married \_\_\_  
3. Widowed \_\_\_ 4. Separated/Divorced \_\_\_

14. (Check all that apply) 1. White \_\_\_ 2. Black or African American \_\_\_  
3. Asian \_\_\_ 4. Hispanic or Latino \_\_\_  
5. American Indian or Alaskan Native \_\_\_  
6. Native Hawaiian or Other Pacific Islander \_\_\_

15. What is the highest grade completed in school?  
(For example 12 years is completion of high school) \_\_\_\_\_

OCCUPATIONAL HISTORY

16A. Have you ever worked full time (30 hours per week or more) for 6 months or more? 1. Yes \_\_\_ 2. No \_\_\_

IF YES TO 16A:

B. Have you ever worked for a year or more in any dusty job?
1. Yes \_\_\_ 2. No \_\_\_ 3. Does Not Apply \_\_\_

Specify job/industry \_\_\_\_\_ Total Years Worked \_\_\_\_\_

Was dust exposure: 1. Mild \_\_\_ 2. Moderate \_\_\_ 3. Severe \_\_\_

C. Have you ever been exposed to gas or chemical fumes in your work?
1. Yes \_\_\_ 2. No \_\_\_

Specify job/industry \_\_\_\_\_ Total Years Worked \_\_\_\_\_

Was exposure: 1. Mild \_\_\_ 2. Moderate \_\_\_ 3. Severe \_\_\_

D. What has been your usual occupation or job -- the one you have worked at the longest?

1. Job occupation \_\_\_\_\_

2. Number of years employed in this occupation \_\_\_\_\_

3. Position/job title \_\_\_\_\_

4. Business, field or industry \_\_\_\_\_

(Record on lines the years in which you have worked in any of these industries, e.g. 1960-1969)

Table with 3 columns: Question (E-J), YES, NO. Rows include: E. In a mine?, F. In a quarry?, G. In a foundry?, H. In a pottery?, I. In a cotton, flax or hemp mill?, J. With asbestos?

17. PAST MEDICAL HISTORY YES NO

A. Do you consider yourself to be in good health?.....

If "NO" state reason \_\_\_\_\_

B. Have you any defect of vision? ..... \_\_\_\_\_

If "YES" state nature of defect \_\_\_\_\_

C. Have you any hearing defect? ..... \_\_\_\_\_

If "YES" state nature of defect \_\_\_\_\_

D. Are you suffering from or have you ever suffered from:      YES      NO

a. Epilepsy (or fits, seizures, convulsions)? ..... \_\_\_\_\_

b. Rheumatic fever? ..... \_\_\_\_\_

c. Kidney disease? ..... \_\_\_\_\_

d. Bladder disease? ..... \_\_\_\_\_

e. Diabetes? ..... \_\_\_\_\_

f. Jaundice? ..... \_\_\_\_\_

18. CHEST COLDS AND CHEST ILLNESSES

18A. If you get a cold, does it "usually" go to your chest? (Usually means more than 1/2 the time) 1. Yes \_\_\_ 2. No \_\_\_ 3. Don't get colds \_\_\_

19A. During the past 3 years, have you had any chest illnesses that have kept you off work, indoors at home, or in bed? 1. Yes \_\_\_ 2. No \_\_\_

IF YES TO 19A:

B. Did you produce phlegm with any of these chest illnesses?  
1. Yes \_\_\_ 2. No \_\_\_ 3. Does Not Apply \_\_\_

C. In the last 3 years, how many such illnesses with (increased) phlegm did you have which lasted a week or more?  
Number of illnesses \_\_\_ No such illnesses \_\_\_

20. Did you have any lung trouble before the age of 16?  
1. Yes \_\_\_ 2. No \_\_\_

21. Have you ever had any of the following?

1A. Attacks of bronchitis? 1. Yes \_\_\_ 2. No \_\_\_

IF YES TO 1A:

B. Was it confirmed by a doctor? 1. Yes \_\_\_ 2. No \_\_\_  
3. Does Not Apply \_\_\_

C. At what age was your first attack?  
Age in Years \_\_\_ Does Not Apply \_\_\_

2A. Pneumonia (include bronchopneumonia)? 1. Yes \_\_\_ 2. No \_\_\_

IF YES TO 2A:

B. Was it confirmed by a doctor? 1. Yes \_\_\_ 2. No \_\_\_  
3. Does Not Apply \_\_\_

C. At what age did you first have it?  
Age in Years \_\_\_ Does Not Apply \_\_\_

3A. Hay Fever? 1. Yes \_\_\_ 2. No \_\_\_

IF YES TO 3A:

B. Was it confirmed by a doctor? 1. Yes \_\_\_ 2. No \_\_\_  
3. Does Not Apply \_\_\_

C. At what age did it start? Age in Years \_\_\_ Does Not Apply \_\_\_

22A. Have you ever had chronic bronchitis? 1. Yes \_\_\_ 2. No \_\_\_

IF YES TO 22A:

B. Do you still have it? 1. Yes \_\_\_ 2. No \_\_\_  
3. Does Not Apply \_\_\_

C. Was it confirmed by a doctor? 1. Yes \_\_\_ 2. No \_\_\_  
3. Does Not Apply \_\_\_

D. At what age did it start? Age in Years \_\_\_ Does Not Apply \_\_\_

23A. Have you ever had emphysema? 1. Yes \_\_\_ 2. No \_\_\_

IF YES TO 23A:

B. Do you still have it? 1. Yes \_\_\_ 2. No \_\_\_ 3. Does Not Apply \_\_\_

C. Was it confirmed by a doctor? 1. Yes \_\_\_ 2. No \_\_\_  
3. Does Not Apply \_\_\_

D. At what age did it start? Age in Years \_\_\_ Does Not Apply \_\_\_

24A. Have you ever had asthma? 1. Yes \_\_\_ 2. No \_\_\_

IF YES TO 24A:

B. Do you still have it? 1. Yes \_\_\_ 2. No \_\_\_  
3. Does Not Apply \_\_\_

C. Was it confirmed by a doctor? 1. Yes \_\_\_ 2. No \_\_\_  
3. Does Not Apply \_\_\_

D. At what age did it start? Age in Years \_\_\_ Does Not Apply \_\_\_

E. If you no longer have it, at what age did it stop?  
Age stopped \_\_\_ Does Not Apply \_\_\_

25. Have you ever had:

A. Any other chest illness? 1. Yes \_\_\_ 2. No \_\_\_

If yes, please specify \_\_\_\_\_

B. Any chest operations? 1. Yes \_\_\_ 2. No \_\_\_

If yes, please specify \_\_\_\_\_

C. Any chest injuries? 1. Yes \_\_\_ 2. No \_\_\_

If yes, please specify \_\_\_\_\_

26A. Has a doctor ever told you that you had heart trouble?  
1. Yes \_\_\_ 2. No \_\_\_

IF YES TO 26A:

B. Have you ever had treatment for heart trouble in the past 10 years?  
1. Yes \_\_\_ 2. No \_\_\_ 3. Does Not Apply \_\_\_

27A. Has a doctor told you that you had high blood pressure?  
1. Yes \_\_\_ 2. No \_\_\_

IF YES TO 27A:

B. Have you had any treatment for high blood pressure (hypertension) in the past 10 years? 1. Yes \_\_\_ 2. No \_\_\_ 3. Does Not Apply \_\_\_

28. When did you last have your chest X-rayed? (Year) \_\_\_ \_\_\_ \_\_\_ \_\_\_

29. Where did you last have your chest X-rayed (if known)? \_\_\_\_\_

What was the outcome? \_\_\_\_\_

FAMILY HISTORY

30. Were either of your natural parents ever told by a doctor that they had a chronic lung condition such as:

	<u>FATHER</u>			<u>MOTHER</u>

COUGH

31A. Do you usually have a cough?

Count a cough with first smoke or on first going out of doors.  
Exclude clearing of throat.

(If no, skip to question 31C.) 1. Yes \_\_\_ 2. No \_\_\_

B. Do you usually cough as much as 4 to 6 times a day 4 or more days out of the week? 1. Yes \_\_\_ 2. No \_\_\_

C. Do you usually cough at all on getting up or first thing in the morning? 1. Yes \_\_\_ 2. No \_\_\_

D. Do you usually cough at all during the rest of the day or at night? 1. Yes \_\_\_ 2. No \_\_\_

IF YES TO ANY OF ABOVE (31A, B, C, OR D,), ANSWER THE FOLLOWING.

IF NO TO ALL, CHECK "DOES NOT APPLY" AND SKIP TO NEXT PAGE

E. Do you usually cough like this on most days for 3 consecutive months or more during the year?

1. Yes \_\_\_ 2. No \_\_\_ 3. Does not apply \_\_\_

F. For how many years have you had the cough?

Number of years \_\_\_ Does not apply \_\_\_

32A. Do you usually bring up phlegm from your chest?

Count phlegm with the first smoke or on first going out of doors.  
Exclude phlegm from the nose.  
Count swallowed phlegm.

(If no, skip to 32C) 1. Yes \_\_\_ 2. No \_\_\_

B. Do you usually bring up phlegm like this as much as twice a day 4 or more days out of the week? 1. Yes \_\_\_ 2. No \_\_\_

C. Do you usually bring up phlegm at all on getting up or first thing in the morning? 1. Yes \_\_\_ 2. No \_\_\_

D. Do you usually bring up phlegm at all on during the rest of the day or at night? 1. Yes \_\_\_ 2. No \_\_\_

IF YES TO ANY OF THE ABOVE (32A, B, C, OR D), ANSWER THE FOLLOWING:

IF NO TO ALL, CHECK "DOES NOT APPLY" AND SKIP TO 33A

E. Do you bring up phlegm like this on most days for 3 consecutive months or more during the year?

1. Yes \_\_\_ 2. No \_\_\_ 3. Does not apply \_\_\_

F. For how many years have you had trouble with phlegm?

Number of years \_\_\_ Does not apply \_\_\_

#### EPISODES OF COUGH AND PHLEGM

33A. Have you had periods or episodes of (increased\*) cough and phlegm lasting for 3 weeks or more each year?

\*(For persons who usually have cough and/or phlegm)

1. Yes \_\_\_ 2. No \_\_\_

IF YES TO 33A

B. For how long have you had at least 1 such episode per year?

Number of years \_\_\_ Does not apply \_\_\_

#### WHEEZING

34A. Does your chest ever sound wheezy or whistling

1. When you have a cold? 1. Yes \_\_\_ 2. No \_\_\_

2. Occasionally apart from colds? 1. Yes \_\_\_ 2. No \_\_\_

3. Most days or nights? 1. Yes \_\_\_ 2. No \_\_\_

IF YES TO 1, 2, or 3 in 34A

B. For how many years has this been present?

Number of years \_\_\_ Does not apply \_\_\_

35A. Have you ever had an attack of wheezing that has made you feel short of breath? 1. Yes \_\_\_ 2. No \_\_\_

IF YES TO 35A

B. How old were you when you had your first such attack?

Age in years \_\_\_ Does not apply \_\_\_

C. Have you had 2 or more such episodes?

1. Yes \_\_\_ 2. No \_\_\_ 3. Does not apply \_\_\_

- D. Have you ever required medicine or treatment for the(se) attack(s)?  
1. Yes \_\_\_ 2. No \_\_\_ 3. Does not apply \_\_\_

BREATHLESSNESS

36. If disabled from walking by any condition other than heart or lung disease, please describe and proceed to question 39A.

Nature of condition(s) \_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_

- 37A. Are you troubled by shortness of breath when hurrying on the level or walking up a slight hill? 1. Yes \_\_\_ 2. No \_\_\_

IF YES TO 37A

- B. Do you have to walk slower than people of your age on the level because of breathlessness?  
1. Yes \_\_\_ 2. No \_\_\_ 3. Does not apply \_\_\_
- C. Do you ever have to stop for breath when walking at your own pace on the level? 1. Yes \_\_\_ 2. No \_\_\_ 3. Does not apply \_\_\_
- D. Do you ever have to stop for breath after walking about 100 yards (or after a few minutes) on the level?  
1. Yes \_\_\_ 2. No \_\_\_ 3. Does not apply \_\_\_
- E. Are you too breathless to leave the house or breathless on dressing or climbing one flight of stairs?  
1. Yes \_\_\_ 2. No \_\_\_ 3. Does not apply \_\_\_

TOBACCO SMOKING

- 38A. Have you ever smoked cigarettes? (No means less than 20 packs of cigarettes or 12 oz. of tobacco in a lifetime or less than 1 cigarette a day for 1 year.) 1. Yes \_\_\_ 2. No \_\_\_

IF YES TO 38A

- B. Do you now smoke cigarettes (as of one month ago)  
1. Yes \_\_\_ 2. No \_\_\_ 3. Does not apply \_\_\_
- C. How old were you when you first started regular cigarette smoking?  
Age in years \_\_\_ Does not apply \_\_\_

D. If you have stopped smoking cigarettes completely, how old were you when you stopped?

Age stopped \_\_\_ Check if still smoking \_\_\_ Does not apply \_\_\_

E. How many cigarettes do you smoke per day now?

Cigarettes per day \_\_\_ Does not apply \_\_\_

F. On the average of the entire time you smoked, how many cigarettes did you smoke per day? Cigarettes per day \_\_\_ Does not apply \_\_\_

G. Do or did you inhale the cigarette smoke?

1. Does not apply

\_\_\_  
2. Not at all

\_\_\_  
3. Slightly

\_\_\_  
4. Moderately

**Appendix E to 1926.1101 —Classification of Chest X-Rays — Mandatory**

- (a) Chest X-rays shall be classified in accordance with Guidelines for the use of the ILO International Classification of Radiographs of Pneumoconioses (revised edition 2011) (incorporated by reference, see 1926.6), and recorded on a classification form following the format of the CDC/NIOSH (M) 2.8 form. As a minimum, the content within the bold lines of this form (items 1 through 4) shall be included. This form is not to be submitted to NIOSH.
- (b) All X-rays shall be classified only by a B-reader, a board eligible/certified radiologist, or an experienced physician with known expertise in pneumoconiosis.
- (c) Whenever classifying chest X-ray film, the physician shall have immediately available for reference a complete set of the ILO standard format radiographs provided for use with the Guidelines for the use of the ILO International Classification of Radiographs for Pneumoconioses (revised edition 2011).
- (d) Whenever classifying digitally-acquired chest X-rays, the physician shall have immediately available for reference a complete set of ILO standard digital chest radiographic images provided for use with the Guidelines for the Use of the ILO International Classification of Radiographs of Pneumoconioses (revised edition 2011). Classification of digitally-acquired chest X-rays shall be based on the viewing of images displayed as electronic copies and shall not be based on the viewing of hard copy printed transparencies of images.

## **Appendix F to 1926.1101 — Work Practices and Engineering Controls for Class I Asbestos Operations (Non-Mandatory)**

This is a non-mandatory appendix to the asbestos standards for construction and for shipyards. It describes criteria and procedures for erecting and using negative pressure enclosures for Class I Asbestos Work, when NPEs are used as an allowable control method to comply with paragraph (g)(5)(i) of this section. Many small and variable details are involved in the erection of a negative pressure enclosure. OSHA and most participants in the rulemaking agreed that only the major, more performance oriented criteria should be made mandatory. These criteria are set out in paragraph (g) of this section. In addition, this appendix includes these mandatory specifications and procedures in its guidelines in order to make this appendix coherent and helpful. The mandatory nature of the criteria which appear in the regulatory text is not changed because they are included in this “non-mandatory” appendix. Similarly, the additional criteria and procedures included as guidelines in the appendix, do not become mandatory because mandatory criteria are also included in these comprehensive guidelines.

In addition, none of the criteria, both mandatory and recommended, are meant to specify or imply the need for use of patented or licensed methods or equipment. Recommended specifications included in this attachment should not discourage the use of creative alternatives which can be shown to reliably achieve the objectives of negative-pressure enclosures.

Requirements included in this appendix, cover general provisions to be followed in all asbestos jobs, provisions which must be followed for all Class I asbestos jobs, and provisions governing the construction and testing of negative pressure enclosures. The first category includes the requirement for use of wet methods, HEPA vacuums, and immediate bagging of waste; Class I work must conform to the following provisions:

1. oversight by competent person
2. use of critical barriers over all openings to work area
3. isolation of HVAC systems
4. use of impermeable drop cloths and coverage of all objects within regulated areas

In addition, more specific requirements for NPEs include:

5. maintenance of -0.02 inches water gauge within enclosure
6. manometric measurements
7. air movement away from employees performing removal work
8. smoke testing or equivalent for detection of leaks and air direction

9. deactivation of electrical circuits, if not provided with ground-fault circuit interrupters.

### **Planning the Project**

The standard requires that an exposure assessment be conducted before the asbestos job is begun [1926.1001(f)(1)]. Information needed for that assessment, includes data relating to prior similar jobs, as applied to the specific variables of the current job. The information needed to conduct the assessment will be useful in planning the project, and in complying with any reporting requirements under this standard, when significant changes are being made to a control system listed in the standard, [see also those of USEPA (40 CFR Part 61, Subpart M)]. Thus, although the standard does not explicitly require the preparation of a written asbestos removal plan, the usual constituents of such a plan, i.e., a description of the enclosure, the equipment, and the procedures to be used throughout the project, must be determined before the enclosure can be erected. The following information should be included in the planning of the system:

1. A physical description of the work area;
2. A description of the approximate amount of material to be removed;
3. A schedule for turning off and sealing existing ventilation systems;
4. Personnel hygiene procedures;
5. A description of personal protective equipment and clothing to be worn by employees;
6. A description of the local exhaust ventilation systems to be used and how they are to be tested;
7. A description of work practices to be observed by employees;
8. An air monitoring plan;
9. A description of the method to be used to transport waste material; and
10. The location of the dump site.

### **Materials and Equipment Necessary for Asbestos Removal**

Although individual asbestos removal projects vary in terms of the equipment required to accomplish the removal of the materials, some equipment and materials are common to most asbestos removal operations.

Plastic sheeting used to protect horizontal surfaces, seal HVAC openings or to seal vertical openings and ceilings should have a minimum thickness of 6 mils. Tape or other adhesive used to attach plastic sheeting should be of sufficient adhesive strength to support the weight of the material plus all stresses encountered during the entire duration of the project without becoming detached from the surface.

Other equipment and materials which should be available at the beginning of each project are:

1. HEPA Filtered Vacuum is essential for cleaning the work area after the asbestos has been removed. It should have a long hose capable of reaching out-of-the-way places, such as areas above ceiling tiles, behind pipes, etc.
2. Portable air ventilation systems installed to provide the negative air pressure and air removal from the enclosure must be equipped with a HEPA filter. The number and capacity of units required to ventilate an enclosure depend on the size of the area to be ventilated. The filters for these systems should be designed in such a manner that they can be replaced when the air flow volume is reduced by the buildup of dust in the filtration material. Pressure monitoring devices with alarms and strip chart recorders attached to each system to indicate the pressure differential and the loss due to dust buildup on the filter are recommended.
3. Water sprayers should be used to keep the asbestos material as saturated as possible during removal; the sprayers will provide a fine mist that minimizes the impact of the spray on the material.
4. Water used to saturate the asbestos containing material can be amended by adding at least 15 milliliters (1/4 ounce) of wetting agent in 1 liter (1 pint) of water. An example of a wetting agent is a 50/50 mixture of polyoxyethylene ether and polyoxyethylene polyglycol ester.
5. Backup power supplies are recommended, especially for ventilation systems.
6. Shower and bath water should be with mixed hot and cold water faucets. Water that has been used to clean personnel or equipment should either be filtered or be collected and discarded as asbestos waste. Soap and shampoo should be provided to aid in removing dust from the workers' skin and hair.
7. See paragraphs (h) and (i) of this section for appropriate respiratory protection and protective clothing.
8. See paragraph (k) of this section for required signs and labels.

### Preparing the Work Area

**Disabling HVAC Systems:** The power to the heating, ventilation, and air conditioning systems that service the restricted area must be deactivated and locked off. All ducts, grills, access ports, windows and vents must be sealed off with two layers of plastic to prevent entrainment of contaminated air.

**Operating HVAC Systems in the Restricted Area:** If components of a HVAC system located in the restricted area are connected to a system that will service another zone during the project, the portion of the duct in the restricted area must be sealed and pressurized. Necessary precautions include caulking the duct joints, covering all cracks and openings with two layers of sheeting, and pressurizing the duct throughout the duration of the project by restricting the return air flow. The power to the fan supplying the positive pressure should be locked “on” to prevent pressure loss.

**Sealing Elevators:** If an elevator shaft is located in the restricted area, it should be either shut down or isolated by sealing with two layers of plastic sheeting. The sheeting should provide enough slack to accommodate the pressure changes in the shaft without breaking the air-tight seal.

**Removing Mobile Objects:** All movable objects should be cleaned and removed from the work area before an enclosure is constructed unless moving the objects creates a hazard. Mobile objects will be assumed to be contaminated and should be either cleaned with amended water and a HEPA vacuum and then removed from the area or wrapped and then disposed of as hazardous waste.

**Cleaning and Sealing Surfaces:** After cleaning with water and a HEPA vacuum, surfaces of stationary objects should be covered with two layers of plastic sheeting. The sheeting should be secured with duct tape or an equivalent method to provide a tight seal around the object.

**Bagging Waste:** In addition to the requirement for immediate bagging of waste for disposal, it is further recommended that the waste material be double-bagged and sealed in plastic bags designed for asbestos disposal. The bags should be stored in a waste storage area that can be controlled by the workers conducting the removal. Filters removed from air handling units and rubbish removed from the area are to be bagged and handled as hazardous waste.

### **Constructing the Enclosure:**

The enclosure should be constructed to provide an air-tight seal around ducts and openings into existing ventilation systems and around penetrations for electrical conduits, telephone wires, water lines, drain pipes, etc. Enclosures should be both airtight and watertight except for those openings designed to provide entry and/or air flow control.

**Size:** An enclosure should be the minimum volume to encompass all of the working surfaces yet allow unencumbered movement by the worker(s), provide unrestricted air flow past the worker(s), and ensure walking surfaces can be kept free of tripping hazards.

**Shape:** The enclosure may be any shape that optimizes the flow of ventilation air past the worker(s).

**Structural Integrity:** The walls, ceilings and floors must be supported in such a manner that portions of the enclosure will not fall down during normal use.

**Openings:** It is not necessary that the structure be airtight; openings may be designed to direct air flow. Such openings should be located at a distance from active removal operations. They should be designed to draw air into the enclosure under all anticipated circumstances. In the event that negative pressure is lost, they should be fitted with either HEPA filters to trap dust or automatic trap doors that prevent dust from escaping the enclosure. Openings for exits should be controlled by an airlock or a vestibule.

**Barrier Supports:** Frames should be constructed to support all unsupported spans of sheeting.

**Sheeting:** Walls, barriers, ceilings, and floors should be lined with two layers of plastic sheeting having a thickness of at least 6 mil.

**Seams:** Seams in the sheeting material should be minimized to reduce the possibilities of accidental rips and tears in the adhesive or connections. All seams in the sheeting should overlap, be staggered and not be located at corners or wall-to-floor joints. Areas Within an Enclosure: Each enclosure consists of a work area, a decontamination area, and waste storage area. The work area where the asbestos removal operations occur should be separated from both the waste storage area and the contamination control area by physical curtains, doors, and/or airflow patterns that force any airborne contamination back into the work area.

See paragraph (j) of this section for requirements for hygiene facilities.

During egress from the work area, each worker should step into the equipment room, clean tools and equipment, and remove gross contamination from clothing by wet cleaning and HEPA vacuuming. Before entering the shower area, foot coverings, head coverings, hand coverings, and coveralls are removed and placed in impervious bags for disposal or cleaning. Airline connections from airline respirators with HEPA disconnects and power cables from powered air-purifying respirators (PAPRs) will be disconnected just prior to entering the shower room.

### Establishing Negative Pressure Within the Enclosure

**Negative Pressure:** Air is to be drawn into the enclosure under all anticipated conditions and exhausted through a HEPA filter for 24 hours a day during the entire duration of the project.

**Air Flow Tests:** Air flow patterns will be checked before removal operations begin, at least once per operating shift and any time there is a question regarding the integrity of the enclosure. The primary test for air flow is to trace air currents with smoke tubes or other visual methods. Flow checks are made at each opening and at each doorway to demonstrate that air is being drawn into the enclosure and at each worker's position to show that air is being drawn away from the breathing zone.

**Monitoring Pressure Within the Enclosure:** After the initial air flow patterns have been checked, the static pressure must be monitored within the enclosure. Monitoring may be made using manometers, pressure gauges, or combinations of these devices. It is recommended that they be attached to alarms and strip chart recorders at points identified by the design engineer.

**Corrective Actions:** If the manometers or pressure gauges demonstrate a reduction in pressure differential below the required level, work should cease and the reason for the change investigated and appropriate changes made. The air flow patterns should be retested before work begins again.

**Pressure Differential:** The design parameters for static pressure differentials between the inside and outside of enclosures typically range from 0.02 to 0.10 inches of water gauge, depending on conditions. All zones inside the enclosure must have less pressure than the ambient pressure outside of the enclosure (-0.02 inches water gauge differential). Design specifications for the differential vary according to the size, configuration, and shape of the enclosure as well as ambient and mechanical air pressure conditions around the enclosure.

**Air Flow Patterns:** The flow of air past each worker shall be enhanced by positioning the intakes and exhaust ports to remove contaminated air from the worker's breathing zone, by positioning HEPA vacuum cleaners to draw air from the worker's breathing zone, by forcing relatively uncontaminated air past the worker toward an exhaust port, or by using a combination of methods to reduce the worker's exposure.

**Air Handling Unit Exhaust:** The exhaust plume from air handling units should be located away from adjacent personnel and intakes for HVAC systems.

**Air Flow Volume:** The air flow volume (cubic meters per minute) exhausted (removed) from the workplace must exceed the amount of makeup air supplied to the enclosure. The rate of air exhausted from the enclosure should be designed to maintain a negative pressure in the enclosure and air movement past each worker. The volume of air flow removed from the enclosure should replace the volume of the container at every 5 to 15 minutes. Air flow volume will need to be relatively high for large enclosures, enclosures with awkward shapes, enclosures with multiple openings, and operations employing several workers in the enclosure.

**Air Flow Velocity:** At each opening, the air flow velocity must visibly "drag" air into the enclosure. The velocity of air flow within the enclosure must be adequate to remove airborne contamination from each worker's breathing zone without disturbing the asbestos-containing material on surfaces.

**Airlocks:** Airlocks are mechanisms on doors and curtains that control the air flow patterns in the doorways. If air flow occurs, the patterns through doorways must be such that the air flows toward the inside of the enclosure. Sometimes vestibules, double doors, or double curtains are used to prevent air movement through the doorways. To use a vestibule, a worker enters a chamber by opening the door or curtain and then closing the entry before opening the exit door or curtain.

Airlocks should be located between the equipment room and shower room, between the shower room and the clean room, and between the waste storage area and the outside of the enclosure. The air flow between adjacent rooms must be checked using smoke tubes or other visual tests to ensure the flow patterns draw air toward the work area without producing eddies.

### **Monitoring for Airborne Concentrations**

In addition to the breathing zone samples taken as outlined in paragraph (f) of this section, samples of air should be taken to demonstrate the integrity of the enclosure, the cleanliness of the clean room and shower area, and the effectiveness of the HEPA filter. If the clean room is shown to be contaminated, the room must be relocated to an uncontaminated area.

Samples taken near the exhaust of portable ventilation systems must be done with care.

### **General Work Practices**

Preventing dust dispersion is the primary means of controlling the spread of asbestos within the enclosure. Whenever practical, the point of removal should be isolated, enclosed, covered, or shielded from the workers in the area. Waste asbestos containing materials must be bagged during or immediately after removal; the material must remain saturated until the waste container is sealed.

Waste material with sharp points or corners must be placed in hard air-tight containers rather than bags.

Whenever possible, large components should be sealed in plastic sheeting and removed intact.

Bags or containers of waste will be moved to the waste holding area, washed, and wrapped in a bag with the appropriate labels.

### **Cleaning the Work Area**

Surfaces within the work area should be kept free of visible dust and debris to the extent feasible. Whenever visible dust appears on surfaces, the surfaces within the enclosure must be cleaned by wiping with a wet sponge, brush, or cloth and then vacuumed with a HEPA vacuum.

All surfaces within the enclosure should be cleaned before the exhaust ventilation system is deactivated and the enclosure is disassembled. An approved encapsulant may be sprayed onto areas after the visible dust has been removed.

**Appendix G to 1926.1101 — Reserved**

## Appendix H to 1926.1101 — Substance Technical Information for Asbestos (Non-Mandatory)

### I. Substance Identification

- A. Substance: "Asbestos" is the name of a class of magnesium-silicate minerals that occur in fibrous form. Minerals that are included in this group are chrysotile, crocidolite, amosite, anthophyllite asbestos, tremolite asbestos, and actinolite asbestos.
- B. Asbestos is and was used in the manufacture of heat-resistant clothing, automotive brake and clutch linings, and a variety of building materials including floor tiles, roofing felts, ceiling tiles, asbestos-cement pipe and sheet, and fire-resistant drywall. Asbestos is also present in pipe and boiler insulation materials, and in sprayed-on materials located on beams, in crawlspaces, and between walls.
- C. The potential for an asbestos-containing product to release breathable fibers depends on its degree of friability. Friable means that the material can be crumbled with hand pressure and is therefore likely to emit fibers. The fibrous fluffy sprayed-on materials used for fireproofing, insulation, or sound proofing are considered to be friable, and they readily release airborne fibers if disturbed. Materials such as vinyl-asbestos floor tile or roofing felt are considered non-friable if intact and generally do not emit airborne fibers unless subjected to sanding, sawing and other aggressive operations. Asbestos-cement pipe or sheet can emit airborne fibers if the materials are cut or sawed, or if they are broken.
- D. Permissible exposure: Exposure to airborne asbestos fibers may not exceed 0.1 fibers per cubic centimeter of air (0.1 f/cc) averaged over the 8-hour workday, and 1 fiber per cubic centimeter of air (1.0 f/cc) averaged over a 30 minute work period.

### II. Health Hazard Data

- A. Asbestos can cause disabling respiratory disease and various types of cancers if the fibers are inhaled. Inhaling or ingesting fibers from contaminated clothing or skin can also result in these diseases. The symptoms of these diseases generally do not appear for 20 or more years after initial exposure.
- B. Exposure to asbestos has been shown to cause lung cancer, mesothelioma, and cancer of the stomach and colon. Mesothelioma is a rare cancer of the thin membrane lining of the chest and abdomen. Symptoms of mesothelioma include shortness of breath, pain in the walls of the chest, and/or abdominal pain.

### III. Respirators and Protective Clothing

- A. Respirators: You are required to wear a respirator when performing tasks that result in asbestos exposure that exceeds the permissible exposure limit (PEL) of 0.1 f/cc and when performing certain designated operations. Air-purifying respirators equipped with a high-efficiency particulate air (HEPA) filter can be used where airborne asbestos fiber concentrations do not exceed 1 f/cc; otherwise, more protective respirators such as air-supplied, positive-pressure, full facepiece respirators must be used. Disposable respirators or dust masks are not permitted to be used for asbestos work. For effective protection, respirators must fit your face and head snugly. Your employer is required to conduct a fit test when you are first assigned a respirator and every 6 months thereafter. Respirators should not be loosened or removed in work situations where their use is required.
  - B. Protective Clothing: You are required to wear protective clothing in work areas where asbestos fiber concentrations exceed the permissible exposure limit (PEL) of 0.1 f/cc.
- IV. Disposal Procedures and Cleanup
- A. Wastes that are generated by processes where asbestos is present include:
    - 1. Empty asbestos shipping containers.
    - 2. Process wastes such as cuttings, trimmings, or reject materials.
    - 3. Housekeeping waste from wet-sweeping or HEPA-vacuuming.
    - 4. Asbestos fireproofing or insulating material that is removed from buildings.
    - 5. Asbestos-containing building products removed during building renovation or demolition.
    - 6. Contaminated disposable protective clothing.
  - B. Empty shipping bags can be flattened under exhaust hoods and packed into airtight containers for disposal. Empty shipping drums are difficult to clean and should be sealed.
  - C. Vacuum bags or disposable paper filters should not be cleaned, but should be sprayed with a fine water mist and placed into a labeled waste container.
  - D. Process waste and housekeeping waste should be wetted with water or a mixture of water and surfactant prior to packaging in disposable containers.
  - E. Asbestos-containing material that is removed from buildings must be disposed of in leak-tight 6-mil thick plastic bags, plastic-lined cardboard containers, or plastic-lined metal containers. These wastes, which are removed while wet, should be sealed in containers before they dry out to minimize the release of asbestos fibers during handling.

## V. Access to Information

- A. Each year, your employer is required to inform you of the information contained in this standard and appendices for asbestos. In addition, your employer must instruct you in the proper work practices for handling asbestos-containing materials, and the correct use of protective equipment.
- B. Your employer is required to determine whether you are being exposed to asbestos. Your employer must treat exposure to thermal system insulation and sprayed-on and troweled-on surfacing material as asbestos exposure, unless results of laboratory analysis show that the material does not contain asbestos. You or your representative has the right to observe employee measurements and to record the results obtained. Your employer is required to inform you of your exposure, and, if you are exposed above the permissible limit, he or she is required to inform you of the actions that are being taken to reduce your exposure to within the permissible limit.
- C. Your employer is required to keep records of your exposures and medical examinations. These exposure records must be kept for at least thirty (30) years. Medical records must be kept for the period of your employment plus thirty (30) years.
- D. Your employer is required to release your exposure and medical records to your physician or designated representative upon your written request.

**Appendix I to 1926.1101 — Medical Surveillance Guidelines for Asbestos (Non-Mandatory)****I. Route of Entry**

Inhalation, ingestion.

**II. Toxicology**

Clinical evidence of the adverse effects associated with exposure to asbestos is present in the form of several well-conducted epidemiological studies of occupationally exposed workers, family contacts of workers, and persons living near asbestos mines. These studies have shown a definite association between exposure to asbestos and an increased incidence of lung cancer, pleural and peritoneal mesothelioma, gastrointestinal cancer, and asbestosis. The latter is a disabling fibrotic lung disease that is caused only by exposure to asbestos. Exposure to asbestos has also been associated with an increased incidence of esophageal, kidney, laryngeal, pharyngeal, and buccal cavity cancers. As with other known chronic occupational diseases, disease associated with asbestos generally appears about 20 years following the first occurrence of exposure: There are no known acute effects associated with exposure to asbestos.

Epidemiological studies indicate that the risk of lung cancer among exposed workers who smoke cigarettes is greatly increased over the risk of lung cancer among non-exposed smokers or exposed nonsmokers. These studies suggest that cessation of smoking will reduce the risk of lung cancer for a person exposed to asbestos but will not reduce it to the same level of risk as that existing for an exposed worker who has never smoked.

**III. Signs and Symptoms of Exposure-Related Disease**

The signs and symptoms of lung cancer or gastrointestinal cancer induced by exposure to asbestos are not unique, except that a chest X-ray of an exposed patient with lung cancer may show pleural plaques, pleural calcification, or pleural fibrosis and may also show asbestosis (i.e. small, irregular parenchymal opacities). Symptoms characteristic of mesothelioma include shortness of breath, pain in the chest or abdominal pain.

Mesothelioma has a much longer average latency period compared with lung cancer (40 years versus 15-20 years), and mesothelioma is therefore more likely to be found among workers who were first exposed to asbestos at an early age. Mesothelioma is a fatal disease.

Asbestosis is pulmonary fibrosis caused by the accumulation of asbestos fibers in the lungs. Symptoms include shortness of breath, coughing, fatigue, and vague feelings of sickness. When the fibrosis worsens, shortness of breath occurs even at rest. The diagnosis of asbestosis is most commonly based on a history of exposure to asbestos, the presence of characteristic radiologic abnormalities, end-inspiratory crackles (rales), and other clinical features of fibrosing lung disease. Pleural plaques and thickening may be observed on chest X-rays. Asbestosis is often a progressive disease even in the absence of continued exposure, although this appears to be a highly individualized characteristic. In severe cases, death may be caused by respiratory or cardiac failure.

#### IV. Surveillance and Preventive Considerations

As noted in section III of this appendix, exposure to asbestos has been linked to an increased risk of lung cancer, mesothelioma, gastrointestinal cancer, and asbestosis among occupationally exposed workers. Adequate screening tests to determine an employee's potential for developing serious chronic diseases, such as a cancer, from exposure to asbestos do not presently exist. However, some tests, particularly chest X-rays and pulmonary function tests, may indicate that an employee has been overexposed to asbestos, increasing his or her risk of developing exposure related chronic diseases. It is important for the physician to become familiar with the operating conditions in which occupational exposure to asbestos is likely to occur. This is particularly important in evaluating medical and work histories and in conducting physical examinations. When an active employee has been identified as having been overexposed to asbestos, measures taken by the employer to eliminate or mitigate further exposure should also lower the risk of serious long-term consequences.

The employer is required to institute a medical surveillance program for all employees who are or will be exposed to asbestos at or above the permissible exposure limit (0.1 fiber per cubic centimeter of air) for 30 or more days per year and for all employees who are assigned to wear a negative-pressure respirator. All examinations and procedures must be performed by or under the supervision of a licensed physician, at a reasonable time and place, and at no cost to the employee.

Although broad latitude is given to the physician in prescribing specific tests to be included in the medical surveillance program, OSHA requires inclusion of the following elements in the routine examination:

- (i) Medical and work histories with special emphasis directed to symptoms of the respiratory system, cardiovascular system, and digestive tract.
- (ii) Completion of the respiratory disease questionnaire contained in Appendix D of this Appendix.

- (iii) A physical examination including a chest X-ray and pulmonary function test that includes measurement of the employee's forced vital capacity (FVC) and forced expiratory volume at one second (FEV<sub>1</sub>).
- (iv) Any laboratory or other test that the examining physician deems by sound medical practice to be necessary.

The employer is required to make the prescribed tests available at least annually to those employees covered; more often than specified if recommended by the examining physician; and upon termination of employment.

The employer is required to provide the physician with the following information: A copy of this standard in this section (including all appendices to this section); a description of the employee's duties as they relate to asbestos exposure; the employee's representative level of exposure to asbestos; a description of any personal protective and respiratory equipment used; and information from previous medical examinations of the affected employee that is not otherwise available to the physician. Making this information available to the physician will aid in the evaluation of the employee's health in relation to assigned duties and fitness to wear personal protective equipment, if required.

The employer is required to obtain a written opinion from the examining physician containing the results of the medical examination; the physician's opinion as to whether the employee has any detected medical conditions that would place the employee at an increased risk of exposure-related disease; any recommended limitations on the employee or on the use of personal protective equipment; and a statement that the employee has been informed by the physician of the results of the medical examination and of any medical conditions related to asbestos exposure that require further explanation or treatment. This written opinion must not reveal specific findings or diagnoses unrelated to exposure to asbestos, and a copy of the opinion must be provided to the affected employee.

## **Appendix J to 1926.1101 — Smoking Cessation Program Information for Asbestos (Non-Mandatory)**

The following organizations provide smoking cessation information.

1. The National Cancer Institute operates a toll-free Cancer Information Service (CIS) with trained personnel to help you. Call 1-800-4-CANCER\* to reach the CIS office serving your area, or write: Office of Cancer Communications, National Cancer Institute, National Institutes of Health, Building 31 Room 10A24, Bethesda, Maryland 20892.
2. American Cancer Society, 3340 Peachtree Road NE, Atlanta, Georgia 30026, (404) 320-3333.

The American Cancer Society (ACS) is a voluntary organization composed of 58 divisions and 3,100 local units. Through “The Great American Smokeout” in November, the annual Cancer Crusade in April, and numerous educational materials, ACS helps people learn about the health hazards of smoking and become successful ex-smokers.

3. American Heart Association, 7320 Greenville Avenue, Dallas, Texas 75231, (214) 750-5300.

The American Heart Association (AHA) is a voluntary organization with 130,000 members (physicians, scientists, and laypersons) in 55 state and regional groups. AHA produces a variety of publications and audiovisual materials about the effects of smoking on the heart. AHA also has developed a guidebook for incorporating a weight-control component into smoking cessation programs.

4. American Lung Association, 1740 Broadway, New York, New York 10019, (212) 245-8000.

A voluntary organization of 7,500 members (physicians, nurses, and laypersons), the American Lung Association (ALA) conducts numerous public information programs about the health effects of smoking. ALA has 59 state and 85 local units. The organization actively supports legislation and information campaigns for non-smokers’ rights and provides help for smokers who want to quit, for example, through “Freedom From Smoking,” a self-help smoking cessation program.

5. Office on Smoking and Health, U.S. Department of Health and Human Services, 5600 Fishers Lane, Park Building, Room 110, Rockville, Maryland 20857.

The Office on Smoking and Health (OSH) is the Department of Health and Human Services’ lead agency in smoking control. OSH has sponsored distribution of publications on smoking-related topics, such as free flyers on relapse after initial quitting, helping a friend or family member quit smoking, the health hazards of smoking, and the effects of parental smoking on teenagers.

\*In Hawaii, on Oahu call 524-1234 (call collect from neighboring islands).

Spanish-speaking staff members are available during daytime hours to callers from the following areas: California, Florida, Georgia, Illinois, New Jersey (area code 201), New York, and Texas. Consult your local telephone directory for listings of local chapters.

**Appendix K to 1926.1101 — Polarized Light Microscopy of Asbestos (Non-Mandatory)**

Method number: ID-191

Matrix: Bulk

Collection Procedure:

Collect approximately 1 to 2 grams of each type of material and place into separate 20 mL scintillation vials.

Analytical Procedure:

A portion of each separate phase is analyzed by gross examination, phase-polar examination, and central stop dispersion microscopy.

Commercial manufacturers and products mentioned in this method are for descriptive use only and do not constitute endorsements by USDOL-OSHA. Similar products from other sources may be substituted.

## 1. Introduction

This method describes the collection and analysis of asbestos bulk materials by light microscopy techniques including phase-polar illumination and central-stop dispersion microscopy. Some terms unique to asbestos analysis are defined below:

**Amphibole:** A family of minerals whose crystals are formed by long, thin units which have two thin ribbons of double chain silicate with a brucite ribbon in between. The shape of each unit is similar to an "I beam". Minerals important in asbestos analysis include cummingtonite-grunerite, crocidolite, tremolite-actinolite and anthophyllite.

**Asbestos:** A term for naturally occurring fibrous minerals. Asbestos includes chrysotile, cummingtonite-grunerite asbestos (amosite), anthophyllite asbestos, tremolite asbestos, crocidolite, actinolite asbestos and any of these minerals which have been chemically treated or altered. The precise chemical formulation of each species varies with the location from which it was mined. Nominal compositions are listed:

Chrysotile	$Mg_3Si_2O_5(OH)_4$
Crocidolite (Riebeckite asbestos)	$Na_2Fe_3^{2+}Fe_2^{3+}Si_8O_{22}(OH)_2$
Cummingtonite-Grunerite asbestos (Amosite)	$(Mg,Fe)_7Si_8O_{22}(OH)_2$
Tremolite-Actinolite asbestos	$Ca_2(Mg,Fe)_5Si_8O_{22}(OH)_2$
Anthophyllite asbestos	$(Mg,Fe)_7Si_8O_{22}(OH)_2$

**Asbestos Fiber:** A fiber of asbestos meeting the criteria for a fiber. (See section 3.5 of this appendix.)

**Aspect Ratio:** The ratio of the length of a fiber to its diameter usually defined as “length : width”, e.g. 3:1.

**Brucite:** A sheet mineral with the composition  $Mg(OH)_2$ .

**Central Stop Dispersion Staining (microscope):** This is a dark field microscope technique that images particles using only light refracted by the particle, excluding light that travels through the particle unrefracted. This is usually accomplished with a McCrone objective or other arrangement which places a circular stop with apparent aperture equal to the objective aperture in the back focal plane of the microscope.

**Cleavage Fragments:** Mineral particles formed by the comminution of minerals, especially those characterized by relatively parallel sides and moderate aspect ratio.

**Differential Counting:** The term applied to the practice of excluding certain kinds of fibers from a phase contrast asbestos count because they are not asbestos.

**Fiber:** A particle longer than or equal to 5  $\mu m$  with a length to width ratio greater than or equal to 3:1. This may include cleavage fragments. (See section 3.5 of this appendix.)

**Phase Contrast:** Contrast obtained in the microscope by causing light scattered by small particles to destructively interfere with unscattered light, thereby enhancing the visibility of very small particles and particles with very low intrinsic contrast.

**Phase Contrast Microscope:** A microscope configured with a phase mask pair to create phase contrast. The technique which uses this is called Phase Contrast Microscopy (PCM).

**Phase-Polar Analysis:** This is the use of polarized light in a phase contrast microscope. It is used to see the same size fibers that are visible in air filter analysis. Although fibers finer than 1  $\mu m$  are visible, analysis of these is inferred from analysis of larger bundles that are usually present.

**Phase-Polar Microscope:** The phase-polar microscope is a phase contrast microscope which has an analyzer, a polarizer, a first order red plate and a rotating phase condenser all in place so that the polarized light image is enhanced by phase contrast.

**Sealing Encapsulant:** This is a product which can be applied, preferably by spraying, onto an asbestos surface which will seal the surface so that fibers cannot be released.

**Serpentine:** A mineral family consisting of minerals with the general composition  $Mg_3(Si_2O_5(OH)_4$  having the magnesium in brucite layer over a silicate layer. Minerals important in asbestos analysis included in this family are chrysotile, lizardite, antigorite.

## 1.1. History

Light microscopy has been used for well over 100 years for the determination of mineral species. This analysis is carried out using specialized polarizing microscopes as well as bright field microscopes. The identification of minerals is an on-going process with many new minerals described each year. The first recorded use of asbestos was in Finland about 2500 B.C. where the material was used in the mud wattle for the wooden huts the people lived in as well as strengthening for pottery. Adverse health aspects of the mineral were noted nearly 2000 years ago when Pliny the Younger wrote about the poor health of slaves in the asbestos mines. Although known to be injurious for centuries, the first modern references to its toxicity were by the British Labor Inspectorate when it banned asbestos dust from the workplace in 1898. Asbestosis cases were described in the literature after the turn of the century. Cancer was first suspected in the mid 1930's and a causal link to mesothelioma was made in 1965. Because of the public concern for worker and public safety with the use of this material, several different types of analysis were applied to the determination of asbestos content. Light microscopy requires a great deal of experience and craft. Attempts were made to apply less subjective methods to the analysis. X-ray diffraction was partially successful in determining the mineral types but was unable to separate out the fibrous portions from the non-fibrous portions. Also, the minimum detection limit for asbestos analysis by X-ray diffraction (XRD) is about 1%. Differential Thermal Analysis (DTA) was no more successful. These provide useful corroborating information when the presence of asbestos has been shown by microscopy; however, neither can determine the difference between fibrous and non-fibrous minerals when both habits are present. The same is true of Infrared Absorption (IR).

When electron microscopy was applied to asbestos analysis, hundreds of fibers were discovered present too small to be visible in any light microscope. There are two different types of electron microscope used for asbestos analysis: Scanning Electron Microscope (SEM) and Transmission Electron Microscope (TEM). Scanning Electron Microscopy is useful in identifying minerals. The SEM can provide two of the three pieces of information required to identify fibers by electron microscopy: morphology and chemistry. The third is structure as determined by Selected Area Electron Diffraction – SAED which is performed in the TEM. Although the resolution of the SEM is sufficient for very fine fibers to be seen, accuracy of chemical analysis that can be performed on the fibers varies with fiber diameter in fibers of less than 0.2  $\mu\text{m}$  diameter. The TEM is a powerful tool to identify fibers too small to be resolved by light microscopy and should be used in conjunction with this method when necessary. The TEM can provide all three pieces of information required for fiber identification. Most fibers thicker than 1  $\mu\text{m}$  can adequately be defined in the light microscope. The light microscope remains as the best instrument for the determination of mineral type. This is because the minerals under investigation were first described analytically with the light microscope. It is inexpensive and gives positive identification for most samples analyzed. Further, when optical techniques are inadequate, there is ample indication that alternative techniques should be used for complete identification of the sample.

## 1.2. Principle

Minerals consist of atoms that may be arranged in random order or in a regular arrangement. Amorphous materials have atoms in random order while crystalline materials have long range order. Many materials are transparent to light, at least for small particles or for thin sections. The properties of these materials can be investigated by the effect that the material has on light passing through it. The six asbestos minerals are all crystalline with particular properties that have been identified and cataloged. These six minerals are anisotropic. They have a regular array of atoms, but the arrangement is not the same in all directions. Each major direction of the crystal presents a different regularity. Light photons travelling in each of these main directions will encounter different electrical neighborhoods, affecting the path and time of travel. The techniques outlined in this method use the fact that light traveling through fibers or crystals in different directions will behave differently, but predictably. The behavior of the light as it travels through a crystal can be measured and compared with known or determined values to identify the mineral species. Usually, Polarized Light Microscopy (PLM) is performed with strain-free objectives on a bright-field microscope platform. This would limit the resolution of the microscope to about 0.4  $\mu\text{m}$ . Because OSHA requires the counting and identification of fibers visible in phase contrast, the phase contrast platform is used to visualize the fibers with the polarizing elements added into the light path. Polarized light methods cannot identify fibers finer than about 1  $\mu\text{m}$  in diameter even though they are visible. The finest fibers are usually identified by inference from the presence of larger, identifiable fiber bundles. When fibers are present, but not identifiable by light microscopy, use either SEM or TEM to determine the fiber identity.

### 1.3. Advantages and Disadvantages

The advantages of light microscopy are:

- (a) Basic identification of the materials was first performed by light microscopy and gross analysis. This provides a large base of published information against which to check analysis and analytical technique.
- (b) The analysis is specific to fibers. The minerals present can exist in asbestiform, fibrous, prismatic, or massive varieties all at the same time. Therefore, bulk methods of analysis such as X-ray diffraction, IR analysis, DTA, etc. are inappropriate where the material is not known to be fibrous.
- (c) The analysis is quick, requires little preparation time, and can be performed on-site if a suitably equipped microscope is available.

The disadvantages are:

- (a) Even using phase-polar illumination, not all the fibers present may be seen. This is a problem for very low asbestos concentrations where agglomerations or large bundles of fibers may not be present to allow identification by inference.
- (b) The method requires a great degree of sophistication on the part of the microscopist. An analyst is only as useful as his mental catalog of images. Therefore, a microscopist's accuracy is enhanced by experience. The mineralogical training of the analyst is very important. It is the basis on which subjective decisions are made.
- (c) The method uses only a tiny amount of material for analysis. This may lead to sampling bias and false results (high or low). This is especially true if the sample is severely inhomogeneous.
- (d) Fibers may be bound in a matrix and not distinguishable as fibers so identification cannot be made.

#### 1.4. Method Performance

- 1.4.1. This method can be used for determination of asbestos content from 0 to 100% asbestos. The detection limit has not been adequately determined, although for selected samples, the limit is very low, depending on the number of particles examined. For mostly homogeneous, finely divided samples, with no difficult fibrous interferences, the detection limit is below 1%. For inhomogeneous samples (most samples), the detection limit remains undefined. NIST has conducted proficiency testing of laboratories on a national scale. Although each round is reported statistically with an average, control limits, etc., the results indicate a difficulty in establishing precision especially in the low concentration range. It is suspected that there is significant bias in the low range especially near 1%. EPA tried to remedy this by requiring a mandatory point counting scheme for samples less than 10%. The point counting procedure is tedious, and may introduce significant biases of its own. It has not been incorporated into this method.
- 1.4.2. The precision and accuracy of the quantitation tests performed in this method are unknown. Concentrations are easier to determine in commercial products where asbestos was deliberately added because the amount is usually more than a few percent. An analyst's results can be "calibrated" against the known amounts added by the manufacturer. For geological samples, the degree of homogeneity affects the precision.

- 1.4.3. The performance of the method is analyst dependent. The analyst must choose carefully and not necessarily randomly the portions for analysis to assure that detection of asbestos occurs when it is present. For this reason, the analyst must have adequate training in sample preparation, and experience in the location and identification of asbestos in samples. This is usually accomplished through substantial on-the-job training as well as formal education in mineralogy and microscopy.

#### 1.5. Interferences

Any material which is long, thin, and small enough to be viewed under the microscope can be considered an interference for asbestos. There are literally hundreds of interferences in workplaces. The techniques described in this method are normally sufficient to eliminate the interferences. An analyst's success in eliminating the interferences depends on proper training.

Asbestos minerals belong to two mineral families: the serpentines and the amphiboles. In the serpentine family, the only common fibrous mineral is chrysotile. Occasionally, the mineral antigorite occurs in a fibril habit with morphology similar to the amphiboles. The amphibole minerals consist of a score of different minerals of which only five are regulated by federal standard: amosite, crocidolite, anthophyllite asbestos, tremolite asbestos and actinolite asbestos. These are the only amphibole minerals that have been commercially exploited for their fibrous properties; however, the rest can and do occur occasionally in asbestiform habit.

In addition to the related mineral interferences, other minerals common in building material may present a problem for some microscopists: gypsum, anhydrite, brucite, quartz fibers, talc fibers or ribbons, wollastonite, perlite, attapulgite, etc. Other fibrous materials commonly present in workplaces are: fiberglass, mineral wool, ceramic wool, refractory ceramic fibers, kevlar, nomex, synthetic fibers, graphite or carbon fibers, cellulose (paper or wood) fibers, metal fibers, etc.

Matrix embedding material can sometimes be a negative interference. The analyst may not be able to easily extract the fibers from the matrix in order to use the method. Where possible, remove the matrix before the analysis, taking careful note of the loss of weight. Some common matrix materials are: vinyl, rubber, tar, paint, plant fiber, cement, and epoxy. A further negative interference is that the asbestos fibers themselves may be either too small to be seen in Phase contrast Microscopy (PCM) or of a very low fibrous quality, having the appearance of plant fibers. The analyst's ability to deal with these materials increases with experience.

#### 1.6. Uses and Occupational Exposure

Asbestos is ubiquitous in the environment. More than 40% of the land area of the United States is composed of minerals which may contain asbestos. Fortunately, the actual formation of great amounts of asbestos is relatively rare. Nonetheless, there are locations in which environmental exposure can be severe such as in the Serpentine Hills of California.

There are thousands of uses for asbestos in industry and the home. Asbestos abatement workers are the most current segment of the population to have occupational exposure to great amounts of asbestos. If the material is undisturbed, there is no exposure. Exposure occurs when the asbestos-containing material is abraded or otherwise disturbed during maintenance operations or some other activity. Approximately 95% of the asbestos in place in the United States is chrysotile.

Amosite and crocidolite make up nearly all the difference. Tremolite and anthophyllite make up a very small percentage. Tremolite is found in extremely small amounts in certain chrysotile deposits. Actinolite exposure is probably greatest from environmental sources, but has been identified in vermiculite containing, sprayed-on insulating materials which may have been certified as asbestos-free.

#### 1.7. Physical and Chemical Properties

The nominal chemical compositions for the asbestos minerals were given in Section 1. Compared to cleavage fragments of the same minerals, asbestiform fibers possess a high tensile strength along the fiber axis. They are chemically inert, non-combustible, and heat resistant. Except for chrysotile, they are insoluble in Hydrochloric acid (HCl). Chrysotile is slightly soluble in HCl. Asbestos has high electrical resistance and good sound absorbing characteristics. It can be woven into cables, fabrics or other textiles, or matted into papers, felts, and mats.

#### 1.8. Toxicology (This Section is for Information Only and Should Not Be Taken as OSHA Policy)

Possible physiologic results of respiratory exposure to asbestos are mesothelioma of the pleura or peritoneum, interstitial fibrosis, asbestosis, pneumoconiosis, or respiratory cancer. The possible consequences of asbestos exposure are detailed in the NIOSH Criteria Document or in the OSHA Asbestos Standards 29 CFR 1910.1001 and 29 CFR 1926.1101 and 29 CFR 1915.1001.

## 2. Sampling Procedure

### 2.1. Equipment for Sampling

- (a) Tube or cork borer sampling device
- (b) Knife
- (c) 20 mL scintillation vial or similar vial
- (d) Sealing encapsulant

## 2.2. Safety Precautions

Asbestos is a known carcinogen. Take care when sampling. While in an asbestos-containing atmosphere, a properly selected and fit-tested respirator should be worn. Take samples in a manner to cause the least amount of dust. Follow these general guidelines:

- (a) Do not make unnecessary dust.
- (b) Take only a small amount (1 to 2 g).
- (c) Tightly close the sample container.
- (d) Use encapsulant to seal the spot where the sample was taken, if necessary.

## 2.3. Sampling Procedure

Samples of any suspect material should be taken from an inconspicuous place. Where the material is to remain, seal the sampling wound with an encapsulant to eliminate the potential for exposure from the sample site. Microscopy requires only a few milligrams of material. The amount that will fill a 20 mL scintillation vial is more than adequate. Be sure to collect samples from all layers and phases of material. If possible, make separate samples of each different phase of the material. This will aid in determining the actual hazard. **DO NOT USE ENVELOPES, PLASTIC OR PAPER BAGS OF ANY KIND TO COLLECT SAMPLES.** The use of plastic bags presents a contamination hazard to laboratory personnel and to other samples. When these containers are opened, a bellows effect blows fibers out of the container onto everything, including the person opening the container.

If a cork-borer type sampler is available, push the tube through the material all the way, so that all layers of material are sampled. Some samplers are intended to be disposable. These should be capped and sent to the laboratory. If a non-disposable cork borer is used, empty the contents into a scintillation vial and send to the laboratory. Vigorously and completely clean the cork borer between samples.

## 2.4 Shipment

Samples packed in glass vials must not touch or they might break in shipment.

- (a) Seal the samples with a sample seal over the end to guard against tampering and to identify the sample.
- (b) Package the bulk samples in separate packages from the air samples. They may cross-contaminate each other and will invalidate the results of the air samples.
- (c) Include identifying paperwork with the samples, but not in contact with the suspected asbestos.

- (d) To maintain sample accountability, ship the samples by certified mail, overnight express, or hand carry them to the laboratory.

### 3. Analysis

The analysis of asbestos samples can be divided into two major parts: sample preparation and microscopy. Because of the different asbestos uses that may be encountered by the analyst, each sample may need different preparation steps. The choices are outlined below. There are several different tests that are performed to identify the asbestos species and determine the percentage. They will be explained below.

#### 3.1. Safety

- (a) Do not create unnecessary dust. Handle the samples in HEPA-filter equipped hoods. If samples are received in bags, envelopes or other inappropriate container, open them only in a hood having a face velocity at or greater than 100 fpm. Transfer a small amount to a scintillation vial and only handle the smaller amount.
- (b) Open samples in a hood, never in the open lab area.
- (c) Index of refraction oils can be toxic. Take care not to get this material on the skin. Wash immediately with soap and water if this happens.
- (d) Samples that have been heated in the muffle furnace or the drying oven may be hot. Handle them with tongs until they are cool enough to handle.
- (e) Some of the solvents used, such as THF (tetrahydrofuran), are toxic and should only be handled in an appropriate fume hood and according to instructions given in the Material Safety Data Sheet (MSDS).

#### 3.2. Equipment

- (a) Phase contrast microscope with 10x, 16x and 40x objectives, 10x wide-field eyepieces, G-22 Walton-Beckett graticule, Whipple disk, polarizer, analyzer and first order red or gypsum plate, 100 Watt illuminator, rotating position condenser with oversize phase rings, central stop dispersion objective, Kohler illumination and a rotating mechanical stage.
- (b) Stereo microscope with reflected light illumination, transmitted light illumination, polarizer, analyzer and first order red or gypsum plate, and rotating stage.
- (c) Negative pressure hood for the stereo microscope
- (d) Muffle furnace capable of 600° C
- (e) Drying oven capable of 50-150° C

- (f) Aluminum specimen pans
- (g) Tongs for handling samples in the furnace
- (h) High dispersion index of refraction oils (Special for dispersion staining.)

n = 1.550	n = 1.620
n = 1.585	n = 1.670
n = 1.590	n = 1.680
n = 1.605	n = 1.690

- (i) A set of index of refraction oils from about n=1.350 to n=2.000 in n=0.005 increments. (Standard for Becke line analysis.)
- (j) Glass slides with painted or frosted ends 1x3 inches 1mm thick, precleaned.
- (k) Cover Slips 22x22 mm, #1 1/2
- (l) Paper clips or dissection needles
- (m) Hand grinder
- (n) Scalpel with both #10 and #11 blades
- (o) 0.1 molar HCl
- (p) Decalcifying solution (Baxter Scientific Products) Ethylenediaminetetraacetic Acid,

Tetrasodium.....	0.7 g/l
Sodium Potassium Tartrate.....	8.0 mg/liter
Hydrochloric Acid.....	99.2 g/liter
Sodium Tartrate.....	0.14 g/liter

- (q) Tetrahydrofuran (THF)
- (r) Hotplate capable of 60° C
- (s) Balance
- (t) Hacksaw blade
- (u) Ruby mortar and pestle

3.3. Sample Pre-Preparation

Sample preparation begins with pre-preparation which may include chemical reduction of the matrix, heating the sample to dryness or heating in the muffle furnace. The end result is a sample which has been reduced to a powder that is sufficiently fine to fit under the cover slip. Analyze different phases of samples separately, e.g., tile and the tile mastic should be analyzed separately as the mastic may contain asbestos while the tile may not.

(a) Wet samples

Samples with a high water content will not give the proper dispersion colors and must be dried prior to sample mounting. Remove the lid of the scintillation vial, place the bottle in the drying oven and heat at 100° C to dryness (usually about 2 h). Samples which are not submitted to the lab in glass must be removed and placed in glass vials or aluminum weighing pans before placing them in the drying oven.

(b) Samples With Organic Interference – Muffle Furnace

These may include samples with tar as a matrix, vinyl asbestos tile, or any other organic that can be reduced by heating. Remove the sample from the vial and weigh in a balance to determine the weight of the submitted portion. Place the sample in a muffle furnace at 500° C for 1 to 2 h or until all obvious organic material has been removed. Retrieve, cool and weigh again to determine the weight loss on ignition. This is necessary to determine the asbestos content of the submitted sample, because the analyst will be looking at a reduced sample.

**Note:** Heating above 600° C will cause the sample to undergo a structural change which, given sufficient time, will convert the chrysotile to forsterite. Heating even at lower temperatures for 1 to 2 h may have a measurable effect on the optical properties of the minerals. If the analyst is unsure of what to expect, a sample of standard asbestos should be heated to the same temperature for the same length of time so that it can be examined for the proper interpretation.

(c) Samples With Organic Interference – THF

Vinyl asbestos tile is the most common material treated with this solvent, although, substances containing tar will sometimes yield to this treatment. Select a portion of the material and then grind it up if possible. Weigh the sample and place it in a test tube. Add sufficient THF to dissolve the organic matrix. This is usually about 4 to 5 mL. Remember, THF is highly flammable. Filter the remaining material through a tared silver membrane, dry and weigh to determine how much is left after the solvent extraction. Further process the sample to remove carbonate or mount directly.

(d) Samples With Carbonate Interference

Carbonate material is often found on fibers and sometimes must be removed in order to perform dispersion microscopy. Weigh out a portion of the material and place it in a test tube. Add a sufficient amount of 0.1 M HCl or decalcifying solution in the tube to react all the carbonate as evidenced by gas formation; i.e., when the gas bubbles stop, add a little more solution. If no more gas forms, the reaction is complete. Filter the material out through a tared silver membrane, dry and weigh to determine the weight lost.

#### 3.4. Sample Preparation

Samples must be prepared so that accurate determination can be made of the asbestos type and amount present. The following steps are carried out in the low-flow hood (a low-flow hood has less than 50 fpm flow):

- (1) If the sample has large lumps, is hard, or cannot be made to lie under a cover slip, the grain size must be reduced. Place a small amount between two slides and grind the material between them or grind a small amount in a clean mortar and pestle. The choice of whether to use an alumina, ruby, or diamond mortar depends on the hardness of the material. Impact damage can alter the asbestos mineral if too much mechanical shock occurs. (Freezer mills can completely destroy the observable crystallinity of asbestos and should not be used). For some samples, a portion of material can be shaved off with a scalpel, ground off with a hand grinder or hack saw blade.

The preparation tools should either be disposable or cleaned thoroughly. Use vigorous scrubbing to loosen the fibers during the washing. Rinse the implements with copious amounts of water and air-dry in a dust-free environment.

- (2) If the sample is powder or has been reduced as in (1) above, it is ready to mount. Place a glass slide on a piece of optical tissue and write the identification on the painted or frosted end. Place two drops of index of refraction medium  $n=1.550$  on the slide. (The medium  $n=1.550$  is chosen because it is the matching index for chrysotile). Dip the end of a clean paperclip or dissecting needle into the droplet of refraction medium on the slide to moisten it. Then dip the probe into the powder sample. Transfer what sticks on the probe to the slide. The material on the end of the probe should have a diameter of about 3 mm for a good mount. If the material is very fine, less sample may be appropriate. For non-powder samples such as fiber mats, forceps should be used to transfer a small amount of material to the slide. Stir the material in the medium on the slide, spreading it out and making the preparation as uniform as possible. Place a cover-slip on the preparation by gently lowering onto the slide and allowing it to fall "trapdoor" fashion on the preparation to push out any bubbles. Press gently on the cover slip to even out the distribution of particulate on the slide. If there is insufficient mounting oil on the slide, one or two drops may be placed near the edge of the coverslip on the slide. Capillary action will draw the necessary amount of liquid into the preparation. Remove excess oil with the point of a laboratory wiper.

Treat at least two different areas of each phase in this fashion. Choose representative areas of the sample. It may be useful to select particular areas or fibers for analysis. This is useful to identify asbestos in severely inhomogeneous samples.

When it is determined that amphiboles may be present, repeat the above process using the appropriate high-dispersion oils until an identification is made or all six asbestos minerals have been ruled out. Note that percent determination must be done in the index medium 1.550 because amphiboles tend to disappear in their matching mediums.

### 3.5. Analytical Procedure

**Note:** This method presumes some knowledge of mineralogy and optical petrography.

The analysis consists of three parts: The determination of whether there is asbestos present, what type is present and the determination of how much is present. The general flow of the analysis is:

- (1) Gross examination.
- (2) Examination under polarized light on the stereo microscope.
- (3) Examination by phase-polar illumination on the compound phase microscope.

- (4) Determination of species by dispersion stain. Examination by Becke line analysis may also be used; however, this is usually more cumbersome for asbestos determination.
- (5) Difficult samples may need to be analyzed by SEM or TEM, or the results from those techniques combined with light microscopy for a definitive identification.

Identification of a particle as asbestos requires that it be asbestiform. Description of particles should follow the suggestion of Campbell. (Figure 1)

Figure 1 Particle definitions showing mineral growth habits. From the U.S. Bureau of Mines.

For the purpose of regulation, the mineral must be one of the six minerals covered and must be in the asbestos growth habit. Large specimen samples of asbestos generally have the gross appearance of wood. Fibers are easily parted from it. Asbestos fibers are very long compared with their widths. The fibers have a very high tensile strength as demonstrated by bending without breaking. Asbestos fibers exist in bundles that are easily parted, show longitudinal fine structure and may be tufted at the ends showing "bundle of sticks" morphology. In the microscope some of these properties may not be observable. Amphiboles do not always show striations along their length even when they are asbestos. Neither will they always show tufting. They generally do not show a curved nature except for very long fibers. Asbestos and asbestiform minerals are usually characterized in groups by extremely high aspect ratios (greater than 100:1). While aspect ratio analysis is useful for characterizing populations of fibers, it cannot be used to identify individual fibers of intermediate to short aspect ratio. Observation of many fibers is often necessary to determine whether a sample consists of "cleavage fragments" or of asbestos fibers.

Most cleavage fragments of the asbestos minerals are easily distinguishable from true asbestos fibers. This is because true cleavage fragments usually have larger diameters than 1  $\mu\text{m}$ . Internal structure of particles larger than this usually shows them to have no internal fibrillar structure. In addition, cleavage fragments of the monoclinic amphiboles show inclined extinction under crossed polars with no compensator. Asbestos fibers usually show extinction at zero degrees or ambiguous extinction if any at all. Morphologically, the larger cleavage fragments are obvious by their blunt or stepped ends showing prismatic habit. Also, they tend to be acicular rather than filiform.

Where the particles are less than 1  $\mu\text{m}$  in diameter and have an aspect ratio greater than or equal to 3:1, it is recommended that the sample be analyzed by SEM or TEM if there is any question whether the fibers are cleavage fragments or asbestiform particles.

Care must be taken when analyzing by electron microscopy because the interferences are different from those in light microscopy and may structurally be very similar to asbestos. The classic interference is between anthophyllite and biopyribole or intermediate fiber. Use the same morphological clues for electron microscopy as are used for light microscopy, e.g. fibril splitting, internal longitudinal striation, fraying, curvature, etc.

(1) Gross examination:

Examine the sample, preferably in the glass vial. Determine the presence of any obvious fibrous component. Estimate a percentage based on previous experience and current observation. Determine whether any pre-preparation is necessary. Determine the number of phases present. This step may be carried out or augmented by observation at 6 to 40x under a stereo microscope.

- (2) After performing any necessary pre-preparation, prepare slides of each phase as described above. Two preparations of the same phase in the same index medium can be made side-by-side on the same glass for convenience. Examine with the polarizing stereo microscope. Estimate the percentage of asbestos based on the amount of birefringent fiber present.
- (3) Examine the slides on the phase-polar microscopes at magnifications of 160 and 400x. Note the morphology of the fibers. Long, thin, very straight fibers with little curvature are indicative of fibers from the amphibole family. Curved, wavy fibers are usually indicative of chrysotile. Estimate the percentage of asbestos on the phase-polar microscope under conditions of crossed polars and a gypsum plate. Fibers smaller than 1.0  $\mu\text{m}$  in thickness must be identified by inference to the presence of larger, identifiable fibers and morphology. If no larger fibers are visible, electron microscopy should be performed. At this point, only a tentative identification can be made. Full identification must be made with dispersion microscopy. Details of the tests are included in the appendices.
- (4) Once fibers have been determined to be present, they must be identified. Adjust the microscope for dispersion mode and observe the fibers. The microscope has a rotating stage, one polarizing element, and a system for generating dark-field dispersion microscopy (see Section 4.6. of this appendix). Align a fiber with its length parallel to the polarizer and note the color of the Becke lines. Rotate the stage to bring the fiber length perpendicular to the polarizer and note the color. Repeat this process for every fiber or fiber bundle examined. The colors must be consistent with the colors generated by standard asbestos reference materials for a positive identification. In  $n=1.550$ , amphiboles will generally show a yellow to straw-yellow color indicating that the fiber indices of refraction are higher than the liquid. If long, thin fibers are noted and the colors are yellow, prepare further slides as above in the suggested matching liquids listed below:

Type of asbestos	Index of refraction
Chrysotile	n=1.550
Amosite	n=1.670 or 1.680
Crocidolite	n=1.690
Anthophyllite	n=1.605 and 1.620
Tremolite	n=1.605 and 1.620
Actinolite	n=1.620

Where more than one liquid is suggested, the first is preferred; however, in some cases this liquid will not give good dispersion color. Take care to avoid interferences in the other liquid; e.g., wollastonite in  $n=1.620$  will give the same colors as tremolite. In  $n=1.605$  wollastonite will appear yellow in all directions. Wollastonite may be determined under crossed polars as it will change from blue to yellow as it is rotated along its fiber axis by tapping on the cover slip. Asbestos minerals will not change in this way.

Determination of the angle of extinction may, when present, aid in the determination of anthophyllite from tremolite. True asbestos fibers usually have  $0^\circ$  extinction or ambiguous extinction, while cleavage fragments have more definite extinction.

Continue analysis until both preparations have been examined and all present species of asbestos are identified. If there are no fibers present, or there is less than 0.1% present, end the analysis with the minimum number of slides (2).

- (5) Some fibers have a coating on them which makes dispersion microscopy very difficult or impossible. Becke line analysis or electron microscopy may be performed in those cases. Determine the percentage by light microscopy. TEM analysis tends to overestimate the actual percentage present.
- (6) Percentage determination is an estimate of occluded area, tempered by gross observation. Gross observation information is used to make sure that the high magnification microscopy does not greatly over- or under-estimate the amount of fiber present. This part of the analysis requires a great deal of experience. Satisfactory models for asbestos content analysis have not yet been developed, although some models based on metallurgical grain-size determination have found some utility. Estimation is more easily handled in situations where the grain sizes visible at about 160x are about the same and the sample is relatively homogeneous.

View all of the area under the cover slip to make the percentage determination. View the fields while moving the stage, paying attention to the clumps of material. These are not usually the best areas to perform dispersion microscopy because of the interference from other materials. But, they are the areas most likely to represent the accurate percentage in the sample. Small amounts of asbestos require slower scanning and more frequent analysis of individual fields.

Report the area occluded by asbestos as the concentration. This estimate does not generally take into consideration the difference in density of the different species present in the sample. For most samples this is adequate. Simulation studies with similar materials must be carried out to apply microvisual estimation for that purpose and is beyond the scope of this procedure.

- (7) Where successive concentrations have been made by chemical or physical means, the amount reported is the percentage of the material in the "as submitted" or original state. The percentage determined by microscopy is multiplied by the fractions remaining after pre-preparation steps to give the percentage in the original sample. For example:

Step 1. 60% remains after heating at 550 C for 1 h.

Step 2. 30% of the residue of step 1 remains after dissolution of carbonate in 0.1 m HCl.

Step 3. Microvisual estimation determines that 5% of the sample is chrysotile asbestos.

The reported result is:

$R = (\text{Microvisual result in percent}) \times (\text{Fraction remaining after step 2}) \times (\text{Fraction remaining of original sample after step 1})$

$R = (5) \times (.30) \times (.60) = 0.9\%$

- (8) Report the percent and type of asbestos present. For samples where asbestos was identified, but is less than 1.0%, report "Asbestos present, less than 1.0%." There must have been at least two observed fibers or fiber bundles in the two preparations to be reported as present. For samples where asbestos was not seen, report as "None Detected."

#### Auxiliary Information

Because of the subjective nature of asbestos analysis, certain concepts and procedures need to be discussed in more depth. This information will help the analyst understand why some of the procedures are carried out the way they are.

#### 4.1. Light

Light is electromagnetic energy. It travels from its source in packets called quanta. It is instructive to consider light as a plane wave. The light has a direction of travel. Perpendicular to this and mutually perpendicular to each other, are two vector components. One is the magnetic vector and the other is the electric vector. We shall only be concerned with the electric vector. In this description, the interaction of the vector and the mineral will describe all the observable phenomena. From a light source such a microscope illuminator, light travels in all different direction from the filament.

In any given direction away from the filament, the electric vector is perpendicular to the direction of travel of a light ray. While perpendicular, its orientation is random about the travel axis. If the electric vectors from all the light rays were lined up by passing the light through a filter that would only let light rays with electric vectors oriented in one direction pass, the light would then be POLARIZED.

Polarized light interacts with matter in the direction of the electric vector. This is the polarization direction. Using this property it is possible to use polarized light to probe different materials and identify them by how they interact with light.

The speed of light in a vacuum is a constant at about  $2.99 \times 10^8$  m/s. When light travels in different materials such as air, water, minerals or oil, it does not travel at this speed. It travels slower. This slowing is a function of both the material through which the light is traveling and the wavelength or frequency of the light. In general, the more dense the material, the slower the light travels. Also, generally, the higher the frequency, the slower the light will travel. The ratio of the speed of light in a vacuum to that in a material is called the index of refraction ( $n$ ). It is usually measured at 589 nm (the sodium D line). If white light (light containing all the visible wavelengths) travels through a material, rays of longer wavelengths will travel faster than those of shorter wavelengths, this separation is called dispersion. Dispersion is used as an identifier of materials as described in Section 4.6.

#### 4.2. Material Properties

Materials are either amorphous or crystalline. The difference between these two descriptions depends on the positions of the atoms in them. The atoms in amorphous materials are randomly arranged with no long range order. An example of an amorphous material is glass. The atoms in crystalline materials, on the other hand, are in regular arrays and have long range order. Most of the atoms can be found in highly predictable locations. Examples of crystalline material are salt, gold, and the asbestos minerals.

It is beyond the scope of this method to describe the different types of crystalline materials that can be found, or the full description of the classes into which they can fall. However, some general crystallography is provided below to give a foundation to the procedures described.

With the exception of anthophyllite, all the asbestos minerals belong to the monoclinic crystal type. The unit cell is the basic repeating unit of the crystal and for monoclinic crystals can be described as having three unequal sides, two  $90^\circ$  angles and one angle not equal to  $90^\circ$ . The orthorhombic group, of which anthophyllite is a member has three unequal sides and three  $90^\circ$  angles. The unequal sides are a consequence of the complexity of fitting the different atoms into the unit cell. Although the atoms are in a regular array, that array is not symmetrical in all directions. There is long range order in the three major directions of the crystal. However, the order is different in each of the three directions. This has the effect that the index of refraction is different in each of the three directions. Using polarized light, we can investigate the index of refraction in each of the directions and identify the mineral or material under investigation. The indices  $\alpha$ ,  $\beta$ , and  $\gamma$  are used to identify the lowest, middle, and highest index of refraction respectively. The  $\chi$  direction, associated with  $\alpha$  is called the fast axis. Conversely, the Z direction is associated with  $\gamma$  and is the slow direction. Crocidolite has  $\alpha$  along the fiber length making it “length-fast”. The remainder of the asbestos minerals have the  $\gamma$  axis along the fiber length. They are called “length-slow”. This orientation to fiber length is used to aid in the identification of asbestos.

#### 4.3. Polarized Light Technique

Polarized light microscopy as described in this section uses the phase-polar microscope described in Section 3.2. A phase contrast microscope is fitted with two polarizing elements, one below and one above the sample. The polarizers have their polarization directions at right angles to each other. Depending on the tests performed, there may be a compensator between these two polarizing elements. A compensator is a piece of mineral with known properties that “compensates” for some deficiency in the optical train. Light emerging from a polarizing element has its electric vector pointing in the polarization direction of the element. The light will not be subsequently transmitted through a second element set at a right angle to the first element. Unless the light is altered as it passes from one element to the other, there is no transmission of light.

#### 4.4. Angle of Extinction

Crystals which have different crystal regularity in two or three main directions are said to be anisotropic. They have a different index of refraction in each of the main directions. When such a crystal is inserted between the crossed polars, the field of view is no longer dark but shows the crystal in color. The color depends on the properties of the crystal. The light acts as if it travels through the crystal along the optical axes. If a crystal optical axis were lined up along one of the polarizing directions (either the polarizer or the analyzer) the light would appear to travel only in that direction, and it would blink out or go dark. The difference in degrees between the fiber direction and the angle at which it blinks out is called the angle of extinction. When this angle can be measured, it is useful in identifying the mineral. The procedure for measuring the angle of extinction is to first identify the polarization direction in the microscope. A commercial alignment slide can be used to establish the polarization directions or use anthophyllite or another suitable mineral. This mineral has a zero degree angle of extinction and will go dark to extinction as it aligns with the polarization directions. When a fiber of anthophyllite has gone to extinction, align the eyepiece reticle or graticule with the fiber so that there is a visual cue as to the direction of polarization in the field of view. Tape or otherwise secure the eyepiece in this position so it will not shift.

After the polarization direction has been identified in the field of view, move the particle of interest to the center of the field of view and align it with the polarization direction. For fibers, align the fiber along this direction. Note the angular reading of the rotating stage. Looking at the particle, rotate the stage until the fiber goes dark or "blinks out". Again note the reading of the stage. The difference in the first reading and the second is an angle of extinction.

The angle measured may vary as the orientation of the fiber changes about its long axis. Tables of mineralogical data usually report the maximum angle of extinction. Asbestos forming minerals, when they exhibit an angle of extinction, usually do show an angle of extinction close to the reported maximum, or as appropriate depending on the substitution chemistry.

#### 4.5. Crossed Polars with Compensator

When the optical axes of a crystal are not lined up along one of the polarizing directions (either the polarizer or the analyzer) part of the light travels along one axis and part travels along the other visible axis. This is characteristic of birefringent materials.

The color depends on the difference of the two visible indices of refraction and the thickness of the crystal. The maximum difference available is the difference between the  $\alpha$  and the  $\gamma$  axes. This maximum difference is usually tabulated as the birefringence of the crystal.

For this test, align the fiber at 45° to the polarization directions in order to maximize the contribution to each of the optical axes. The colors seen are called retardation colors. They arise from the recombination of light which has traveled through the two separate directions of the crystal. One of the rays is retarded behind the other since the light in that direction travels slower. On recombination, some of the colors which make up white light are enhanced by constructive interference and some are suppressed by destructive interference. The result is a color dependent on the difference between the indices and the thickness of the crystal. The proper colors, thicknesses, and retardations are shown on a Michel-Levy chart. The three items, retardation, thickness and birefringence are related by the following relationship:

$$R = t(n_{\gamma} - n_{\alpha})$$

R = retardation, t = crystal thickness in  $\mu\text{m}$ , and  
 $n_{\alpha,\gamma}$  = indices of refraction.

Examination of the equation for asbestos minerals reveals that the visible colors for almost all common asbestos minerals and fiber sizes are shades of gray and black. The eye is relatively poor at discriminating different shades of gray. It is very good at discriminating different colors. In order to compensate for the low retardation, a compensator is added to the light train between the polarization elements. The compensator used for this test is a gypsum plate of known thickness and birefringence. Such a compensator when oriented at  $45^\circ$  to the polarizer direction, provides a retardation of 530 nm of the 530 nm wavelength color. This enhances the red color and gives the background a characteristic red to red-magenta color. If this "full-wave" compensator is in place when the asbestos preparation is inserted into the light train, the colors seen on the fibers are quite different. Gypsum, like asbestos has a fast axis and a slow axis. When a fiber is aligned with its fast axis in the same direction as the fast axis of the gypsum plate, the ray vibrating in the slow direction is retarded by both the asbestos and the gypsum. This results in a higher retardation than would be present for either of the two minerals. The color seen is a second order blue. When the fiber is rotated  $90^\circ$  using the rotating stage, the slow direction of the fiber is now aligned with the fast direction of the gypsum and the fast direction of the fiber is aligned with the slow direction of the gypsum. Thus, one ray vibrates faster in the fast direction of the gypsum, and slower in the slow direction of the fiber; the other ray will vibrate slower in the slow direction of the gypsum and faster in the fast direction of the fiber. In this case, the effect is subtractive and the color seen is a first order yellow. As long as the fiber thickness does not add appreciably to the color, the same basic colors will be seen for all asbestos types except crocidolite. In crocidolite the colors will be weaker, may be in the opposite directions, and will be altered by the blue absorption color natural to crocidolite. Hundreds of other materials will give the same colors as asbestos, and therefore, this test is not definitive for asbestos. The test is useful in discriminating against fiberglass or other amorphous fibers such as some synthetic fibers. Certain synthetic fibers will show retardation colors different than asbestos; however, there are some forms of polyethylene and aramid which will show morphology and retardation colors similar to asbestos minerals. This test must be supplemented with a positive identification test when birefringent fibers are present which can not be excluded by morphology. This test is relatively ineffective for use on fibers less than  $1\ \mu\text{m}$  in diameter. For positive confirmation TEM or SEM should be used if no larger bundles or fibers are visible.

#### 4.6. Dispersion Staining

Dispersion microscopy or dispersion staining is the method of choice for the identification of asbestos in bulk materials. Becke line analysis is used by some laboratories and yields the same results as does dispersion staining for asbestos and can be used in lieu of dispersion staining. Dispersion staining is performed on the same platform as the phase-polar analysis with the analyzer and compensator removed. One polarizing element remains to define the direction of the light so that the different indices of refraction of the fibers may be separately determined. Dispersion microscopy is a dark-field technique when used for asbestos. Particles are imaged with scattered light. Light which is unscattered is blocked from reaching the eye either by the back field image mask in a McCrone objective or a back field image mask in the phase condenser. The most convenient method is to use the rotating phase condenser to move an oversized phase ring into place. The ideal size for this ring is for the central disk to be just larger than the objective entry aperture as viewed in the back focal plane. The larger the disk, the less scattered light reaches the eye. This will have the effect of diminishing the intensity of dispersion color and will shift the actual color seen. The colors seen vary even on microscopes from the same manufacturer. This is due to the different bands of wavelength exclusion by different mask sizes. The mask may either reside in the condenser or in the objective back focal plane. It is imperative that the analyst determine by experimentation with asbestos standards what the appropriate colors should be for each asbestos type. The colors depend also on the temperature of the preparation and the exact chemistry of the asbestos. Therefore, some slight differences from the standards should be allowed. This is not a serious problem for commercial asbestos uses. This technique is used for identification of the indices of refraction for fibers by recognition of color. There is no direct numerical readout of the index of refraction. Correlation of color to actual index of refraction is possible by referral to published conversion tables. This is not necessary for the analysis of asbestos. Recognition of appropriate colors along with the proper morphology are deemed sufficient to identify the commercial asbestos minerals. Other techniques including SEM, TEM, and XRD may be required to provide additional information in order to identify other types of asbestos.

Make a preparation in the suspected matching high dispersion oil, e.g.,  $n=1.550$  for chrysotile. Perform the preliminary tests to determine whether the fibers are birefringent or not. Take note of the morphological character. Wavy fibers are indicative of chrysotile while long, straight, thin, frayed fibers are indicative of amphibole asbestos. This can aid in the selection of the appropriate matching oil. The microscope is set up and the polarization direction is noted as in Section 4.4. Align a fiber with the polarization direction.

Note the color. This is the color parallel to the polarizer. Then rotate the fiber rotating the stage  $90^\circ$  so that the polarization direction is across the fiber. This is the perpendicular position. Again note the color. Both colors must be consistent with standard asbestos minerals in the correct direction for a positive identification of asbestos. If only one of the colors is correct while the other is not, the identification is not positive. If the colors in both directions are bluish-white, the analyst has chosen a matching index oil which is higher than the correct matching oil, e.g. the analyst has used  $n=1.620$  where chrysotile is present. The next lower oil (Section 3.5.) should be used to prepare another specimen. If the color in both directions is yellow-white to straw-yellow-white, this indicates that the index of the oil is lower than the index of the fiber, e.g. the preparation is in  $n=1.550$  while anthophyllite is present. Select the next higher oil (Section 3.5.) and prepare another slide. Continue in this fashion until a positive identification of all asbestos species present has been made or all possible asbestos species have been ruled out by negative results in this test. Certain plant fibers can have similar dispersion colors as asbestos. Take care to note and evaluate the morphology of the fibers or remove the plant fibers in pre-preparation. Coating material on the fibers such as carbonate or vinyl may destroy the dispersion color. Usually, there will be some out-cropping of fiber which will show the colors sufficient for identification. When this is not the case, treat the sample as described in Section 3.3. and then perform dispersion staining. Some samples will yield to Becke line analysis if they are coated or electron microscopy can be used for identification.

**1926.1126 Chromium (VI)**

## (a) Scope.

- (1) This standard applies to occupational exposures to chromium (VI) in all forms and compounds in construction, except:

**NOTE:** Oregon OSHA did not adopt 1910.1026(a)(2). Federal OSHA does not regulate the use of pesticides because the Environmental Protection Agency (EPA) regulates these exposures through the Worker Protection Standard (WPS). However, since Oregon OSHA enforces the WPS, this exemption does not apply in Oregon.

- (3) Exposures to Portland cement; or
- (4) Where the employer has objective data demonstrating that a material containing chromium or a specific process, operation, or activity involving chromium cannot release dusts, fumes, or mists of chromium (VI) in concentrations at or above 0.5 µg/m<sup>3</sup> as an 8-hour time-weighted average (TWA) under any expected conditions of use.

## (b) Definitions. For the purposes of this section the following definitions apply:

**Action level** means a concentration of airborne chromium (VI) of 2.5 micrograms per cubic meter of air (2.5 µg/m<sup>3</sup>) calculated as an 8-hour time-weighted average (TWA).

**Assistant Secretary** means the Assistant Secretary of Labor for Occupational Safety and Health, U.S. Department of Labor, or designee.

**Chromium (VI) [hexavalent chromium or Cr(VI)]** means chromium with a valence of positive six, in any form and in any compound.

**Director** means the Director of the National Institute for Occupational Safety and Health (NIOSH), U.S. Department of Health and Human Services, or designee.

**Emergency** means any occurrence that results, or is likely to result, in an uncontrolled release of chromium (VI). If an incidental release of chromium (VI) can be controlled at the time of release by employees in the immediate release area, or by maintenance personnel, it is not an emergency.

**Employee exposure** means the exposure to airborne chromium (VI) that would occur if the employee were not using a respirator.

**High-efficiency particulate air [HEPA] filter** means a filter that is at least 99.97 percent efficient in removing mono-dispersed particles of 0.3 micrometers in diameter or larger.

**Historical monitoring data** means data from chromium (VI) monitoring conducted prior to May 30, 2006, obtained during work operations conducted under workplace conditions closely resembling the processes, types of material, control methods, work practices, and environmental conditions in the employer's current operations.

**Objective data** means information such as air monitoring data from industry-wide surveys or calculations based on the composition or chemical and physical properties of a substance demonstrating the employee exposure to chromium (VI) associated with a particular product or material or a specific process, operation, or activity. The data must reflect workplace conditions closely resembling the processes, types of material, control methods, work practices, and environmental conditions in the employer's current operations.

**Physician or other licensed health care professional [PLHCP]** is an individual whose legally permitted scope of practice (i.e., license, registration, or certification) allows him or her to independently provide or be delegated the responsibility to provide some or all of the particular health care services required by paragraph (i) of this section.

- (c) Permissible exposure limit (PEL). The employer shall ensure that no employee is exposed to an airborne concentration of chromium (VI) in excess of 5 micrograms per cubic meter of air ( $5 \mu\text{g}/\text{m}^3$ ), calculated as an 8-hour time-weighted average (TWA).
- (d) Exposure determination.
  - (1) General. Each employer who has a workplace or work operation covered by this section shall determine the 8-hour TWA exposure for each employee exposed to chromium (VI). This determination shall be made in accordance with either paragraph (d)(2) or paragraph (d)(3) of this section.
  - (2) Scheduled monitoring option.
    - (i) The employer shall perform initial monitoring to determine the 8-hour TWA exposure for each employee on the basis of a sufficient number of personal breathing zone air samples to accurately characterize full shift exposure on each shift, for each job classification, in each work area. Where an employer does representative sampling instead of sampling all employees in order to meet this requirement, the employer shall sample the employee(s) expected to have the highest chromium (VI) exposures.
    - (ii) If initial monitoring indicates that employee exposures are below the action level, the employer may discontinue monitoring for those employees whose exposures are represented by such monitoring.
    - (iii) If monitoring reveals employee exposures to be at or above the action level, the employer shall perform periodic monitoring at least every six months.

- (iv) If monitoring reveals employee exposures to be above the PEL, the employer shall perform periodic monitoring at least every three months.
  - (v) If periodic monitoring indicates that employee exposures are below the action level, and the result is confirmed by the result of another monitoring taken at least seven days later, the employer may discontinue the monitoring for those employees whose exposures are represented by such monitoring.
  - (vi) The employer shall perform additional monitoring when there has been any change in the production process, raw materials, equipment, personnel, work practices, or control methods that may result in new or additional exposures to chromium (VI), or when the employer has any reason to believe that new or additional exposures have occurred.
- (3) Performance-oriented option. The employer shall determine the 8-hour TWA exposure for each employee on the basis of any combination of air monitoring data, historical monitoring data, or objective data sufficient to accurately characterize employee exposure to chromium (VI).
- (4) Employee notification of determination results.
- (i) Within 5 work days after making an exposure determination in accordance with paragraph (d)(2) or paragraph (d)(3) of this section, the employer shall individually notify each affected employee in writing of the results of that determination or post the results in an appropriate location accessible to all affected employees.
  - (ii) Whenever the exposure determination indicates that employee exposure is above the PEL, the employer shall describe in the written notification the corrective action being taken to reduce employee exposure to or below the PEL.
- (5) Accuracy of measurement. Where air monitoring is performed to comply with the requirements of this section, the employer shall use a method of monitoring and analysis that can measure chromium (VI) to within an accuracy of plus or minus 25 percent ( $\pm 25\%$ ) and can produce accurate measurements to within a statistical confidence level of 95 percent for airborne concentrations at or above the action level.
- (6) Observation of monitoring.
- (i) Where air monitoring is performed to comply with the requirements of this section, the employer shall provide affected employees or their designated representatives an opportunity to observe any monitoring of employee exposure to chromium (VI).

- (ii) When observation of monitoring requires entry into an area where the use of protective clothing or equipment is required, the employer shall provide the observer with clothing and equipment and shall assure that the observer uses such clothing and equipment and complies with all other applicable safety and health procedures.

(e) Methods of compliance.

(1) Engineering and work practice controls.

- (i) Except as permitted in paragraph (e)(1)(ii) of this section, the employer shall use engineering and work practice controls to reduce and maintain employee exposure to chromium (VI) to or below the PEL unless the employer can demonstrate that such controls are not feasible. Wherever feasible engineering and work practice controls are not sufficient to reduce employee exposure to or below the PEL, the employer shall use them to reduce employee exposure to the lowest levels achievable, and shall supplement them by the use of respiratory protection that complies with the requirements of paragraph (f) of this section.
- (ii) Where the employer can demonstrate that a process or task does not result in any employee exposure to chromium (VI) above the PEL for 30 or more days per year (12 consecutive months), the requirement to implement engineering and work practice controls to achieve the PEL does not apply to that process or task.

(2) Prohibition of rotation. The employer shall not rotate employees to different jobs to achieve compliance with the PEL.

(f) Respiratory protection.

(1) General. Where respiratory protection is required by this section, the employer must provide each employee an appropriate respirator that complies with the requirements of this paragraph. Respiratory protection is required during:

- (i) Periods necessary to install or implement feasible engineering and work practice controls;
- (ii) Work operations, such as maintenance and repair activities, for which engineering and work practice controls are not feasible;
- (iii) Work operations for which an employer has implemented all feasible engineering and work practice controls and such controls are not sufficient to reduce exposures to or below the PEL;

- (iv) Work operations where employees are exposed above the PEL for fewer than 30 days per year, and the employer has elected not to implement engineering and work practice controls to achieve the PEL; or
    - (v) Emergencies.
  - (2) Respiratory protection program. Where respirator use is required by this section, the employer shall institute a respiratory protection program in accordance with 29 CFR 1910.134, which covers each employee required to use a respirator.
- (g) Protective work clothing and equipment.
  - (1) Provision and use. Where a hazard is present or is likely to be present from skin or eye contact with chromium (VI), the employer shall provide appropriate personal protective clothing and equipment at no cost to employees, and shall ensure that employees use such clothing and equipment.
  - (2) Removal and storage.
    - (i) The employer shall ensure that employees remove all protective clothing and equipment contaminated with chromium (VI) at the end of the work shift or at the completion of their tasks involving chromium (VI) exposure, whichever comes first.
    - (ii) The employer shall ensure that no employee removes chromium (VI)-contaminated protective clothing or equipment from the workplace, except for those employees whose job it is to launder, clean, maintain, or dispose of such clothing or equipment.
    - (iii) When contaminated protective clothing or equipment is removed for laundering, cleaning, maintenance, or disposal, the employer shall ensure that it is stored and transported in sealed, impermeable bags or other closed, impermeable containers.
    - (iv) The employer shall ensure that bags or containers of contaminated protective clothing or equipment that are removed from change rooms for laundering, cleaning, maintenance, or disposal shall be labeled in accordance with the requirements of the Hazard Communication Standard, 29 CFR 1910.1200.
  - (3) Cleaning and replacement.
    - (i) The employer shall clean, launder, repair and replace all protective clothing and equipment required by this section as needed to maintain its effectiveness.

- (ii) The employer shall prohibit the removal of chromium (VI) from protective clothing and equipment by blowing, shaking, or any other means that disperses chromium (VI) into the air or onto an employee's body.
  - (iii) The employer shall inform any person who launders or cleans protective clothing or equipment contaminated with chromium (VI) of the potentially harmful effects of exposure to chromium (VI) and that the clothing and equipment should be laundered or cleaned in a manner that minimizes skin or eye contact with chromium (VI) and effectively prevents the release of airborne chromium (VI) in excess of the PEL.
- (h) Hygiene areas and practices.
  - (1) General. Where protective clothing and equipment is required, the employer shall provide change rooms in conformance with 29 CFR 1926.51. Where skin contact with chromium (VI) occurs, the employer shall provide washing facilities in conformance with 29 CFR 1926.51. Eating and drinking areas provided by the employer shall also be in conformance with 1926.51.
  - (2) Change rooms. The employer shall assure that change rooms are equipped with separate storage facilities for protective clothing and equipment and for street clothes, and that these facilities prevent cross-contamination.
  - (3) Washing facilities.
    - (i) The employer shall provide readily accessible washing facilities capable of removing chromium (VI) from the skin, and shall ensure that affected employees use these facilities when necessary.
    - (ii) The employer shall ensure that employees who have skin contact with chromium (VI) wash their hands and faces at the end of the work shift and prior to eating, drinking, smoking, chewing tobacco or gum, applying cosmetics, or using the toilet.
  - (4) Eating and drinking areas.
    - (i) Whenever the employer allows employees to consume food or beverages at a worksite where chromium (VI) is present, the employer shall ensure that eating and drinking areas and surfaces are maintained as free as practicable of chromium (VI).
    - (ii) The employer shall ensure that employees do not enter eating and drinking areas with protective work clothing or equipment unless surface chromium (VI) has been removed from the clothing and equipment by methods that do not disperse chromium (VI) into the air or onto an employee's body.

- (5) Prohibited activities. The employer shall ensure that employees do not eat, drink, smoke, chew tobacco or gum, or apply cosmetics in areas where skin or eye contact with chromium (VI) occurs; or carry the products associated with these activities, or store such products in these areas.
- (i) Medical surveillance.
- (1) General.
- (i) The employer shall make medical surveillance available at no cost to the employee, and at a reasonable time and place, for all employees:
- (A) Who are or may be occupationally exposed to chromium (VI) at or above the action level for 30 or more days a year;
- (B) Experiencing signs or symptoms of the adverse health effects associated with chromium (VI) exposure; or
- (C) Exposed in an emergency.
- (ii) The employer shall assure that all medical examinations and procedures required by this section are performed by or under the supervision of a PLHCP.
- (2) Frequency. The employer shall provide a medical examination:
- (i) Within 30 days after initial assignment, unless the employee has received a chromium (VI) related medical examination that meets the requirements of this paragraph within the last twelve months;
- (ii) Annually;
- (iii) Within 30 days after a PLHCP's written medical opinion recommends an additional examination;
- (iv) Whenever an employee shows signs or symptoms of the adverse health effects associated with chromium (VI) exposure;
- (v) Within 30 days after exposure during an emergency which results in an uncontrolled release of chromium (VI); or
- (vi) At the termination of employment, unless the last examination that satisfied the requirements of paragraph (i) of this section was less than six months prior to the date of termination.
- (3) Contents of examination. A medical examination consists of:

- (i) A medical and work history, with emphasis on: past, present, and anticipated future exposure to chromium (VI); any history of respiratory system dysfunction; any history of asthma, dermatitis, skin ulceration, or nasal septum perforation; and smoking status and history;
  - (ii) A physical examination of the skin and respiratory tract; and
  - (iii) Any additional tests deemed appropriate by the examining PLHCP.
- (4) Information provided to the PLHCP. The employer shall ensure that the examining PLHCP has a copy of this standard, and shall provide the following information:
- (i) A description of the affected employee's former, current, and anticipated duties as they relate to the employee's occupational exposure to chromium (VI);
  - (ii) The employee's former, current, and anticipated levels of occupational exposure to chromium (VI);
  - (iii) A description of any personal protective equipment used or to be used by the employee, including when and for how long the employee has used that equipment; and
  - (iv) Information from records of employment-related medical examinations previously provided to the affected employee, currently within the control of the employer.
- (5) PLHCP's written medical opinion.
- (i) The employer shall obtain a written medical opinion from the PLHCP, within 30 days for each medical examination performed on each employee, which contains:
    - (A) The PLHCP's opinion as to whether the employee has any detected medical condition(s) that would place the employee at increased risk of material impairment to health from further exposure to chromium (VI);
    - (B) Any recommended limitations upon the employee's exposure to chromium (VI) or upon the use of personal protective equipment such as respirators;
    - (C) A statement that the PLHCP has explained to the employee the results of the medical examination, including any medical conditions related to chromium (VI) exposure that require further evaluation or treatment, and any special provisions for use of protective clothing or equipment.
  - (ii) The PLHCP shall not reveal to the employer specific findings or diagnoses unrelated to occupational exposure to chromium (VI).

- (iii) The employer shall provide a copy of the PLHCP's written medical opinion to the examined employee within two weeks after receiving it.
- (j) Communication of chromium (VI) hazards to employees.
  - (1) Hazard communication. The employer shall include chromium (VI) in the program established to comply with the Hazard Communication Standard (HCS) (1910.1200). The employer shall ensure that each employee has access to labels on containers of chromium and safety data sheets, and is trained in accordance with the provisions of 1910.1200 and paragraph (j)(2) of this section. The employer shall provide information on at least the following hazards: Cancer; eye irritation; and skin sensitization.
  - (2) Employee information and training.
    - (i) The employer shall ensure that each employee can demonstrate knowledge of at least the following:
      - (A) The contents of this section; and
      - (B) The purpose and a description of the medical surveillance program required by paragraph (i) of this section.
    - (ii) The employer shall make a copy of this section readily available without cost to all affected employees.
- (k) Recordkeeping.
  - (1) Air monitoring data.
    - (i) The employer shall maintain an accurate record of all air monitoring conducted to comply with the requirements of this section.
    - (ii) This record shall include at least the following information:
      - (A) The date of measurement for each sample taken;
      - (B) The operation involving exposure to chromium (VI) that is being monitored;
      - (C) Sampling and analytical methods used and evidence of their accuracy;
      - (D) Number, duration, and the results of samples taken;
      - (E) Type of personal protective equipment, such as respirators worn; and
      - (F) Name and job classification of all employees represented by the monitoring, indicating which employees were actually monitored.
    - (iii) The employer shall ensure that exposure records are maintained and made available in accordance with 29 CFR 1910.1020.

(2) Historical monitoring data.

- (i) Where the employer has relied on historical monitoring data to determine exposure to chromium (VI), the employer shall establish and maintain an accurate record of the historical monitoring data relied upon.
- (ii) The record shall include information that reflects the following conditions:
  - (A) The data were collected using methods that meet the accuracy requirements of paragraph (d)(5) of this section;
  - (B) The processes and work practices that were in use when the historical monitoring data were obtained are essentially the same as those to be used during the job for which exposure is being determined;
  - (C) The characteristics of the chromium (VI) containing material being handled when the historical monitoring data were obtained are the same as those on the job for which exposure is being determined;
  - (D) Environmental conditions prevailing when the historical monitoring data were obtained are the same as those on the job for which exposure is being determined; and
  - (E) Other data relevant to the operations, materials, processing, or employee exposures covered by the exception.
- (iii) The employer shall ensure that historical exposure records are maintained and made available in accordance with 29 CFR 1910.1020.

(3) Objective data.

- (i) The employer shall maintain an accurate record of all objective data relied upon to comply with the requirements of this section.
- (ii) This record shall include at least the following information:
  - (A) The chromium containing material in question;
  - (B) The source of the objective data;
  - (C) The testing protocol and results of testing, or analysis of the material for the release of chromium (VI);
  - (D) A description of the process, operation, or activity and how the data support the determination; and
  - (E) Other data relevant to the process, operation, activity, material, or employee exposures.

- (iii) The employer shall ensure that objective data are maintained and made available in accordance with 29 CFR 1910.1020.
  - (4) Medical surveillance.
    - (i) The employer shall establish and maintain an accurate record for each employee covered by medical surveillance under paragraph (i) of this section.
    - (ii) The record shall include the following information about the employee:
      - (A) Name;
      - (B) A copy of the PLHCP's written opinions;
      - (C) A copy of the information provided to the PLHCP as required by paragraph (i)(4) of this section.
    - (iii) The employer shall ensure that medical records are maintained and made available in accordance with 29 CFR 1910.1020.
- (l) Dates.
  - (1) For employers with 20 or more employees, all obligations of this section, except engineering controls required by paragraph (e) of this section, commence November 27, 2006.
  - (2) For employers with 19 or fewer employees, all obligations of this section, except engineering controls required by paragraph (e) of this section, commence May 30, 2007.
  - (3) For all employers, engineering controls required by paragraph (e) of this section shall be implemented no later than May 31, 2010.

**1926.1127 Cadmium**

- (a) **Scope.** This standard applies to all occupational exposures to cadmium and cadmium compounds, in all forms, in all construction work where an employee may potentially be exposed to cadmium. Construction work is defined as work involving construction, alteration and/or repair, including but not limited to the following:
- (1) Wrecking, demolition or salvage of structures where cadmium or materials containing cadmium are present;
  - (2) Use of cadmium containing-paints and cutting, brazing, burning, grinding or welding on surfaces that were painted with cadmium-containing paints;
  - (3) Construction, alteration, repair, maintenance, or renovation of structures, substrates, or portions thereof, that contain cadmium, or materials containing cadmium;
  - (4) Cadmium welding; cutting and welding cadmium-plated steel; brazing or welding with cadmium alloys;
  - (5) Installation of products containing cadmium;
  - (6) Electrical grounding with cadmium welding, or electrical work using cadmium-coated conduit;
  - (7) Maintaining or retrofitting cadmium-coated equipment;
  - (8) Cadmium contamination/emergency cleanup; and
  - (9) Transportation, disposal, storage, or containment of cadmium or materials containing cadmium on the site or location at which construction activities are performed.

- (b) **Definitions.**

**Action level (AL)** is defined as an airborne concentration of cadmium of 2.5 micrograms per cubic meter of air (2.5 µg/m<sup>3</sup>), calculated as an 8-hour time-weighted average (TWA).

**Assistant Secretary** means the Assistant Secretary of Labor for Occupational Safety and Health, U.S. Department of Labor, or designee.

**Authorized person** means any person authorized by the employer and required by work duties to be present in regulated areas or any person authorized by the OSH Act or regulations issued under it to be in regulated areas.

**Competent person**, in accordance with 29 CFR 1926.32(f), means a person designated by the employer to act on the employer's behalf who is capable of identifying existing and potential cadmium hazards in the workplace and the proper methods to control them in order to protect workers, and has the authority necessary to take prompt corrective measures to eliminate or control such hazards. The duties of a competent person include at least the following: Determining prior to the performance of work whether cadmium is present in the workplace; establishing, where necessary, regulated areas and assuring that access to and from those areas is limited to authorized employees; assuring the adequacy of any employee exposure monitoring required by this standard; assuring that all employees exposed to air cadmium levels above the PEL wear appropriate personal protective equipment and are trained in the use of appropriate methods of exposure control; assuring that proper hygiene facilities are provided and that workers are trained to use those facilities; and assuring that the engineering controls required by this standard are implemented, maintained in proper operating condition, and functioning properly.

**Director** means the Director of the National Institute for Occupational Safety and Health (NIOSH), U.S. Department of Health and Human Services, or designee.

**Employee exposure** and similar language referring to the air cadmium level to which an employee is exposed means the exposure to airborne cadmium that would occur if the employee were not using respiratory protective equipment.

**Final medical determination** is the written medical opinion of the employee's health status by the examining physician under paragraphs (I)(3) through (12) of this section or, if multiple physician review under paragraph (I)(13) of this section or the alternative physician determination under paragraph (I)(14) of this section is invoked, it is the final, written medical finding, recommendation or determination that emerges from that process.

**High-efficiency Particulate Air (HEPA) filter** means a filter capable of trapping and retaining at least 99.97 percent of mono-dispersed particles of 0.3 micrometers in diameter.

**Regulated area** means an area demarcated by the employer where an employee's exposure to airborne concentrations of cadmium exceeds, or can reasonably be expected to exceed the permissible exposure limit (PEL).

**This section** means this cadmium standard.

- (c) Permissible Exposure Limit (PEL). The employer shall assure that no employee is exposed to an airborne concentration of cadmium in excess of five micrograms per cubic meter of air ( $5 \mu\text{g}/\text{m}^3$ ), calculated as an eight-hour time-weighted average exposure (TWA).

(d) Exposure Monitoring.

(1) General.

- (i) Prior to the performance of any construction work where employees may be potentially exposed to cadmium, the employer shall establish the applicability of this standard by determining whether cadmium is present in the workplace and whether there is the possibility that employee exposures will be at or above the action level. The employer shall designate a competent person who shall make this determination. Investigation and material testing techniques shall be used, as appropriate, in the determination. Investigation shall include a review of relevant plans, past reports, material safety data sheets, and other available records, and consultations with the property owner and discussions with appropriate individuals and agencies.
- (ii) Where cadmium has been determined to be present in the workplace, and it has been determined that there is a possibility the employee's exposure will be at or above the action level, the competent person shall identify employees potentially exposed to cadmium at or above the action level.
- (iii) Determinations of employee exposure shall be made from breathing-zone air samples that reflect the monitored employee's regular, daily 8-hour TWA exposure to cadmium.
- (iv) Eight-hour TWA exposures shall be determined for each employee on the basis of one or more personal breathing-zone air samples reflecting full shift exposure on each shift, for each job classification, in each work area. Where several employees perform the same job tasks, in the same job classification, on the same shift, in the same work area, and the length, duration, and level of cadmium exposures are similar, an employer may sample a representative fraction of the employees instead of all employees in order to meet this requirement. In representative sampling, the employer shall sample the employee(s) expected to have the highest cadmium exposures.

(2) Specific.

- (i) Initial monitoring. Except as provided for in paragraph (d)(2)(iii) of this section, where a determination conducted under paragraph (d)(1)(i) of this section shows the possibility of employee exposure to cadmium at or above the action level, the employer shall conduct exposure monitoring as soon as practicable that is representative of the exposure for each employee in the workplace who is or may be exposed to cadmium at or above the action level.

- (ii) In addition, if the employee periodically performs tasks that may expose the employee to a higher concentration of airborne cadmium, the employee shall be monitored while performing those tasks.
  - (iii) Where the employer has objective data, as defined in paragraph (n)(2) of this section, demonstrating that employee exposure to cadmium will not exceed airborne concentrations at or above the action level under the expected conditions of processing, use, or handling, the employer may rely upon such data instead of implementing initial monitoring.
  - (iv) Where a determination conducted under paragraphs (d)(1) or (d)(2) of this section is made that a potentially exposed employee is not exposed to airborne concentrations of cadmium at or above the action level, the employer shall make a written record of such determination. The record shall include at least the monitoring data developed under paragraphs (d)(2)(i) through (iii) of this section, where applicable, and shall also include the date of determination, and the name of each employee.
- (3) Monitoring frequency (periodic monitoring).
- (i) If the initial monitoring or periodic monitoring reveals employee exposures to be at or above the action level, the employer shall monitor at a frequency and pattern needed to assure that the monitoring results reflect with reasonable accuracy the employee's typical exposure levels, given the variability in the tasks performed, work practices, and environmental conditions on the job site, and to assure the adequacy of respiratory selection and the effectiveness of engineering and work practice controls.
  - (ii) If the initial monitoring or the periodic monitoring indicates that employee exposures are below the action level and that result is confirmed by the results of another monitoring taken at least seven days later, the employer may discontinue the monitoring for those employees whose exposures are represented by such monitoring.
- (4) Additional monitoring. The employer also shall institute the exposure monitoring required under paragraphs (d)(2)(i) and (d)(3) of this section whenever there has been a change in the raw materials, equipment, personnel, work practices, or finished products that may result in additional employees being exposed to cadmium at or above the action level or in employees already exposed to cadmium at or above the action level being exposed above the PEL, or whenever the employer or competent person has any reason to suspect that any other change might result in such further exposure.
- (5) Employee notification of monitoring results.

- (i) The employer must, as soon as possible but no later than 5 working days after the receipt of the results of any monitoring performed under this section, notify each affected employee of these results either individually in writing or by posting the results in an appropriate location that is accessible to employees.
  - (ii) Wherever monitoring results indicate that employee exposure exceeds the PEL, the employer shall include in the written notice a statement that the PEL has been exceeded and a description of the corrective action being taken by the employer to reduce employee exposure to or below the PEL.
- (6) Accuracy of measurement. The employer shall use a method of monitoring and analysis that has an accuracy of not less than plus or minus 25 percent ( $\pm 25\%$ ), with a confidence level of 95 percent, for airborne concentrations of cadmium at or above the action level and the permissible exposure limit.
- (e) Regulated areas.
  - (1) Establishment. The employer shall establish a regulated area wherever an employee's exposure to airborne concentrations of cadmium is, or can reasonably be expected to be in excess of the permissible exposure limit (PEL).
  - (2) Demarcation. Regulated areas shall be demarcated from the rest of the workplace in any manner that adequately establishes and alerts employees of the boundaries of the regulated area, including employees who are or may be incidentally in the regulated areas, and that protects persons outside the area from exposure to airborne concentrations of cadmium in excess of the PEL.
  - (3) Access. Access to regulated areas shall be limited to authorized persons.
  - (4) Provision of respirators. Each person entering a regulated area shall be supplied with and required to use a respirator, selected in accordance with paragraph (g)(2) of this section.
  - (5) Prohibited activities. The employer shall assure that employees do not eat, drink, smoke, chew tobacco or gum, or apply cosmetics in regulated areas, or carry the products associated with any of these activities into regulated areas or store such products in those areas.
- (f) Methods of compliance.
  - (1) Compliance hierarchy.
    - (i) Except as specified in paragraph (f)(1)(ii) of this section, the employer shall implement engineering and work practice controls to reduce and maintain employee exposure to cadmium at or below the PEL, except to the extent that the employer can demonstrate that such controls are not feasible.

- (ii) The requirement to implement engineering controls to achieve the PEL does not apply where the employer demonstrates the following:
    - (A) The employee is only intermittently exposed; and
    - (B) The employee is not exposed above the PEL on 30 or more days per year (12 consecutive months).
  - (iii) Wherever engineering and work practice controls are not sufficient to reduce employee exposure to or below the PEL, the employer nonetheless shall implement such controls to reduce exposures to the lowest levels achievable. The employer shall supplement such controls with respiratory protection that complies with the requirements of paragraph (g) of this section and the PEL.
  - (iv) The employer shall not use employee rotation as a method of compliance.
- (2) Specific operations.
- (i) Abrasive blasting. Abrasive blasting on cadmium or cadmium-containing materials shall be conducted in a manner that will provide adequate protection.
  - (ii) Heating cadmium and cadmium-containing materials. Welding, cutting, and other forms of heating of cadmium or cadmium-containing materials shall be conducted in accordance with the requirements of 29 CFR 1926.353 and 29 CFR 1926.354, where applicable.
- (3) Prohibitions.
- (i) High speed abrasive disc saws and similar abrasive power equipment shall not be used for work on cadmium or cadmium-containing materials unless they are equipped with appropriate engineering controls to minimize emissions, if the exposure levels are above the PEL.
  - (ii) Materials containing cadmium shall not be applied by spray methods, if exposures are above the PEL, unless employees are protected with supplied-air respirators with full facepiece, hood, helmet, suit, operated in positive pressure mode and measures are instituted to limit overspray and prevent contamination of adjacent areas.
- (4) Mechanical ventilation.
- (i) When ventilation is used to control exposure, measurements that demonstrate the effectiveness of the system in controlling exposure, such as capture velocity, duct velocity, or static pressure shall be made as necessary to maintain its effectiveness.

- (ii) Measurements of the system's effectiveness in controlling exposure shall be made as necessary within five working days of any change in production, process, or control that might result in a significant increase in employee exposure to cadmium.
  - (iii) Recirculation of air. If air from exhaust ventilation is recirculated into the workplace, the system shall have a high efficiency filter and be monitored to assure effectiveness.
  - (iv) Procedures shall be developed and implemented to minimize employee exposure to cadmium when maintenance of ventilation systems and changing of filters is being conducted.
- (5) Compliance program.
  - (i) Where employee exposure to cadmium exceeds the PEL and the employer is required under paragraph (f)(1) of this section to implement controls to comply with the PEL, prior to the commencement of the job the employer shall establish and implement a written compliance program to reduce employee exposure to or below the PEL. To the extent that engineering and work practice controls cannot reduce exposures to or below the PEL, the employer shall include in the written compliance program the use of appropriate respiratory protection to achieve compliance with the PEL.
  - (ii) Written compliance programs shall be reviewed and updated as often and as promptly as necessary to reflect significant changes in the employer's compliance status or significant changes in the lowest air cadmium level that is technologically feasible.
  - (iii) A competent person shall review the comprehensive compliance program initially and after each change.
  - (iv) Written compliance programs shall be provided upon request for examination and copying to the Assistant Secretary, the Director, affected employees, and designated employee representatives.
- (g) Respirator protection.
  - (1) General. For employees who use respirators required by this section, the employer must provide each employee an appropriate respirator that complies with the requirements of this paragraph. Respirators must be used during:
    - (i) Periods necessary to install or implement feasible engineering and work-practice controls when employee exposures exceed the PEL.

- (ii) Maintenance and repair activities, and brief or intermittent work operations, for which employee exposures exceed the PEL and engineering and work-practice controls are not feasible or are not required.
  - (iii) Work operations in the regulated areas specified in paragraph (e) of this section.
  - (iv) Work operations for which the employer has implemented all feasible engineering and work-practice controls, and such controls are not sufficient to reduce employee exposures to or below the PEL.
  - (v) Work operations for which an employee, who is exposed to cadmium at or above the action level, requests a respirator.
  - (vi) Work operations for which engineering controls are not required by paragraph (f)(1)(ii) of this section to reduce employee exposures that exceed the PEL.
  - (vii) Emergencies.
- (2) Respirator program.

**Note:** Oregon OSHA repealed 1926.1127(g)(2)(i). In Oregon, OAR 437-003-1127 applies.

### **437-003-1127 Cadmium Respiratory Protection Program**

*The employer must implement a respiratory protection program in accordance with Division 2/I, 1910.134(b) through (d) (except (d)(1)(iii)), and (e) through (m) and (o), which covers each employee required by Division 3/Z, 1926.1127 Cadmium, to use a respirator.*

**Note:** *This is in addition to other respiratory protection and medical surveillance requirements specified in these Cadmium rules.*

Stat. Auth.: ORS 654.025(2) and 656.726(4).

Stats. Implemented: ORS 654.001 through 654.295.

Hist: OR-OSHA Administrative Order 5-2011, filed 12/8/11, effective 7/1/12.

1926.1127(g)(2)(ii) If an employee exhibits breathing difficulty during fit testing or respirator use, the employer must provide the employee with a medical examination in accordance with paragraph (l)(6)(ii) of this section to determine if the employee can use a respirator while performing the required duties.

- (iii) No employee must use a respirator when, based on their most recent medical examination, the examining physician determines that the employee will be unable to continue to function normally while using a respirator. If the physician determines the employee must be limited in, or removed from, their current job because of the employee's inability to use a respirator, the job limitation or removal must be conducted in accordance with paragraphs (l)(11) and (12) of this section.
- (3) Respirator selection.
  - (i) Employers must:
    - (A) Select, and provide to employees, the appropriate respirators specified in paragraph (d)(3)(i)(A) of 29 CFR 1910.134.
    - (B) Provide employees with full facepiece respirators when they experience eye irritation.
    - (C) Provide HEPA filters for powered and non-powered air-purifying respirators.
  - (ii) The employer must provide a powered air-purifying respirator instead of a negative-pressure respirator when an employee entitled to a respirator chooses to use this type of respirator and such a respirator will provide adequate protection to the employee.
- (h) Emergency situations. The employer shall develop and implement a written plan for dealing with emergency situations involving substantial releases of airborne cadmium. The plan shall include provisions for the use of appropriate respirators and personal protective equipment. In addition, employees not essential to correcting the emergency situation shall be restricted from the area and normal operations halted in that area until the emergency is abated.
- (i) Protective work clothing and equipment.
  - (1) Provision and use. If an employee is exposed to airborne cadmium above the PEL or where skin or eye irritation is associated with cadmium exposure at any level, the employer shall provide at no cost to the employee, and assure that the employee uses, appropriate protective work clothing and equipment that prevents contamination of the employee and the employee's garments. Protective work clothing and equipment includes, but is not limited to:
    - (i) Coveralls or similar full-body work clothing;
    - (ii) Gloves, head coverings, and boots or foot coverings; and

- (iii) Face shields, vented goggles, or other appropriate protective equipment that complies with 29 CFR 1910.133.
- (2) Removal and storage.
- (i) The employer shall assure that employees remove all protective clothing and equipment contaminated with cadmium at the completion of the work shift and do so only in change rooms provided in accordance with paragraph (j)(1) of this section.
  - (ii) The employer shall assure that no employee takes cadmium-contaminated protective clothing or equipment from the workplace, except for employees authorized to do so for purposes of laundering, cleaning, maintaining, or disposing of cadmium-contaminated protective clothing and equipment at an appropriate location or facility away from the workplace.
  - (iii) The employer shall assure that contaminated protective clothing and equipment, when removed for laundering, cleaning, maintenance, or disposal, is placed and stored in sealed, impermeable bags or other closed, impermeable containers that are designed to prevent dispersion of cadmium dust.
  - (iv) The employer shall ensure that containers of contaminated protective clothing and equipment that are to be taken out of the change rooms or the workplace for laundering, cleaning, maintenance or disposal shall bear labels in accordance with paragraph (m)(3)(ii) of this section.
- (3) Cleaning, replacement, and disposal.
- (i) The employer shall provide the protective clothing and equipment required by paragraph (i)(1) of this section in a clean and dry condition as often as necessary to maintain its effectiveness, but in any event at least weekly. The employer is responsible for cleaning and laundering the protective clothing and equipment required by this paragraph to maintain its effectiveness and is also responsible for disposing of such clothing and equipment.
  - (ii) The employer also is responsible for repairing or replacing required protective clothing and equipment as needed to maintain its effectiveness. When rips or tears are detected while an employee is working they shall be immediately mended, or the worksuit shall be immediately replaced.
  - (iii) The employer shall prohibit the removal of cadmium from protective clothing and equipment by blowing, shaking, or any other means that disperses cadmium into the air.

- (iv) The employer shall assure that any laundering of contaminated clothing or cleaning of contaminated equipment in the workplace is done in a manner that prevents the release of airborne cadmium in excess of the permissible exposure limit prescribed in paragraph (c) of this section.
  - (v) The employer shall inform any person who launders or cleans protective clothing or equipment contaminated with cadmium of the potentially harmful effects of exposure to cadmium, and that the clothing and equipment should be laundered or cleaned in a manner to effectively prevent the release of airborne cadmium in excess of the PEL.
- (j) Hygiene areas and practices.
  - (1) General. For employees whose airborne exposure to cadmium is above the PEL, the employer shall provide clean change rooms, handwashing facilities, showers, and lunchroom facilities that comply with 29 CFR 1926.51.
  - (2) Change rooms. The employer shall assure that change rooms are equipped with separate storage facilities for street clothes and for protective clothing and equipment, which are designed to prevent dispersion of cadmium and contamination of the employee's street clothes.
  - (3) Showers and handwashing facilities.
    - (i) The employer shall assure that employees whose airborne exposure to cadmium is above the PEL shower during the end of the work shift.
    - (ii) The employer shall assure that employees who are exposed to cadmium above the PEL wash their hands and faces prior to eating, drinking, smoking, chewing tobacco or gum, or applying cosmetics.
  - (4) Lunchroom facilities.
    - (i) The employer shall assure that the lunchroom facilities are readily accessible to employees, that tables for eating are maintained free of cadmium, and that no employee in a lunchroom facility is exposed at any time to cadmium at or above a concentration of 2.5  $\mu\text{g}/\text{m}^3$ .
    - (ii) The employer shall assure that employees do not enter lunchroom facilities with protective work clothing or equipment unless surface cadmium has been removed from the clothing and equipment by HEPA vacuuming or some other method that removes cadmium dust without dispersing it.
- (k) Housekeeping.
  - (1) All surfaces shall be maintained as free as practicable of accumulations of cadmium.

- (2) All spills and sudden releases of material containing cadmium shall be cleaned up as soon as possible.
  - (3) Surfaces contaminated with cadmium shall, wherever possible, be cleaned by vacuuming or other methods that minimize the likelihood of cadmium becoming airborne.
  - (4) HEPA-filtered vacuuming equipment or equally effective filtration methods shall be used for vacuuming. The equipment shall be used and emptied in a manner that minimizes the reentry of cadmium into the workplace.
  - (5) Shoveling, dry or wet sweeping, and brushing may be used only where vacuuming or other methods that minimize the likelihood of cadmium becoming airborne have been tried and found not to be effective.
  - (6) Compressed air shall not be used to remove cadmium from any surface unless the compressed air is used in conjunction with a ventilation system designed to capture the dust cloud created by the compressed air.
  - (7) Waste, scrap, debris, bags, and containers, personal protective equipment and clothing contaminated with cadmium and consigned for disposal shall be collected and disposed of in sealed impermeable bags or other closed, impermeable containers. These bags and containers shall be labeled in accordance with paragraph (m)(3)(ii) of this section.
- (l) Medical Surveillance.
- (1) General.
    - (i) Scope.
      - (A) Currently exposed. The employer shall institute a medical surveillance program for all employees who are or may be exposed at or above the action level and all employees who perform the following tasks, operations or jobs: Electrical grounding with cadmium welding; cutting, brazing, burning, grinding or welding on surfaces that were painted with cadmium-containing paints; electrical work using cadmium-coated conduit; use of cadmium containing paints; cutting and welding cadmium-plated steel; brazing or welding with cadmium alloys; fusing of reinforced steel by cadmium welding; maintaining or retrofitting cadmium-coated equipment; and, wrecking and demolition where cadmium is present. A medical surveillance program will not be required if the employer demonstrates that the employee:

- (1) Is not currently exposed by the employer to airborne concentrations of cadmium at or above the action level on 30 or more days per year (twelve consecutive months); and,
      - (2) Is not currently exposed by the employer in those tasks on 30 or more days per year (twelve consecutive months).
    - (B) Previously exposed. The employer shall also institute a medical surveillance program for all employees who might previously have been exposed to cadmium by the employer prior to the effective date of this standard in tasks specified under paragraph (I)(1)(i)(A) of this section, unless the employer demonstrates that the employee did not in the years prior to the effective date of this section work in those tasks for the employer with exposure to cadmium for an aggregated total of more than 12 months.
  - (ii) To determine an employee's fitness for using a respirator, the employer shall provide the limited medical examination specified in paragraph (I)(6) of this section.
  - (iii) The employer shall assure that all medical examinations and procedures required by this section are performed by or under the supervision of a licensed physician, who has read and is familiar with the health effects section of appendix A to this section, the regulatory text of this section, the protocol for sample handling and lab selection in appendix F to this section, and the questionnaire of appendix D to this section.
  - (iv) The employer shall provide the medical surveillance required by this section, including multiple physician review under paragraph (I)(13) of this section without cost to employees, and at a time and place that is reasonable and convenient to employees.
  - (v) The employer shall assure that the collecting and handling of biological samples of cadmium in urine (CdU), cadmium in blood (CdB), and beta-2 microglobulin in urine ( $\beta$ 2-M) taken from employees under this section is done in a manner that assures their reliability and that analysis of biological samples of cadmium in urine (CdU), cadmium in blood (CdB), and beta-2 microglobulin in urine ( $\beta$ 2-M) taken from employees under this section is performed in laboratories with demonstrated proficiency to perform the particular analysis. (See appendix F to this section.)
- (2) Initial examination.

- (i) For employees covered by medical surveillance under paragraph (I)(1)(i) of this section, the employer shall provide an initial medical examination. The examination shall be provided to those employees within 30 days after initial assignment to a job with exposure to cadmium or no later than 90 days after the effective date of this section, whichever date is later.
  - (ii) The initial medical examination shall include:
    - (A) A detailed medical and work history, with emphasis on: Past, present, and anticipated future exposure to cadmium; any history of renal, cardiovascular, respiratory, hematopoietic, reproductive, and/or musculoskeletal system dysfunction; current usage of medication with potential nephrotoxic side-effects; and smoking history and current status; and
    - (B) Biological monitoring that includes the following tests:
      - (1) Cadmium in urine (CdU), standardized to grams of creatinine (g/Cr);
      - (2) Beta-2 microglobulin in urine ( $\beta_2$ -M), standardized to grams of creatinine (g/Cr), with pH specified, as described in Appendix F to this section; and
      - (3) Cadmium in blood (CdB), standardized to liters of whole blood (lwb).
  - (iii) Recent Examination: An initial examination is not required to be provided if adequate records show that the employee has been examined in accordance with the requirements of paragraph (I)(2)(ii) of this section within the past 12 months. In that case, such records shall be maintained as part of the employee's medical record and the prior exam shall be treated as if it were an initial examination for the purposes of paragraphs (I)(3) and (4) of this section.
- (3) Actions triggered by initial biological monitoring.
- (i) If the results of the biological monitoring tests in the initial examination show the employee's CdU level to be at or below 3  $\mu\text{g/g}$  Cr,  $\beta_2$ -M level to be at or below 300  $\mu\text{g/g}$  Cr and CdB level to be at or below 5  $\mu\text{g/lwb}$ , then:
    - (A) For employees who are subject to medical surveillance under paragraphs (I)(1)(i)(A) of this section because of current or anticipated exposure to cadmium, the employer shall provide the minimum level of periodic medical surveillance in accordance with the requirements in paragraph (I)(4)(i) of this section; and

- (B) For employees who are subject to medical surveillance under paragraph (I)(1)(i)(B) of this section because of prior but not current exposure, the employer shall provide biological monitoring for CdU, B<sub>2</sub>-M, and CdB one year after the initial biological monitoring and then the employer shall comply with the requirements of paragraph (I)(4)(vi) of this section.
- (ii) For all employees who are subject to medical surveillance under paragraph (I)(1)(i) of this section, if the results of the initial biological monitoring tests show the level of CdU to exceed 3 µg/g Cr, the level of β<sub>2</sub>-M to be in excess of 300 µg/g Cr, or the level of CdB to be in excess of 5 µg/lwb, the employer shall:
- (A) Within two weeks after receipt of biological monitoring results, reassess the employee's occupational exposure to cadmium as follows:
- (1) Reassess the employee's work practices and personal hygiene;
  - (2) Reevaluate the employee's respirator use, if any, and the respirator program;
  - (3) Review the hygiene facilities;
  - (4) Reevaluate the maintenance and effectiveness of the relevant engineering controls;
  - (5) Assess the employee's smoking history and status;
- (B) Within 30 days after the exposure reassessment, specified in paragraph (I)(3)(ii)(A) of this section, take reasonable steps to correct any deficiencies found in the reassessment that may be responsible for the employee's excess exposure to cadmium; and,
- (C) Within 90 days after receipt of biological monitoring results, provide a full medical examination to the employee in accordance with the requirements of paragraph (I)(4)(ii) of this section. After completing the medical examination, the examining physician shall determine in a written medical opinion whether to medically remove the employee. If the physician determines that medical removal is not necessary, then until the employee's CdU level falls to or below 3 µg/g Cr, β<sub>2</sub>-M level falls to or below 300 µg/g Cr and CdB level falls to or below 5 µg/lwb, the employer shall:
- (1) Provide biological monitoring in accordance with paragraph (I)(2)(ii)(B) of this section on a semi-annual basis; and

- (2) Provide annual medical examinations in accordance with paragraph (I)(4)(ii) of this section.
- (iii) For all employees who are subject to medical surveillance under paragraph (I)(1)(i) of this section, if the results of the initial biological monitoring tests show the level of CdU to be in excess of 15 µg/g Cr, or the level of CdB to be in excess of 15 µg/lwb, or the level of β<sub>2</sub>-M to be in excess of 1,500 µg/g Cr, the employer shall comply with the requirements of paragraphs (I)(3)(ii)(A)-(B) of this section. Within 90 days after receipt of biological monitoring results, the employer shall provide a full medical examination to the employee in accordance with the requirements of paragraph (I)(4)(ii) of this section. After completing the medical examination, the examining physician shall determine in a written medical opinion whether to medically remove the employee. However, if the initial biological monitoring results and the biological monitoring results obtained during the medical examination both show that: CdU exceeds 15 µg/g Cr; or CdB exceeds 15 µg/lwb; or β<sub>2</sub>-M exceeds 1500 µg/g Cr, and in addition CdU exceeds 3 µg/g Cr or CdB exceeds 5 µg/liter of whole blood, then the physician shall medically remove the employee from exposure to cadmium at or above the action level. If the second set of biological monitoring results obtained during the medical examination does not show that a mandatory removal trigger level has been exceeded, then the employee is not required to be removed by the mandatory provisions of this paragraph. If the employee is not required to be removed by the mandatory provisions of this paragraph or by the physician's determination, then until the employee's CdU level falls to or below 3 µg/g Cr, β<sub>2</sub>-M level falls to or below 300 µg/g Cr and CdB level falls to or below 5 µg/lwb, the employer shall:
- (A) Periodically reassess the employee's occupational exposure to cadmium;
  - (B) Provide biological monitoring in accordance with paragraph (I)(2)(ii)(B) of this section on a quarterly basis; and
  - (C) Provide semiannual medical examinations in accordance with paragraph (I)(4)(ii) of this section.

- (iv) For all employees to whom medical surveillance is provided, beginning on January 1, 1999, and in lieu of paragraph (l)(3)(iii) of this section, whenever the results of initial biological monitoring tests show the employee's CdU level to be in excess of 7 µg/g Cr, or β<sub>2</sub>-M level to be in excess of 750 µg/g Cr, or CdB level to be in excess of 10 µg/lwb, the employer shall comply with the requirements of paragraphs (l)(3)(ii)(A)-(B) of this section. Within 90 days after receipt of biological monitoring results, the employer shall provide a full medical examination to the employee in accordance with the requirements of paragraph (l)(4)(ii) of this section. After completing the medical examination, the examining physician shall determine in a written medical opinion whether to medically remove the employee. However, if the initial biological monitoring results and the biological monitoring results obtained during the medical examination both show that: CdU exceeds 7 µg/g Cr; or CdB exceeds 10 µg/lwb; or β<sub>2</sub>-M exceeds 750 µg/g Cr, and in addition CdU exceeds 3 µg/g Cr or CdB exceeds 5 µg/liter of whole blood, then the physician shall medically remove the employee from exposure to cadmium at or above the action level. If the second set of biological monitoring results obtained during the medical examination does not show that a mandatory removal trigger level has been exceeded, then the employee is not required to be removed by the mandatory provisions of this paragraph. If the employee is not required to be removed by the mandatory provisions of this paragraph or by the physician's determination, then until the employee's CdU level falls to or below 3 µg/g Cr, β<sub>2</sub>-M level falls to or below 300 µg/g Cr and CdB level falls to or below 5 µg/lwb, the employer shall:
- (A) Periodically reassess the employee's occupational exposure to cadmium;
  - (B) Provide biological monitoring in accordance with paragraph (l)(2)(ii)(B) of this section on a quarterly basis; and
  - (C) Provide semiannual medical examinations in accordance with paragraph (l)(4)(ii) of this section.
- (4) Periodic medical surveillance.

- (i) For each employee who is covered by medical surveillance under paragraph (l)(1)(i)(A) of this section because of current or anticipated exposure to cadmium, the employer shall provide at least the minimum level of periodic medical surveillance, which consists of periodic medical examinations and periodic biological monitoring. A periodic medical examination shall be provided within one year after the initial examination required by paragraph (l)(2) of this section and thereafter at least biennially. Biological sampling shall be provided at least annually either as part of a periodic medical examination or separately as periodic biological monitoring.
- (ii) The periodic medical examination shall include:
  - (A) A detailed medical and work history, or update thereof, with emphasis on: Past, present and anticipated future exposure to cadmium; smoking history and current status; reproductive history; current use of medications with potential nephrotoxic side-effects; any history of renal, cardiovascular, respiratory, hematopoietic, and/or musculoskeletal system dysfunction; and as part of the medical and work history, for employees who wear respirators, questions 3-11 and 25-32 in Appendix D to this section;
  - (B) A complete physical examination with emphasis on: blood pressure, the respiratory system, and the urinary system;
  - (C) A 14 inch by 17 inch or other reasonably-sized standard film or digital posterior-anterior chest X-ray (after the initial X-ray, the frequency of chest X-rays is to be determined by the examining physician);
  - (D) Pulmonary function tests, including forced vital capacity (FVC) and forced expiratory volume at 1 second (FEV1);
  - (E) Biological monitoring, as required in paragraph (l)(2)(ii)(B) of this section;
  - (F) Blood analysis, in addition to the analysis required under paragraph (l)(2)(ii)(B) of this section, including blood urea nitrogen, complete blood count, and serum creatinine;
  - (G) Urinalysis, in addition to the analysis required under paragraph (l)(2)(ii)(B) of this section, including the determination of albumin, glucose, and total and low molecular weight proteins;
  - (H) For males over 40 years old, prostate palpation, or other at least as effective diagnostic test(s), and;

- (I) Any additional tests or procedures deemed appropriate by the examining physician.
- (iii) Periodic biological monitoring shall be provided in accordance with paragraph (I)(2)(ii)(B) of this section.
- (iv) If the results of periodic biological monitoring or the results of biological monitoring performed as part of the periodic medical examination show the level of the employee's CdU,  $\beta_2$ -M, or CdB to be in excess of the levels specified in paragraphs (I)(3)(ii) or (iii) of this section; or beginning on January 1, 1999, in excess of the levels specified in paragraphs (I)(3)(ii) or (iv), the employer shall take the appropriate actions specified in paragraphs (I)(3)(ii)-(iv) of this section, respectively.
- (v) For previously exposed employees under paragraph (I)(1)(i)(B) of this section:
  - (A) If the employee's levels of CdU did not exceed 3  $\mu\text{g/g}$  Cr, CdB did not exceed 5  $\mu\text{g/lwb}$ , and  $\beta_2$ -M did not exceed 300  $\mu\text{g/g}$  Cr in the initial biological monitoring tests, and if the results of the followup biological monitoring required by paragraph (I)(3)(i)(B) of this section one year after the initial examination confirm the previous results, the employer may discontinue all periodic medical surveillance for that employee.
  - (B) If the initial biological monitoring results for CdU, CdB, or  $\beta_2$ -M were in excess of the levels specified in paragraph (I)(3)(i) of this section, but subsequent biological monitoring results required by paragraph (I)(3)(ii)-(iv) of this section show that the employee's CdU levels no longer exceed 3  $\mu\text{g/g}$  Cr, CdB levels no longer exceed 5  $\mu\text{g/lwb}$ , and  $\beta_2$ -M levels no longer exceed 300  $\mu\text{g/g}$  Cr, the employer shall provide biological monitoring for CdU, CdB, and  $\beta_2$ -M one year after these most recent biological monitoring results. If the results of the followup biological monitoring specified in this paragraph, confirm the previous results, the employer may discontinue all periodic medical surveillance for that employee.
  - (C) However, if the results of the follow-up tests specified in paragraph (I)(4)(v)(A) or (B) of this section indicate that the level of the employee's CdU,  $\beta_2$ -M, or CdB exceeds these same levels, the employer is required to provide annual medical examinations in accordance with the provisions of paragraph (I)(4)(ii) of this section until the results of biological monitoring are consistently below these levels or the examining physician determines in a written medical opinion that further medical surveillance is not required to protect the employee's health.

- (vi) A routine, biennial medical examination is not required to be provided in accordance with paragraphs (l)(3)(i) and (l)(4) of this section if adequate medical records show that the employee has been examined in accordance with the requirements of paragraph (l)(4)(ii) of this section within the past 12 months. In that case, such records shall be maintained by the employer as part of the employee's medical record, and the next routine, periodic medical examination shall be made available to the employee within two years of the previous examination.
- (5) Actions triggered by medical examinations.
- (i) If the results of a medical examination carried out in accordance with this section indicate any laboratory or clinical finding consistent with cadmium toxicity that does not require employer action under paragraphs (l)(2), (3) or (4) of this section, the employer shall take the following steps and continue to take them until the physician determines that they are no longer necessary.
    - (A) Periodically reassess: The employee's work practices and personal hygiene; the employee's respirator use, if any; the employee's smoking history and status; the respiratory protection program; the hygiene facilities; the maintenance and effectiveness of the relevant engineering controls; and take all reasonable steps to correct the deficiencies found in the reassessment that may be responsible for the employee's excess exposure to cadmium.
    - (B) Provide semi-annual medical reexaminations to evaluate the abnormal clinical sign(s) of cadmium toxicity until the results are normal or the employee is medically removed; and
    - (C) Where the results of tests for total proteins in urine are abnormal, provide a more detailed medical evaluation of the toxic effects of cadmium on the employee's renal system.
- (6) Examination for respirator use.
- (i) To determine an employee's fitness for respirator use, the employer shall provide a medical examination that includes the elements specified in paragraph (l)(6)(i)(A) through (D) of this section. This examination shall be provided prior to the employee's being assigned to a job that requires the use of a respirator or no later than 90 days after this section goes into effect, whichever date is later, to any employee without a medical examination within the preceding 12 months that satisfies the requirements of this paragraph.

- (A) A detailed medical and work history, or update thereof, with emphasis on: past exposure to cadmium; smoking history and current status; any history of renal, cardiovascular, respiratory, hematopoietic, and/or musculoskeletal system dysfunction; a description of the job for which the respirator is required; and questions 3 through 11 and 25 through 32 in Appendix D;
  - (B) A blood pressure test;
  - (C) Biological monitoring of the employee's levels of CdU, CdB and  $\beta_2$ -M in accordance with the requirements of paragraph (I)(2)(ii)(B) of this section, unless such results already have been obtained within the twelve months; and
  - (D) Any other test or procedure that the examining physician deems appropriate.
- (ii) After reviewing all the information obtained from the medical examination required in paragraph (I)(6)(i) of this section, the physician shall determine whether the employee is fit to wear a respirator.
  - (iii) Whenever an employee has exhibited difficulty in breathing during a respirator fit test or during use of a respirator, the employer, as soon as possible, shall provide the employee with a periodic medical examination in accordance with paragraph (I)(4)(ii) of this section to determine the employee's fitness to wear a respirator.
  - (iv) Where the results of the examination required under paragraph (I)(6)(i), (ii) or (iii) of this section are abnormal, medical limitation or prohibition of respirator use shall be considered. If the employee is allowed to wear a respirator, the employee's ability to continue to do so shall be periodically evaluated by a physician.
- (7) Emergency Examinations.
- (i) In addition to the medical surveillance required in paragraphs (I)(2) through (6) of this section, the employer shall provide a medical examination as soon as possible to any employee who may have been acutely exposed to cadmium because of an emergency.
  - (ii) The examination shall include the requirements of paragraph (I)(4)(ii), of this section, with emphasis on the respiratory system, other organ systems considered appropriate by the examining physician, and symptoms of acute overexposure, as identified in paragraphs II(B)(1)-(2) and IV of Appendix A of this section.

- (8) Termination of employment examination.
- (i) At termination of employment, the employer shall provide a medical examination in accordance with paragraph (l)(4)(ii) of this section, including a chest X-ray where necessary, to any employee to whom at any prior time the employer was required to provide medical surveillance under paragraph (l)(1)(i) or (l)(7) of this section. However, if the last examination satisfied the requirements of paragraph (l)(4)(ii) of this section and was less than six months prior to the date of termination, no further examination is required unless otherwise specified in paragraph (l)(3) or (l)(5) of this section;
  - (ii) In addition, if the employer has discontinued all periodic medical surveillance under paragraph (l)(4)(v) of this section, no termination of employment medical examination is required.
- (9) Information provided to the physician. The employer shall provide the following information to the examining physician:
- (i) A copy of this standard and appendices;
  - (ii) A description of the affected employee's former, current, and anticipated duties as they relate to the employee's occupational exposure to cadmium;
  - (iii) The employee's former, current, and anticipated future levels of occupational exposure to cadmium;
  - (iv) A description of any personal protective equipment, including respirators, used or to be used by the employee, including when and for how long the employee has used that equipment; and
  - (v) Relevant results of previous biological monitoring and medical examinations.
- (10) Physician's written medical opinion.
- (i) The employer shall promptly obtain a written medical opinion from the examining physician for each medical examination performed on each employee. This written opinion shall contain:
    - (A) The physician's diagnosis for the employee;
    - (B) The physician's opinion as to whether the employee has any detected medical condition(s) that would place the employee at increased risk of material impairment to health from further exposure to cadmium, including any indications of potential cadmium toxicity;
    - (C) The results of any biological or other testing or related evaluations that directly assess the employee's absorption of cadmium;

- (D) Any recommended removal from, or limitation on the activities or duties of the employee or on the employee's use of personal protective equipment, such as respirators;
  - (E) A statement that the physician has clearly and carefully explained to the employee the results of the medical examination, including all biological monitoring results and any medical conditions related to cadmium exposure that require further evaluation or treatment, and any limitation on the employee's diet or use of medications.
- (ii) The employer shall promptly obtain a copy of the results of any biological monitoring provided by an employer to an employee independently of a medical examination under paragraphs (I)(2) and (I)(4) of this section, and, in lieu of a written medical opinion, an explanation sheet explaining those results.
  - (iii) The employer shall instruct the physician not to reveal orally or in the written medical opinion given to the employer specific findings or diagnoses unrelated to occupational exposure to cadmium.
- (11) Medical Removal Protection (MRP).
- (i) General.
    - (A) The employer shall temporarily remove an employee from work where there is excess exposure to cadmium on each occasion that medical removal is required under paragraphs (I)(3), (I)(4), or (I)(6) of this section and on each occasion that a physician determines in a written medical opinion that the employee should be removed from such exposure. The physician's determination may be based on biological monitoring results, inability to wear a respirator, evidence of illness, other signs or symptoms of cadmium-related dysfunction or disease, or any other reason deemed medically sufficient by the physician.
    - (B) The employer shall medically remove an employee in accordance with paragraph (I)(11) of this section regardless of whether at the time of removal a job is available into which the removed employee may be transferred.
    - (C) Whenever an employee is medically removed under paragraph (I)(11) of this section, the employer shall transfer the removed employee to a job where the exposure to cadmium is within the permissible levels specified in that paragraph as soon as one becomes available.

- (D) For any employee who is medically removed under the provisions of paragraph (I)(11)(i) of this section, the employer shall provide follow-up medical examinations semi-annually until, in a written medical opinion, the examining physician determines that either the employee may be returned to his/her former job status or the employee must be permanently removed from excess cadmium exposure.
- (E) The employer may not return an employee who has been medically removed for any reason to his/her former job status until a physician determines in a written medical opinion that continued medical removal is no longer necessary to protect the employee's health.
- (ii) Where an employee is found unfit to wear a respirator under paragraph (I)(6)(ii) of this section, the employer shall remove the employee from work where exposure to cadmium is above the PEL.
- (iii) Where removal is based upon any reason other than the employee's inability to wear a respirator, the employer shall remove the employee from work where exposure to cadmium is at or above the action level.
- (iv) Except as specified in paragraph (I)(11)(v) of this section, no employee who was removed because his/her level of CdU, CdB and/or  $\beta_2$ -M exceeded the trigger levels in paragraph (I)(3) or (I)(4) of this section may be returned to work with exposure to cadmium at or above the action level until the employee's levels of CdU fall to or below 3  $\mu\text{g/g Cr}$ , CdB fall to or below 5  $\mu\text{g/lwb}$ , and  $\beta_2$ -M fall to or below 300  $\mu\text{g/g Cr}$ .
- (v) However, when in the examining physician's opinion continued exposure to cadmium will not pose an increased risk to the employee's health and there are special circumstances that make continued medical removal an inappropriate remedy, the physician shall fully discuss these matters with the employee, and then in a written determination may return a worker to his/her former job status despite what would otherwise be unacceptably high biological monitoring results. Thereafter and until such time as the employee's biological monitoring results have decreased to levels where he/she could have been returned to his/her former job status, the returned employee shall continue medical surveillance as if he/she were still on medical removal. Until such time, the employee is no longer subject to mandatory medical removal. Subsequent questions regarding the employee's medical removal shall be decided solely by a final medical determination.

- (vi) Where an employer, although not required by this section to do so, removes an employee from exposure to cadmium or otherwise places limitations on an employee due to the effects of cadmium exposure on the employee's medical condition, the employer shall provide the same medical removal protection benefits to that employee under paragraph (l)(12) of this section as would have been provided had the removal been required under paragraph (l)(11) of this section.
- (12) Medical removal protection benefits.
- (i) The employer shall provide medical removal protection benefits to an employee for up to a maximum of 18 months each time, and while the employee is temporarily medically removed under paragraph (l)(11) of this section.
  - (ii) For purposes of this section, the requirement that the employer provide medical removal protection benefits means that the employer shall maintain the total normal earnings, seniority, and all other employee rights and benefits of the removed employee, including the employee's right to his/her former job status, as if the employee had not been removed from the employee's job or otherwise medically limited.
  - (iii) Where, after 18 months on medical removal because of elevated biological monitoring results, the employee's monitoring results have not declined to a low enough level to permit the employee to be returned to his/her former job status:
    - (A) The employer shall make available to the employee a medical examination pursuant to this section in order to obtain a final medical determination as to whether the employee may be returned to his/her former job status or must be permanently removed from excess cadmium exposure; and
    - (B) The employer shall assure that the final medical determination indicates whether the employee may be returned to his/her former job status and what steps, if any, should be taken to protect the employee's health;
  - (iv) The employer may condition the provision of medical removal protection benefits upon the employee's participation in medical surveillance provided in accordance with this section.
- (13) Multiple physician review.

- (i) If the employer selects the initial physician to conduct any medical examination or consultation provided to an employee under this section, the employee may designate a second physician to:
  - (A) Review any findings, determinations, or recommendations of the initial physician; and
  - (B) Conduct such examinations, consultations, and laboratory tests as the second physician deems necessary to facilitate this review.
- (ii) The employer shall promptly notify an employee of the right to seek a second medical opinion after each occasion that an initial physician provided by the employer conducts a medical examination or consultation pursuant to this section. The employer may condition its participation in, and payment for, multiple physician review upon the employee doing the following within fifteen (15) days after receipt of this notice, or receipt of the initial physician's written opinion, whichever is later:
  - (A) Informing the employer that he or she intends to seek a medical opinion; and
  - (B) Initiating steps to make an appointment with a second physician.
- (iii) If the findings, determinations, or recommendations of the second physician differ from those of the initial physician, then the employer and the employee shall assure that efforts are made for the two physicians to resolve any disagreement.
- (iv) If the two physicians have been unable to quickly resolve their disagreement, then the employer and the employee, through their respective physicians, shall designate a third physician to:
  - (A) Review any findings, determinations, or recommendations of the other two physicians; and
  - (B) Conduct such examinations, consultations, laboratory tests, and discussions with the other two physicians as the third physician deems necessary to resolve the disagreement among them.
- (v) The employer shall act consistently with the findings, determinations, and recommendations of the third physician, unless the employer and the employee reach an agreement that is consistent with the recommendations of at least one of the other two physicians.

- (14) Alternate physician determination. The employer and an employee or designated employee representative may agree upon the use of any alternate form of physician determination in lieu of the multiple physician review provided by paragraph (l)(13) of this section, so long as the alternative is expeditious and at least as protective of the employee.
- (15) Information the employer must provide the employee.
- (i) The employer shall provide a copy of the physician's written medical opinion to the examined employee within five working days after receipt thereof.
  - (ii) The employer shall provide the employee with a copy of the employee's biological monitoring results and an explanation sheet explaining the results within five working days after receipt thereof.
  - (iii) Within 30 days after a request by an employee, the employer shall provide the employee with the information the employer is required to provide the examining physician under paragraph (l)(9) of this section.
- (16) Reporting. In addition to other medical events that are required to be reported on the OSHA Form No. 200, the employer shall report any abnormal condition or disorder caused by occupational exposure to cadmium associated with employment as specified in Chapter (V)(E) of the Reporting Guidelines for Occupational Injuries and Illnesses.
- (m) Communication of cadmium hazards to employees.
- (1) Hazard communication. The employer shall include cadmium in the program established to comply with the Hazard Communication Standard (HCS) (1910.1200). The employer shall ensure that each employee has access to labels on containers of cadmium and safety data sheets, and is trained in accordance with the provisions of HCS and paragraph (m)(4) of this section. The employer shall provide information on at least the following hazards: Cancer; lung effects; kidney effects; and acute toxicity effects.
  - (2) Warning signs.
    - (i) Warning signs shall be provided and displayed in regulated areas. In addition, warning signs shall be posted at all approaches to regulated areas so that an employee may read the signs and take necessary protective steps before entering the area.
    - (ii) Warning signs required by paragraph (m)(2)(i) of this section shall bear the following legend:

DANGER  
CADMIUM  
MAY CAUSE CANCER  
CAUSES DAMAGE TO LUNGS AND KIDNEYS  
WEAR RESPIRATORY PROTECTION IN THIS AREA  
AUTHORIZED PERSONNEL ONLY

- (iii) The employer shall ensure that signs required by this paragraph (m)(2) are illuminated, cleaned, and maintained as necessary so that the legend is readily visible.
- (iv) Prior to June 1, 2016, employers may use the following legend in lieu of that specified in paragraph (m)(2)(ii) of this section:

DANGER  
CADMIUM  
CANCER HAZARD  
CAN CAUSE LUNG AND KIDNEY DISEASE  
AUTHORIZED PERSONNEL ONLY  
RESPIRATORS REQUIRED IN THIS AREA

(3) Warning labels.

- (i) Shipping and storage containers containing cadmium or cadmium compounds shall bear appropriate warning labels, as specified in paragraph (m)(1) of this section.
- (ii) The warning labels for containers of cadmium-contaminated protective clothing, equipment, waste, scrap, or debris shall include at least the following information:

DANGER  
CONTAINS CADMIUM  
MAY CAUSE CANCER  
CAUSES DAMAGE TO LUNGS AND KIDNEYS  
AVOID CREATING DUST

- (iii) Where feasible, installed cadmium products shall have a visible label or other indication that cadmium is present.

- (iv) Prior to June 1, 2015, employers may include the following information on shipping and storage containers containing cadmium, cadmium compounds, or cadmium-contaminated clothing, equipment, waste, scrap, or debris in lieu of the labeling requirements specified in paragraphs (m)(3)(i) and (m)(3)(ii) of this section:

DANGER  
CONTAINS CADMIUM  
CANCER HAZARD  
AVOID CREATING DUST  
CAN CAUSE LUNG AND KIDNEY DISEASE

- (4) Employee information and training.
- (i) The employer shall train each employee who is potentially exposed to cadmium in accordance with the requirements of this section. The employer shall institute a training program, ensure employee participation in the program, and maintain a record of the contents of the training program.
- (ii) Training shall be provided prior to or at the time of initial assignment to a job involving potential exposure to cadmium and at least annually thereafter.
- (iii) The employer shall make the training program understandable to the employee and shall assure that each employee is informed of the following:
- (A) The health hazards associated with cadmium exposure, with special attention to the information incorporated in Appendix A to this section;
- (B) The quantity, location, manner of use, release, and storage of cadmium in the workplace and the specific nature of operations that could result in exposure to cadmium, especially exposures above the PEL;
- (C) The engineering controls and work practices associated with the employee's job assignment;
- (D) The measures employees can take to protect themselves from exposure to cadmium, including modification of such habits as smoking and personal hygiene, and specific procedures the employer has implemented to protect employees from exposure to cadmium such as appropriate work practices, emergency procedures, and the provision of personal protective equipment;
- (E) The purpose, proper selection, fitting, proper use, and limitations of respirators and protective clothing;

- (F) The purpose and a description of the medical surveillance program required by paragraph (l) of this section;
  - (G) The contents of this section and its appendices, and,
  - (H) The employee's rights of access to records under 1926.33(g)(1) and (2).
- (iv) Additional access to information and training program and materials.
- (A) The employer shall make a copy of this section and its appendices readily available to all affected employees and shall provide a copy without cost if requested.
  - (B) Upon request, the employer shall provide to the Assistant Secretary or the Director all materials relating to the employee information and the training program.
- (5) Multi-employer workplace. In a multi-employer workplace, an employer who produces, uses, or stores cadmium in a manner that may expose employees of other employers to cadmium shall notify those employers of the potential hazard in accordance with paragraph (e) of the hazard communication standard for construction, 29 CFR 1926.59.
- (n) Recordkeeping.
- (1) Exposure monitoring.
- (i) The employer shall establish and keep an accurate record of all air monitoring for cadmium in the workplace.
  - (ii) This record shall include at least the following information:
    - (A) The monitoring date, shift, duration, air volume, and results in terms of an 8 hour TWA of each sample taken, and if cadmium is not detected, the detection level;
    - (B) The name and job classification of all employees monitored and of all other employees whose exposures the monitoring result is intended to represent, including, where applicable, a description of how it was determined that the employee's monitoring result could be taken to represent other employee's exposures;
    - (C) A description of the sampling and analytical methods used and evidence of their accuracy;
    - (D) The type of respiratory protective device, if any, worn by the monitored employee and by any other employee whose exposure the monitoring result is intended to represent;

- (E) A notation of any other conditions that might have affected the monitoring results.
  - (F) Any exposure monitoring or objective data that were used and the levels.
  - (iii) The employer shall maintain this record for at least thirty (30) years, in accordance with 1926.33 of this part.
  - (iv) The employer shall also provide a copy of the results of an employee's air monitoring prescribed in paragraph (d) of this section to an industry trade association and to the employee's union, if any, or, if either of such associations or unions do not exist, to another comparable organization that is competent to maintain such records and is reasonably accessible to employers and employees in the industry.
- (2) Objective data for exemption from requirement for initial monitoring.
- (i) For purposes of this section, objective data are information demonstrating that a particular product or material containing cadmium or a specific process, operation, or activity involving cadmium cannot release dust or fumes in concentrations at or above the action level even under the worst-case release conditions. Objective data can be obtained from an industry-wide study or from laboratory product test results from manufacturers of cadmium-containing products or materials. The data the employer uses from an industry-wide survey must be obtained under workplace conditions closely resembling the processes, types of material, control methods, work practices and environmental conditions in the employer's current operations.
  - (ii) The employer shall maintain the record for at least 30 years of the objective data relied upon.
- (3) Medical surveillance.
- (i) The employer shall establish and maintain an accurate record for each employee covered by medical surveillance under paragraph (l)(1)(i) of this section.
  - (ii) The record shall include at least the following information about the employee:
    - (A) Name and description of duties;
    - (B) A copy of the physician's written opinions and of the explanation sheets for biological monitoring results;

- (C) A copy of the medical history, and the results of any physical examination and all test results that are required to be provided by this section, including biological tests, X-rays, pulmonary function tests, etc., or that have been obtained to further evaluate any condition that might be related to cadmium exposure;
      - (D) The employee's medical symptoms that might be related to exposure to cadmium; and
      - (E) A copy of the information provided to the physician as required by paragraph (l)(9) of this section.
    - (iii) The employer shall assure that this record is maintained for the duration of employment plus thirty (30) years, in accordance with 1926.33 of this part.
    - (iv) At the employee's request, the employer shall promptly provide a copy of the employee's medical record, or update as appropriate, to a medical doctor or a union specified by the employee.
  - (4) Availability.
    - (i) Except as otherwise provided for in this section, access to all records required to be maintained by paragraphs (n)(1) through (3) of this section shall be in accordance with the provisions of 29 CFR 1910.1020.
    - (ii) Within 15 days after a request, the employer shall make an employee's medical records required to be kept by paragraph (n)(3) of this section available for examination and copying to the subject employee, to designated representatives, to anyone having the specific written consent of the subject employee, and after the employee's death or incapacitation, to the employee's family members.
  - (5) Transfer of records. Whenever an employer ceases to do business and there is no successor employer or designated organization to receive and retain records for the prescribed period, the employer shall comply with the requirements concerning transfer of records set forth in 1926.33(h) of this part.
- (o) Observation of monitoring.
- (1) Employee observation. The employer shall provide affected employees or their designated representatives an opportunity to observe any monitoring of employee exposure to cadmium.

- (2) Observation procedures. When observation of monitoring requires entry into an area where the use of protective clothing or equipment is required, the employer shall provide the observer with that clothing and equipment and shall assure that the observer uses such clothing and equipment and complies with all other applicable safety and health procedures.
- (p) Reserved.
- (q) Appendices. Except where portions of Appendices A, B, D, E, and F to this section are expressly incorporated in requirements of this section, these appendices are purely informational and are not intended to create any additional obligations not otherwise imposed or to detract from any existing obligations.

[57 FR 42452, Sept. 14, 1992, as amended at 57 FR 49272, Oct. 30, 1992; 58 FR 21787, Apr. 23, 1993. Redesignated and amended at 59 FR 215, Jan. 3, 1994; 61 FR 5510, Feb. 13, 1996; 61 FR 31433, 31434, June 20, 1996; 63 FR 1298, Jan. 8, 1998; 70 FR 1144, Jan. 5, 2005; 71 FR 16675, Apr. 3, 2006; 71 FR 50192, Aug. 24, 2006; 73 FR 75589, Dec. 12, 2008; 76 FR 33612, June 8, 2011; 77 FR 17895, Mar. 26, 2012; 84 FR 21416, May 14, 2019.]

## **1926.1127 Cadmium, Appendices A through F**

**Note:** The requirement applicable to construction work under these appendices are identical to those in 1910.1027, Cadmium, Appendices A through F ([General Industry, Division 2/Z](#)).

## **1926.1152 Methylene Chloride**

**Note:** The requirements to construction work under this section are identical to those in 1910.1052, Methylene Chloride ([General Industry, Division 2/Z](#))

## Historical Notes for Subdivision Z

**Note:** Federal OSHA's final rule on Occupational Exposure to Asbestos was adopted on August 10, 1994. This rule amends the OSHA standards issued June 20, 1986, for Occupational Exposure to Asbestos in general industry and the construction industry. In addition, they include a separate standard covering occupational exposure to asbestos in the shipyard industry. Oregon OSHA has adopted these new federal standards by reference. The repeal of Oregon initiated rules 437-02-366 and 437-03-033 are necessary to avoid duplicative language due to adoption of the new federal standard on exposure to asbestos.

This is Oregon OSHA Administrative Order 4-1995, Adopted and effective March 29, 1995.

**Note:** On March 29, 1995, Oregon OSHA adopted by reference federal OSHA's standards on Occupational Exposure to Asbestos, as Oregon OSHA Administrative Order 4-1995. Recently, federal OSHA issued corrections to the adopted asbestos standard. The corrections to the standards include: Correction of typographical errors, corrections that clarify the intent but do not change the substantive requirements imposed by the standard, and corrections intended to better effectuate the intent when the standard was adopted. Oregon OSHA adopted these corrections by reference with this rulemaking.

This is Oregon OSHA Administrative Order 8-1995, Adopted and effective August 25, 1995.

**Note:** Oregon OSHA adopted by reference federal corrections to occupational exposure to asbestos in general industry, construction, and shipyard work. Also, being amended by clarification and correction of errors is the Confined and Enclosed Spaces and Other Dangerous Atmospheres in Shipyard Employment standard in Oregon's Division 5, Maritime Activities. This rulemaking contains the federal corrections to the asbestos standard in construction and maritime. The nature of the corrections is to clarify various provisions and correct typographical errors. In both the construction and shipyards standards, paragraph (g)(7)(iii) is redesignated as (g)(7)(ii)(C) to clarify that drop cloths are required beneath all outdoor removal activity.

OSHA has determined that when gaskets are removed intact, wet methods are not required. Therefore paragraph (b)(8)(iv)(B) is deleted and the word "wet" is removed from (g)(8)(iv)(C). The standard still required that when gaskets are visibly deteriorated, they must be removed using glovebags and wet methods.

Paragraph (g)(11) of 1926.1101, Construction is revised to allow bituminous or asphaltic pipeline coating to be handled using the same "alternative methods" set forth in a previous correction notice, for certain bituminous/resinous roofing materials. OSHA recognizes that asphaltic wrap is similar to these roofing materials because the highly effective material used to bind asbestos fibers is the same. A new paragraph (g)(11)(vi) of the construction standard is added to specify that activities that disturb asphaltic pipeline wrap must be performed using wet methods.

This is Oregon Administrative Order 5-1996, Adopted and effective November 29, 1996.

**Note:** On August 23, 1996, federal OSHA published in the federal register further corrections and clarifications to certain provisions of the asbestos standard in general industry, construction, and shipyard work. The corrections issued on August 23, 1996 are not intended to affect the protection afforded by the standards in a significant way. Also included in this rulemaking are corrections to the asbestos standard in general industry that were inadvertently omitted from the prior adoption by reference.

This is Oregon Administrative Order 6-1996, Adopted and effective November 29, 1996.

**Note:** Federal OSHA amended the standards that regulate employee exposure to 1, 3-Butadiene (BD) and Methylene Chloride (MC). Oregon OSHA adopts these standards by reference into Oregon's Division 2, Division 3, Division 5, and amend Oregon's Rules for Air Contaminants.

Federal OSHA has determined, based on studies and tests, that the current permissible exposure limits (PELs) do not properly protect workers. Both final standards have reduced PELs.

In order to reduce exposures and protect employees, OSHA's BD and MC standards include requirements such as engineering controls, work practices and personal protective equipment, measurement of employee exposures training, medical surveillance, hazard communication, regulated areas, emergency procedures, and recordkeeping.

This is Oregon Administrative Order 6-1997, Adopted and effective May 2, 1997.

**Note:** Federal OSHA published in the Federal Register the new respiratory protection standard. The new standard replaces respiratory protection standards that were adopted in 1971 by OSHA. The new respiratory protection text is in general industry 29 CFR 1910.134. The text previously in 1910.134 has been redesignated as 1910.139. Four subdivisions in the construction standard have also been amended.

This new standard requires employers to establish or maintain a respiratory protection program to protect workers that wear respirators. Other provisions include requirements for program administration; work site-specific procedures; respirator selection; employee training; fit testing; medical evaluation; respirator use; and respirator cleaning, maintenance, and repair. Addressed for the first time are atmospheres that are Immediately Dangerous to Life and Health, including interior structural firefighting. The standard also simplifies and updates previous respiratory protection requirements.

This is Oregon OSHA Administrative Order 3-1998, Adopted and effective July 7, 1998.

**Note:** Federal OSHA published in the Federal Register June 29, 1998, amendments to the asbestos standard in construction (1926.1101). The asbestos standard in general industry remains unchanged by this action.

On August 10, 1994, Federal OSHA published final asbestos standards. June 29, 1995, Federal OSHA issued amendments to the construction and maritime/shipyard standards regarding occupational exposure to asbestos, to correct and clarify various provisions.

There was a petition for review of the construction and maritime standards requirements for work practices, training, and hazard communication for asphalt roof cements, coating and mastics which contain asbestos. The court vacated the standards insofar as they regulate these materials. To conform the regulations to the court's decision, federal OSHA added a statement to paragraph (a) to state the standard does not apply to asbestos-containing asphalt roof cements, coatings, and mastics. In paragraph (g)(11) in the construction standard covering alternative work practices, federal OSHA has deleted references to roofing cements, mastics, and coatings.

This is Oregon OSHA Administrative Order 7-1998, Adopted and effective December 28, 1998.

**Note:** Oregon OSHA found slight differences in the air contaminants rules from Federal OSHA. Therefore, Oregon OSHA has modified three substances: Carbon disulfide, ethylene dibromide, mercury, and mercury organo (alkyl), to match federal OSHA's standard in construction and maritime. For uniformity, Oregon initiated air contaminant rules in general industry, construction, and agriculture will all reflect the current amendments.

This is Oregon OSHA Administrative Order 4-2001, Adopted and effective February 5, 2001.

**Note:** Federal OSHA published in the January 5, 2005 Federal Register amendments to remove and revise provisions of its standards that are outdated, duplicative, unnecessary, inconsistent, or can be clarified or simplified by being written in plain language. Most of these changes are in the health standards in general industry, construction, and shipyard employment. The December 6, 2004 Federal Register makes a correction to a cross reference in Methylenedianiline in construction. We also repealed an Oregon-initiated rule that has effective dates that have passed a number of years ago and is no longer necessary. A nonmandatory appendix to OAR 437-002-0161, Medical and First Aid, was added.

This is Oregon OSHA Administrative Order 1-2005, Adopted and effective April 12, 2005.

**Note:** Oregon OSHA adopted federal OSHA changes as they appear in the April 3, 2006 Federal Register. These revisions include updating references and removing obsolete effective dates and statup dates from existing rules in general industry, construction, and maritime activities. Two changes federal OSHA made that we do not include in this rulemaking are to remove effective dates in 1910.266 and 1926.1092, neither of which Oregon OSHA has adopted before.

This is Oregon Administrative Order 4-2006, Adopted and effective July 24, 2006.

**Note:** This rule adds new requirements for exposures to hexavalent chromium, including a lower airborne permissible exposure limit, an action level, airborne exposure assessments, regulated areas, change and washing facilities, medical surveillance, and training.

This is Oregon Administrative Order 6-2006, Adopted and effective August 30, 2006.

**Note:** Oregon OSHA adopts the federal OSHA changes as they appear in the August 24, 2006 Federal Register. These changes revise the existing rules on respiratory protection, adding definitions and new language that establishes Assigned Protection Factors (APFs) and Maximum Use Concentrations (MUCs) for respirator use. The revisions also supercede the respirator selection provisions of existing substance-specific standards with these new APFs (except for the respirator selection provisions of the 1,3-Butadiene Standard).

Federal OSHA developed the final APFs after thoroughly reviewing the available literature, including chamber-simulation studies and workplace protection factor studies, comments submitted to the record, and hearing testimony. The final APFs provide employers with critical information to use when selecting respirators for employees exposed to atmospheric contaminants found in general industry, construction, shipyards, longshoring, and marine terminal workplaces. Oregon OSHA also adopts these changes into Division 4, Agriculture. Proper respirator selection using APFs is an important component of an effective respiratory protection program. Accordingly, federal OSHA concludes that the final APFs are necessary to protect employees who must use respirators to protect them from airborne contaminants.

This is Oregon Administrative Order 10-2006, Adopted and effective November 30, 2006.

**Note:** Oregon OSHA is adopting final changes to the permissible exposure limit (PEL) for airborne concentrations of respirable silica to a fixed limit of 0.1 milligrams per cubic meter (mg/m<sup>3</sup>). The formula and footnote (e) for Silica in Table Z-3 in the Air Contaminants standards in general industry and construction is also amended. Both of these changes reflect better scientific processes for determining airborne respirable exposures, and the calculation used to determine exposures continues to cause confusion.

Crystalline silica, also known as quartz, is a natural constituent of the earth's crust and is a basic component of sand and granite. However, airborne exposures to silica can lead to silicosis. Silicosis is a disease of the lungs that can cause fibrosis or scar tissue formations in the lungs that reduce the lung's ability to work to extract oxygen from the air.

Comments received during the comment period and during the public hearing indicated that the proposed change of 0.05 mg/m<sup>3</sup> would impact industry more than Oregon OSHA had anticipated. The original calculation was based on a 0.1 mg/m<sup>3</sup> limit. OR-OSHA carefully considered these comments and as a result is adopting a PEL of 0.1 mg/m<sup>3</sup>.

Oregon OSHA also received comments regarding the proposed sampling method and as a result is adopting a rule that allows for a sampling method accepted by OSHA or NIOSH for respirable quartz silica.

Changes will also be made in the Z-1 table in air contaminants for accuracy, correction, and uniformity. Oregon OSHA also adopts these changes into general industry and construction.

This is Oregon OSHA Administrative Order 6-2008, adopted May 13, 2008 and effective July 1, 2008.

**Note:** In this rulemaking, Oregon OSHA is amending its standards to add language clarifying that the personal protective equipment (PPE) and training requirements impose a compliance duty to each and every employee covered by the standards, and that noncompliance may expose the employer to liability on a per-employee basis. The amendments consist of new paragraphs added to the introductory sections of the affected rules and changes to the language of some existing respirator and training requirements. These federal OSHA changes are in general industry, construction, and maritime and were published in the December 12, 2008 Federal Register.

This is Oregon OSHA Administrative Order 5-2009, adopted and effective May 29, 2009.

**Note:** This rulemaking is to keep Oregon OSHA in harmony with recent changes to federal OSHA's standards.

Federal OSHA revised the notification requirements in the Hexavalent Chromium (Cr(VI)) standard in general industry, construction, and maritime activities. Employers will be required to notify employees of the results of all exposure determinations regardless of exposure levels. Oregon OSHA adopts the changes in Divisions 2/Z, general industry, 3/Z, construction, and 5/Z, maritime activities as published in the March 17, 2010 Federal Register

This is Oregon OSHA Administrative Order 3-2010, Adopted June 10, 2010 and effective June 15, 2010.

**Note:** Oregon OSHA adopted changes to rules in general industry, construction, agriculture, and maritime. Federal OSHA published a number of rule changes in these industries in the June 8, 2011 Federal Register. This is Phase III of the Standards Improvement Project (SIP III), the third in a series of rulemaking by Federal OSHA to improve and streamline the standards. This removes or revises individual requirements within rules that are confusing, outdated, duplicative, or inconsistent.

Oregon OSHA adopted the majority of the federal changes that include:

1. Personal Protective Equipment – Division 2/I, remove requirements that employers prepare and maintain written training certification records.
2. Respiratory Protection – revise requirements for breathing-gas containers.
3. Material Handling/Slings – revise standards in general industry, construction, and maritime standards.
4. Commercial Division Operations – Division 2/T, remove two obsolete recordkeeping requirements.
5. General industry and construction – remove requirements in numerous standards for employers to transfer specific records to the National Institute for Occupational Safety and Health (NIOSH).
6. Lead – amend trigger levels in general industry and construction.

In connection with rule changes in the SIP III rulemaking process, Oregon OSHA adopted additional changes to the subdivisions and rules opened during this rulemaking activity. We also made reference changes to Underground Installations in Division 3/P.

Oregon OSHA repealed all of Division 2/I rules with the exception of 1910.134 Respiratory Protection, 1910.137 Electrical Protective Equipment, 437-002-0138 Additional Oregon Rule for Electrical Protective Equipment, 437-002-0139 Working Underway on Water, and 437-002-1139 Working Over or In Water.

To replace them, we adopted new Oregon-initiated rule, 437-002-0134 Personal Protective Equipment, that includes sections covering scope/application, hazard assessment, equipment, training, payment, fall protection, clothing, high visibility garments, eye, head, foot, leg, hand and skin protection.

The change in format simplifies the existing text while making little change to the overall rule requirements with the following exceptions:

1. Modifies the hazard assessment requirement to clarify that employers must identify hazards to the entire body, including the torso and extremities, when performing the assessment. The assessment is currently limited to head, hands, eyes and face and foot protection. **Note: The assessment for eyes, face, head, hands, and feet are currently in effect. The torso and extremities (e.g. arms and legs) element of the body assessment will not be enforced until July 1, 2012.**
2. Change the fall protection component criteria to align with the systems criteria found in 1926.502 of the construction standards. The training requirement in this rule would also cover those parts not previously covered, such as fall protection.

Definition of "potable water":

Previously, Oregon OSHA did not adopt 1910.141(a)(1), so the SIP-III changes to the definition of potable water must be addressed through Oregon-initiated rules. We will maintain the current definition of potable water in Division 2/J, 437-002-0141(1)(a), Sanitation and Division 4/J, 437-004-1105(1)(b), Sanitation. However, for consistency, we changed the definition of potable water in Division 4/J, 437-004-1110, Field Sanitation for Hand Labor Work, and Division 3/D, 437-003-0015 Drinking Water to the same definition.

MOCA -- 4,4'-Methylene bis (2-chloroaniline):

As a logical extension of the Federal OSHA SIP-III changes to 29 CFR 1910.1003, 13 Carcinogens, we amended the Oregon Rules for MOCA (4,4'-Methylene bis (2-chloroaniline)) at Division 2/Z, 437-002-0364. The requirements for respiratory protection are updated and the requirements for transfer of records is simplified. Most transfer of medical records to NIOSH is eliminated with the SIP III rulemaking. The employer is required to follow the requirements of the Respiratory Protection rule and select appropriate respirators based on the selection criteria in 1910.134(d). (The type of respirator to use is no longer specified.) We will also remove and reserve 437-002-0364(6)(a) which had a reporting requirement end date of December 1974.

This is Oregon OSHA Administrative Order 4-2011, adopted and effective December 8, 2011.

**Note:** Oregon OSHA adopted changes to rules in general industry and construction. Federal OSHA published a number of rule changes in these industries in the June 8, 2011 Federal Register. This is Phase III of the Standards Improvement Project (SIP III), the third in a series of rulemaking by Federal OSHA to improve and streamline the standards. This removes or revises individual requirements within rules that are confusing, outdated, duplicative, or inconsistent.

In connection with rule changes in the SIP III rulemaking process, Oregon OSHA adopted additional changes to the subdivisions and rules opened during this rulemaking activity.

For Substance-specific rules:

We adopted new Oregon-initiated rules in Divisions 2/Z, 3/D, and 3/Z, that replace the respiratory protection program paragraphs in the 1910 and 1926 substance specific rules referencing 1910.134 Respiratory Protection. The new rules expand the 1910.134 reference to include paragraphs (e) Medical Evaluation, and (o) Appendices. Also, notes are added following each of these new rules to clarify that these requirements are in addition to other medical evaluation and respiratory-protection-related requirements in each rule.

In most instances, the change in the requirement for a respirator medical evaluation (1910.134(e)) is a change in timing. Employers in many instances are already required to provide respirator medical evaluations based on contaminant exposure and required use of a respirator. Employers subject to the substance-specific rules would be required to provide a respirator medical evaluation to determine the employee's ability to wear a respirator without adverse health effects before the employee is fit tested or required to use a respirator in the workplace.

By adding section (o) of 1910.134, the new rules specify that all the Appendices to 1910.134 apply, providing approved procedures and respirator protocols to employers. These include Appendix A, Fit Testing Procedures; Appendix B-1, User Seal Check Procedures; Appendix B-2, Respirator Cleaning Procedures; Appendix C, OSHA Respirator Medical Evaluation Questionnaire; and Appendix D, Information for Employees Using Respirators When Not Required under the Standard.

This is Oregon OSHA Administrative Order 5-2011, adopted December 8, 2011, and effective July 1, 2012.

**Note:** Federal OSHA modified its Hazard Communication Standard (HCS) to conform to the United Nations' Globally Harmonized System of Classification and Labelling of Chemicals (GHS). OSHA determined that the modifications will significantly reduce costs and burdens while also improving the quality and consistency of information provided to employers and employees regarding chemical hazards and associated protective measures. OSHA concluded this improved information will enhance the effectiveness of the HCS in ensuring that employees are apprised of the chemical hazards to which they may be exposed, and in reducing the incidence of chemical-related occupational illnesses and injuries.

The modifications to the standard include revised criteria for classification of chemical hazards; revised labeling provisions that include requirements for use of standardized signal words, pictograms, hazard statements, and precautionary statements; a specified format for safety data sheets; and related revisions to definitions of terms used in the standard, and requirements for employee training on labels and safety data sheets. OSHA and Oregon OSHA are also modifying provisions of other standards, including standards for flammable and combustible liquids, spray finishing, reinforced plastics, dipping and coating, welding, cutting, and brazing, hazardous waste operations and emergency response, process safety management, pipe labeling, and most substance specific health standards, to ensure consistency with the modified HCS requirements. The consequences of these modifications will be to improve safety, to facilitate global harmonization of standards, and to produce hundreds of millions of dollars in annual savings nationally.

This rulemaking also repeals three Oregon-initiated rules: OAR 437-002-0289 Precautionary Labels, general requirements in Division 2/Q; 437-002-0361, regarding certain compliance dates for the Ethylene Oxide rule in Division 2/Z; and 437-003-0035 additional rules in hazard communication in Division 3/D. All three rules repealed are obsolete and unnecessary. The text of 1926.59 Hazard Communication in Division 3/D is repealed and a note added to refer the reader to 1910.1200 Hazard Communication in Division 2/Z (same as federal OSHA).

This is Oregon OSHA Administrative Order 5-2012, adopted and effective September 25, 2012.

**Note:** This rulemaking is to keep Oregon OSHA in harmony with recent changes to Federal OSHA's standards.

Federal OSHA has corrected regulations that were amended by the Hazard Communication standard published in the March 26, 2012 Federal Register. The majority of corrections are to references inadvertently missed in the original publication of the final rule. Other corrections include correcting values or notations in tables, and updating references to terms. These corrections appear in the February 8, 2013 Federal Register.

Oregon OSHA adopts these amendments in general industry, construction, and shipyard employment.

This is Oregon OSHA Administrative Order 4-2013, Adopted and effective July 19, 2013.

**Note:** On March 25, 2016, federal OSHA adopted final rules for crystalline silica for general industry, construction, and maritime. Before these rules, the only specific rule for crystalline silica was an airborne permissible exposure limit (PEL) of 100 micrograms per cubic meter of air ( $\mu\text{g}/\text{m}^3$ ). With the adoption of these rules, federal OSHA lowered the PEL from 100  $\mu\text{g}/\text{m}^3$  to 50  $\mu\text{g}/\text{m}^3$ , and instituted an action level of 25  $\mu\text{g}/\text{m}^3$ . These rules require an exposure assessment, with periodic monitoring under certain circumstances, requires engineering and work practice controls to reduce exposure levels, institutes a written exposure control plan, requires provisions for regulating employee access to certain areas, respiratory protection, medical surveillance, and employee training and information. The construction rule also lists specific tasks with engineering controls, work practice controls, and respiratory protection for specific tasks that do not require an exposure assessment, and requires that a competent person ensure that the written program and specific tasks are followed.

On July 15, 2016 Oregon OSHA proposed to combine the requirements of the general industry and construction rules into one set of rules applicable to both industries, as new Oregon-initiated rules OAR 437-002-1053 through 437-002-1065. These Oregon-initiated rules provide the same options for construction employers to use certain specified methods in lieu of an exposure assessment as the federal rules, and a note was added at Table 1 in 437-002-1057 Specified exposure control methods, to remind employers that the rest of the rules still apply.

Oregon OSHA amended the compliance dates to July 1, 2018 for both general industry and construction. The one effective date, paired with education and outreach, will help increase employer understanding and compliance with the new silica standard. The effective date for medical evaluations for employees exposed to airborne levels above the action level but below the PEL is July 1, 2020.

This is Oregon OSHA Administrative Order 5-2016, adopted September 23, 2016, and effective July 1, 2018.

**Note:** On January 9, 2017, federal OSHA adopted final rules for beryllium for general industry, construction, and maritime. Before these rules, the only specific rule for beryllium was an airborne permissible exposure limit (PEL) of 2 micrograms per cubic meter of air ( $\mu\text{g}/\text{m}^3$ ). With the adoption of these rules, federal OSHA lowered the PEL from 2  $\mu\text{g}/\text{m}^3$  to 0.2  $\mu\text{g}/\text{m}^3$ , and instituted an action level of 0.1  $\mu\text{g}/\text{m}^3$ . These rules require an exposure assessment, with periodic monitoring under certain circumstances, requires engineering and work practice controls to reduce exposure levels, institutes a written exposure control plan, requires provisions for regulating employee access to certain areas, respiratory protection, medical surveillance, and employee training and information.

Oregon OSHA combined the requirements of the general industry and construction rules into one set of rules applicable to both industries, as new Oregon-initiated rules OAR 437-002-2024 through 437-002-2026, 437-002-2028 through 437-002-2030, 437-002-2032 through 437-002-2038, 437-002-2040, and 437-002-2045.

Oregon OSHA also updated the air contaminants rules for general industry and construction, OAR 437-002-0382 and 437-003-1000, to reflect the new beryllium rules.

Two public hearings were held during June of 2017. Oregon OSHA did not receive any comments at these hearings. We received one written comment in support of this rulemaking.

This is Oregon OSHA Administrative Order 3-2017, adopted July 7, 2017 and effective March 12, 2018.

**Note:** Oregon OSHA is adopting changes to their administrative (recordkeeping), general industry, and construction standards, and updating references in the maritime activity standards in response to federal OSHA's adoption of final rules published in the May 14, 2019 Federal Register. This is Phase IV of federal OSHA's Standards Improvement Project (SIP-IV), the fourth in a series of rulemakings to improve and streamline workplace safety and health standards. Oregon's response removes or revises rules or requirements within our corresponding rules that are outdated, duplicative, or inconsistent. This rulemaking is anticipated to reduce regulatory burden and compliance costs while maintaining or enhancing worker safety and health as well as worker privacy protections.

In Division 3Z, Oregon OSHA eliminated the requirements for the use of employee social security numbers in employee records, including medical surveillance records, updated and clarified medical surveillance requirements for both general industry and construction in certain substance-specific standards: To eliminate the requirement for periodic x-rays; To reflect current technology and medical practice for the evaluation and storage of x-rays; To reflect current technology and medical practice for pulmonary function testing; and To improve the consistency of information collected on standardized forms.

This is Oregon OSHA Administrative Order 3-2019, filed and effective October 29, 2019.

**Note:** This rulemaking reduces Oregon OSHA's permissible exposure limit (PEL) for manganese compounds and fume (as Mn, C.A.S. #7349-96-5) in the Air Contaminants rules for general industry (Subdivision 2/Z), construction (Subdivision 3/Z), and agriculture (Subdivision 4/Z). The revised PEL is 0.1 mg/m<sup>3</sup>, as an 8-hour time-weighted average; and retains the ceiling limit of 5 mg/m<sup>3</sup>.

It clarified and simplified the Oregon-initiated rules that supplement the federal OSHA 29 CFR 1910.252 General Requirements protections in Subdivision 2/Q, and amended:

- 437-002-0280- Adoption by Reference,
- 437-002-0282- Job Planning and Layout,
- 437-002-0283- Additional Protective Clothing Requirements,
- 437-002-0284- Additional Specifications for Eye and Face Protection,
- 437-002-0285- Additional Special Precautions,
- 437-002-0286- Flammable Preservative Coatings,
- 437-002-0287- Toxic Preservative Coatings,
- 437-002-0288- Additional General Health Protection,
- 437-002-0297- Oregon Requirements for Welding or Cutting Containers, and
- 437-002-0298- Supplied Air Respiratory Equipment.

This rulemaking also adopted three new rules to supplement the requirements in Subdivision 2/Q.

OAR 437-002-0279, Additional Oregon Confined Space Requirements clarifies and standardizes the protections for workers welding in confined spaces. The rule title emphasizes that these requirements related to welding in confined spaces are in addition to those in 29 CFR 1910.252.

OAR 437-002-0281, Manganese (includes a new Table OR Q-2.) Offers an alternative to air monitoring for estimating manganese exposures. The rule allows employers to use specific levels of respiratory protection – based on the assigned protective factor (APF) of the equipment -- for specific types of welding tasks within specific periods of time and other limits. The new Table OR Q-2 correlates this approach which is offered as an option, and not as a requirement.

OAR 437-002-0299, Definitions. Adds a more general definition of terms used in Division 2/Q. (This new rule is referenced in 437-002-0280 as a substitute for the repealed 1910.251, replacing the previous reference to 437-002-2253, where the definitions in the rule only pertain to that specific rule.)

This is Oregon OSHA **Administrative Order 11-2021, adopted September 1, 2021, and effective September 1, 2022.**

Oregon Administrative Rules  
Chapter 437

Division 3  
Construction

---

# Cranes and Derricks in Construction

Subdivision

**CC**

Administrative  
Order 1-2019

Pursuant to **Oregon Revised Statutes (ORS) 654**, The Oregon Safe Employment Act (OSEAct), the Oregon Department of Consumer and Business Services, Occupational Safety and Health Division (Oregon OSHA), adopted these rules.

The Secretary of State designated Oregon Administrative Rules Chapter 437 as the Oregon Occupational Safety and Health Division Rules. Six subject areas are designated as “Divisions” of these rules.

- **Division 1** Administration of the Oregon Safe Employment Act
- **Division 2** General Occupational Safety and Health Rules
- **Division 3** Construction
- **Division 4** Agriculture
- **Division 5** Maritime Activities
- **Division 7** Forest Activities

Oregon-initiated rules are numbered in a uniform system developed by the Secretary of State. This system does not number the rules in sequence (001, 002, 003, etc.). Omitted numbers may be assigned to new rules at the time of their adoption.

**Oregon-initiated rules** are arranged in the following codification structure prescribed by the Secretary of State for Oregon Administrative Rules (OAR):

Chapter	Division	Subdivision	Rule	Section	Paragraphs
437	002	N	0221	(1)	(a)(A)(i)(I)

Cite as 437-002-0221(1)(a)

Many of the Oregon OSHA rules are adopted by reference from the Code of Federal Regulations (CFR), and are arranged in the following federal numbering system:

Part	Subpart (Subdivision)	Section	Paragraphs
1910	N	.176	(a)(1)(i)(A)(1)(i)

Cite as 1910.176(a)(1)

The terms “subdivision” and “subpart” are synonymous within OAR 437, Oregon Occupational Safety and Health rules.

---

These rules are available for viewing in the Office of the Secretary of State, Oregon State Archives Building, Salem, Oregon.

These rules are available in electronic and printable formats at [osha.oregon.gov](http://osha.oregon.gov).

Printed copies of these rules are available at:

**Department of Consumer & Business Services**  
**Oregon Occupational Safety & Health Division (Oregon OSHA)**  
350 Winter St. NE  
Salem, OR 97301-3882

**437-003-0001 Adoption by Reference**

*In addition to, and not in lieu of, any other safety and health codes contained in OAR Chapter 437, the Department adopts by reference the following federal regulations printed as part of the Code of Federal Regulations, in the Federal Register:*

(28) Subdivision CC – Cranes and Derricks in Construction.

- (a) 29 CFR 1926.1400 Scope, published 4/11/14, FR vol. 79, no. 70, p. 20316; amended with Oregon OSHA AO 3-2015, f. 10/9/15, ef. 1/1/16.
- (b) 29 CFR 1926.1401 Definitions, published 8/9/10, FR vol. 75, no. 152, pp. 47906-48177.
- (c) 29 CFR 1926.1402 Ground conditions, published 8/9/10, FR vol. 75, no. 152. Pp. 47906-48177.
- (d) 29 CFR 1926.1403 Assembly/Disassembly – selection of manufacturer or employer procedures, published 8/9/10, FR vol. 75, no. 152, pp. 47906-48177.
- (e) 29 CFR 1926.1404 Assembly/Disassembly – general requirements (applies to all assembly and disassembly operations), published 8/9/10, FR vol. 75, no. 152, pp. 47906-48177.
- (f) 29 CFR 1926.1405 Disassembly – additional requirements for dismantling of booms and jibs (applies to both the use of manufacturer procedures and employer procedures), published 8/9/10, FR vol. 75, no. 152. Pp. 47906-48177.
- (g) 29 CFR 1926.1406 Assembly/Disassembly – employer procedures – general requirements, published 8/9/10, FR vol. 75, no. 152, pp. 47906-48177.
- (h) 29 CFR 1926.1407 Power line safety (up to 350 kV) – assembly and disassembly, published 8/9/10, FR vol. 75, no. 152, pp. 47906-48177.
- (i) 29 CFR 1926.1408 Power line safety (up to 350 kV) – equipment operations, published 8/9/10, FR vol. 75, no. 152, pp. 47906-48177.
- (j) 29 CFR 1926.1409 Power line safety (over 35 kV), published 8/9/10, FR vol. 75, vol. 152, pp. 47906-48177.
- (k) 29 CFR 1926.1410 Power line safety (all voltages) – equipment operations closer than the Table A zone, published 4/11/14, FR vol. 79, no. 70, p. 20316.

- (l) 29 CFR 1926.1411 Power line safety – while traveling, published 8/9/10, FR vol. 75, no. 152, pp. 47906-48177.
- (m) 29 CFR 1926.1412 Inspections, published 8/9/10, FR vol. 75, no. 152, pp. 47906-48177.
- (n) 29 CFR 1926.1413 Wire rope – inspection, published 8/9/10, FR vol. 75, no. 152, pp. 47906-48177.
- (o) 29 CFR 1926.1414 Wire rope – selection and installation criteria, published 8/9/10, FR vol. 75, no. 152, pp. 47906-48177.
- (p) 29 CFR 1926.1415 Safety devices, published 8/9/10, FR vol. 75, no. 152, pp. 47906-48177.
- (q) 29 CFR 1926.1416 Operational aids, published 8/9/10, FR vol. 75, no. 152, pp. 47906-48177.
- (r) 29 CFR 1926.1417 Operation, published 8/9/10, FR vol. 75, no. 152, pp. 47906-48177.
- (s) 29 CFR 1926.1418 Authority to stop operation, published 8/9/10, FR vol. 75, no. 152, pp. 47906-48177.
- (t) 29 CFR 1926.1419 Signals – general requirements, published 8/9/10, FR vol. 75, no. 152, pp. 47906-48177.
- (u) 29 CFR 1926.1420 Signals – radio, telephone or other electronic transmission of signals, published 8/9/10, FR vol. 75, no. 152, pp. 47906-48177.
- (v) 29 CFR 1926.1421 Signals – voice signals – additional requirements, published 8/9/10, FR vol. 75, no. 152, pp. 47906-48177.
- (w) 29 CFR 1926.1422 Signals – hand signal chart, published 8/9/10, FR vol. 75, no. 152, pp. 47906-48177.

## 1926.1400 Scope

- (a) This standard applies to power-operated equipment, when used in construction, that can hoist, lower and horizontally move a suspended load. Such equipment includes, but is not limited to: articulating cranes (such as knuckle-boom cranes); crawler cranes; floating cranes; cranes on barges; locomotive cranes; mobile cranes (such as wheel-mounted, rough-terrain, all-terrain, commercial truck-mounted, and boom truck cranes); multi-purpose machines when configured to hoist and lower (by means of a winch or hook) and horizontally move a suspended load; industrial cranes (such as carry-deck cranes); dedicated pile drivers; service/ mechanic trucks with a hoisting device; a crane on a monorail; tower cranes (such as a fixed jib, i.e., “hammerhead boom”), luffing boom and self-erecting); pedestal cranes; portal cranes; overhead and gantry cranes; straddle cranes; sideboom cranes; derricks; and variations of such equipment. However, items listed in paragraph (c) of this section are excluded from the scope of this standard.

- (b) Attachments. This standard applies to equipment included in paragraph (a) of this section when used with attachments. Such attachments, whether crane-attached or suspended include, but are not limited to: hooks, magnets, grapples, clamshell buckets, orange peel buckets, concrete buckets, drag lines, personnel platforms, augers or drills and pile driving equipment.
- (c) Exclusions. This subpart does not cover:
- (1) Machinery included in paragraph (a) of this section while it has been converted or adapted for a non-hoisting/lifting use. Such conversions/adaptations include, but are not limited to, power shovels, excavators and concrete pumps.
  - (2) Power shovels, excavators, wheel loaders, backhoes, loader backhoes, track loaders. This machinery is also excluded when used with chains, slings or other rigging to lift suspended loads.
  - (3) Automotive wreckers and tow trucks when used to clear wrecks and haul vehicles.
  - (4) Digger derricks when used for augering holes for poles carrying electric or telecommunication lines, placing and removing the poles, and for handling associated materials for installation on, or removal from, the poles, or when used for any other work subject to subpart V of this part. To be eligible for this exclusion, digger derrick use in work subject to subpart V of this part must comply with all of the provisions of that subpart, and digger derrick use in construction work for telecommunication service (as defined at 1910.268(s)(40)) must comply with all of the provisions of 1910.268.
  - (5) Machinery originally designed as vehicle-mounted aerial devices (for lifting personnel) and self-propelled elevating work platforms.
  - (6) Telescopic/hydraulic gantry systems.
  - (7) Stacker cranes.
  - (8) Powered industrial trucks (forklifts), except when configured to hoist and lower (by means of a winch or hook) and horizontally move a suspended load.
  - (9) Mechanic's truck with a hoisting device when used in activities related to equipment maintenance and repair.
  - (10) Machinery that hoists by using a come-a-long or chainfall.
  - (11) Dedicated drilling rigs.
  - (12) Gin poles when used for the erection of communication towers.

- (13) Tree trimming and tree removal work.
- (14) Anchor handling or dredge-related operations with a vessel or barge using an affixed A-frame.
- (15) Roustabouts.
- (16) Helicopter cranes.
- (17) Material Delivery.
  - (i) Articulating/knuckle-boom truck cranes that deliver material to a construction site when used to transfer materials from the truck crane to the ground, without arranging the materials in a particular sequence for hoisting.
  - (ii) Articulating/knuckle-boom truck cranes that deliver material to a construction site when the crane is used to transfer building supply sheet goods or building supply packaged materials from the truck crane onto a structure, using a fork/cradle at the end of the boom, but only when the truck crane is equipped with a properly functioning automatic overload prevention device. Such sheet goods or packaged materials include, but are not limited to: sheets of sheet rock, sheets of plywood, bags of cement, sheets or packages of roofing shingles, and rolls of roofing felt.
  - (iii) This exclusion does not apply when:
    - (A) The articulating/knuckle-boom crane is used to hold, support or stabilize the material to facilitate a construction activity, such as holding material in place while it is attached to the structure;
    - (B) The material being handled by the articulating/knuckle-boom crane is a prefabricated component. Such prefabricated components include, but are not limited to: precast concrete members or panels, roof trusses (wooden, cold-formed metal, steel, or other material), prefabricated building sections such as, but not limited to: floor panels, wall panels, roof panels, roof structures, or similar items;
    - (C) The material being handled by the crane is a structural steel member (for example, steel joists, beams, columns, steel decking (bundled or unbundled) or a component of a systems-engineered metal building (as defined in 29 CFR 1926 subpart R).
    - (D) The activity is not specifically excluded under 1400(c)(17)(i) and (ii).
- (d) All sections of this subpart CC apply to the equipment covered by this standard unless specified otherwise.

- (e) The duties of controlling entities under this subpart include, but are not limited to, the duties specified in 1926.1402(c), 1926.1402(e) and 1926.1424(b).
- (f) Where provisions of this standard direct an operator, crewmember, or other employee to take certain actions, the employer must establish, effectively communicate to the relevant persons, and enforce, work rules to ensure compliance with such provisions.
- (g) For work covered by Division 2/RR, compliance with OAR 437-002-2315 is deemed compliance with 1926.1407 through 1926.1411.
- (h) Section 1926.1402 does not apply to cranes designed for use on railroad tracks, when used on railroad tracks that are part of the general railroad system of transportation that is regulated pursuant to the Federal Railroad Administration under 49 CFR part 213, and that comply with applicable Federal Railroad Administration requirements. See 1926.1402(f).

[75 FR 48135, Aug. 9, 2010, as amended at 78 FR 32116, May 29, 2013; 79 FR 20743, Apr. 11, 2014]

## 1926.1401 Definitions

**A/D director (Assembly/Disassembly director)** means an individual who meets this subpart's requirements for an A/D director, irrespective of the person's formal job title or whether the person is non-management or management personnel.

**Articulating crane** means a crane whose boom consists of a series of folding, pin connected structural members, typically manipulated to extend or retract by power from hydraulic cylinders.

**Assembly/Disassembly** means the assembly and/or disassembly of equipment covered under this standard. With regard to tower cranes, "erecting and climbing" replaces the term "assembly," and "dismantling" replaces the term "disassembly." Regardless of whether the crane is initially erected to its full height or is climbed in stages, the process of increasing the height of the crane is an erection process.

**Assist crane** means a crane used to assist in assembling or disassembling a crane.

**Attachments** means any device that expands the range of tasks that can be done by the equipment. Examples include, but are not limited to: an auger, drill, magnet, pile-driver, and boom-attached personnel platform.

**Audible** signal means a signal made by a distinct sound or series of sounds. Examples include, but are not limited to, sounds made by a bell, horn, or whistle.

**Blocking (also referred to as “cribbing”)** is wood or other material used to support equipment or a component and distribute loads to the ground. It is typically used to support lattice boom sections during assembly/ disassembly and under outrigger and stabilizer floats.

**Boatswain’s chair** means a single-point adjustable suspension scaffold consisting of a seat or sling (which may be incorporated into a full body harness) designed to support one employee in a sitting position.

**Bogie** means “travel bogie,” which is defined below.

**Boom (equipment other than tower crane)** means an inclined spar, strut, or other long structural member which supports the upper hoisting tackle on a crane or derrick. Typically, the length and vertical angle of the boom can be varied to achieve increased height or height and reach when lifting loads. Booms can usually be grouped into general categories of hydraulically extendible, cantilevered type, latticed section, cable supported type or articulating type.

**Boom (tower cranes):** On tower cranes, if the “boom” (i.e., principal horizontal structure) is fixed, it is referred to as a jib; if it is moveable up and down, it is referred to as a boom.

**Boom angle indicator** means a device which measures the angle of the boom relative to horizontal.

**Boom hoist limiting device** includes boom hoist disengaging device, boom hoist shut-off, boom hoist disconnect, boom hoist hydraulic relief, boom hoist kick-outs, automatic boom stop device, or derricking limiter. This type of device disengages boom hoist power when the boom reaches a predetermined operating angle. It also sets brakes or closes valves to prevent the boom from lowering after power is disengaged.

**Boom length indicator** indicates the length of the permanent part of the boom (such as ruled markings on the boom) or, as in some computerized systems, the length of the boom with extensions/attachments.

**Boom stop** includes boom stops, (belly straps with struts/standoff), telescoping boom stops, attachment boom stops, and backstops. These devices restrict the boom from moving above a certain maximum angle and toppling over backward.

**Boom suspension system** means a system of pendants, running ropes, sheaves, and other hardware which supports the boom tip and controls the boom angle.

**Builder** means the builder/constructor of equipment.

**Center of gravity:** The center of gravity of any object is the point in the object around which its weight is evenly distributed. If you could put a support under that point, you could balance the object on the support.

**Certified welder** means a welder who meets nationally recognized certification requirements applicable to the task being performed.

**Climbing** means the process in which a tower crane is raised to a new working height, either by adding additional tower sections to the top of the crane (top climbing), or by a system in which the entire crane is raised inside the structure (inside climbing).

**Come-a-long** means a mechanical device typically consisting of a chain or cable attached at each end that is used to facilitate movement of materials through leverage.

**Competent person** means one who is capable of identifying existing and predictable hazards in the surroundings or working conditions which are unsanitary, hazardous, or dangerous to employees, and who has authorization to take prompt corrective measures to eliminate them.

**Controlled load lowering** means lowering a load by means of a mechanical hoist drum device that allows a hoisted load to be lowered with maximum control using the gear train or hydraulic components of the hoist mechanism. Controlled load lowering requires the use of the hoist drive motor, rather than the load hoist brake, to lower the load.

**Controlling entity** means an employer that is a prime contractor, general contractor, construction manager or any other legal entity which has the overall responsibility for the construction of the project – its planning, quality and completion.

**Counterweight** means a weight used to supplement the weight of equipment in providing stability for lifting loads by counterbalancing those loads.

**Crane/derrick** includes all equipment covered by this subpart.

**Crawler crane** means equipment that has a type of base mounting which incorporates a continuous belt of sprocket driven track.

**Crossover points** means locations on a wire rope which is spooled on a drum where one layer of rope climbs up on and crosses over the previous layer. This takes place at each flange of the drum as the rope is spooled onto the drum, reaches the flange, and begins to wrap back in the opposite direction.

**Dedicated channel** means a line of communication assigned by the employer who controls the communication system to only one signal person and crane/derrick or to a coordinated group of cranes/derricks/signal person(s).

**Dedicated pile-driver** is a machine that is designed to function exclusively as a pile-driver. These machines typically have the ability to both hoist the material that will be pile-driven and to pile-drive that material.

**Dedicated spotter (power lines):** To be considered a dedicated spotter, the requirements of 1926.1428 (Signal person qualifications) must be met and his/her sole responsibility is to watch the separation between the power line and: the equipment, load line and load (including rigging and lifting accessories), and ensure through communication with the operator that the applicable minimum approach distance is not breached.

**Directly under the load** means a part or all of an employee is directly beneath the load.

**Dismantling** includes partial dismantling (such as dismantling to shorten a boom or substitute a different component).

**Drum rotation indicator** means a device on a crane or hoist which indicates in which direction and at what relative speed a particular hoist drum is turning.

**Electrical contact** occurs when a person, object, or equipment makes contact or comes in close proximity with an energized conductor or equipment that allows the passage of current.

**Employer-made equipment** means floating cranes/derricks designed and built by an employer for the employer's own use.

**Encroachment** is where any part of the crane, load line or load (including rigging and lifting accessories) breaches a minimum clearance distance that this subpart requires to be maintained from a power line.

**Equipment** means equipment covered by this subpart.

**Equipment criteria** means instructions, recommendations, limitations and specifications.

**Fall protection equipment** means guardrail systems, safety net systems, personal fall arrest systems, positioning device systems or fall restraint systems.

**Fall restraint system** means a fall protection system that prevents the user from falling any distance. The system is comprised of either a body belt or body harness, along with an anchorage, connectors and other necessary equipment. The other components typically include a lanyard, and may also include a lifeline and other devices.

**Fall zone** means the area (including but not limited to the area directly beneath the load) in which it is reasonably foreseeable that partially or completely suspended materials could fall in the event of an accident.

**Flange points** are points of contact between rope and drum flange where the rope changes layers.

**Floating cranes/derricks** means equipment designed by the manufacturer (or employer) for marine use by permanent attachment to a barge, pontoons, vessel or other means of flotation.

**For example** means “one example, although there are others.”

**Free fall (of the load line)** means that only the brake is used to regulate the descent of the load line (the drive mechanism is not used to drive the load down faster or retard its lowering).

**Free surface effect** is the uncontrolled transverse movement of liquids in compartments which reduce a vessel’s transverse stability.

**Hoist** means a mechanical device for lifting and lowering loads by winding a line onto or off a drum.

**Hoisting** is the act of raising, lowering or otherwise moving a load in the air with equipment covered by this standard. As used in this standard, “hoisting” can be done by means other than wire rope/ hoist drum equipment.

**Include/including** means “including, but not limited to.”

**Insulating link/device** means an insulating device listed, labeled, or accepted by a Nationally Recognized Testing Laboratory in accordance with 29 CFR 1910.7.

**Jib stop (also referred to as a jib backstop)**, is the same type of device as a boom stop but is for a fixed or luffing jib.

**Land crane/derrick** is equipment not originally designed by the manufacturer for marine use by permanent attachment to barges, pontoons, vessels, or other means of flotation.

**List** means the angle of inclination about the longitudinal axis of a barge, pontoons, vessel or other means of flotation.

**Load** refers to the object(s) being hoisted and/or the weight of the object(s); both uses refer to the object(s) and the load-attaching equipment, such as, the load block, ropes, slings, shackles, and any other ancillary attachment.

**Load moment (or rated capacity) indicator** means a system which aids the equipment operator by sensing (directly or indirectly) the overturning moment on the equipment, i.e., load multiplied by radius. It compares this lifting condition to the equipment's rated capacity, and indicates to the operator the percentage of capacity at which the equipment is working. Lights, bells, or buzzers may be incorporated as a warning of an approaching overload condition.

**Load moment (or rated capacity) limiter** means a system which aids the equipment operator by sensing (directly or indirectly) the overturning moment on the equipment, i.e., load multiplied by radius. It compares this lifting condition to the equipment's rated capacity, and when the rated capacity is reached, it shuts off power to those equipment functions which can increase the severity of loading on the equipment, e.g., hoisting, telescoping out, or luffing out. Typically, those functions which decrease the severity of loading on the equipment remain operational, e.g., lowering, telescoping in, or luffing in.

**Locomotive crane** means a crane mounted on a base or car equipped for travel on a railroad track.

**Luffing jib limiting device** is similar to a boom hoist limiting device, except that it limits the movement of the luffing jib.

**Marine hoisted personnel transfer device** means a device, such as a "transfer net," that is designed to protect the employees being hoisted during a marine transfer and to facilitate rapid entry into and exit from the device. Such devices do not include boatswain's chairs when hoisted by equipment covered by this standard.

**Marine worksite** means a construction worksite located in, on or above the water.

**Mobile crane** means a lifting device incorporating a cable suspended latticed boom or hydraulic telescopic boom designed to be moved between operating locations by transport over the road.

**Moving point-to-point** means the times during which an employee is in the process of going to or from a work station.

**Multi-purpose machine** means a machine that is designed to be configured in various ways, at least one of which allows it to hoist (by means of a winch or hook) and horizontally move a suspended load. For example, a machine that can rotate and can be configured with removable forks/tongs (for use as a forklift) or with a winch pack, jib (with a hook at the end) or jib used in conjunction with a winch. When configured with the forks/tongs, it is not covered by this subpart. When configured with a winch pack, jib (with a hook at the end) or jib used in conjunction with a winch, it is covered by this subpart.

**Nationally recognized accrediting agency** is an organization that, due to its independence and expertise, is widely recognized as competent to accredit testing organizations. Examples of such accrediting agencies include, but are not limited to, the National Commission for Certifying Agencies and the American National Standards Institute

**Nonconductive** means that, because of the nature and condition of the materials used, and the conditions of use (including environmental conditions and condition of the material), the object in question has the property of not becoming energized (that is, it has high dielectric properties offering a high resistance to the passage of current under the conditions of use).

**Operational aids** are devices that assist the operator in the safe operation of the crane by providing information or automatically taking control of a crane function. These include, but are not limited to, the devices listed in 1926.1416 (“listed operational aids”).

**Operational controls** means levers, switches, pedals and other devices for controlling equipment operation.

**Operator** means a person who is operating the equipment.

**Overhead and gantry cranes** includes overhead/bridge cranes, semigantry, cantilever gantry, wall cranes, storage bridge cranes, launching gantry cranes, and similar equipment, irrespective of whether it travels on tracks, wheels, or other means.

**Paragraph** refers to a paragraph in the same section of this subpart that the word “paragraph” is used, unless otherwise specified.

**Pendants** includes both wire and bar types. Wire type: a fixed length of wire rope with mechanical fittings at both ends for pinning segments of wire rope together. Bar type: instead of wire rope, a bar is used. Pendants are typically used in a latticed boom crane system to easily change the length of the boom suspension system without completely changing the rope on the drum when the boom length is increased or decreased.

**Personal fall arrest system** means a system used to arrest an employee in a fall from a working level. It consists of an anchorage, connectors, a body harness and may include a lanyard, deceleration device, lifeline, or suitable combination of these.

**Portal crane** is a type of crane consisting of a rotating upperstructure, hoist machinery, and boom mounted on top of a structural gantry which may be fixed in one location or have travel capability. The gantry legs or columns usually have portal openings in between to allow passage of traffic beneath the gantry.

**Power lines** means electric transmission and distribution lines.

Procedures include, but are not limited to: instructions, diagrams, recommendations, warnings, specifications, protocols and limitations.

**Proximity alarm** is a device that provides a warning of proximity to a power line and that has been listed, labeled, or accepted by a Nationally Recognized Testing Laboratory in accordance with 29 CFR 1910.7.

**Qualified evaluator (not a third party)** means a person employed by the signal person's employer who has demonstrated that he/she is competent in accurately assessing whether individuals meet the Qualification Requirements in this subpart for a signal person.

**Qualified evaluator (third party)** means an entity that, due to its independence and expertise, has demonstrated that it is competent in accurately assessing whether individuals meet the Qualification Requirements in this subpart for a signal person.

**Qualified person** means a person who, by possession of a recognized degree, certificate, or professional standing, or who by extensive knowledge, training and experience, successfully demonstrated the ability to solve/resolve problems relating to the subject matter, the work, or the project.

**Qualified rigger** is a rigger who meets the criteria for a qualified person.

**Range control limit device** is a device that can be set by an equipment operator to limit movement of the boom or jib tip to a plane or multiple planes.

**Range control warning device** is a device that can be set by an equipment operator to warn that the boom or jib tip is at a plane or multiple planes.

**Rated capacity** means the maximum working load permitted by the manufacturer under specified working conditions. Such working conditions typically include a specific combination of factors such as equipment configuration, radii, boom length, and other parameters of use.

**Rated capacity indicator:** See load moment indicator.

**Rated capacity limiter:** See load moment limiter.

**Repetitive pickup points** refer to, when operating on a short cycle operation, the rope being used on a single layer and being spooled repetitively over a short portion of the drum.

**Running wire rope** means a wire rope that moves over sheaves or drums.

**Runway** means a firm, level surface designed, prepared and designated as a path of travel for the weight and configuration of the crane being used to lift and travel with the crane suspended platform. An existing surface may be used as long as it meets these criteria.

**Section** means a section of this subpart, unless otherwise specified.

**Sideboom crane** means a track-type or wheel-type tractor having a boom mounted on the side of the tractor, used for lifting, lowering or transporting a load suspended on the load hook. The boom or hook can be lifted or lowered in a vertical direction only.

**Special hazard** warnings means warnings of site-specific hazards (for example, proximity of power lines).

**Stability (flotation device)** means the tendency of a barge, pontoons, vessel or other means of flotation to return to an upright position after having been inclined by an external force.

**Standard Method** means the protocol in Appendix A of this subpart for hand signals.

**Such as** means “such as, but not limited to.”

**Superstructure:** See Upperworks.

**Tagline** means a rope (usually fiber) attached to a lifted load for purposes of controlling load spinning and pendular motions or used to stabilize a bucket or magnet during material handling operations.

**Tender** means an individual responsible for monitoring and communicating with a diver.

**Tilt up or tilt down operation** means raising/lowering a load from the horizontal to vertical or vertical to horizontal.

**Tower crane** is a type of lifting structure which utilizes a vertical mast or tower to support a working boom (jib) in an elevated position. Loads are suspended from the working boom. While the working boom may be of the fixed type (horizontal or angled) or have luffing capability, it can always rotate to swing loads, either by rotating on the top of the tower (top slewing) or by the rotation of the tower (bottom slewing). The tower base may be fixed in one location or ballasted and moveable between locations. Mobile cranes that are configured with luffing jib and/or tower attachments are not considered tower cranes under this section.

**Travel bogie (tower cranes)** is an assembly of two or more axles arranged to permit vertical wheel displacement and equalize the loading on the wheels.

**Trim** means angle of inclination about the transverse axis of a barge, pontoons, vessel or other means of floatation.

**Two blocking** means a condition in which a component that is uppermost on the hoist line such as the load block, hook block, overhaul ball, or similar component, comes in contact with the boom tip, fixed upper block or similar component. This binds the system and continued application of power can cause failure of the hoist rope or other component.

**Unavailable procedures** means procedures that are no longer available from the manufacturer, or have never been available, from the manufacturer.

**Upperstructure:** See Upperworks.

**Upperworks** means the revolving frame of equipment on which the operating machinery (and many cases the engine) are mounted along with the operator's cab. The counterweight is typically supported on the rear of the upperstructure and the boom or other front end attachment is mounted on the front.

**Up to** means "up to and including."

**Wire rope** means a flexible rope constructed by laying steel wires into various patterns of multi-wired strands around a core system to produce a helically wound rope.

## 1926.1402 Ground conditions

### (a) Definitions.

- (1) “**Ground conditions**” means the ability of the ground to support the equipment (including slope, compaction, and firmness).
  - (2) “**Supporting materials**” means blocking, mats, cribbing, marsh buggies (in marshes/wetlands), or similar supporting materials or devices.
- (b) The equipment must not be assembled or used unless ground conditions are firm, drained, and graded to a sufficient extent so that, in conjunction (if necessary) with the use of supporting materials, the equipment manufacturer’s specifications for adequate support and degree of level of the equipment are met. The requirement for the ground to be drained does not apply to marshes/wetlands.
- (c) The controlling entity must:
- (1) Ensure that ground preparations necessary to meet the requirements in paragraph (b) of this section are provided.
  - (2) Inform the user of the equipment and the operator of the location of hazards beneath the equipment set-up area (such as voids, tanks, utilities) if those hazards are identified in documents (such as site drawings, as-built drawings, and soil analyses) that are in the possession of the controlling entity (whether at the site or off-site) or the hazards are otherwise known to that controlling entity.
- (d) If there is no controlling entity for the project, the requirement in paragraph (c)(1) of this section must be met by the employer that has authority at the site to make or arrange for ground preparations needed to meet paragraph (b) of this section.
- (e) If the A/D director or the operator determines that ground conditions do not meet the requirements in paragraph (b) of this section, that person’s employer must have a discussion with the controlling entity regarding the ground preparations that are needed so that, with the use of suitable supporting materials/devices (if necessary), the requirements in paragraph (b) of this section can be met.
- (f) This section does not apply to cranes designed for use on railroad tracks when used on railroad tracks that are part of the general railroad system of transportation that is regulated pursuant to the Federal Railroad Administration under 49 CFR part 213 and that comply with applicable Federal Railroad Administration requirements.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 1-2011, f. 2/9/11, ef. 2/9/11.

### **1926.1403 Assembly/Disassembly – selection of manufacturer or employer procedures**

When assembling or disassembling equipment (or attachments), the employer must comply with all applicable manufacturer prohibitions and must comply with either:

- (a) Manufacturer procedures applicable to assembly and disassembly, or
- (b) Employer procedures for assembly and disassembly. Employer procedures may be used only where the employer can demonstrate that the procedures used meet the requirements in 1926.1406.

**Note:** The employer must follow manufacturer procedures when an employer uses synthetic slings during assembly or disassembly rigging. (See 1926.1404(r).)

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 1-2011, f. 2/9/11, ef. 2/9/11.

### **1926.1404 Assembly/Disassembly – general requirements (applies to all assembly and disassembly operations)**

- (a) Supervision – competent-qualified person.
  - (1) Assembly/disassembly must be directed by a person who meets the criteria for both a competent person and a qualified person, or by a competent person who is assisted by one or more qualified persons (“A/D director”).
  - (2) Where the assembly/disassembly is being performed by only one person, that person must meet the criteria for both a competent person and a qualified person. For purposes of this standard, that person is considered the A/D director.
- (b) Knowledge of procedures. The A/D director must understand the applicable assembly/disassembly procedures.
- (c) Review of procedures. The A/D director must review the applicable assembly/disassembly procedures immediately prior to the commencement of assembly/disassembly unless the A/D director understands the procedures and has applied them to the same type and configuration of equipment (including accessories, if any).
- (d) Crew instructions.
  - (1) Before commencing assembly/disassembly operations, the A/D director must ensure that the crew members understand all of the following:

- (i) Their tasks.
    - (ii) The hazards associated with their tasks.
    - (iii) The hazardous positions/locations that they need to avoid.
  - (2) During assembly/disassembly operations, before a crew member takes on a different task, or when adding new personnel during the operations, the requirements in paragraphs (d)(1)(i) through (d)(1)(iii) of this section must be met.
- (e) Protecting assembly/disassembly crew members out of operator view.
- (1) Before a crew member goes to a location that is out of view of the operator and is either in, on, or under the equipment, or near the equipment (or load) where the crew member could be injured by movement of the equipment (or load), the crew member must inform the operator that he/she is going to that location.
  - (2) Where the operator knows that a crew member went to a location covered by paragraph (e)(1) of this section, the operator must not move any part of the equipment (or load) until the operator is informed in accordance with a pre-arranged system of communication that the crew member is in a safe position.
- (f) Working under the boom, jib or other components.
- (1) When pins (or similar devices) are being removed, employees must not be under the boom, jib, or other components, except where the requirements of paragraph (f)(2) of this section are met.
  - (2) Exception. Where the employer demonstrates that site constraints require one or more employees to be under the boom, jib, or other components when pins (or similar devices) are being removed, the A/D director must implement procedures that minimize the risk of unintended dangerous movement and minimize the duration and extent of exposure under the boom. (See Non-mandatory Appendix B of this subpart for an example.)
- (g) Capacity limits. During all phases of assembly/disassembly, rated capacity limits for loads imposed on the equipment, equipment components (including rigging), lifting lugs and equipment accessories, must not be exceeded for the equipment being assembled/disassembled.
- (h) Addressing specific hazards. The A/D director supervising the assembly/disassembly operation must address the hazards associated with the operation, which include:

- (1) Site and ground bearing conditions. Site and ground conditions must be adequate for safe assembly/disassembly operations and to support the equipment during assembly/disassembly (see 1926.1402 for ground condition requirements).
- (2) Blocking material. The size, amount, condition and method of stacking the blocking must be sufficient to sustain the loads and maintain stability.
- (3) Proper location of blocking. When used to support lattice booms or components, blocking must be appropriately placed to:
  - (i) Protect the structural integrity of the equipment, and
  - (ii) Prevent dangerous movement and collapse.
- (4) Verifying assist crane loads. When using an assist crane, the loads that will be imposed on the assist crane at each phase of assembly/disassembly must be verified in accordance with 1926.1417(o)(3) before assembly/disassembly begins.
- (5) Boom and jib pick points. The point(s) of attachment of rigging to a boom (or boom sections or jib or jib sections) must be suitable for preventing structural damage and facilitating safe handling of these components.
- (6) Center of gravity.
  - (i) The center of gravity of the load must be identified if that is necessary for the method used for maintaining stability.
  - (ii) Where there is insufficient information to accurately identify the center of gravity, measures designed to prevent unintended dangerous movement resulting from an inaccurate identification of the center of gravity must be used. (See Non-mandatory Appendix B of this subpart for an example.)
- (7) Stability upon pin removal. The boom sections, boom suspension systems (such as gantry A-frames and jib struts), and components must be rigged or supported to maintain stability upon the removal of the pins.
- (8) Snagging. Suspension ropes and pendants must not be allowed to catch on the boom or jib connection pins or cotter pins (including keepers and locking pins).
- (9) Struck by counterweights. The potential for unintended movement from inadequately supported counterweights and from hoisting counterweights.

- (10) Boom hoist brake failure. Each time reliance is to be placed on the boom hoist brake to prevent boom movement during assembly/disassembly, the brake must be tested prior to such reliance to determine if it is sufficient to prevent boom movement. If it is not sufficient, a boom hoist pawl, other locking device/back-up braking device, or another method of preventing dangerous movement of the boom (such as blocking or using an assist crane) from a boom hoist brake failure must be used.
- (11) Loss of backward stability. Backward stability before swinging the upperworks, travel, and when attaching or removing equipment components.
- (12) Wind speed and weather. The effect of wind speed and weather on the equipment.
- (i) [Reserved.]
- (j) Cantilevered boom sections. Manufacturer limitations on the maximum amount of boom supported only by cantilevering must not be exceeded. Where these are unavailable, a registered professional engineer familiar with the type of equipment involved must determine in writing this limitation, which must not be exceeded.
- (k) Weight of components. The weight of each of the components must be readily available.
- (l) [Reserved.]
- (m) Components and configuration.
- (1) The selection of components, and configuration of the equipment, that affect the capacity or safe operation of the equipment must be in accordance with:
- (i) Manufacturer instructions, prohibitions, limitations, and specifications. Where these are unavailable, a registered professional engineer familiar with the type of equipment involved must approve, in writing, the selection and configuration of components; or
- (ii) Approved modifications that meet the requirements of 1926.1434 (Equipment modifications).
- (2) Post-assembly inspection. Upon completion of assembly, the equipment must be inspected to ensure compliance with paragraph (m)(1) of this section (see 1926.1412(c) for post-assembly inspection requirements).
- (n) [Reserved.]

- (o) Shipping pins. Reusable shipping pins, straps, links, and similar equipment must be removed. Once they are removed they must either be stowed or otherwise stored so that they do not present a falling object hazard.
- (p) Pile driving. Equipment used for pile driving must not have a jib attached during pile driving operations.
- (q) Outriggers and Stabilizers. When the load to be handled and the operating radius require the use of outriggers or stabilizers, or at any time when outriggers or stabilizers are used, all of the following requirements must be met (except as otherwise indicated):
- (1) The outriggers or stabilizers must be either fully extended or, if manufacturer procedures permit, deployed as specified in the load chart.
  - (2) The outriggers must be set to remove the equipment weight from the wheels, except for locomotive cranes (see paragraph (q)(6) of this section for use of outriggers on locomotive cranes). This provision does not apply to stabilizers.
  - (3) When outrigger floats are used, they must be attached to the outriggers. When stabilizer floats are used, they must be attached to the stabilizers.
  - (4) Each outrigger or stabilizer must be visible to the operator or to a signal person during extension and setting.
  - (5) Outrigger and stabilizer blocking must:
    - (i) Meet the requirements in paragraphs (h)(2) and (h)(3) of this section.
    - (ii) Be placed only under the outrigger or stabilizer float/pad of the jack or, where the outrigger or stabilizer is designed without a jack, under the outer bearing surface of the extended outrigger or stabilizer beam.
  - (6) For locomotive cranes, when using outriggers or stabilizers to handle loads, the manufacturer's procedures must be followed. When lifting loads without using outriggers or stabilizers, the manufacturer's procedures must be met regarding truck wedges or screws.
- (r) Rigging. In addition to following the requirements in 29 CFR 1926.251 and other requirements in this and other standards applicable to rigging, when rigging is used for assembly/disassembly, the employer must ensure that:
- (1) The rigging work is done by a qualified rigger.
  - (2) Synthetic slings are protected from: abrasive, sharp or acute edges, and configurations that could cause a reduction of the sling's rated capacity, such as distortion or localized compression.

**Note:** Requirements for the protection of wire rope slings are contained in 29 CFR 1926.251(c)(9).

- (3) When synthetic slings are used, the synthetic sling manufacturer's instructions, limitations, specifications and recommendations must be followed.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 1-2011, f. 2/9/11, ef. 2/9/11.

### **1926.1405 Disassembly – additional requirements for dismantling of booms and jibs (applies to both the use of manufacturer procedures and employer procedures)**

Dismantling (including dismantling for changing the length of) booms and jibs.

- (a) None of the pins in the pendants are to be removed (partly or completely) when the pendants are in tension.
- (b) None of the pins (top or bottom) on boom sections located between the pendant attachment points and the crane/derrick body are to be removed (partly or completely) when the pendants are in tension.
- (c) None of the pins (top or bottom) on boom sections located between the uppermost boom section and the crane/derrick body are to be removed (partly or completely) when the boom is being supported by the uppermost boom section resting on the ground (or other support).
- (d) None of the top pins on boom sections located on the cantilevered portion of the boom being removed (the portion being removed ahead of the pendant attachment points) are to be removed (partly or completely) until the cantilevered section to be removed is fully supported.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 1-2011, f. 2/9/11, ef. 2/9/11.

### **1926.1406 Assembly/Disassembly – employer procedures – general requirements**

- (a) When using employer procedures instead of manufacturer procedures for assembly/disassembly, the employer must ensure that the procedures:
- (1) Prevent unintended dangerous movement, and prevent collapse, of any part of the equipment.

- (2) Provide adequate support and stability of all parts of the equipment.
  - (3) Position employees involved in the assembly/disassembly operation so that their exposure to unintended movement or collapse of part or all of the equipment is minimized.
- (b) Qualified person. Employer procedures must be developed by a qualified person.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 1-2011, f. 2/9/11, ef. 2/9/11.

### **1926.1407 Power line safety (up to 350 kV) – assembly and disassembly**

- (a) Before assembling or disassembling equipment, the employer must determine if any part of the equipment, load line, or load (including rigging and lifting accessories) could get, in the direction or area of assembly/disassembly, closer than 20 feet to a power line during the assembly/disassembly process. If so, the employer must meet the requirements in Option (1), Option (2), or Option (3) of this section, as follows:
- (1) Option (1) – Deenergize and ground. Confirm from the utility owner/operator that the power line has been deenergized and visibly grounded at the worksite.
  - (2) Option (2) – 20 foot clearance. Ensure that no part of the equipment, load line or load (including rigging and lifting accessories), gets closer than 20 feet to the power line by implementing the measures specified in paragraph (b) of this section.
  - (3) Option (3) – Table A clearance.
    - (i) Determine the line’s voltage and the minimum clearance distance permitted under Table A (see 1926.1408).
    - (ii) Determine if any part of the equipment, load line, or load (including rigging and lifting accessories), could get closer than the minimum clearance distance to the power line permitted under Table A (see 1926.1408). If so, then the employer must follow the requirements in paragraph (b) of this section to ensure that no part of the equipment, load line, or load (including rigging and lifting accessories), gets closer to the line than the minimum clearance distance.
- (b) Preventing encroachment/electrocution. Where encroachment precautions are required under Option (2), or Option (3) of this section, all of the following requirements must be met:

- (1) Conduct a planning meeting with the Assembly/Disassembly director (A/D director), operator, assembly/disassembly crew and the other workers who will be in the assembly/disassembly area to review the location of the power line(s) and the steps that will be implemented to prevent encroachment/electrocution.
- (2) If tag lines are used, they must be nonconductive.
- (3) At least one of the following additional measures must be in place. The measure selected from this list must be effective in preventing encroachment. The additional measures are:
  - (i) Use a dedicated spotter who is in continuous contact with the equipment operator. The dedicated spotter must:
    - (A) Be equipped with a visual aid to assist in identifying the minimum clearance distance. Examples of a visual aid include, but are not limited to: a clearly visible line painted on the ground; a clearly visible line of stanchions; a set of clearly visible line-of-sight landmarks (such as a fence post behind the dedicated spotter and a building corner ahead of the dedicated spotter).
    - (B) Be positioned to effectively gauge the clearance distance.
    - (C) Where necessary, use equipment that enables the dedicated spotter to communicate directly with the operator.
    - (D) Give timely information to the operator so that the required clearance distance can be maintained.
  - (ii) A proximity alarm set to give the operator sufficient warning to prevent encroachment.
  - (iii) A device that automatically warns the operator when to stop movement, such as a range control warning device. Such a device must be set to give the operator sufficient warning to prevent encroachment.
  - (iv) A device that automatically limits range of movement, set to prevent encroachment.
  - (v) An elevated warning line, barricade, or line of signs, in view of the operator, equipped with flags or similar high-visibility markings.

- (c) Assembly/disassembly below power lines prohibited. No part of a crane/derrick, load line, or load (including rigging and lifting accessories), whether partially or fully assembled, is allowed below a power line unless the employer has confirmed that the utility owner/operator has deenergized and (at the worksite) visibly grounded the power line.
- (d) Assembly/disassembly inside Table A clearance prohibited. No part of a crane/derrick, load line, or load (including rigging and lifting accessories), whether partially or fully assembled, is allowed closer than the minimum approach distance under Table A (see 1926.1408) to a power line unless the employer has confirmed that the utility owner/operator has deenergized and (at the worksite) visibly grounded the power line.
- (e) Voltage information. Where Option (3) of this section is used, the utility owner/operator of the power lines must provide the requested voltage information within two working days of the employer's request.
- (f) Power lines presumed energized. The employer must assume that all power lines are energized unless the utility owner/operator confirms that the power line has been and continues to be deenergized and visibly grounded at the worksite.
- (g) Posting of electrocution warnings. There must be at least one electrocution hazard warning conspicuously posted in the cab so that it is in view of the operator and (except for overhead gantry and tower cranes) at least two on the outside of the equipment.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 1-2011, f. 2/9/11, ef. 2/9/11.

## **1926.1408 Power line safety (up to 350 kV) – equipment operations**

- (a) Hazard assessments and precautions inside the work zone. Before beginning equipment operations, the employer must:
  - (1) Identify the work zone by either:
    - (i) Demarcating boundaries (such as with flags, or a device such as a range limit device or range control warning device) and prohibiting the operator from operating the equipment past those boundaries, or
    - (ii) Defining the work zone as the area 360 degrees around the equipment, up to the equipment's maximum working radius.

- (2) Determine if any part of the equipment, load line or load (including rigging and lifting accessories), if operated up to the equipment's maximum working radius in the work zone, could get closer than 20 feet to a power line. If so, the employer must meet the requirements in Option (1), Option (2), or Option (3) of this section, as follows:
- (i) Option (1) - Deenergize and ground. Confirm from the utility owner/operator that the power line has been deenergized and visibly grounded at the worksite.
  - (ii) Option (2) - 20 foot clearance. Ensure that no part of the equipment, load line, or load (including rigging and lifting accessories), gets closer than 20 feet to the power line by implementing the measures specified in paragraph (b) of this section.
  - (iii) Option (3) - Table A clearance.
    - (A) Determine the line's voltage and the minimum approach distance permitted under Table A (see 1926.1408).
    - (B) Determine if any part of the equipment, load line or load (including rigging and lifting accessories), while operating up to the equipment's maximum working radius in the work zone, could get closer than the minimum approach distance of the power line permitted under Table A (see 1926.1408). If so, then the employer must follow the requirements in paragraph (b) of this section to ensure that no part of the equipment, load line, or load (including rigging and lifting accessories), gets closer to the line than the minimum approach distance.
- (b) Preventing encroachment/electrocution. Where encroachment precautions are required under Option (2) or Option (3) of this section, all of the following requirements must be met:
- (1) Conduct a planning meeting with the operator and the other workers who will be in the area of the equipment or load to review the location of the power line(s), and the steps that will be implemented to prevent encroachment/electrocution.
  - (2) If tag lines are used, they must be non-conductive.

- (3) Erect and maintain an elevated warning line, barricade, or line of signs, in view of the operator, equipped with flags or similar high-visibility markings, at 20 feet from the power line (if using Option (2) of this section) or at the minimum approach distance under Table A (see 1926.1408) (if using Option (3) of this section). If the operator is unable to see the elevated warning line, a dedicated spotter must be used as described in 1926.1408(b)(4)(ii) in addition to implementing one of the measures described in 1926.1408(b)(4)(i), (iii), (iv) and (v).
- (4) Implement at least one of the following measures:
  - (i) A proximity alarm set to give the operator sufficient warning to prevent encroachment.
  - (ii) A dedicated spotter who is in continuous contact with the operator. Where this measure is selected, the dedicated spotter must:
    - (A) Be equipped with a visual aid to assist in identifying the minimum clearance distance. Examples of a visual aid include, but are not limited to: a clearly visible line painted on the ground; a clearly visible line of stanchions; a set of clearly visible line-of-sight landmarks (such as a fence post behind the dedicated spotter and a building corner ahead of the dedicated spotter).
    - (B) Be positioned to effectively gauge the clearance distance.
    - (C) Where necessary, use equipment that enables the dedicated spotter to communicate directly with the operator.
    - (D) Give timely information to the operator so that the required clearance distance can be maintained.
  - (iii) A device that automatically warns the operator when to stop movement, such as a range control warning device. Such a device must be set to give the operator sufficient warning to prevent encroachment.
  - (iv) A device that automatically limits range of movement, set to prevent encroachment.
  - (v) An insulating link/device, as defined in 1926.1401, installed at a point between the end of the load line (or below) and the load.
- (5) The requirements of paragraph (b)(4) of this section do not apply to work covered by subpart V of this part.

- (c) Voltage information. Where Option (3) of this section is used, the utility owner/operator of the power lines must provide the requested voltage information within two working days of the employer's request.
- (d) Operations below power lines.
- (1) No part of the equipment, load line, or load (including rigging and lifting accessories) is allowed below a power line unless the employer has confirmed that the utility owner/operator has deenergized and (at the worksite) visibly grounded the power line, except where one of the exceptions in paragraph (d)(2) of this section applies.
  - (2) Exceptions. Paragraph (d)(1) of this section is inapplicable where the employer demonstrates that one of the following applies:
    - (i) The work is covered by subpart V of this part.
    - (ii) For equipment with non-extensible booms: The uppermost part of the equipment, with the boom at true vertical, would be more than 20 feet below the plane of the power line or more than the Table A of this section minimum clearance distance below the plane of the power line.
    - (iii) For equipment with articulating or extensible booms: The uppermost part of the equipment, with the boom in the fully extended position, at true vertical, would be more than 20 feet below the plane of the power line or more than the Table A of this section minimum clearance distance below the plane of the power line.
    - (iv) The employer demonstrates that compliance with paragraph (d)(1) of this section is infeasible and meets the requirements of 1926.1410.
- (e) Power lines presumed energized. The employer must assume that all power lines are energized unless the utility owner/operator confirms that the power line has been and continues to be deenergized and visibly grounded at the worksite.
- (f) When working near transmitter/communication towers where the equipment is close enough for an electrical charge to be induced in the equipment or materials being handled, the transmitter must be deenergized or the following precautions must be taken:
- (1) The equipment must be provided with an electrical ground.
  - (2) If tag lines are used, they must be non-conductive.
- (g) Training.
- (1) The employer must train each operator and crew member assigned to work with the equipment on all of the following:

- (i) The procedures to be followed in the event of electrical contact with a power line. Such training must include:
    - (A) Information regarding the danger of electrocution from the operator simultaneously touching the equipment and the ground.
    - (B) The importance to the operator's safety of remaining inside the cab except where there is an imminent danger of fire, explosion, or other emergency that necessitates leaving the cab.
    - (C) The safest means of evacuating from equipment that may be energized.
    - (D) The danger of the potentially energized zone around the equipment (step potential).
    - (E) The need for crew in the area to avoid approaching or touching the equipment and the load.
    - (F) Safe clearance distance from power lines.
  - (ii) Power lines are presumed to be energized unless the utility owner/operator confirms that the power line has been and continues to be deenergized and visibly grounded at the worksite.
  - (iii) Power lines are presumed to be uninsulated unless the utility owner/operator or a registered engineer who is a qualified person with respect to electrical power transmission and distribution confirms that a line is insulated.
  - (iv) The limitations of an insulating link/device, proximity alarm, and range control (and similar) device, if used.
  - (v) The procedures to be followed to properly ground equipment and the limitations of grounding.
- (2) Employees working as dedicated spotters must be trained to enable them to effectively perform their task, including training on the applicable requirements of this section.
- (3) Training under this section must be administered in accordance with 1926.1430(g).
- (h) Devices originally designed by the manufacturer for use as: a safety device (see 1926.1415), operational aid, or a means to prevent power line contact or electrocution, when used to comply with this section, must meet the manufacturer's procedures for use and conditions of use.

Table A - Minimum Clearance Distances

Voltage (nominal, kV, alternating current)	Minimum clearance distance (feet)
up to 50	10
over 50 to 200	15
over 200 to 350	20
over 350 to 500	25
over 500 to 750	35
over 750 to 1,000	45
over 750 to 1,000	(as established by the utility owner/ operator or registered professional engineer who is a qualified person with respect to electrical power transmission and distribution)

**Note:** The value that follows “to” is up to and includes that value. For example, over 50 to 200 means up to and including 200 kV.

**Oregon Note:** Nominal “Direct Current (DC)” voltages apply.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
 Stats. Implemented: ORS 654.001 through 654.295.  
 Hist: OR-OSHA Admin. Order 1-2011, f. 2/9/11, ef. 2/9/11.

**1926.1409 Power line safety (over 350 kV )**

The requirements of 1926.1407 and 1926.1408 apply to power lines over 350 kV except:

- (a) For power lines at or below 1000 kV, wherever the distance “20 feet” is specified, the distance “50 feet” must be substituted; and
- (b) For power lines over 1000 kV, the minimum clearance distance must be established by the utility owner/operator or registered professional engineer who is a qualified person with respect to electrical power transmission and distribution.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
 Stats. Implemented: ORS 654.001 through 654.295.  
 Hist: OR-OSHA Admin. Order 1-2011, f. 2/9/11, ef. 2/9/11.

## **1926.1410 Power line safety (all voltages) – equipment operations closer than the Table A zone**

Equipment operations in which any part of the equipment, load line, or load (including rigging and lifting accessories) is closer than the minimum approach distance under Table A of 1926.1408 to an energized power line is prohibited, except where the employer demonstrates that all of the following requirements are met:

- (a) The employer determines that it is infeasible to do the work without breaching the minimum approach distance under Table A of 1926.1408.
- (b) The employer determines that, after consultation with the utility owner/operator, it is infeasible to deenergize and ground the power line or relocate the power line.
- (c) Minimum clearance distance.
  - (1) The power line owner/operator or registered professional engineer who is a qualified person with respect to electrical power transmission and distribution determines the minimum clearance distance that must be maintained to prevent electrical contact in light of the on-site conditions. The factors that must be considered in making this determination include, but are not limited to: conditions affecting atmospheric conductivity; time necessary to bring the equipment, load line, and load (including rigging and lifting accessories) to a complete stop; wind conditions; degree of sway in the power line; lighting conditions, and other conditions affecting the ability to prevent electrical contact.
  - (2) Paragraph (c)(1) of this section does not apply to work covered by Division 2/RR; instead, for such work, the minimum approach distances established by the employer under OAR 437-002-2311(3) apply.
- (d) A planning meeting with the employer and utility owner/operator (or registered professional engineer who is a qualified person with respect to electrical power transmission and distribution) is held to determine the procedures that will be followed to prevent electrical contact and electrocution. At a minimum these procedures must include:
  - (1) If the power line is equipped with a device that automatically reenergizes the circuit in the event of a power line contact, before the work begins, the automatic reclosing feature of the circuit interrupting device must be made inoperative if the design of the device permits.

- (2) A dedicated spotter who is in continuous contact with the operator. The dedicated spotter must:
- (i) Be equipped with a visual aid to assist in identifying the minimum clearance distance. Examples of a visual aid include, but are not limited to: a line painted on the ground; a clearly visible line of stanchions; a set of clearly visible line-of-sight landmarks (such as a fence post behind the dedicated spotter and a building corner ahead of the dedicated spotter).
  - (ii) Be positioned to effectively gauge the clearance distance.
  - (iii) Where necessary, use equipment that enables the dedicated spotter to communicate directly with the operator.
  - (iv) Give timely information to the operator so that the required clearance distance can be maintained.
- (3) An elevated warning line, or barricade (not attached to the crane), in view of the operator (either directly or through video equipment), equipped with flags or similar high-visibility markings, to prevent electrical contact. However, this provision does not apply to work covered by subpart V of this part.
- (4) Insulating link/device.
- (i) An insulating link/device installed at a point between the end of the load line (or below) and the load.
  - (ii) Paragraph (d)(4)(i) of this section does not apply to work covered by Division 2/RR.
  - (iii) [Reserved.]
  - (iv) Until November 8, 2011, the following procedure may be substituted for the requirement in paragraph (d)(4)(i) of this section: all employees, excluding equipment operators located on the equipment, who may come in contact with the equipment, the load line, or the load must be insulated or guarded from the equipment, the load line, and the load. Insulating gloves rated for the voltage involved are adequate insulation for the purposes of this paragraph.
  - (v) Until November 8, 2013, the following procedure may be substituted for the requirement in (d)(4)(i) of this section:

- (A) The employer must use a link/device manufactured on or before November 8, 2011, that meets the definition of an insulating link/device, except that it has not been approved by a Nationally Recognized Testing Laboratory, and that is maintained and used in accordance with manufacturer requirements and recommendations, and is installed at a point between the end of the load line (or below) and the load; and
- (B) All employees, excluding equipment operators located on the equipment, who may come in contact with the equipment, the load line, or the load must be insulated or guarded from the equipment, the load line, and the load through an additional means other than the device described in paragraph (d)(4)(v)(A) of this section. Insulating gloves rated for the voltage involved are adequate additional means of protection for the purposes of this paragraph.
- (5) Nonconductive rigging if the rigging may be within the Table A of 1926.1408 distance during the operation.
- (6) If the equipment is equipped with a device that automatically limits range of movement, it must be used and set to prevent any part of the equipment, load line, or load (including rigging and lifting accessories) from breaching the minimum approach distance established under paragraph (c) of this section.
- (7) If a tag line is used, it must be of the nonconductive type.
- (8) Barricades forming a perimeter at least 10 feet away from the equipment to prevent unauthorized personnel from entering the work area. In areas where obstacles prevent the barricade from being at least 10 feet away, the barricade must be as far from the equipment as feasible.
- (9) Workers other than the operator must be prohibited from touching the load line above the insulating link/device and crane. Operators remotely operating the equipment from the ground must use either wireless controls that isolate the operator from the equipment or insulating mats that insulate the operator from the ground.
- (10) Only personnel essential to the operation are permitted to be in the area of the crane and load.
- (11) The equipment must be properly grounded.

- (12) Insulating line hose or cover-up must be installed by the utility owner/operator except where such devices are unavailable for the line voltages involved.
- (e) The procedures developed to comply with paragraph (d) of this section are documented and immediately available on-site.
- (f) The equipment user and utility owner/operator (or registered professional engineer) meet with the equipment operator and the other workers who will be in the area of the equipment or load to review the procedures that will be implemented to prevent breaching the minimum approach distance established in paragraph (c) of this section and prevent electrocution.
- (g) The procedures developed to comply with paragraph (d) of this section are implemented.
- (h) The utility owner/operator (or registered professional engineer) and all employers of employees involved in the work must identify one person who will direct the implementation of the procedures. The person identified in accordance with this paragraph must direct the implementation of the procedures and must have the authority to stop work at any time to ensure safety.
- (i) [Reserved.]
- (j) If a problem occurs implementing the procedures being used to comply with paragraph (d) of this section, or indicating that those procedures are inadequate to prevent electrocution, the employer must safely stop operations and either develop new procedures to comply with paragraph (d) of this section or have the utility owner/operator deenergize and visibly ground or relocate the power line before resuming work.
- (k) Devices originally designed by the manufacturer for use as a safety device (see 1926.1415), operational aid, or a means to prevent power line contact or electrocution, when used to comply with this section, must comply with the manufacturer's procedures for use and conditions of use.
- (l) [Reserved.]
- (m) The employer must train each operator and crew member assigned to work with the equipment in accordance with 1926.1408(g).

[75 FR 48135, Aug. 9, 2010, as amended at 79 FR 20743, Apr. 11, 2014]

Stat. Auth.: ORS 654.025(2) and 656.726(4).

Stats. Implemented: ORS 654.001 through 654.295.

Hist: OR-OSHA Admin. Order 1-2011, f. 2/9/11, ef. 2/9/11.

OR-OSHA Admin. Order 3-2015, f. 10/9/15, ef. 1/1/16.

**1926.1411 Power line safety – while traveling under or near power lines with no load**

- (a) This section establishes procedures and criteria that must be met for equipment traveling under or near a power line on a construction site with no load. Equipment traveling on a construction site with a load is governed by 1926.1408, 1926.1409 or 1926.1410, whichever is appropriate, and 1926.1417(u).
- (b) The employer must ensure that:
- (1) The boom/mast and boom/mast support system are lowered sufficiently to meet the requirements of this paragraph.
  - (2) The clearances specified in Table T of this section are maintained.
  - (3) The effects of speed and terrain on equipment movement (including movement of the boom/mast) are considered so that those effects do not cause the minimum clearance distances specified in Table T of this section to be breached.
  - (4) Dedicated spotter. If any part of the equipment while traveling will get closer than 20 feet to the power line, the employer must ensure that a dedicated spotter who is in continuous contact with the driver/operator is used. The dedicated spotter must:
    - (i) Be positioned to effectively gauge the clearance distance.
    - (ii) Where necessary, use equipment that enables the dedicated spotter to communicate directly with the operator.
    - (iii) Give timely information to the operator so that the required clearance distance can be maintained.
  - (5) Additional precautions for traveling in poor visibility. When traveling at night, or in conditions of poor visibility, in addition to the measures specified in paragraphs (b)(1) through (4) of this section, the employer must ensure that:
    - (i) The power lines are illuminated or another means of identifying the location of the lines is used.
    - (ii) A safe path of travel is identified and used.

Table T - Minimum Clearance Distances While Traveling With No Load

Voltage (nominal, kV, alternating current)	While traveling - minimum clearance distance (feet)
up to 0.75	4
over .75 to 50	6
over 50 to 345	10
over 345 to 750	16
over 750 to 1,000	20
over 1,000	(as established by the utility owner/operator or registered professional engineer who is a qualified person with respect to electrical power transmission and distribution)

**Oregon Note:** Nominal "Direct Current (DC)" voltages apply.

Stat. Auth.: ORS 654.025(2) and 656.726(4).

## 1926.1412 Inspections

### (a) Modified equipment.

(1) Equipment that has had modifications or additions which affect the safe operation of the equipment (such as modifications or additions involving a safety device or operational aid, critical part of a control system, power plant, braking system, load-sustaining structural components, load hook, or in-use operating mechanism) or capacity must be inspected by a qualified person after such modifications/additions have been completed, prior to initial use. The inspection must meet all of the following requirements:

- (i) The inspection must assure that the modifications or additions have been done in accordance with the approval obtained pursuant to 1926.1434 (Equipment modifications).
- (ii) The inspection must include functional testing of the equipment.

(2) Equipment must not be used until an inspection under this paragraph demonstrates that the requirements of paragraph (a)(1)(i) of this section have been met.

### (b) Repaired/adjusted equipment.

- (1) Equipment that has had a repair or adjustment that relates to safe operation (such as: a repair or adjustment to a safety device or operator aid, or to a critical part of a control system, power plant, braking system, load-sustaining structural components, load hook, or in-use operating mechanism), must be inspected by a qualified person after such a repair or adjustment has been completed, prior to initial use. The inspection must meet all of the following requirements:
    - (i) The qualified person must determine if the repair/adjustment meets manufacturer equipment criteria (where applicable and available).
    - (ii) Where manufacturer equipment criteria are unavailable or inapplicable, the qualified person must:
      - (A) Determine if a registered professional engineer (RPE) is needed to develop criteria for the repair/adjustment. If an RPE is not needed, the employer must ensure that the criteria are developed by the qualified person. If an RPE is needed, the employer must ensure that they are developed by an RPE.
      - (B) Determine if the repair/adjustment meets the criteria developed in accordance with paragraph (b)(1)(ii)(A) of this section.
    - (iii) The inspection must include functional testing of the repaired/adjusted parts and other components that may be affected by the repair/adjustment.
  - (2) Equipment must not be used until an inspection under this paragraph demonstrates that the repair/adjustment meets the requirements of paragraph (b)(1)(i) of this section (or, where applicable, paragraph (b)(1)(ii) of this section).
- (c) Post-assembly.
- (1) Upon completion of assembly, the equipment must be inspected by a qualified person to assure that it is configured in accordance with manufacturer equipment criteria.
  - (2) Where manufacturer equipment criteria are unavailable, a qualified person must:
    - (i) Determine if a registered professional engineer (RPE) familiar with the type of equipment involved is needed to develop criteria for the equipment configuration. If an RPE is not needed, the employer must ensure that the criteria are developed by the qualified person. If an RPE is needed, the employer must ensure that they are developed by an RPE.

- (ii) Determine if the equipment meets the criteria developed in accordance with paragraph (c)(2)(i) of this section.
- (3) Equipment must not be used until an inspection under this paragraph demonstrates that the equipment is configured in accordance with the applicable criteria.
- (d) Each shift.
  - (1) A competent person must begin a visual inspection prior to each shift the equipment will be used, which must be completed before or during that shift. The inspection must consist of observation for apparent deficiencies. Taking apart equipment components and booming down is not required as part of this inspection unless the results of the visual inspection or trial operation indicate that further investigation necessitating taking apart equipment components or booming down is needed. Determinations made in conducting the inspection must be reassessed in light of observations made during operation. At a minimum the inspection must include all of the following:
    - (i) Control mechanisms for maladjustments interfering with proper operation.
    - (ii) Control and drive mechanisms for apparent excessive wear of components and contamination by lubricants, water or other foreign matter.
    - (iii) Air, hydraulic, and other pressurized lines for deterioration or leakage, particularly those which flex in normal operation.
    - (iv) Hydraulic system for proper fluid level.
    - (v) Hooks and latches for deformation, cracks, excessive wear, or damage such as from chemicals or heat.
    - (vi) Wire rope reeving for compliance with the manufacturer's specifications.
    - (vii) Wire rope, in accordance with 1926.1413(a).
    - (viii) Electrical apparatus for malfunctioning, signs of apparent excessive deterioration, dirt or moisture accumulation.
    - (ix) Tires (when in use) for proper inflation and condition.

- (x) Ground conditions around the equipment for proper support, including ground settling under and around outriggers/stabilizers and supporting foundations, ground water accumulation, or similar conditions. This paragraph does not apply to the inspection of ground conditions for railroad tracks and their underlying support when the railroad tracks are part of the general railroad system of transportation that is regulated pursuant to the Federal Railroad Administration under 49 CFR part 213.
  - (xi) The equipment for level position within the tolerances specified by the equipment manufacturer's recommendations, both before each shift and after each move and setup.
  - (xii) Operator cab windows for significant cracks, breaks, or other deficiencies that would hamper the operator's view.
  - (xiii) Rails, rail stops, rail clamps and supporting surfaces when the equipment has rail traveling. This paragraph does not apply to the inspection of rails, rail stops, rail clamps and supporting surfaces when the railroad tracks are part of the general railroad system of transportation that is regulated pursuant to the Federal Railroad Administration under 49 CFR part 213.
  - (xiv) Safety devices and operational aids for proper operation.
- (2) If any deficiency in paragraphs (d)(1)(i) through (xiii) of this section (or in additional inspection items required to be checked for specific types of equipment in accordance with other sections of this standard) is identified, an immediate determination must be made by the competent person as to whether the deficiency constitutes a safety hazard. If the deficiency is determined to constitute a safety hazard, the equipment must be taken out of service until it has been corrected. See 1926.1417.
- (3) If any deficiency in paragraph (d)(1)(xiv) of this section (safety devices/operational aids) is identified, the action specified in 1926.1415 and 1926.1416 must be taken prior to using the equipment.
- (e) Monthly.
- (1) Each month the equipment is in service it must be inspected in accordance with paragraph (d) of this section (each shift).
  - (2) Equipment must not be used until an inspection under this paragraph demonstrates that no corrective action under paragraphs (d)(2) and (3) of this section is required.
  - (3) Documentation.

- (i) The following information must be documented and maintained by the employer that conducts the inspection:
    - (A) The items checked and the results of the inspection.
    - (B) The name and signature of the person who conducted the inspection and the date.
  - (ii) This document must be retained for a minimum of three months.
- (f) Annual/comprehensive.
- (1) At least every 12 months the equipment must be inspected by a qualified person in accordance with paragraph (d) of this section (each shift) except that the corrective action set forth in paragraphs (f)(4), (f)(5), and (f)(6) of this section must apply in place of the corrective action required by paragraphs (d)(2) and (d)(3) of this section.
  - (2) In addition, at least every 12 months, the equipment must be inspected by a qualified person. Disassembly is required, as necessary, to complete the inspection. The equipment must be inspected for all of the following:
    - (i) Equipment structure (including the boom and, if equipped, the jib):
      - (A) Structural members: deformed, cracked, or significantly corroded.
      - (B) Bolts, rivets and other fasteners: loose, failed or significantly corroded.
      - (C) Welds for cracks.
    - (ii) Sheaves and drums for cracks or significant wear.
    - (iii) Parts such as pins, bearings, shafts, gears, rollers and locking devices for distortion, cracks or significant wear.
    - (iv) Brake and clutch system parts, linings, pawls and ratchets for excessive wear.
    - (v) Safety devices and operational aids for proper operation (including significant inaccuracies).
    - (vi) Gasoline, diesel, electric, or other power plants for safety-related problems (such as leaking exhaust and emergency shut-down feature) and conditions, and proper operation.
    - (vii) Chains and chain drive sprockets for excessive wear of sprockets and excessive chain stretch.
    - (viii) Travel steering, brakes, and locking devices, for proper operation.
    - (ix) Tires for damage or excessive wear.

- (x) Hydraulic, pneumatic and other pressurized hoses, fittings and tubing, as follows:
  - (A) Flexible hose or its junction with the fittings for indications of leaks.
  - (B) Threaded or clamped joints for leaks.
  - (C) Outer covering of the hose for blistering, abnormal deformation or other signs of failure/impending failure.
  - (D) Outer surface of a hose, rigid tube, or fitting for indications of excessive abrasion or scrubbing.
- (xi) Hydraulic and pneumatic pumps and motors, as follows:
  - (A) Performance indicators: unusual noises or vibration, low operating speed, excessive heating of the fluid, low pressure.
  - (B) Loose bolts or fasteners.
  - (C) Shaft seals and joints between pump sections for leaks.
- (xii) Hydraulic and pneumatic valves, as follows:
  - (A) Spools: sticking, improper return to neutral, and leaks.
  - (B) Leaks.
  - (C) Valve housing cracks.
  - (D) Relief valves: failure to reach correct pressure (if there is a manufacturer procedure for checking pressure, it must be followed).
- (xiii) Hydraulic and pneumatic cylinders, as follows:
  - (A) Drifting caused by fluid leaking across the piston.
  - (B) Rod seals and welded joints for leaks.
  - (C) Cylinder rods for scores, nicks, or dents.
  - (D) Case (barrel) for significant dents.
  - (E) Rod eyes and connecting joints: loose or deformed.
- (xiv) Outrigger or stabilizer pads/floats for excessive wear or cracks.
- (xv) Slider pads for excessive wear or cracks
- (xvi) Electrical components and wiring for cracked or split insulation and loose or corroded terminations.

- (xvii) Warning labels and decals originally supplied with the equipment by the manufacturer or otherwise required under this standard: missing or unreadable.
  - (xviii) Originally equipped operator seat (or equivalent): missing.
  - (xix) Operator seat: unserviceable.
  - (xx) Originally equipped steps, ladders, handrails, guards: missing.
  - (xxi) Steps, ladders, handrails, guards: in unusable/unsafe condition.
- (3) This inspection must include functional testing to determine that the equipment as configured in the inspection is functioning properly.
- (4) If any deficiency is identified, an immediate determination must be made by the qualified person as to whether the deficiency constitutes a safety hazard or, though not yet a safety hazard, needs to be monitored in the monthly inspections.
- (5) If the qualified person determines that a deficiency is a safety hazard, the equipment must be taken out of service until it has been corrected, except when temporary alternative measures are implemented as specified in 1926.1416(d) or 1926.1435(e). See 1926.1417.
- (6) If the qualified person determines that, though not presently a safety hazard, the deficiency needs to be monitored, the employer must ensure that the deficiency is checked in the monthly inspections.
- (7) Documentation of annual/comprehensive inspection. The following information must be documented, maintained, and retained for a minimum of 12 months, by the employer that conducts the inspection:
- (i) The items checked and the results of the inspection.
  - (ii) The name and signature of the person who conducted the inspection and the date.
- (g) Severe service. Where the severity of use/conditions is such that there is a reasonable probability of damage or excessive wear (such as loading that may have exceeded rated capacity, shock loading that may have exceeded rated capacity, prolonged exposure to a corrosive atmosphere), the employer must stop using the equipment and a qualified person must:
- (1) Inspect the equipment for structural damage to determine if the equipment can continue to be used safely.

- (2) In light of the use/conditions determine whether any items/conditions listed in paragraph (f) of this section need to be inspected; if so, the qualified person must inspect those items/conditions.
- (3) If a deficiency is found, the employer must follow the requirements in paragraphs (f)(4) through (6) of this section.
- (h) Equipment not in regular use. Equipment that has been idle for 3 months or more must be inspected by a qualified person in accordance with the requirements of paragraph (e) (Monthly) of this section before initial use.
- (i) [Reserved.]
- (j) Any part of a manufacturer's procedures regarding inspections that relate to safe operation (such as to a safety device or operational aid, critical part of a control system, power plant, braking system, load-sustaining structural components, load hook, or in-use operating mechanism) that is more comprehensive or has a more frequent schedule of inspection than the requirements of this section must be followed.
- (k) All documents produced under this section must be available, during the applicable document retention period, to all persons who conduct inspections under this section.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 1-2011, f. 2/9/11, ef. 2/9/11.

## 1926.1413 Wire rope – inspection

- (a) Shift inspection.
  - (1) A competent person must begin a visual inspection prior to each shift the equipment is used, which must be completed before or during that shift. The inspection must consist of observation of wire ropes (running and standing) that are likely to be in use during the shift for apparent deficiencies, including those listed in paragraph (a)(2) of this section. Untwisting (opening) of wire rope or booming down is not required as part of this inspection.
  - (2) Apparent deficiencies.
    - (i) Category I. Apparent deficiencies in this category include the following:
      - (A) Significant distortion of the wire rope structure such as kinking, crushing, unstranding, birdcaging, signs of core failure or steel core protrusion between the outer strands.

- (B) Significant corrosion.
  - (C) Electric arc damage (from a source other than power lines) or heat damage.
  - (D) Improperly applied end connections.
  - (E) Significantly corroded, cracked, bent, or worn end connections (such as from severe service).
- (ii) Category II. Apparent deficiencies in this category are:
- (A) Visible broken wires, as follows:
    - (1) In running wire ropes: six randomly distributed broken wires in one rope lay or three broken wires in one strand in one rope lay, where a rope lay is the length along the rope in which one strand makes a complete revolution around the rope.
    - (2) In rotation resistant ropes: two randomly distributed broken wires in six rope diameters or four randomly distributed broken wires in 30 rope diameters.
    - (3) In pendants or standing wire ropes: more than two broken wires in one rope lay located in rope beyond end connections and/or more than one broken wire in a rope lay located at an end connection.
  - (B) A diameter reduction of more than 5% from nominal diameter.
- (iii) Category III. Apparent deficiencies in this category include the following:
- (A) In rotation resistant wire rope, core protrusion or other distortion indicating core failure.
  - (B) Prior electrical contact with a power line.
  - (C) A broken strand.
- (3) Critical review items. The competent person must give particular attention to all of the following:
- (i) Rotation resistant wire rope in use.
  - (ii) Wire rope being used for boom hoists and luffing hoists, particularly at reverse bends.
  - (iii) Wire rope at flange points, crossover points and repetitive pickup points on drums.
  - (iv) Wire rope at or near terminal ends.

(v) Wire rope in contact with saddles, equalizer sheaves or other sheaves where rope travel is limited.

(4) Removal from service.

(i) If a deficiency in Category I (see paragraph (a)(2)(i) of this section) is identified, an immediate determination must be made by the competent person as to whether the deficiency constitutes a safety hazard. If the deficiency is determined to constitute a safety hazard, operations involving use of the wire rope in question must be prohibited until:

(A) The wire rope is replaced (see 1926.1417), or

(B) If the deficiency is localized, the problem is corrected by severing the wire rope in two; the undamaged portion may continue to be used. Joining lengths of wire rope by splicing is prohibited. If a rope is shortened under this paragraph, the employer must ensure that the drum will still have two wraps of wire when the load and/or boom is in its lowest position.

(ii) If a deficiency in Category II (see paragraph (a)(2)(ii) of this section) is identified, operations involving use of the wire rope in question must be prohibited until:

(A) The employer complies with the wire rope manufacturer's established criterion for removal from service or a different criterion that the wire rope manufacturer has approved in writing for that specific wire rope (see 1926.1417),

(B) The wire rope is replaced (see 1926.1417), or

(C) If the deficiency is localized, the problem is corrected by severing the wire rope in two; the undamaged portion may continue to be used. Joining lengths of wire rope by splicing is prohibited. If a rope is shortened under this paragraph, the employer must ensure that the drum will still have two wraps of wire when the load and/or boom is in its lowest position.

(iii) If a deficiency in Category III is identified, operations involving use of the wire rope in question must be prohibited until:

(A) The wire rope is replaced (see 1926.1417), or

(B) If the deficiency (other than power line contact) is localized, the problem is corrected by severing the wire rope in two; the undamaged portion may continue to be used. Joining lengths of wire rope by splicing is prohibited. Repair of wire rope that contacted an energized power line is also prohibited. If a rope is shortened under this paragraph, the employer must ensure that the drum will still have two wraps of wire when the load and/or boom is in its lowest position.

(iv) Where a wire rope is required to be removed from service under this section, either the equipment (as a whole) or the hoist with that wire rope must be tagged-out, in accordance with 1926.1417(f)(1), until the wire rope is repaired or replaced.

(b) Monthly inspection.

- (1) Each month an inspection must be conducted in accordance with paragraph (a) (shift inspection) of this section.
- (2) The inspection must include any deficiencies that the qualified person who conducts the annual inspection determines under paragraph (c)(3)(ii) of this section must be monitored.
- (3) Wire ropes on equipment must not be used until an inspection under this paragraph demonstrates that no corrective action under paragraph (a)(4) of this section is required.
- (4) The inspection must be documented according to 1926.1412(e)(3) (monthly inspection documentation).

(c) Annual/comprehensive.

- (1) At least every 12 months, wire ropes in use on equipment must be inspected by a qualified person in accordance with paragraph (a) of this section (shift inspection).
- (2) In addition, at least every 12 months, the wire ropes in use on equipment must be inspected by a qualified person, as follows:
  - (i) The inspection must be for deficiencies of the types listed in paragraph (a)(2) of this section.
  - (ii) The inspection must be complete and thorough, covering the surface of the entire length of the wire ropes, with particular attention given to all of the following:
    - (A) Critical review items listed in paragraph (a)(3) of this section.

- (B) Those sections that are normally hidden during shift and monthly inspections.
- (C) Wire rope subject to reverse bends.
- (D) Wire rope passing over sheaves.
- (iii) Exception: In the event an inspection under paragraph (c)(2) of this section is not feasible due to existing set-up and configuration of the equipment (such as where an assist crane is needed) or due to site conditions (such as a dense urban setting), such inspections must be conducted as soon as it becomes feasible, but no longer than an additional 6 months for running ropes and, for standing ropes, at the time of disassembly.
- (3) If a deficiency is identified, an immediate determination must be made by the qualified person as to whether the deficiency constitutes a safety hazard.
  - (i) If the deficiency is determined to constitute a safety hazard, operations involving use of the wire rope in question must be prohibited until:
    - (A) The wire rope is replaced (see 1926.1417), or
    - (B) If the deficiency is localized, the problem is corrected by severing the wire rope in two; the undamaged portion may continue to be used. Joining lengths of wire rope by splicing is prohibited. If a rope is shortened under this paragraph, the employer must ensure that the drum will still have two wraps of wire when the load and/or boom is in its lowest position.
  - (ii) If the qualified person determines that, though not presently a safety hazard, the deficiency needs to be monitored, the employer must ensure that the deficiency is checked in the monthly inspections.
- (4) The inspection must be documented according to 1926.1412(f)(7) (annual/comprehensive inspection documentation).
- (d) Rope lubricants that are of the type that hinder inspection must not be used.
- (e) All documents produced under this section must be available, during the applicable document retention period, to all persons who conduct inspections under this section.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 1-2011, f. 2/9/11, ef. 2/9/11.

## 1926.1414 Wire rope – selection and installation criteria

- (a) Original equipment wire rope and replacement wire rope must be selected and installed in accordance with the requirements of this section. Selection of replacement wire rope must be in accordance with the recommendations of the wire rope manufacturer, the equipment manufacturer, or a qualified person.
- (b) Wire rope design criteria: Wire rope (other than rotation resistant rope) must comply with either Option (1) or Option (2) of this section, as follows:
  - (1) Option (1). Wire rope must comply with section 5-1.7.1 of ASME B30.5-2004 (incorporated by reference, see 1926.6) except that section's paragraph (c) must not apply.
  - (2) Option (2). Wire rope must be designed to have, in relation to the equipment's rated capacity, a sufficient minimum breaking force and design factor so that compliance with the applicable inspection provisions in 1926.1413 will be an effective means of preventing sudden rope failure.
- (c) Wire rope must be compatible with the safe functioning of the equipment.
- (d) Boom hoist reeving.
  - (1) Fiber core ropes must not be used for boom hoist reeving, except for derricks.
  - (2) Rotation resistant ropes must be used for boom hoist reeving only where the requirements of paragraph (e)(4)(ii) of this section are met.
- (e) Rotation resistant ropes.
  - (1) Definitions.
    - (i) Type I rotation resistant wire rope ("Type I"). Type I rotation resistant rope is stranded rope constructed to have little or no tendency to rotate or, if guided, transmits little or no torque. It has at least 15 outer strands and comprises an assembly of at least three layers of strands laid helically over a center in two operations. The direction of lay of the outer strands is opposite to that of the underlying layer.
    - (ii) Type II rotation resistant wire rope ("Type II"). Type II rotation resistant rope is stranded rope constructed to have significant resistance to rotation. It has at least 10 outer strands and comprises an assembly of two or more layers of strands laid helically over a center in two or three operations. The direction of lay of the outer strands is opposite to that of the underlying layer.

- (iii) Type III rotation resistant wire rope (“Type III”). Type III rotation resistant rope is stranded rope constructed to have limited resistance to rotation. It has no more than nine outer strands, and comprises an assembly of two layers of strands laid helically over a center in two operations. The direction of lay of the outer strands is opposite to that of the underlying layer.
- (2) Requirements.
- (i) Types II and III with an operating design factor of less than 5 must not be used for duty cycle or repetitive lifts.
- (ii) Rotation resistant ropes (including Types I, II and III) must have an operating design factor of no less than 3.5.
- (iii) Type I must have an operating design factor of no less than 5, except where the wire rope manufacturer and the equipment manufacturer approves the design factor, in writing.
- (iv) Types II and III must have an operating design factor of no less than 5, except where the requirements of paragraph (e)(3) of this section are met.
- (3) When Types II and III with an operating design factor of less than 5 are used (for non-duty cycle, non-repetitive lifts), the following requirements must be met for each lifting operation:
- (i) A qualified person must inspect the rope in accordance with 1926.1413(a). The rope must be used only if the qualified person determines that there are no deficiencies constituting a hazard. In making this determination, more than one broken wire in any one rope lay must be considered a hazard.
- (ii) Operations must be conducted in such a manner and at such speeds as to minimize dynamic effects.
- (iii) Each lift made under 1926.1414(e)(3) must be recorded in the monthly and annual inspection documents. Such prior uses must be considered by the qualified person in determining whether to use the rope again.
- (4) Additional requirements for rotation resistant ropes for boom hoist reeving.
- (i) Rotation resistant ropes must not be used for boom hoist reeving, except where the requirements of paragraph (e)(4)(ii) of this section are met.

- (ii) Rotation resistant ropes may be used as boom hoist reeving when load hoists are used as boom hoists for attachments such as luffing attachments or boom and mast attachment systems. Under these conditions, all of the following requirements must be met:
  - (A) The drum must provide a first layer rope pitch diameter of not less than 18 times the nominal diameter of the rope used.
  - (B) The requirements in 1926.1426(a) (irrespective of the date of manufacture of the equipment), and 1926.1426(b).
  - (C) The requirements in ASME B30.5-2004 sections 5-1.3.2(a), (a)(2) through (a)(4), (b) and (d) (incorporated by reference, see 1926.6) except that the minimum pitch diameter for sheaves used in multiple rope reeving is 18 times the nominal diameter of the rope used (instead of the value of 16 specified in section 5-1.3.2(d)).
  - (D) All sheaves used in the boom hoist reeving system must have a rope pitch diameter of not less than 18 times the nominal diameter of the rope used.
  - (E) The operating design factor for the boom hoist reeving system must be not less than five.
  - (F) The operating design factor for these ropes must be the total minimum breaking force of all parts of rope in the system divided by the load imposed on the rope system when supporting the static weights of the structure and the load within the equipment's rated capacity.
  - (G) When provided, a power-controlled lowering system must be capable of handling rated capacities and speeds as specified by the manufacturer.
- (f) Wire rope clips used in conjunction with wedge sockets must be attached to the unloaded dead end of the rope only, except that the use of devices specifically designed for dead-ending rope in a wedge socket is permitted.
- (g) Socketing must be done in the manner specified by the manufacturer of the wire rope or fitting.
- (h) Prior to cutting a wire rope, seizings must be placed on each side of the point to be cut. The length and number of seizings must be in accordance with the wire rope manufacturer's instructions.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.

Hist: OR-OSHA Admin. Order 1-2011, f. 2/9/11, ef. 2/9/11.

## 1926.1415 Safety devices

- (a) Safety devices. The following safety devices are required on all equipment covered by this subpart, unless otherwise specified:
- (1) Crane level indicator.
    - (i) The equipment must have a crane level indicator that is either built into the equipment or is available on the equipment.
    - (ii) If a built-in crane level indicator is not working properly, it must be tagged-out or removed. If a removable crane level indicator is not working properly, it must be removed.
    - (iii) This requirement does not apply to portal cranes, derricks, floating cranes/derricks and land cranes/derricks on barges, pontoons, vessels or other means of flotation.
  - (2) Boom stops, except for derricks and hydraulic booms.
  - (3) Jib stops (if a jib is attached), except for derricks.
  - (4) Equipment with foot pedal brakes must have locks.
  - (5) Hydraulic outrigger jacks and hydraulic stabilizer jacks must have an integral holding device/check valve.
  - (6) Equipment on rails must have rail clamps and rail stops, except for portal cranes.
  - (7) Horn.
    - (i) The equipment must have a horn that is either built into the equipment or is on the equipment and immediately available to the operator.
    - (ii) If a built-in horn is not working properly, it must be tagged-out or removed. If a removable horn is not working properly, it must be removed.
- (b) Proper operation required. Operations must not begin unless all of the devices listed in this section are in proper working order. If a device stops working properly during operations, the operator must safely stop operations. If any of the devices listed in this section are not in proper working order, the equipment must be taken out of service and operations must not resume until the device is again working properly. See 1926.1417 (Operation). Alternative measures are not permitted to be used.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 1-2011, f. 2/9/11, ef. 2/9/11.

## 1926.1416 Operational aids

- (a) The devices listed in this section (“listed operational aids”) are required on all equipment covered by this subpart, unless otherwise specified.
- (1) The requirements in paragraphs (e)(1), (e)(2), and (e)(3) of this section do not apply to articulating cranes.
  - (2) The requirements in paragraphs (d)(3), (e)(1), and (e)(4) of this section apply only to those digger derricks manufactured after November 8, 2011.
- (b) Operations must not begin unless the listed operational aids are in proper working order, except where an operational aid is being repaired the employer uses the specified temporary alternative measures. The time periods permitted for repairing defective operational aids are specified in paragraphs (d) and (e) of this section. More protective alternative measures specified by the crane/derrick manufacturer, if any, must be followed.
- (c) If a listed operational aid stops working properly during operations, the operator must safely stop operations until the temporary alternative measures are implemented or the device is again working properly. If a replacement part is no longer available, the use of a substitute device that performs the same type of function is permitted and is not considered a modification under 1926.1434.
- (d) Category I operational aids and alternative measures. Operational aids listed in this paragraph that are not working properly must be repaired no later than 7 calendar days after the deficiency occurs. Exception: If the employer documents that it has ordered the necessary parts within 7 calendar days of the occurrence of the deficiency, the repair must be completed within 7 calendar days of receipt of the parts. See 1926.1417(j) for additional requirements.
- (1) Boom hoist limiting device.
    - (i) For equipment manufactured after December 16, 1969, a boom hoist limiting device is required. Temporary alternative measures (use at least one). One or more of the following methods must be used:
      - (A) Use a boom angle indicator.

- (B) Clearly mark the boom hoist cable (so that it can easily be seen by the operator) at a point that will give the operator sufficient time to stop the hoist to keep the boom within the minimum allowable radius. In addition, install mirrors or remote video cameras and displays if necessary for the operator to see the mark.
- (C) Clearly mark the boom hoist cable (so that it can easily be seen by a spotter) at a point that will give the spotter sufficient time to signal the operator and have the operator stop the hoist to keep the boom within the minimum allowable radius.
  - (ii) If the equipment was manufactured on or before December 16, 1969, and is not equipped with a boom hoist limiting device, at least one of the measures in paragraphs (d)(1)(i)(A) through (C) of this section must be used.
- (2) Luffing jib limiting device. Equipment with a luffing jib must have a luffing jib limiting device. Temporary alternative measures are the same as in paragraph (d)(1)(i) of this section, except to limit the movement of the luffing jib rather than the boom hoist.
- (3) Anti two-blocking device.
  - (i) Telescopic boom cranes manufactured after February 28, 1992, must be equipped with a device which automatically prevents damage from contact between the load block, overhaul ball, or similar component, and the boom tip (or fixed upper block or similar component). The device(s) must prevent such damage at all points where two-blocking could occur.

Temporary alternative measures: Clearly mark the cable (so that it can easily be seen by the operator) at a point that will give the operator sufficient time to stop the hoist to prevent two-blocking, and use a spotter when extending the boom.
  - (ii) Lattice boom cranes.
    - (A) Lattice boom cranes manufactured after Feb 28, 1992, must be equipped with a device that either automatically prevents damage and load failure from contact between the load block, overhaul ball, or similar component, and the boom tip (or fixed upper block or similar component), or warns the operator in time for the operator to prevent two-blocking. The device must prevent such damage/failure or provide adequate warning for all points where two-blocking could occur.

- (B) Lattice boom cranes and derricks manufactured after November 8, 2011 must be equipped with a device which automatically prevents damage and load failure from contact between the load block, overhaul ball, or similar component, and the boom tip (or fixed upper block or similar component). The device(s) must prevent such damage/failure at all points where two-blocking could occur.
- (C) Exception. The requirements in paragraphs (d)(3)(ii)(A) and (B) of this section do not apply to such lattice boom equipment when used for dragline, clamshell (grapple), magnet, drop ball, container handling, concrete bucket, marine operations that do not involve hoisting personnel, and pile driving work.
- (D) Temporary alternative measures. Clearly mark the cable (so that it can easily be seen by the operator) at a point that will give the operator sufficient time to stop the hoist to prevent two-blocking, or use a spotter.
- (iii) Articulating cranes manufactured after December 31, 1999, that are equipped with a load hoist must be equipped with a device that automatically prevents damage from contact between the load block, overhaul ball, or similar component, and the boom tip (or fixed upper block or similar component). The device must prevent such damage at all points where two-blocking could occur. Temporary alternative measures: When two-blocking could only occur with movement of the load hoist, clearly mark the cable (so that it can easily be seen by the operator) at a point that will give the operator sufficient time to stop the hoist to prevent two-blocking, or use a spotter. When two-blocking could occur without movement of the load hoist, clearly mark the cable (so that it can easily be seen by the operator) at a point that will give the operator sufficient time to stop the hoist to prevent two-blocking, and use a spotter when extending the boom.
- (e) Category II operational aids and alternative measures. Operational aids listed in this paragraph that are not working properly must be repaired no later than 30 calendar days after the deficiency occurs. Exception: If the employer documents that it has ordered the necessary parts within 7 calendar days of the occurrence of the deficiency, and the part is not received in time to complete the repair in 30 calendar days, the repair must be completed within 7 calendar days of receipt of the parts. See 1926.1417(j) for additional requirements.

- (1) Boom angle or radius indicator. The equipment must have a boom angle or radius indicator readable from the operator's station. Temporary alternative measures: Radii or boom angle must be determined by measuring the radii or boom angle with a measuring device.
- (2) Jib angle indicator if the equipment has a luffing jib. Temporary alternative measures: Radii or jib angle must be determined by ascertaining the main boom angle and then measuring the radii or jib angle with a measuring device.
- (3) Boom length indicator if the equipment has a telescopic boom, except where the rated capacity is independent of the boom length. Temporary alternative measures. One or more of the following methods must be used:
  - (i) Mark the boom with measured marks to calculate boom length,
  - (ii) Calculate boom length from boom angle and radius measurements,
  - (iii) Measure the boom with a measuring device.
- (4) Load weighing and similar devices.
  - (i) Equipment (other than derricks and articulating cranes) manufactured after March 29, 2003 with a rated capacity over 6,000 pounds must have at least one of the following: load weighing device, load moment (or rated capacity) indicator, or load moment (or rated capacity) limiter. Temporary alternative measures: The weight of the load must be determined from a source recognized by the industry (such as the load's manufacturer) or by a calculation method recognized by the industry (such as calculating a steel beam from measured dimensions and a known per foot weight). This information must be provided to the operator prior to the lift.
  - (ii) Articulating cranes manufactured after November 8, 2011 must have at least one of the following: automatic overload prevention device, load weighing device, load moment (or rated capacity) indicator, or load moment (rated capacity) limiter. Temporary alternative measures: The weight of the load must be determined from a source recognized by the industry (such as the load's manufacturer) or by a calculation method recognized by the industry (such as calculating a steel beam from measured dimensions and a known per foot weight). This information must be provided to the operator prior to the lift.
- (5) The following devices are required on equipment manufactured after November 8, 2011:

- (i) Outrigger/stabilizer position (horizontal beam extension) sensor/monitor if the equipment has outriggers or stabilizers. Temporary alternative measures: the operator must verify that the position of the outriggers or stabilizers is correct (in accordance with manufacturer procedures) before beginning operations requiring outrigger or stabilizer deployment.
- (ii) Hoist drum rotation indicator if the equipment has a hoist drum not visible from the operator's station. Temporary alternative measures: Mark the drum to indicate the rotation of the drum. In addition, install mirrors or remote video cameras and displays if necessary for the operator to see the mark.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 1-2011, f. 2/9/11, ef. 2/9/11.

## 1926.1417 Operation

- (a) The employer must comply with all manufacturer procedures applicable to the operational functions of equipment, including its use with attachments.
- (b) Unavailable operation procedures.
  - (1) Where the manufacturer procedures are unavailable, the employer must develop and ensure compliance with all procedures necessary for the safe operation of the equipment and attachments.
  - (2) Procedures for the operational controls must be developed by a qualified person.
  - (3) Procedures related to the capacity of the equipment must be developed and signed by a registered professional engineer familiar with the equipment.
- (c) Accessibility of procedures.
  - (1) The procedures applicable to the operation of the equipment, including rated capacities (load charts), recommended operating speeds, special hazard warnings, instructions, and operator's manual, must be readily available in the cab at all times for use by the operator.
  - (2) Where rated capacities are available in the cab only in electronic form: in the event of a failure which makes the rated capacities inaccessible, the operator must immediately cease operations or follow safe shut-down procedures until the rated capacities (in electronic or other form) are available.

- (d) The operator must not engage in any practice or activity that diverts his/her attention while actually engaged in operating the equipment, such as the use of cellular phones (other than when used for signal communications).
- (e) Leaving the equipment unattended.
- (1) The operator must not leave the controls while the load is suspended, except where all of the following are met:
- (i) The operator remains adjacent to the equipment and is not engaged in any other duties.
  - (ii) The load is to be held suspended for a period of time exceeding normal lifting operations.
  - (iii) The competent person determines that it is safe to do so and implements measures necessary to restrain the boom hoist and telescoping, load, swing, and outrigger or stabilizer functions.
  - (iv) Barricades or caution lines, and notices, are erected to prevent all employees from entering the fall zone. No employees, including those listed in 1926.1425(b)(1) through (3), 1926.1425(d) or 1926.1425(e), are permitted in the fall zone.
- (2) The provisions in 1926.1417(e)(1) do not apply to working gear (such as slings, spreader bars, ladders, and welding machines) where the weight of the working gear is negligible relative to the lifting capacity of the equipment as positioned, and the working gear is suspended over an area other than an entrance or exit.
- (f) Tag-out.
- (1) Tagging out of service equipment/functions. Where the employer has taken the equipment out of service, a tag must be placed in the cab stating that the equipment is out of service and is not to be used. Where the employer has taken a function(s) out of service, a tag must be placed in a conspicuous position stating that the function is out of service and is not to be used.
- (2) Response to “do not operate”/tag-out signs.
- (i) If there is a warning (tag-out or maintenance/do not operate) sign on the equipment or starting control, the operator must not activate the switch or start the equipment until the sign has been removed by a person authorized to remove it, or until the operator has verified that:
    - (A) No one is servicing, working on, or otherwise in a dangerous position on the machine.

- (B) The equipment has been repaired and is working properly.
- (ii) If there is a warning (tag-out or maintenance/do not operate) sign on any other switch or control, the operator must not activate that switch or control until the sign has been removed by a person authorized to remove it, or until the operator has verified that the requirements in paragraphs (f)(2)(i)(A) and (B) of this section have been met.
- (g) Before starting the engine, the operator must verify that all controls are in the proper starting position and that all personnel are in the clear.
- (h) Storm warning. When a local storm warning has been issued, the competent person must determine whether it is necessary to implement manufacturer recommendations for securing the equipment.
- (i) [Reserved.]
- (j) If equipment adjustments or repairs are necessary:
- (1) The operator must, in writing, promptly inform the person designated by the employer to receive such information and, where there are successive shifts, to the next operator; and
  - (2) The employer must notify all affected employees, at the beginning of each shift, of the necessary adjustments or repairs and all alternative measures.
- (k) Safety devices and operational aids must not be used as a substitute for the exercise of professional judgment by the operator.
- (l) [Reserved.]
- (m) If the competent person determines that there is a slack rope condition requiring respooling of the rope, it must be verified (before starting to lift) that the rope is seated on the drum and in the sheaves as the slack is removed.
- (n) The competent person must adjust the equipment and/or operations to address the effect of wind, ice, and snow on equipment stability and rated capacity.
- (o) Compliance with rated capacity.
- (1) The equipment must not be operated in excess of its rated capacity.
  - (2) The operator must not be required to operate the equipment in a manner that would violate paragraph (o)(1) of this section.
  - (3) Load weight. The operator must verify that the load is within the rated capacity of the equipment by at least one of the following methods:

- (i) The weight of the load must be determined from a source recognized by the industry (such as the load's manufacturer), or by a calculation method recognized by the industry (such as calculating a steel beam from measured dimensions and a known per foot weight), or by other equally reliable means. In addition, when requested by the operator, this information must be provided to the operator prior to the lift; or
  - (ii) The operator must begin hoisting the load to determine, using a load weighing device, load moment indicator, rated capacity indicator, or rated capacity limiter, if it exceeds 75 percent of the maximum rated capacity at the longest radius that will be used during the lift operation. If it does, the operator must not proceed with the lift until he/she verifies the weight of the load in accordance with paragraph (o)(3)(i) of this section.
- (p) The boom or other parts of the equipment must not contact any obstruction.
- (q) The equipment must not be used to drag or pull loads sideways.
- (r) On wheel-mounted equipment, no loads must be lifted over the front area, except as permitted by the manufacturer.
- (s) The operator must test the brakes each time a load that is 90% or more of the maximum line pull is handled by lifting the load a few inches and applying the brakes. In duty cycle and repetitive lifts where each lift is 90% or more of the maximum line pull, this requirement applies to the first lift but not to successive lifts.
- (t) Neither the load nor the boom must be lowered below the point where less than two full wraps of rope remain on their respective drums.
- (u) Traveling with a load.
- (1) Traveling with a load is prohibited if the practice is prohibited by the manufacturer.
  - (2) Where traveling with a load, the employer must ensure that:
    - (i) A competent person supervises the operation, determines if it is necessary to reduce rated capacity, and makes determinations regarding load position, boom location, ground support, travel route, overhead obstructions, and speed of movement necessary to ensure safety.
    - (ii) The determinations of the competent person required in paragraph (u)(2)(i) of this section are implemented.
    - (iii) For equipment with tires, tire pressure specified by the manufacturer is maintained.

- (v) Rotational speed of the equipment must be such that the load does not swing out beyond the radius at which it can be controlled.
- (w) A tag or restraint line must be used if necessary to prevent rotation of the load that would be hazardous.
- (x) The brakes must be adjusted in accordance with manufacturer procedures to prevent unintended movement.
- (y) The operator must obey a stop (or emergency stop) signal, irrespective of who gives it.
- (z) Swinging locomotive cranes. A locomotive crane must not be swung into a position where railway cars on an adjacent track could strike it, until it is determined that cars are not being moved on the adjacent track and that proper flag protection has been established.
- (aa) Counterweight/ballast.
  - (1) The following applies to equipment other than tower cranes:
    - (i) Equipment must not be operated without the counterweight or ballast in place as specified by the manufacturer.
    - (ii) The maximum counterweight or ballast specified by the manufacturer for the equipment must not be exceeded.
  - (2) Counterweight/ballast requirements for tower cranes are specified in 1926.1435(b)(8).

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 1-2011, f. 2/9/11, ef. 2/9/11.

## **1926.1418 Authority to stop operation**

Whenever there is a concern as to safety, the operator must have the authority to stop and refuse to handle loads until a qualified person has determined that safety has been assured.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 1-2011, f. 2/9/11, ef. 2/9/11.

## **1926.1419 Signals – general requirements**

- (a) A signal person must be provided in each of the following situations:

- (1) The point of operation, meaning the load travel or the area near or at load placement, is not in full view of the operator.
  - (2) When the equipment is traveling, the view in the direction of travel is obstructed.
  - (3) Due to site specific safety concerns, either the operator or the person handling the load determines that it is necessary.
- (b) Types of signals. Signals to operators must be by hand, voice, audible, or new signals.
- (c) Hand signals.
- (1) When using hand signals, the Standard Method must be used (see Appendix A of this subpart). Exception: Where use of the Standard Method for hand signals is infeasible, or where an operation or use of an attachment is not covered in the Standard Method, non-standard hand signals may be used in accordance with paragraph (c)(2) of this section.
  - (2) Non-standard hand signals. When using non-standard hand signals, the signal person, operator, and lift director (where there is one) must contact each other prior to the operation and agree on the non-standard hand signals that will be used.
- (d) New signals. Signals other than hand, voice, or audible signals may be used where the employer demonstrates that:
- (1) The new signals provide at least equally effective communication as voice, audible, or Standard Method hand signals, or
  - (2) The new signals comply with a national consensus standard that provides at least equally effective communication as voice, audible, or Standard Method hand signals.
- (e) Suitability. The signals used (hand, voice, audible, or new), and means of transmitting the signals to the operator (such as direct line of sight, video, radio, etc.), must be appropriate for the site conditions.
- (f) During operations requiring signals, the ability to transmit signals between the operator and signal person must be maintained. If that ability is interrupted at any time, the operator must safely stop operations requiring signals until it is reestablished and a proper signal is given and understood.

- (g) If the operator becomes aware of a safety problem and needs to communicate with the signal person, the operator must safely stop operations. Operations must not resume until the operator and signal person agree that the problem has been resolved.
- (h) Only one person may give signals to a crane/derrick at a time, except in circumstances covered by paragraph (j) of this section.
- (i) [Reserved.]
- (j) Anyone who becomes aware of a safety problem must alert the operator or signal person by giving the stop or emergency stop signal. (Note: 1926.1417(y) requires the operator to obey a stop or emergency stop signal).
- (k) All directions given to the operator by the signal person must be given from the operator's direction perspective.
- (l) [Reserved.]
- (m) Communication with multiple cranes/derricks. Where a signal person(s) is in communication with more than one crane/derrick, a system must be used for identifying the crane/derrick each signal is for, as follows:
- (1) for each signal, prior to giving the function/direction, the signal person must identify the crane/derrick the signal is for, or
  - (2) must use an equally effective method of identifying which crane/derrick the signal is for.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 1-2011, f. 2/9/11, ef. 2/9/11.

## **1926.1420 Signals – radio, telephone or other electronic transmission of signals**

- (a) The device(s) used to transmit signals must be tested on site before beginning operations to ensure that the signal transmission is effective, clear, and reliable.
- (b) Signal transmission must be through a dedicated channel, except:
- (1) Multiple cranes/derricks and one or more signal persons may share a dedicated channel for the purpose of coordinating operations.
  - (2) Where a crane is being operated on or adjacent to railroad tracks, and the actions of the crane operator need to be coordinated with the movement of other equipment or trains on the same or adjacent tracks.

(c) The operator's reception of signals must be by a hands-free system.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 1-2011, f. 2/9/11, ef. 2/9/11.

### 1926.1421 Signals – voice signals – additional requirements

- (a) Prior to beginning operations, the operator, signal person and lift director (if there is one), must contact each other and agree on the voice signals that will be used. Once the voice signals are agreed upon, these workers need not meet again to discuss voice signals unless another worker is added or substituted, there is confusion about the voice signals, or a voice signal is to be changed.
- (b) Each voice signal must contain the following three elements, given in the following order: function (such as hoist, boom, etc.), direction; distance and/or speed; function, stop command.
- (c) The operator, signal person and lift director (if there is one), must be able to effectively communicate in the language used.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 1-2011, f. 2/9/11, ef. 2/9/11.

### 1926.1422 Signals – hand signal chart

Hand signal charts must be either posted on the equipment or conspicuously posted in the vicinity of the hoisting operations.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 1-2011, f. 2/9/11, ef. 2/9/11.

### 1926.1423 Fall protection

- (a) Application.
  - (1) Paragraphs (b), (c)(3), (e) and (f) of this section apply to all equipment covered by this subpart except tower cranes.
  - (2) Paragraphs (c)(1), (c)(2), (d), (g), (j) and (k) of this section apply to all equipment covered by this subpart.
  - (3) Paragraphs (c)(4) and (h) of this section apply only to tower cranes.

(b) Boom walkways.

- (1) Equipment manufactured after November 8, 2011 with lattice booms must be equipped with walkways on the boom(s) if the vertical profile of the boom (from cord centerline to cord centerline) is 6 or more feet.
- (2) Boom walkway criteria.
  - (i) The walkways must be at least 12 inches wide.
  - (ii) Guardrails, railings and other permanent fall protection attachments along walkways are:
    - (A) Not required.
    - (B) Prohibited on booms supported by pendant ropes or bars if the guardrails/railings/attachments could be snagged by the ropes or bars.
    - (C) Prohibited if of the removable type (designed to be installed and removed each time the boom is assembled/disassembled).
    - (D) Where not prohibited, guardrails or railings may be of any height up to, but not more than, 45 inches.

(c) Steps, handholds, ladders, grabrails, guardrails and railings.

- (1) Section 1926.502(b) does not apply to equipment covered by this subpart.
- (2) The employer must maintain in good condition originally-equipped steps, hand- holds, ladders and guardrails/railings/grabrails.
- (3) Equipment manufactured after November 8, 2011 must be equipped so as to provide safe access and egress between the ground and the operator work station(s), including the forward and rear positions, by the provision of devices such as steps, handholds, ladders, and guardrails/railings/grabrails. These devices must meet the following criteria:
  - (i) Steps, handholds, ladders and guardrails/railings/grabrails must meet the criteria of SAE J185 (May 2003) (incorporated by reference, see 1926.6) or ISO 11660-2:1994(E) (incorporated by reference, see 1926.6) except where infeasible.
  - (ii) Walking/stepping surfaces, except for crawler treads, must have slip-resistant features/properties (such as diamond plate metal, strategically placed grip tape, expanded metal, or slip-resistant paint).

- (4) Tower cranes manufactured after November 8, 2011 must be equipped so as to provide safe access and egress between the ground and the cab, machinery platforms, and tower (mast), by the provision of devices such as steps, handholds, ladders, and guardrails/railings/grabrails. These devices must meet the following criteria:
- (i) Steps, handholds, ladders, and guardrails/railings/grabrails must meet the criteria of ISO 11660-1:2008(E) (incorporated by reference, see 1926.6) and ISO 11660-3:2008(E) (incorporated by reference, see 1926.6) or SAE J185 (May 2003) (incorporated by reference, see 1926.6) except where infeasible.
  - (ii) Walking/stepping surfaces must have slip-resistant features/properties (such as diamond plate metal, strategically placed grip tape, expanded metal, or slip-resistant paint).

**Note:** 1926.1423(d) was not adopted by Oregon OSHA. In Oregon, 437-003-1423 applies.

### **437-003-1423     *Fall Protection***

*(1) Personal fall arrest and fall restraint systems must use personal fall arrest components that conform to the criteria in Division 3/M, Fall Protection.*

**Note:** Except that 1926.502(d)(15), *Fall Protection Systems Criteria and Practices/Personal fall arrest systems (anchors)*, does not apply to components used in personal fall arrest and fall restraint systems. (See 1926.1423(g) and 437-003-1423(3).)

**Note:** 1926.1423(e) and (f) were not adopted by Oregon OSHA. In Oregon, 437-003-1423 applies.

*(2) When employees are assembling, disassembling or otherwise performing work on a walking/working surface of a crane with an unprotected side or edge more than 10 feet above a lower level, the employer must provide fall protection systems and ensure they are installed and used according to the criteria in Division 3/M, Fall Protection and as follows:*

*(a) When moving point-to-point:*

*(A) On non-lattice booms (whether horizontal or not horizontal).*

*(B) On lattice booms that are not horizontal.*

*(C) On horizontal lattice booms where the fall distance is 10 feet or more.*

*(b) While at a work station on any part of the equipment (including the boom, of any type), except when the employee is at or near draw-works (when the equipment is running), in the cab, or on the deck.*

1926.1423 (g) Anchorage criteria.

**Note:** 1926.1423(g)(1) was not adopted by Oregon OSHA. In Oregon, 437-003-1423 applies.

*(3) Anchorage criteria. 1926.502(d)(15), 1926.502(e)(2), and 437-003-0502(4) apply to equipment covered by this subdivision only to the extent delineated in paragraphs 1926.1423(g)(2) and (3).*

1926.1423 (g)(2) Anchorages for personal fall arrest and positioning device systems.

(i) Personal fall arrest systems must be anchored to any apparently substantial part of the equipment unless a competent person, from a visual inspection, without an engineering analysis, would conclude that the criteria in 1926.502(d)(15) would not be met.

(ii) Positioning device systems must be anchored to any apparently substantial part of the equipment unless a competent person, from a visual inspection, without an engineering analysis, would conclude that the criteria in 1926.502(e)(2) would not be met.

(iii) Attachable anchor devices (portable anchor devices that are attached to the equipment) must meet the anchorage criteria in 1926.502(d)(15) for personal fall arrest systems and 1926.502(e)(2) for positioning device systems.

(3) Anchorages for fall restraint systems. Fall restraint systems must be anchored to any part of the equipment that is capable of withstanding twice the maximum load that an employee may impose on it during reasonably anticipated conditions of use.

**Note:** 1926.1423(h) was not adopted by Oregon OSHA. In Oregon, 437-003-1423 applies.

*(4) Tower cranes. When employees are erecting, climbing, dismantling or otherwise performing work on a walking/working surface of a tower crane with an unprotected side or edge more than 10 feet above a lower level, employers must ensure that fall protection systems are provided, installed, and used according to the criteria in Division 3/M Fall Protection.*

1926.1423 (i) [Reserved.]

**Note:** 1926.1423(j) was not adopted by Oregon OSHA. In Oregon, 437-003-1423 applies.

*(5) Anchoring to the load line. A personal fall arrest system is permitted to be anchored to the crane/derrick's hook or other part of the load line when all of the following requirements are met:*

*(a) A qualified person determines that the set up and rated capacity of the crane/derrick, including the hook, load line and rigging, meets or exceeds the requirements in 1926.502(d)(15).*

- (b) The operator is informed that it is being used for this purpose and is in view of and no more than 25 feet from the operator station/cab.*
- (c) No load is suspended from the crane/derrick when the personal fall arrest system is anchored and used.*
- (d) The crane/derrick is not moved when the personal fall arrest system is anchored and being used.*

1926.1423 (k) Training. The employer must train each employee who may be exposed to fall hazards while on, or hoisted by, equipment covered by this subpart on all of the following:

- (1) the requirements in this subpart that address fall protection.
- (2) the applicable requirements in 1926.500 and 1926.502.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 1-2011, f. 2/9/11, ef. 2/9/11.

*(6) Training. The employer must train each employee who may be exposed to fall hazards while on, or hoisted by, equipment covered by this subdivision on the applicable requirements in OARs 437-003-1500 and 437-003-0502.*

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 1-2011, f. 2/9/11, ef. 2/9/11.

## 1926.1424 Work area control

(a) Swing radius hazards.

- (1) The requirements in paragraph (a)(2) of this section apply where there are accessible areas in which the equipment's rotating superstructure (whether permanently or temporarily mounted) poses a reasonably foreseeable risk of:
  - (i) Striking and injuring an employee; or
  - (ii) Pinching/crushing an employee against another part of the equipment or another object.
- (2) To prevent employees from entering these hazard areas, the employer must:
  - (i) Train each employee assigned to work on or near the equipment ("authorized personnel") in how to recognize struck-by and pinch/crush hazard areas posed by the rotating superstructure.

- (ii) Erect and maintain control lines, warning lines, railings or similar barriers to mark the boundaries of the hazard areas. Exception: When the employer can demonstrate that it is neither feasible to erect such barriers on the ground nor on the equipment, the hazard areas must be clearly marked by a combination of warning signs (such as “Danger – Swing/Crush Zone”) and high visibility markings on the equipment that identify the hazard areas. In addition, the employer must train each employee to understand what these markings signify.
- (3) Protecting employees in the hazard area.
- (i) Before an employee goes to a location in the hazard area that is out of view of the operator, the employee (or someone instructed by the employee) must ensure that the operator is informed that he/she is going to that location.
  - (ii) Where the operator knows that an employee went to a location covered by paragraph (a)(1) of this section, the operator must not rotate the superstructure until the operator is informed in accordance with a pre-arranged system of communication that the employee is in a safe position.
- (b) Where any part of a crane/derrick is within the working radius of another crane/derrick, the controlling entity must institute a system to coordinate operations. If there is no controlling entity, the employer (if there is only one employer operating the multiple pieces of equipment), or employers, must institute such a system.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 1-2011, f. 2/9/11, ef. 2/9/11.

## **1926.1425 Keeping clear of the load**

- (a) Where available, hoisting routes that minimize the exposure of employees to hoisted loads must be used, to the extent consistent with public safety.
- (b) While the operator is not moving a suspended load, no employee must be within the fall zone, except for employees:
  - (1) Engaged in hooking, unhooking or guiding a load;
  - (2) Engaged in the initial attachment of the load to a component or structure; or
  - (3) Operating a concrete hopper or concrete bucket.

- (c) When employees are engaged in hooking, unhooking, or guiding the load, or in the initial connection of a load to a component or structure and are within the fall zone, all of the following criteria must be met:
- (1) The materials being hoisted must be rigged to prevent unintentional displacement.
  - (2) Hooks with self-closing latches or their equivalent must be used. Exception: "J" hooks are permitted to be used for setting wooden trusses.
  - (3) The materials must be rigged by a qualified rigger.
- (d) Receiving a load. Only employees needed to receive a load are permitted to be within the fall zone when a load is being landed.
- (e) During a tilt-up or tilt-down operation:
- (1) No employee must be directly under the load.
  - (2) Only employees essential to the operation are permitted in the fall zone (but not directly under the load). An employee is essential to the operation if the employee is conducting one of the following operations and the employer can demonstrate it is infeasible for the employee to perform that operation from outside the fall zone: (1) physically guide the load; (2) closely monitor and give instructions regarding the load's movement; or (3) either detach it from or initially attach it to another component or structure (such as, but not limited to, making an initial connection or installing bracing).

**Note:** Boom free fall is prohibited when an employee is in the fall zone of the boom or load, and load line free fall is prohibited when an employee is directly under the load; see 1926.1426.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 1-2011, f. 2/9/11, ef. 2/9/11.

## 1926.1426 Free fall and controlled load lowering

- (a) Boom free fall prohibitions.
- (1) The use of equipment in which the boom is designed to free fall (live boom) is prohibited in each of the following circumstances:
    - (i) An employee is in the fall zone of the boom or load.
    - (ii) An employee is being hoisted.

- (iii) The load or boom is directly over a power line, or over any part of the area extending the Table A of 1926.1408 clearance distance to each side of the power line; or any part of the area extending the Table A clearance distance to each side of the power line is within the radius of vertical travel of the boom or the load.
  - (iv) The load is over a shaft, except where there are no employees in the shaft.
  - (v) The load is over a cofferdam, except where there are no employees in the fall zone of the boom or the load.
  - (vi) Lifting operations are taking place in a refinery or tank farm.
- (2) The use of equipment in which the boom is designed to free fall (live boom) is permitted only where none of the circumstances listed in paragraph (a)(1) of this section are present and:
- (i) The equipment was manufactured prior to October 31, 1984; or
  - (ii) The equipment is a floating crane/derrick or a land crane/derrick on a vessel/flotation device.
- (b) Preventing boom free fall. Where the use of equipment with a boom that is designed to free fall (live boom) is prohibited, the boom hoist must have a secondary mechanism or device designed to prevent the boom from falling in the event the primary system used to hold or regulate the boom hoist fails, as follows:
- (1) Friction drums must have:
    - (i) A friction clutch and, in addition, a braking device, to allow for controlled boom lowering.
    - (ii) A secondary braking or locking device, which is manually or automatically engaged, to back-up the primary brake while the boom is held (such as a secondary friction brake or a ratchet and pawl device).
  - (2) Hydraulic drums must have an integrally mounted holding device or internal static brake to prevent boom hoist movement in the event of hydraulic failure.
  - (3) Neither clutches nor hydraulic motors must be considered brake or locking devices for purposes of this subpart.
  - (4) Hydraulic boom cylinders must have an integrally mounted holding device.

- (c) Preventing uncontrolled retraction. Hydraulic telescoping booms must have an integrally mounted holding device to prevent the boom from retracting in the event of hydraulic failure.
- (d) Load line free fall. In each of the following circumstances, controlled load lowering is required and free fall of the load line hoist is prohibited:
- (1) An employee is directly under the load.
  - (2) An employee is being hoisted.
  - (3) The load is directly over a power line, or over any part of the area extending the Table A of 1926.1408 clearance distance to each side of the power line; or any part of the area extending the Table A of 1926.1408 clearance distance to each side of the power line is within the radius of vertical travel of the load.
  - (4) The load is over a shaft.
  - (5) The load is over a cofferdam, except where there are no employees in the fall zone of the load.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 1-2011, f. 2/9/11, ef. 2/9/11.

## 1926.1427 Operator training, certification, and evaluation

- (a) General requirements for operators. The employer must ensure that each operator is trained, certified/licensed, and evaluated in accordance with this section before operating any equipment covered under Subpart CC, except for the equipment listed in paragraph (a)(2) of this section.
- (1) Operation during training. An employee who has not been certified/licensed and evaluated to operate assigned equipment in accordance with this section may only operate the equipment as an operator-in-training under supervision in accordance with the requirements of paragraph (b) of this section.
  - (2) Exceptions. Operators of derricks (see 1926.1436), sideboom cranes (see 1926.1440), or equipment with a maximum manufacturer-rated hoisting/lifting capacity of 2,000 pounds or less (see 1926.1441) are not required to comply with 1926.1427.  
**Note:** The training requirements in those other sections continue to apply (for the training requirement for operators of sideboom cranes, follow section 1926.1430(c)).
  - (3) Qualification by the U.S. military.

- (i) For purposes of this section, an operator who is an employee of the U.S. military meets the requirements of this section if he/she has a current operator qualification issued by the U.S. military for operation of the equipment. An employee of the U.S. military is a Federal employee of the Department of Defense or Armed Forces and does not include employees of private contractors.
- (ii) A qualification under this paragraph is:
  - (A) Not portable: Such a qualification meets the requirements of paragraph (a) of this section only where the operator is employed by (and operating the equipment for) the employer that issued the qualification.
  - (B) Valid for the period of time stipulated by the issuing entity.
- (b) Operator training. The employer must provide each operator-in-training with sufficient training, through a combination of formal and practical instruction, to ensure that the operator-in-training develops the skills, knowledge, and ability to recognize and avert risk necessary to operate the equipment safely for assigned work.
  - (1) The employer must provide instruction on the knowledge and skills listed in paragraphs (j)(1) and (2) of this section to the operator-in-training.
  - (2) The operator-in-training must be continuously monitored on site by a trainer while operating equipment.
  - (3) The employer may only assign tasks within the operator-in-training's ability. However, except as provided in paragraph (b)(3)(v) of this section, the operator-in-training shall not operate the equipment in any of the following circumstances unless certified in accordance with paragraph (c) of this section:
    - (i) If any part of the equipment, load line, or load (including rigging and lifting accessories), if operated up to the equipment's maximum working radius in the work zone (see 1926.1408(a)(1)), could get within 20 feet of a power line that is up to 350 kV, or within 50 feet of a power line that is over 350 kV.
    - (ii) If the equipment is used to hoist personnel.
    - (iii) In multiple-equipment lifts.
    - (iv) If the equipment is used over a shaft, cofferdam, or in a tank farm.

- (v) In multiple-lift rigging operations, except where the operator's trainer determines that the operator-in-training's skills are sufficient for this high-skill work.
- (4) The employer must ensure that an operator-in-training is monitored as follows when operating equipment covered by this subpart:
- (i) While operating the equipment, the operator-in-training must be continuously monitored by an individual ("operator's trainer") who meets all of the following requirements:
    - (A) The operator's trainer is an employee or agent of the operator-in-training's employer.
    - (B) The operator's trainer has the knowledge, training, and experience necessary to direct the operator-in-training on the equipment in use.
  - (ii) While monitoring the operator-in-training, the operator's trainer performs no tasks that detract from the trainer's ability to monitor the operator-in-training.
  - (iii) For equipment other than tower cranes: The operator's trainer and the operator-in-training must be in direct line of sight of each other. In addition, they must communicate verbally or by hand signals. For tower cranes: The operator's trainer and the operator-in-training must be in direct communication with each other.
  - (iv) The operator-in-training must be monitored by the operator's trainer at all times, except for short breaks where all of the following are met:
    - (A) The break lasts no longer than 15 minutes and there is no more than one break per hour.
    - (B) Immediately prior to the break the operator's trainer informs the operator-in-training of the specific tasks that the operator-in-training is to perform and limitations to which he/she must adhere during the operator trainer's break.
    - (C) The specific tasks that the operator-in-training will perform during the operator trainer's break are within the operator-in-training's abilities.
- (5) Retraining. The employer must provide retraining in relevant topics for each operator when, based on the performance of the operator or an evaluation of the operator's knowledge, there is an indication that retraining is necessary.
- (c) Operator certification and licensing. The employer must ensure that each operator is certified or licensed to operate the equipment as follows:

- (1) Licensing. When a state or local government issues operator licenses for equipment covered under Subpart CC, the equipment operator must be licensed by that government entity for operation of equipment within that entity's jurisdiction if that government licensing program meets the following requirements:
    - (i) The requirements for obtaining the license include an assessment, by written and practical tests, of the operator applicant regarding, at a minimum, the knowledge and skills listed in paragraphs (j)(1) and (2) of this section.
    - (ii) The testing meets industry recognized criteria for written testing materials, practical examinations, test administration, grading, facilities/equipment, and personnel.
    - (iii) The government authority that oversees the licensing department/office has determined that the requirements in paragraphs (c)(1)(i) and (ii) of this section have been met.
    - (iv) The licensing department/office has testing procedures for re-licensing designed to ensure that the operator continues to meet the technical knowledge and skills requirements in paragraphs (j)(1) and (2) of this section.
    - (v) For the purposes of compliance with this section, a license is valid for the period of time stipulated by the licensing department/office, but no longer than 5 years.
  - (2) Certification. When an operator is not required to be licensed under paragraph (c)(1) of this section, the operator must be certified in accordance with paragraph (d) or (e) of this section.
  - (3) No cost to employees. Whenever operator certification/licensure is required under this section, the employer must provide the certification/licensure at no cost to employees.
  - (4) Provision of testing and training. A testing entity is permitted to provide training as well as testing services as long as the criteria of the applicable governmental or accrediting agency (in the option selected) for an organization providing both services are met.
- (d) Certification by an accredited crane operator testing organization.
- (1) For a certification to satisfy the requirements of this section, the crane operator testing organization providing the certification must:

- (i) Be accredited by a nationally recognized accrediting agency based on that agency's determination that industry-recognized criteria for written testing materials, practical examinations, test administration, grading, facilities/equipment, and personnel have been met.
  - (ii) Administer written and practical tests that:
    - (A) Assess the operator applicant regarding, at a minimum, the knowledge and skills listed in paragraphs (j)(1) and (2) of this section.
    - (B) Provide certification based on equipment type, or type and capacity.
  - (iii) Have procedures for operators to re-apply and be re-tested in the event an operator applicant fails a test or is decertified.
  - (iv) Have testing procedures for recertification designed to ensure that the operator continues to meet the technical knowledge and skills requirements in paragraphs (j)(1) and (2) of this section.
  - (v) Have its accreditation reviewed by the nationally recognized accrediting agency at least every 3 years.
- (2) If no accredited testing agency offers certification examinations for a particular type of equipment, an operator will be deemed to have complied with the certification requirements of this section for that equipment if the operator has been certified for the type that is most similar to that equipment and for which a certification examination is available. The operator's certificate must state the type of equipment for which the operator is certified.
- (3) A certification issued under this option is portable among employers who are required to have operators certified under this option.
- (4) A certification issued under this paragraph is valid for 5 years.
- (e) Audited employer program. The employer's certification of its employee must meet the following requirements:
- (1) Testing. The written and practical tests must be either:
    - (i) Developed by an accredited crane operator testing organization (see paragraph (d) of this section); or
    - (ii) Approved by an auditor in accordance with the following requirements:
      - (A) The auditor is certified to evaluate such tests by an accredited crane operator testing organization (see paragraph (d) of this section).
      - (B) The auditor is not an employee of the employer.

- (C) The approval must be based on the auditor's determination that the written and practical tests meet nationally recognized test development criteria and are valid and reliable in assessing the operator applicants regarding, at a minimum, the knowledge and skills listed in paragraphs (j)(1) and (2) of this section.
  - (D) The audit must be conducted in accordance with nationally recognized auditing standards.
- (2) Administration of tests.
- (i) The written and practical tests must be administered under circumstances approved by the auditor as meeting nationally recognized test administration standards.
  - (ii) The auditor must be certified to evaluate the administration of the written and practical tests by an accredited crane operator testing organization (see paragraph (d) of this section).
  - (iii) The auditor must not be an employee of the employer.
  - (iv) The audit must be conducted in accordance with nationally recognized auditing standards.
- (3) Timing of audit. The employer program must be audited within 3 months of the beginning of the program and at least every 3 years thereafter.
- (4) Requalification. The employer program must have testing procedures for re-qualification designed to ensure that the operator continues to meet the technical knowledge and skills requirements in paragraphs (j)(1) and (2) of this section. The re-qualification procedures must be audited in accordance with paragraphs (e)(1) and (2) of this section.
- (5) Deficiencies. If the auditor determines that there is a significant deficiency ("deficiency") in the program, the employer must ensure that:
- (i) No operator is qualified until the auditor confirms that the deficiency has been corrected.
  - (ii) The program is audited again within 180 days of the confirmation that the deficiency was corrected.
  - (iii) The auditor files a documented report of the deficiency to the appropriate Regional Office of the Occupational Safety and Health Administration within 15 days of the auditor's determination that there is a deficiency.

- (iv) Records of the audits of the employer's program are maintained by the auditor for 3 years and are made available by the auditor to the Secretary of Labor or the Secretary's designated representative upon request.
- (6) Audited-program certificates. A certification under this paragraph is:
- (i) Not portable: Such a certification meets the requirements of paragraph (c) of this section only where the operator is employed by (and operating the equipment for) the employer that issued the certification.
  - (ii) Valid for 5 years.
- (f) Evaluation.
- (1) Through an evaluation, the employer must ensure that each operator is qualified by a demonstration of:
    - (i) The skills and knowledge, as well as the ability to recognize and avert risk, necessary to operate the equipment safely, including those specific to the safety devices, operational aids, software, and the size and configuration of the equipment. Size and configuration includes, but is not limited to, lifting capacity, boom length, attachments, luffing jib, and counterweight set-up.
    - (ii) The ability to perform the hoisting activities required for assigned work, including, if applicable, blind lifts, personnel hoisting, and multi-crane lifts.
  - (2) For operators employed prior to December 10, 2018, the employer may rely on its previous assessments of the operator in lieu of conducting a new evaluation of that operator's existing knowledge and skills.
  - (3) The definition of "qualified" in 1926.32 does not apply to paragraph (f)(1) of this section: Possession of a certificate or degree cannot, by itself, cause a person to be qualified for purposes of paragraph (f)(1).
  - (4) The evaluation required under paragraph (f)(1) of this section must be conducted by an individual who has the knowledge, training, and experience necessary to assess equipment operators.
  - (5) The evaluator must be an employee or agent of the employer. Employers that assign evaluations to an agent retain the duty to ensure that the requirements in paragraph (f) are satisfied. Once the evaluation is completed successfully, the employer may allow the operator to operate other equipment that the employer can demonstrate does not require substantially different skills, knowledge, or ability to recognize and avert risk to operate.

- (6) The employer must document the completion of the evaluation. This document must provide: The operator's name; the evaluator's name and signature; the date; and the make, model, and configuration of equipment used in the evaluation. The employer must make the document available at the worksite while the operator is employed by the employer. For operators assessed per paragraph (f)(2) of this section, the documentation must reflect the date of the employer's determination of the operator's abilities and the make, model and configuration of equipment on which the operator has previously demonstrated competency.
- (7) When an employer is required to provide an operator with retraining under paragraph (b)(5) of this section, the employer must re-evaluate the operator with respect to the subject of the retraining.
- (g) [Reserved.]
- (h) Language and literacy requirements.
- (1) Tests under this section may be administered verbally, with answers given verbally, where the operator candidate:
- (i) Passes a written demonstration of literacy relevant to the work.
  - (ii) Demonstrates the ability to use the type of written manufacturer procedures applicable to the class/type of equipment for which the candidate is seeking certification.
- (2) Tests under this section may be administered in any language the operator candidate understands, and the operator's certification documentation must note the language in which the test was given. The operator is only permitted to operate equipment that is furnished with materials required by this subpart, such as operations manuals and load charts, that are written in the language of the certification.
- (i) [Reserved.]
- (j) Certification criteria. Certifications must be based on the following:
- (1) A determination through a written test that:
- (i) The individual knows the information necessary for safe operation of the specific type of equipment the individual will operate, including all of the following:
    - (A) The controls and operational/performance characteristics.

- (B) Use of, and the ability to calculate (manually or with a calculator), load/capacity information on a variety of configurations of the equipment.
- (C) Procedures for preventing and responding to power line contact.
- (D) Technical knowledge of the subject matter criteria listed in appendix C of this subpart applicable to the specific type of equipment the individual will operate. Use of the appendix C criteria meets the requirements of this provision.
- (E) Technical knowledge applicable to the suitability of the supporting ground and surface to handle expected loads, site hazards, and site access.
- (F) This subpart, including applicable incorporated materials.
  - (ii) The individual is able to read and locate relevant information in the equipment manual and other materials containing information referred to in paragraph (j)(1)(i) of this section.
- (2) A determination through a practical test that the individual has the skills necessary for safe operation of the equipment, including the following:
  - (i) Ability to recognize, from visual and auditory observation, the items listed in 1926.1412(d) (shift inspection).
  - (ii) Operational and maneuvering skills.
  - (iii) Application of load chart information.
  - (iv) Application of safe shut-down and securing procedures.
- (k) Effective dates.
  - (1) Apart from the evaluation and documentation requirements in paragraphs (a) and (f), this section is effective on December 10, 2018.
  - (2) The evaluation and documentation requirements in paragraphs (a) and (f) are effective on February 7, 2019.

## 1926.1428 Signal person qualifications

- (a) The employer of the signal person must ensure that each signal person meets the Qualification Requirements (paragraph (c) of this section) prior to giving any signals. This requirement must be met by using either Option (1) or Option (2) of this section.
- (1) Option (1) – Third party qualified evaluator. The signal person has documentation from a third party qualified evaluator (see Qualified Evaluator (third party), 1926.1401 for definition) showing that the signal person meets the Qualification Requirements (see paragraph (c) of this section).
  - (2) Option (2) – Employer’s qualified evaluator. The employer’s qualified (see Qualified Evaluator (not a third party), 1926.1401 for definition) evaluator assesses the individual and determines that the individual meets the Qualification Requirements (see paragraph (c) of this section) and provides documentation of that determination. An assessment by an employer’s qualified evaluator under this option is not portable – other employers are not permitted to use it to meet the requirements of this section.
  - (3) The employer must make the documentation for whichever option is used available at the site while the signal person is employed by the employer. The documentation must specify each type of signaling (e.g. hand signals, radio signals, etc.) for which the signal person meets the requirements of paragraph (c) of this section.
- (b) If subsequent actions by the signal person indicate that the individual does not meet the Qualification Requirements (see paragraph (c) of this section), the employer must not allow the individual to continue working as a signal person until re-training is provided and a re-assessment is made in accordance with paragraph (a) of this section that confirms that the individual meets the Qualification Requirements.
- (c) Qualification Requirements. Each signal person must:
- (1) Know and understand the type of signals used. If hand signals are used, the signal person must know and understand the Standard Method for hand signals.
  - (2) Be competent in the application of the type of signals used.
  - (3) Have a basic understanding of equipment operation and limitations, including the crane dynamics involved in swinging and stopping loads and boom deflection from hoisting loads.

- (4) Know and understand the relevant requirements of 1926.1419 through 1926.1422 and 1926.1428.
- (5) Demonstrate that he/she meets the requirements in paragraphs (c)(1) through (4) of this section through an oral or written test, and through a practical test.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 1-2011, f. 2/9/11, ef. 2/9/11.

### **1926.1429 Qualifications of maintenance & repair employees**

- (a) Maintenance, inspection and repair personnel are permitted to operate the equipment only where all of the following requirements are met:
  - (1) The operation is limited to those functions necessary to perform maintenance, inspect the equipment, or verify its performance.
  - (2) The personnel either:
    - (i) Operate the equipment under the direct supervision of an operator who meets the requirements of 1926.1427 (Operator qualification and certification); or
    - (ii) Are familiar with the operation, limitations, characteristics and hazards associated with the type of equipment.
- (b) Maintenance and repair personnel must meet the definition of a qualified person with respect to the equipment and maintenance/repair tasks performed.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 1-2011, f. 2/9/11, ef. 2/9/11.

### **1926.1430 Training**

The employer must provide training as follows:

- (a) Overhead powerlines. The employer must train each employee specified in 1926.1408(g) and 1926.1410(m) in the topics listed in 1926.1408(g).
- (b) Signal persons. The employer must train each employee who will be assigned to work as a signal persons who does not meet the requirements of 1926.1428(c) in the areas addressed in that paragraph.
- (c) Operators.

- (1) The employer must train each operator in accordance with 1926.1427(a) and (b), on the safe operation of the equipment the operator will be using.
- (2) The employer must train each operator covered under the exception of 1926.1427(a)(2) on the safe operation of the equipment the operator will be using.
- (3) The employer must train each operator of the equipment covered by this subpart in the following practices:
  - (i) On friction equipment, whenever moving a boom off a support, first raise the boom a short distance (sufficient to take the load of the boom) to determine if the boom hoist brake needs to be adjusted. On other types of equipment with a boom, the same practice is applicable, except that typically there is no means of adjusting the brake; if the brake does not hold, a repair is necessary. See 1926.1417(f) and (j) for additional requirements.
  - (ii) Where available, the manufacturer's emergency procedures for halting unintended equipment movement.
- (d) Competent persons and qualified persons. The employer must train each competent person and each qualified person regarding the requirements of this subpart applicable to their respective roles.
- (e) Crush/pinch points. The employer must train each employee who works with the equipment to keep clear of holes, and crush/pinch points and the hazards addressed in 1926.1424 (Work area control).
- (f) Tag-out. The employer must train each operator and each additional employee authorized to start/energize equipment or operate equipment controls (such as maintenance and repair employees), in the tag-out and start-up procedures in 1926.1417(f) and (g).
- (g) Training administration.
  - (1) The employer must evaluate each employee required to be trained under this subpart to confirm that the employee understands the information provided in the training.
  - (2) The employer must provide refresher training in relevant topics for each employee when, based on the conduct of the employee or an evaluation of the employee's knowledge, there is an indication that retraining is necessary.
  - (3) Whenever training is required under subpart CC, the employer must provide the training at no cost to the employee.

Hist: OR-OSHA Admin. Order 1-2011, f. 2/9/11, ef. 2/9/11.

OR-OSHA Admin. Order 1-2019, f. 5/9/19, ef. 5/9/19.

## 1926.1431 Hoisting personnel

The requirements of this section are supplemental to the other requirements in this subpart and apply when one or more employees are hoisted.

- (a) The use of equipment to hoist employees is prohibited except where the employer demonstrates that the erection, use, and dismantling of conventional means of reaching the work area, such as a personnel hoist, ladder, stairway, aerial lift, elevating work platform, or scaffold, would be more hazardous, or is not possible because of the project's structural design or worksite conditions. This paragraph does not apply to work covered by subpart R (Steel Erection) of this part.
- (b) Use of personnel platform.
- (1) When using equipment to hoist employees, the employees must be in a personnel platform that meets the requirements of paragraph (e) of this section.
  - (2) Exceptions: A personnel platform is not required for hoisting employees:
    - (i) Into and out of drill shafts that are up to and including 8 feet in diameter (see paragraph (o) of this section for requirements for hoisting these employees).
    - (ii) In pile driving operations (see paragraph (p) of this section for requirements for hoisting these employees).
    - (iii) Solely for transfer to or from a marine worksite in a marine-hoisted personnel transfer device (see paragraph (r) of this section for requirements for hoisting these employees).
    - (iv) In storage-tank (steel or concrete), shaft and chimney operations (see paragraph (s) of this section for requirements for hoisting these employees).
- (c) Equipment set-up.
- (1) The equipment must be uniformly level, within one percent of level grade, and located on footing that a qualified person has determined to be sufficiently firm and stable.

- (2) Equipment with outriggers or stabilizers must have them all extended and locked. The amount of extension must be the same for all outriggers and stabilizers and in accordance with manufacturer procedures and load charts.

(d) Equipment criteria.

- (1) Capacity: use of suspended personnel platforms. The total load (with the platform loaded, including the hook, load line and rigging) must not exceed 50 percent of the rated capacity for the radius and configuration of the equipment, except during proof testing.
- (2) Capacity: use of boom-attached personnel platforms. The total weight of the loaded personnel platform must not exceed 50 percent of the rated capacity for the radius and configuration of the equipment (except during proof testing).
- (3) Capacity: hoisting personnel without a personnel platform. When hoisting personnel without a personnel platform pursuant to paragraph (b)(2) of this section, the total load (including the hook, load line, rigging and any other equipment that imposes a load) must not exceed 50 percent of the rated capacity for the radius and configuration of the equipment, except during proof testing.
- (4) When the occupied personnel platform is in a stationary working position, the load and boom hoist brakes, swing brakes, and operator actuated secondary braking and locking features (such as pawls or dogs) or automatic secondary brakes must be engaged.
- (5) Devices.
  - (i) Equipment (except for derricks and articulating cranes) with a variable angle boom must be equipped with all of the following:
    - (A) A boom angle indicator, readily visible to the operator, and
    - (B) A boom hoist limiting device.
  - (ii) Articulating cranes must be equipped with a properly functioning automatic overload protection device.
  - (iii) Equipment with a luffing jib must be equipped with:
    - (A) A jib angle indicator, readily visible to the operator, and
    - (B) A jib hoist limiting device.
  - (iv) Equipment with telescoping booms must be equipped with a device to indicate the boom's extended length clearly to the operator, or must have measuring marks on the boom.

(v) Anti two-block. A device which automatically prevents damage and load failure from contact between the load block, overhaul ball, or similar component, and the boom tip (or fixed upper block or similar component) must be used. The device(s) must prevent such damage/failure at all points where two-blocking could occur. Exception: this device is not required when hoisting personnel in pile driving operations. Instead, paragraph (p)(2) of this section specifies how to prevent two-blocking during such operations.

(vi) Controlled load lowering. The load line hoist drum must have a system, other than the load line hoist brake, which regulates the lowering rate of speed of the hoist mechanism. This system or device must be used when hoisting personnel.

(Note: Free fall of the load line hoist is prohibited (see 1926.1426(d); the use of equipment in which the boom hoist mechanism can free fall is also prohibited (see 1926.1426(a)(1).)

(vii) Proper operation required. Personnel hoisting operations must not begin unless the devices listed in this section are in proper working order. If a device stops working properly during such operations, the operator must safely stop operations. Personnel hoisting operations must not resume until the device is again working properly. Alternative measures are not permitted. (See 1926.1417 for tag-out and related requirements.)

(6) Direct attachment of a personnel platform to a luffing jib is prohibited.

(e) Personnel platform criteria.

- (1) A qualified person familiar with structural design must design the personnel platform and attachment/suspension system used for hoisting personnel.
- (2) The system used to connect the personnel platform to the equipment must allow the platform to remain within 10 degrees of level, regardless of boom angle.
- (3) The suspension system must be designed to minimize tipping of the platform due to movement of employees occupying the platform.
- (4) The personnel platform itself (excluding the guardrail system and personal fall arrest system anchorages), must be capable of supporting, without failure, its own weight and at least five times the maximum intended load.
- (5) All welding of the personnel platform and its components must be performed by a certified welder familiar with the weld grades, types and material specified in the platform design.

- (6) The personnel platform must be equipped with a guardrail system which meets the requirements of subpart M of this part, and must be enclosed at least from the toeboard to midrail with either solid construction material or expanded metal having openings no greater than ½ inch (1.27cm). Points to which personal fall arrest systems are attached must meet the anchorage requirements in subpart M of this part.
  - (7) A grab rail must be installed inside the entire perimeter of the personnel platform except for access gates/doors.
  - (8) Access gates/doors. If installed, access gates/doors of all types (including swinging, sliding, folding, or other types) must:
    - (i) Not swing outward. If due to the size of the personnel platform, such as a 1-person platform, it is infeasible for the door to swing inward and allow safe entry for the platform occupant, then the access gate/door may swing outward.
    - (ii) Be equipped with a device that prevents accidental opening.
  - (9) Headroom must be sufficient to allow employees to stand upright in the platform.
  - (10) In addition to the use of hard hats, employees must be protected by overhead protection on the personnel platform when employees are exposed to falling objects. The platform overhead protection must not obscure the view of the operator or platform occupants (such as wire mesh that has up to ½ inch openings), unless full protection is necessary.
  - (11) All edges exposed to employee contact must be smooth enough to prevent injury.
  - (12) The weight of the platform and its rated capacity must be conspicuously posted on the platform with a plate or other permanent marking.
- (f) Personnel platform loading.
- (1) The personnel platform must not be loaded in excess of its rated capacity.
  - (2) Use.
    - (i) Personnel platforms must be used only for employees, their tools, and the materials necessary to do their work. Platforms must not be used to hoist materials or tools when not hoisting personnel.
    - (ii) Exception: materials and tools to be used during the lift, if secured and distributed in accordance with paragraph (f)(3) of this section may be in the platform for trial lifts.

- (3) Materials and tools must be:
- (i) Secured to prevent displacement.
  - (ii) Evenly distributed within the confines of the platform while it is suspended.
- (4) The number of employees occupying the personnel platform must not exceed the maximum number the platform was designed to hold or the number required to perform the work, whichever is less.
- (g) Attachment and rigging.
- (1) Hooks and other detachable devices.
    - (i) Hooks used in the connection between the hoist line and the personnel platform (including hooks on overhaul ball assemblies, lower load blocks, bridle legs, or other attachment assemblies or components) must be:
      - (A) Of a type that can be closed and locked, eliminating the throat opening.
      - (B) Closed and locked when attached.
    - (ii) Shackles used in place of hooks must be of the alloy anchor type, with either:
      - (A) A bolt, nut and retaining pin, in place; or
      - (B) Of the screw type, with the screw pin secured from accidental removal.
    - (iii) Where other detachable devices are used, they must be of the type that can be closed and locked to the same extent as the devices addressed in paragraphs (g)(1)(i) and (ii) of this section. Such devices must be closed and locked when attached.
  - (2) Rope bridle. When a rope bridle is used to suspend the personnel platform, each bridle leg must be connected to a master link or shackle (see paragraph (g)(1) of this section) in a manner that ensures that the load is evenly divided among the bridle legs.
  - (3) Rigging hardware (including wire rope, shackles, rings, master links, and other rigging hardware) and hooks must be capable of supporting, without failure, at least five times the maximum intended load applied or transmitted to that component. Where rotation resistant rope is used, the slings must be capable of supporting without failure at least ten times the maximum intended load.
  - (4) Eyes in wire rope slings must be fabricated with thimbles.

- (5) Bridles and associated rigging for suspending the personnel platform must be used only for the platform and the necessary employees, their tools and materials necessary to do their work. The bridles and associated rigging must not have been used for any purpose other than hoisting personnel.
- (h) Trial lift and inspection.
- (1) A trial lift with the unoccupied personnel platform loaded at least to the anticipated liftweight must be made from ground level, or any other location where employees will enter the platform, to each location at which the platform is to be hoisted and positioned. Where there is more than one location to be reached from a single set-up position, either individual trial lifts for each location, or a single trial lift, in which the platform is moved sequentially to each location, must be performed; the method selected must be the same as the method that will be used to hoist the personnel.
  - (2) The trial lift must be performed immediately prior to each shift in which personnel will be hoisted. In addition, the trial lift must be repeated prior to hoisting employees in each of the following circumstances:
    - (i) The equipment is moved and set up in a new location or returned to a previously used location.
    - (ii) The lift route is changed, unless the competent person determines that the new route presents no new factors affecting safety.
  - (3) The competent person must determine that:
    - (i) Safety devices and operational aids required by this section are activated and functioning properly. Other safety devices and operational aids must meet the requirements of 1926.1415 and 1926.1416.
    - (ii) Nothing interferes with the equipment or the personnel platform in the course of the trial lift.
    - (iii) The lift will not exceed 50 percent of the equipment's rated capacity at any time during the lift.
    - (iv) The load radius to be used during the lift has been accurately determined.
  - (4) Immediately after the trial lift, the competent person must:
    - (i) Conduct a visual inspection of the equipment, base support or ground, and personnel platform, to determine whether the trial lift has exposed any defect or problem or produced any adverse effect.
    - (ii) Confirm that, upon the completion of the trial lift process, the test weight has been removed.

- (5) Immediately prior to each lift:
- (i) The platform must be hoisted a few inches with the personnel and materials/tools on board and inspected by a competent person to ensure that it is secure and properly balanced.
  - (ii) The following conditions must be determined by a competent person to exist before the lift of personnel proceeds:
    - (A) Hoist ropes must be free of deficiencies in accordance with 1926.1413(a).
    - (B) Multiple part lines must not be twisted around each other.
    - (C) The primary attachment must be centered over the platform.
    - (D) If the load rope is slack, the hoisting system must be inspected to ensure that all ropes are properly seated on drums and in sheaves.
- (6) Any condition found during the trial lift and subsequent inspection(s) that fails to meet a requirement of this standard or otherwise creates a safety hazard must be corrected before hoisting personnel. (See 1926.1417 for tag-out and related requirements.)
- (i) [Reserved.]
- (j) Proof testing.
- (1) At each jobsite, prior to hoisting employees on the personnel platform, and after any repair or modification, the platform and rigging must be proof tested to 125 percent of the platform's rated capacity. The proof test may be done concurrently with the trial lift.
  - (2) The platform must be lowered by controlled load lowering, braked, and held in a suspended position for a minimum of five minutes with the test load evenly distributed on the platform.
  - (3) After proof testing, a competent person must inspect the platform and rigging to determine if the test has been passed. If any deficiencies are found that pose a safety hazard, the platform and rigging must not be used to hoist personnel unless the deficiencies are corrected, the test is repeated, and a competent person determines that the test has been passed. (See 1926.1417 for tag-out and related requirements.)
  - (4) Personnel hoisting must not be conducted until the competent person determines that the platform and rigging have successfully passed the proof test.

(k) Work practices.

- (1) Hoisting of the personnel platform must be performed in a slow, controlled, cautious manner, with no sudden movements of the equipment or the platform.
- (2) Platform occupants must:
  - (i) Keep all parts of the body inside the platform during raising, lowering, and horizontal movement. This provision does not apply to an occupant of the platform when necessary to position the platform or while performing the duties of a signal person.
  - (ii) Not stand, sit on, or work from the top or intermediate rail or toeboard, or use any other means/device to raise their working height.
  - (iii) Not pull the platform out of plumb in relation to the hoisting equipment.
- (3) Before employees exit or enter a hoisted personnel platform that is not landed, the platform must be secured to the structure where the work is to be performed, unless the employer can demonstrate that securing to the structure would create a greater hazard.
- (4) If the platform is tied to the structure, the operator must not move the platform until the operator receives confirmation that it is freely suspended.
- (5) Tag lines must be used when necessary to control the platform.
- (6) Platforms without controls. Where the platform is not equipped with controls, the equipment operator must remain at the equipment controls, on site, and in view of the equipment, at all times while the platform is occupied.
- (7) Platforms with controls. Where the platform is equipped with controls, all of the following must be met at all times while the platform is occupied:
  - (i) The occupant using the controls in the platform must be a qualified person with respect to their use, including the safe limitations of the equipment and hazards associated with its operation.
  - (ii) The equipment operator must be at a set of equipment controls that include boom and swing functions of the equipment, and must be on site and in view of the equipment.
  - (iii) The platform operating manual must be in the platform or on the equipment.
- (8) Environmental conditions.

- (i) Wind. When wind speed (sustained or gusts) exceeds 20 mph at the personnel platform, a qualified person must determine if, in light of the wind conditions, it is not safe to lift personnel. If it is not, the lifting operation must not begin (or, if already in progress, must be terminated).
  - (ii) Other weather and environmental conditions. A qualified person must determine if, in light of indications of dangerous weather conditions, or other impending or existing danger, it is not safe to lift personnel. If it is not, the lifting operation must not begin (or, if already in progress, must be terminated).
- (9) Employees being hoisted must remain in direct communication with the signal person (where used), or the operator.
- (10) Fall protection.
- (i) Except over water, employees occupying the personnel platform must be provided and use a personal fall arrest system. The system must be attached to a structural member within the personnel platform. When working over or near water, the requirements of 1926.106 apply.
  - (ii) The fall arrest system, including the attachment point (anchorage) used to comply with paragraph (i) of this section, must meet the requirements in 1926.502.
- (11) Other load lines.
- (i) No lifts must be made on any other of the equipment's load lines while personnel are being hoisted, except in pile driving operations.
  - (ii) Factory-produced boom-mounted personnel platforms that incorporate a winch as original equipment. Loads are permitted to be hoisted by such a winch while employees occupy the personnel platform only where the load on the winch line does not exceed 500 pounds and does not exceed the rated capacity of the winch and platform.
- (12) Traveling – equipment other than derricks.
- (i) Hoisting of employees while the equipment is traveling is prohibited, except for:
    - (A) Equipment that travels on fixed rails; or
    - (B) Where the employer demonstrates that there is no less hazardous way to perform the work.
    - (C) This exception does not apply to rubber-tired equipment.

- (ii) Where employees are hoisted while the equipment is traveling, all of the following criteria must be met:
  - (A) Equipment travel must be restricted to a fixed track or runway.
  - (B) Where a runway is used, it must be a firm, level surface designed, prepared and designated as a path of travel for the weight and configuration of the equipment being used to lift and travel with the personnel platform. An existing surface may be used as long as it meets these criteria.
  - (C) Equipment travel must be limited to boom length.
  - (D) The boom must be parallel to the direction of travel, except where it is safer to do otherwise.
  - (E) A complete trial run must be performed to test the route of travel before employees are allowed to occupy the platform. This trial run can be performed at the same time as the trial lift required by paragraph (h) of this section which tests the lift route.
- (13) Traveling – derricks. Derricks are prohibited from traveling while personnel are hoisted.
- (l) [Reserved.]
- (m) Pre-lift meeting. A pre-lift meeting must be:
  - (1) Held to review the applicable requirements of this section and the procedures that will be followed.
  - (2) Attended by the equipment operator, signal person (if used for the lift), employees to be hoisted, and the person responsible for the task to be performed.
  - (3) Held prior to the trial lift at each new work location, and must be repeated for any employees newly assigned to the operation.
- (n) Hoisting personnel near power lines. Hoisting personnel within 20 feet of a power line that is up to 350 kV, and hoisting personnel within 50 feet of a power line that is over 350 kV, is prohibited, except for work covered by subpart V of this part (Power Transmission and Distribution).
- (o) Hoisting personnel in drill shafts. When hoisting employees into and out of drill shafts that are up to and including 8 feet in diameter, all of the following requirements must be met:
  - (1) The employee must be in either a personnel platform or on a boatswain's chair.

- (2) If using a personnel platform, paragraphs (a) through (n) of this section apply.
- (3) If using a boatswain's chair:
- (i) The following paragraphs of this section apply: (a), (c), (d)(1), (d)(3), (d)(4), (e)(1), (e)(2), (e)(3), (f)(1), (f)(2)(i), (f)(3)(i), (g), (h), (k)(1), (k)(6), (k)(8), (k)(9), (k)(11)(i), (m), (n). Where the terms "personnel platform" or "platform" are used in these paragraphs, substitute them with "boatswain's chair."
  - (ii) A signal person must be stationed at the shaft opening.
  - (iii) The employee must be hoisted in a slow, controlled descent and ascent.
  - (iv) The employee must use personal fall protection equipment, including a full body harness, attached independent of the crane/derrick.
  - (v) The fall protection equipment must meet the applicable requirements in 1926.502.
  - (vi) The boatswain's chair itself (excluding the personal fall arrest system anchorages), must be capable of supporting, without failure, its own weight and at least five times the maximum intended load.
  - (vii) No more than one person must be hoisted at a time.
- (p) Hoisting personnel for pile driving operations. When hoisting an employee in pile driving operations, the following requirements must be met:
- (1) The employee must be in a personnel platform or boatswain's chair.
  - (2) For lattice boom cranes: Clearly mark the cable (so that it can easily be seen by the operator) at a point that will give the operator sufficient time to stop the hoist to prevent two-blocking, or use a spotter who is in direct communication with the operator to inform the operator when this point is reached. For telescopic boom cranes: Clearly mark the cable (so that it can be easily seen by the operator) at a point that will give the operator sufficient time to stop the hoist to prevent two-blocking, and use a spotter who is in direct communication with the operator to inform the operator when this point is reached.
  - (3) If using a personnel platform, paragraphs (b) through (n) of this section apply.
  - (4) If using a boatswain's chair:

- (i) The following paragraphs of this section apply: (a), (c), (d)(1), (d)(3), (d)(4), (e)(1), (e)(2), (e)(3), (f)(1), (f)(2)(i), (f)(3)(i), (g), (h), (j), (k)(1), (k)(6), (k)(8), (k)(9), (k)(11)(i), (m), and (n). Where the terms “personnel platform” or “platform” are used in these paragraphs, substitute them with “boatswain’s chair.”
  - (ii) The employee must be hoisted in a slow, controlled descent and ascent.
  - (iii) The employee must use personal fall protection equipment, including a full body harness, independently attached to the lower load block or overhaul ball.
  - (iv) The fall protection equipment must meet the applicable requirements in 1926.502.
  - (v) The boatswain’s chair itself (excluding the personal fall arrest system anchorages), must be capable of supporting, without failure, its own weight and at least five times the maximum intended load.
  - (vi) No more than one person must be hoisted at a time.
- (q) [Reserved.]
- (r) Hoisting personnel for marine transfer. When hoisting employees solely for transfer to or from a marine worksite, the following requirements must be met:
- (1) The employee must be in either a personnel platform or a marine-hoisted personnel transfer device.
  - (2) If using a personnel platform, paragraphs (a) through (n) of this section apply.
  - (3) If using a marine-hoisted personnel transfer device:
    - (i) The following paragraphs of this section apply: (a), (c)(2), (d)(1), (d)(3), (d)(4), (e)(1) through (5), (e)(12), (f)(1), (g), (h), (j), (k)(1), (k)(8), (k)(9), (k)(10)(ii), (k)(11)(i), (k)(12), (m), and (n). Where the terms “personnel platform” or “platform” are used in these paragraphs, substitute them with “marine-hoisted personnel transfer device.”
    - (ii) The transfer device must be used only for transferring workers.
    - (iii) The number of workers occupying the transfer device must not exceed the maximum number it was designed to hold.
    - (iv) Each employee must wear a U.S. Coast Guard personal flotation device approved for industrial use.

- (s) Hoisting personnel for storage-tank (steel or concrete), shaft and chimney operations. When hoisting an employee in storage tank (steel or concrete), shaft and chimney operations, the following requirements must be met:
- (1) The employee must be in a personnel platform except when the employer can demonstrate that use of a personnel platform is infeasible; in such a case, a boatswain's chair must be used.
  - (2) If using a personnel platform, paragraphs (a) through (n) of this section apply.
  - (3) If using a boatswain's chair:
    - (i) The following paragraphs of this section apply: (a), (c), (d)(1), (d)(3), (d)(4), (e)(1), (e)(2), (e)(3), (f)(1), (f)(2)(i), (f)(3)(i), (g), (h), (k)(1), (k)(6), (k)(8), (k)(9), (k)(11)(i), (m), (n). Where the terms "personnel platform" or "platform" are used in these paragraphs, substitute them with "boatswain's chair."
    - (ii) The employee must be hoisted in a slow, controlled descent and ascent.
    - (iii) The employee must use personal fall protection equipment, including a full body harness, attached independent of the crane/derrick. When there is no adequate structure for attachment of personal fall arrest equipment as required in 1926.502(d)(15), the attachment must be to the lower load block or overhaul ball.
    - (iv) The fall protection equipment must meet the applicable requirements in 1926.502.
    - (v) The boatswain's chair itself (excluding the personal fall arrest system anchorages), must be capable of supporting, without failure, its own weight and at least five times the maximum intended load.
    - (vi) No more than one person must be hoisted at a time.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 1-2011, f. 2/9/11, ef. 2/9/11.

### **1926.1432 Multiple-crane/derrick lifts supplemental requirements**

- (a) Plan development. Before beginning a crane/derrick operation in which more than one crane/derrick will be supporting the load, the operation must be planned. The planning must meet the following requirements:
- (1) The plan must be developed by a qualified person.
  - (2) The plan must be designed to ensure that the requirements of this subpart are met.

(3) Where the qualified person determines that engineering expertise is needed for the planning, the employer must ensure that it is provided.

(b) Plan implementation.

(1) The multiple-crane/derrick lift must be directed by a person who meets the criteria for both a competent person and a qualified person, or by a competent person who is assisted by one or more qualified persons (lift director).

(2) The lift director must review the plan in a meeting with all workers who will be involved with the operation.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 1-2011, f. 2/9/11, ef. 2/9/11.

## 1926.1433 Design, construction and testing

The following requirements apply to equipment that has a manufacturer-rated hoisting/lifting capacity of more than 2,000 pounds.

(a) Crawler, truck and locomotive cranes manufactured prior to November 8, 2010 must meet the applicable requirements for design, construction, and testing as prescribed in ANSI B30.5-1968 (incorporated by reference, see 1926.6), PCSA Std. No. 2 (1968) (incorporated by reference, see 1926.6), the requirements in paragraph (b) of this section, or the applicable DIN standards that were in effect at the time of manufacture.

(b) Mobile (including crawler and truck) and locomotive cranes manufactured on or after November 8, 2010 must meet the following portions of ASME B30.5-2004 (incorporated by reference, see 1926.6) as applicable:

(1) In section 5-1.1.1 (“Load Ratings – Where Stability Governs Lifting Performance”), paragraphs (a) – (d) (including subparagraphs).

(2) In section 5-1.1.2 (“Load Ratings – Where Structural Competence Governs Lifting Performance”), paragraph (b).

(3) Section 5-1.2 (“Stability (Backward and Forward)”).

(4) In section 5-1.3.1 (“Boom Hoist Mechanism”), paragraphs (a), (b)(1) and (b)(2), except that when using rotation resistant rope, 1926.1414(c)(4)(ii)(A) applies.

(5) In section 5-1.3.2 (“Load Hoist Mechanism”), paragraphs (a)(2) through (a)(4) (including subparagraphs), (b) (including subparagraphs), (c) (first sentence only) and (d).

- (6) Section 5-1.3.3 (“Telescoping Boom”).
  - (7) Section 5-1.4 (“Swing Mechanism”).
  - (8) In section 5-1.5 (“Crane Travel”), all provisions except 5-1.5.3(d).
  - (9) In section 5-1.6 (“Controls”), all provisions except 5-1.6.1 (c).
  - (10) Section 5-1.7.4 (“Sheaves”).
  - (11) Section 5-1.7.5 (“Sheave sizes”).
  - (12) In section 5-1.9.1 (“Booms”), paragraph (f).
  - (13) Section 5-1.9.3 (“Outriggers”).
  - (14) Section 5-1.9.4 (“Locomotive Crane Equipment”).
  - (15) Section 5-1.9.7 (“Clutch and Brake Protection”).
  - (16) In section 5-1.9.11 (“Miscellaneous equipment”), paragraphs (a), (c), (e), and (f).
- (c) Prototype testing: mobile (including crawler and truck) and locomotive cranes manufactured on or after November 8, 2010 must meet the prototype testing requirements in Test Option A or Test Option B of this section. Tower cranes manufactured on or after November 8, 2010 must meet the prototype testing requirements in BS EN 14439:2006 (incorporated by reference, see 1926.6).
- Note:** Prototype testing of crawler, locomotive and truck cranes manufactured prior to November 8, 2010 must conform to paragraph (a) of this section.
- (1) Test Option A.
    - (i) The following applies to equipment with cantilevered booms (such as hydraulic boom cranes): All the tests listed in SAE J1063 (Nov. 1993) Table 1 (incorporated by reference, see 1926.6) must be performed to load all critical structural elements to their respective limits. All the strength margins listed in SAE J1063 (Nov. 1993) Table 2 (incorporated by reference, see 1926.6) must be met.
    - (ii) The following applies to equipment with pendant supported lattice booms: All the tests listed in SAE J987 (Jun. 2003) Table 1 (incorporated by reference, see 1926.6) must be performed to load all critical structural elements to their respective limits. All the strength margins listed in SAE J987 (Jun. 2003) Table 2 (incorporated by reference, see 1926.6) must be met.

- (2) Test Option B. The testing and verification requirements of BS EN 13000:2004 (incorporated by reference, see 1926.6) must be met. In applying BS EN 13000:2004, the following additional requirements must be met:
- (i) The following applies to equipment with cantilevered booms (such as hydraulic boom cranes): The analysis methodology (computer modeling) must demonstrate that all load cases listed in SAE J1063 (Nov. 1993) (incorporated by reference, see 1926.6) meet the strength margins listed in SAE J1063 (Nov. 1993) Table 2.
  - (ii) The following applies to equipment with pendant supported lattice booms: The analysis methodology (computer modeling) must demonstrate that all load cases listed in SAE J987 (Jun. 2003) (incorporated by reference, see 1926.6) meet the strength margins listed in SAE J987 (Jun. 2003) Table 2.
  - (iii) Analysis verification. The physical testing requirements under SAE J1063 (Nov. 1993) (incorporated by reference, see 1926.6) and SAE J987 (Jun. 2003) (incorporated by reference, see 1926.6) must be met unless the reliability of the analysis methodology (computer modeling) has been demonstrated by a documented history of verification through strain gauge measuring or strain gauge measuring in combination with other physical testing.
- (d) All equipment covered by this subpart must meet the following requirements:
- (1) Rated capacity and related information. The information available in the cab (see 1926.1417(c)) regarding “rated capacity” and related information must include, at a minimum, the following information:
    - (i) A complete range of the manufacturer’s equipment rated capacities, as follows:
      - (A) At all manufacturer approved operating radii, boom angles, work areas, boom lengths and configurations, jib lengths and angles (or offset).
      - (B) Alternate ratings for use and nonuse of option equipment which affects rated capacities, such as outriggers, stabilizers, and extra counterweights.
    - (ii) A work area chart for which capacities are listed in the load chart. (Note: an example of this type of chart is in ASME B30.5-2004, section 5-1.1.3, Figure 11).

- (iii) The work area figure and load chart must clearly indicate the areas where no load is to be handled.
  - (iv) Recommended reeving for the hoist lines must be shown.
  - (v) Recommended parts of hoist reeving, size, and type of wire rope for various equipment loads.
  - (vi) Recommended boom hoist reeving diagram, where applicable; size, type and length of wire rope.
  - (vii) Tire pressure (where applicable).
  - (viii) Caution or warnings relative to limitations on equipment and operating procedures, including an indication of the least stable direction.
  - (ix) Position of the gantry and requirements for intermediate boom suspension (where applicable).
  - (x) Instructions for boom erection and conditions under which the boom, or boom and jib combinations, may be raised or lowered.
  - (xi) Whether the hoist holding mechanism is automatically or manually controlled, whether free fall is available, or any combination of these.
  - (xii) The maximum telescopic travel length of each boom telescopic section.
  - (xiii) Whether sections are telescoped manually or with power.
  - (xiv) The sequence and procedure for extending and retracting the telescopic boom section.
  - (xv) Maximum loads permitted during the boom extending operation, and any limiting conditions or cautions.
  - (xvi) Hydraulic relief valve settings specified by the manufacturer.
- (2) Load hooks (including latched and unlatched types), ball assemblies and load blocks must be of sufficient weight to overhaul the line from the highest hook position for boom or boom and jib lengths and the number of parts of the line in use.
- (3) Hook and ball assemblies and load blocks must be marked with their rated capacity and weight.
- (4) Latching hooks.
- (i) Hooks must be equipped with latches, except where the requirements of paragraph (d)(4)(ii) of this section are met.

- (ii) Hooks without latches, or with latches removed or disabled, must not be used unless:
  - (A) A qualified person has determined that it is safer to hoist and place the load without latches (or with the latches removed/tied-back).
  - (B) Routes for the loads are pre-planned to ensure that no employee is required to work in the fall zone except for employees necessary for the hooking or unhooking of the load.
- (iii) The latch must close the throat opening and be designed to retain slings or other lifting devices/accessories in the hook when the rigging apparatus is slack.
- (5) Posted warnings. Posted warnings required by this subpart as well as those originally supplied with the equipment by the manufacturer must be maintained in legible condition.
- (6) An accessible fire extinguisher must be on the equipment.
- (7) Cabs. Equipment with cabs must meet the following requirements:
  - (i) Cabs must be designed with a form of adjustable ventilation and method for clearing the windshield for maintaining visibility and air circulation. Examples of means for adjustable ventilation include air conditioner or window that can be opened (for ventilation and air circulation); examples of means for maintaining visibility include heater (for preventing windshield icing), defroster, fan, windshield wiper.
  - (ii) Cab doors (swinging, sliding) must be designed to prevent inadvertent opening or closing while traveling or operating the machine. Swinging doors adjacent to the operator must open outward. Sliding operator doors must open rearward.
  - (iii) Windows.
    - (A) The cab must have windows in front and on both sides of the operator. Forward vertical visibility must be sufficient to give the operator a view of the boom point at all times.
    - (B) Windows may have sections designed to be opened or readily removed. Windows with sections designed to be opened must be designed so that they can be secured to prevent inadvertent closure.

- (C) Windows must be of safety glass or material with similar optical and safety properties, that introduce no visible distortion or otherwise obscure visibility that interferes with the safe operation of the equipment.
- (iv) A clear passageway must be provided from the operator's station to an exit door on the operator's side.
- (v) Areas of the cab roof that serve as a workstation for rigging, maintenance or other equipment-related tasks must be capable of supporting 250 pounds without permanent distortion.
- (8) Belts, gears, shafts, pulleys, sprockets, spindles, drums, fly wheels, chains, and other parts or components that reciprocate, rotate or otherwise move must be guarded where contact by employees (except for maintenance and repair employees) is possible in the performance of normal duties.
- (9) All exhaust pipes, turbochargers, and charge air coolers must be insulated or guarded where contact by employees (except for maintenance and repair employees) is possible in the performance of normal duties.
- (10) Hydraulic and pneumatic lines must be protected from damage to the extent feasible.
- (11) The equipment must be designed so that exhaust fumes are not discharged in the cab and are discharged in a direction away from the operator.
- (12) Friction mechanisms. Where friction mechanisms (such as brakes and clutches) are used to control the boom hoist or load line hoist, they must be:
- (i) Of a size and thermal capacity sufficient to control all rated loads with the minimum recommended reeving.
- (ii) Adjustable to permit compensation for lining wear to maintain proper operation.
- (13) Hydraulic load hoists. Hydraulic drums must have an integrally mounted holding device or internal static brake to prevent load hoist movement in the event of hydraulic failure.
- (e) The employer's obligations under paragraphs (a) through (c) and (d)(7) through (13) of this section are met where the equipment has not changed (except in accordance with 1926.1434 (Equipment modifications)) and it can refer to documentation from the manufacturer showing that the equipment has been designed, constructed and tested in accordance with those paragraphs.

Stat. Auth.: ORS 654.025(2) and 656.726(4).

Stats. Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 1-2011, f. 2/9/11, ef. 2/9/11.

## 1926.1434 Equipment modifications

- (a) Modifications or additions which affect the capacity or safe operation of the equipment are prohibited except where the requirements of paragraphs (a)(1), (a)(2), (a)(3), (a)(4), or (a)(5) of this section are met.
- (1) Manufacturer review and approval.
- (i) The manufacturer approves the modifications/additions in writing.
  - (ii) The load charts, procedures, instruction manuals and instruction plates/tags/decals are modified as necessary to accord with the modification/addition.
  - (iii) The original safety factor of the equipment is not reduced.
- (2) Manufacturer refusal to review request. The manufacturer is provided a detailed description of the proposed modification/addition, is asked to approve the modification/ addition, but it declines to review the technical merits of the proposal or fails, within 30 days, to acknowledge the request or initiate the review, and all of the following are met:
- (i) A registered professional engineer who is a qualified person with respect to the equipment involved:
    - (A) Approves the modification/addition and specifies the equipment configurations to which that approval applies, and
    - (B) Modifies load charts, procedures, instruction manuals and instruction plates/tags/decals as necessary to accord with the modification/addition.
  - (ii) The original safety factor of the equipment is not reduced.
- (3) Unavailable manufacturer. The manufacturer is unavailable and the requirements of paragraphs (a)(2)(i) and (ii) of this section are met.
- (4) Manufacturer does not complete the review within 120 days of the request. The manufacturer is provided a detailed description of the proposed modification/ addition, is asked to approve the modification/ addition, agrees to review the technical merits of the proposal, but fails to complete the review of the proposal within 120 days of the date it was provided the detailed description of the proposed modification/ addition, and the requirements of paragraphs (a)(2)(i) and (ii) of this section are met.

- (5) Multiple manufacturers of equipment designed for use on marine work sites. The equipment is designed for marine work sites, contains major structural components from more than one manufacturer, and the requirements of paragraphs (a)(2)(i) and (ii) of this section are met.
- (b) Modifications or additions which affect the capacity or safe operation of the equipment are prohibited where the manufacturer, after a review of the technical safety merits of the proposed modification/addition, rejects the proposal and explains the reasons for the rejection in a written response. If the manufacturer rejects the proposal but does not explain the reasons for the rejection in writing, the employer may treat this as a manufacturer refusal to review the request under paragraph (a)(2) of this section.
- (c) The provisions in paragraphs (a) and (b) of this section do not apply to modifications made or approved by the U.S. military.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 1-2011, f. 2/9/11, ef. 2/9/11.

## 1926.1435 Tower cranes

- (a) This section contains supplemental requirements for tower cranes; all sections of this subpart apply to tower cranes unless specified otherwise.
- (b) Erecting, climbing and dismantling.
- (1) Section 1926.1403 (Assembly/Disassembly – selection of manufacturer or employer procedures), 1926.1404 (Assembly/Disassembly – general requirements (applies to all assembly and disassembly operations)), 1926.1405 (Disassembly – additional requirements for dismantling of booms and jibs (applies to both the use of manufacturer procedures and employer procedures)), and 1926.1406 (Assembly/Disassembly – employer procedures - general requirements), apply to tower cranes (except as otherwise specified), except that the term “assembly/ disassembly” is replaced by “erecting, climbing and dismantling,” and the term “disassembly” is replaced by “dismantling.”
- (2) Dangerous areas (self-erecting tower cranes). In addition to the requirements in 1926.1404(e), for self-erecting tower cranes, the following applies: Employees must not be in or under the tower, jib, or rotating portion of the crane during erecting, climbing and dismantling operations until the crane is secured in a locked position and the competent person in charge indicates it is safe to enter this area, unless the manufacturer’s instructions direct otherwise and only the necessary personnel are permitted in this area.

- (3) Foundations and structural supports. Tower crane foundations and structural supports (including both the portions of the structure used for support and the means of attachment) must be designed by the manufacturer or a registered professional engineer.
- (4) Addressing specific hazards. The requirements in 1926.1404(h)(1) through (9) apply. In addition, the A/D director must address the following:
  - (i) Foundations and structural supports. The A/D director must determine that tower crane foundations and structural supports are installed in accordance with their design.
  - (ii) Loss of backward stability. Backward stability before swinging self erecting cranes or cranes on traveling or static undercarriages.
  - (iii) Wind speed. Wind must not exceed the speed recommended by the manufacturer or, where manufacturer does not specify this information, the speed determined by a qualified person.
- (5) Plumb tolerance. Towers must be erected plumb to the manufacturer's tolerance and verified by a qualified person. Where the manufacturer does not specify plumb tolerance, the crane tower must be plumb to a tolerance of at least 1:500 (approximately 1 inch in 40 feet).
- (6) Multiple tower crane jobsites. On jobsites where more than one fixed jib (hammerhead) tower crane is installed, the cranes must be located such that no crane can come in contact with the structure of another crane. Cranes are permitted to pass over one another.
- (7) Climbing procedures. Prior to, and during, all climbing procedures (including inside climbing and top climbing), the employer must:
  - (i) Comply with all manufacturer prohibitions.
  - (ii) Have a registered professional engineer verify that the host structure is strong enough to sustain the forces imposed through the braces, brace anchorages and supporting floors.
- (8) Counterweight/ballast.
  - (i) Equipment must not be erected, dismantled or operated without the amount and position of counterweight and/or ballast in place as specified by the manufacturer or a registered professional engineer familiar with the equipment.

- (ii) The maximum counterweight and/or ballast specified by the manufacturer or registered professional engineer familiar with the equipment must not be exceeded.
- (c) Signs. The size and location of signs installed on tower cranes must be in accordance with manufacturer specifications. Where these are unavailable, a registered professional engineer familiar with the type of equipment involved must approve in writing the size and location of any signs.
- (d) Safety devices.
  - (1) Section 1926.1415 does not apply to tower cranes.
  - (2) The following safety devices are required on all tower cranes unless otherwise specified:
    - (i) Boom stops on luffing boom type tower cranes.
    - (ii) Jib stops on luffing boom type tower cranes if equipped with a jib attachment.
    - (iii) Travel rail end stops at both ends of travel rail.
    - (iv) Travel rail clamps on all travel bogies.
    - (v) Integrally mounted check valves on all load supporting hydraulic cylinders.
    - (vi) Hydraulic system pressure limiting device.
    - (vii) The following brakes, which must automatically set in the event of pressure loss or power failure, are required:
      - (A) A hoist brake on all hoists.
      - (B) Swing brake.
      - (C) Trolley brake.
      - (D) Rail travel brake.
    - (viii) Deadman control or forced neutral return control (hand) levers.
    - (ix) Emergency stop switch at the operator's station.
    - (x) Trolley end stops must be provided at both ends of travel of the trolley.

- (3) Proper operation required. Operations must not begin unless the devices listed in this section are in proper working order. If a device stops working properly during operations, the operator must safely stop operations. The equipment must be taken out of service, and operations must not resume until the device is again working properly. See 1926.1417(f). Alternative measures are not permitted to be used.

(e) Operational aids.

- (1) Section 1926.1416 does not apply to tower cranes.
- (2) The devices listed in this section (“operational aids”) are required on all tower cranes covered by this subpart, unless otherwise specified.
- (3) Operations must not begin unless the operational aids are in proper working order, except where the employer meets the specified temporary alternative measures. More protective alternative measures specified by the tower crane manufacturer, if any, must be followed. See 1926.1417(j) for additional requirements.
- (4) If an operational aid stops working properly during operations, the operator must safely stop operations until the temporary alternative measures are implemented or the device is again working properly. If a replacement part is no longer available, the use of a substitute device that performs the same type of function is permitted and is not considered a modification under 1926.1434.
- (5) Category I operational aids and alternative measures. Operational aids listed in this paragraph that are not working properly must be repaired no later than 7 calendar days after the deficiency occurs. Exception: If the employer documents that it has ordered the necessary parts within 7 calendar days of the occurrence of the deficiency, the repair must be completed within 7 calendar days of receipt of the parts.
  - (i) Trolley travel limiting device. The travel of the trolley must be restricted at both ends of the jib by a trolley travel limiting device to prevent the trolley from running into the trolley end stops. Temporary alternative measures:
    - (A) Option A. The trolley rope must be marked (so it can be seen by the operator) at a point that will give the operator sufficient time to stop the trolley prior to the end stops.
    - (B) Option B. A spotter who is in direct communication with the operator must be used when operations are conducted within 10 feet of the outer or inner trolley end stops.

- (ii) Boom hoist limiting device. The range of the boom must be limited at the minimum and maximum radius. Temporary alternative measures: Clearly mark the cable (so it can be seen by the operator) at a point that will give the operator sufficient time to stop the boom hoist within the minimum and maximum boom radius, or use a spotter who is in direct communication with the operator to inform the operator when this point is reached.
- (iii) Anti two-blocking device. The tower crane must be equipped with a device which automatically prevents damage from contact between the load block, overhaul ball, or similar component, and the boom tip (or fixed upper block or similar component). The device(s) must prevent such damage at all points where two-blocking could occur. Temporary alternative measures: Clearly mark the cable (so it can be seen by the operator) at a point that will give the operator sufficient time to stop the hoist to prevent two-blocking, or use a spotter who is in direct communication with the operator to inform the operator when this point is reached.
- (iv) Hoist drum lower limiting device. Tower cranes manufactured after November 8, 2011 must be equipped with a device that prevents the last 2 wraps of hoist cable from being spooled off the drum. Temporary alternative measures: Mark the cable (so it can be seen by the operator) at a point that will give the operator sufficient time to stop the hoist prior to last 2 wraps of hoist cable being spooled off the drum, or use a spotter who is in direct communication with the operator to inform the operator when this point is reached.
- (v) Load moment limiting device. The tower crane must have a device that prevents moment overloading. Temporary alternative measures: A radius indicating device must be used (if the tower crane is not equipped with a radius indicating device, the radius must be measured to ensure the load is within the rated capacity of the crane). In addition, the weight of the load must be determined from a source recognized by the industry (such as the load's manufacturer), or by a calculation method recognized by the industry (such as calculating a steel beam from measured dimensions and a known per foot weight), or by other equally reliable means. This information must be provided to the operator prior to the lift.

- (vi) Hoist line pull limiting device. The capacity of the hoist must be limited to prevent overloading, including each individual gear ratio if equipped with a multiple speed hoist transmission. Temporary alternative measures: The operator must ensure that the weight of the load does not exceed the capacity of the hoist (including for each individual gear ratio if equipped with a multiple speed hoist transmission).
  - (vii) Rail travel limiting device. The travel distance in each direction must be limited to prevent the travel bogies from running into the end stops or buffers. Temporary alternative measures: A spotter who is in direct communication with the operator must be used when operations are conducted within 10 feet of either end of the travel rail end stops; the spotter must inform the operator of the distance of the travel bogies from the end stops or buffers.
  - (viii) Boom hoist drum positive locking device and control. The boom hoist drum must be equipped with a control that will enable the operator to positively lock the boom hoist drum from the cab. Temporary alternative measures: The device must be manually set when required if an electric, hydraulic or automatic control is not functioning.
- (6) Category II operational aids and alternative measures. Operational aids listed in this paragraph that are not working properly must be repaired no later than 30 calendar days after the deficiency occurs. Exception: If the employer documents that it has ordered the necessary parts within 7 calendar days of the occurrence of the deficiency, and the part is not received in time to complete the repair in 30 calendar days, the repair must be completed within 7 calendar days of receipt of the parts.
- (i) Boom angle or hook radius indicator.
    - (A) Luffing boom tower cranes must have a boom angle indicator readable from the operator's station.
    - (B) Hammerhead tower cranes manufactured after November 8, 2011 must have a hook radius indicator readable from the operator's station.
    - (C) Temporary alternative measures: Hook radii or boom angle must be determined by measuring the hook radii or boom angle with a measuring device.

- (ii) Trolley travel deceleration device. The trolley speed must be automatically reduced prior to the trolley reaching the end limit in both directions. Temporary alternative measure: The employer must post a notice in the cab of the crane notifying the operator that the trolley travel deceleration device is malfunctioning and instructing the operator to take special care to reduce the trolley speed when approaching the trolley end limits.
  - (iii) Boom hoist deceleration device. The boom speed must be automatically reduced prior to the boom reaching the minimum or maximum radius limit. Temporary alternative measure: The employer must post a notice in the cab of the crane notifying the operator that the boom hoist deceleration device is malfunctioning and instructing the operator to take special care to reduce the boom speed when approaching the minimum or maximum radius limits.
  - (iv) Load hoist deceleration device. The load speed must be automatically reduced prior to the hoist reaching the upper limit. Temporary alternative measure: The employer must post a notice in the cab of the crane notifying the operator that the load hoist deceleration device is malfunctioning and instructing the operator to take special care to reduce the load speed when approaching the upper limits.
  - (v) Wind speed indicator. A device must be provided to display the wind speed and must be mounted above the upper rotating structure on tower cranes. On self erecting cranes, it must be mounted at or above the jib level. Temporary alternative measures: Use of wind speed information from a properly functioning indicating device on another tower crane on the same site, or a qualified person estimates the wind speed.
  - (vi) Load indicating device. Cranes manufactured after November 8, 2011 must have a device that displays the magnitude of the load on the hook. Displays that are part of load moment limiting devices that display the load on the hook meet this requirement. Temporary alternative measures: The weight of the load must be determined from a source recognized by the industry (such as the load's manufacturer), or by a calculation method recognized by the industry (such as calculating a steel beam from measured dimensions and a known per foot weight), or by other equally reliable means. This information must be provided to the operator prior to the lift.
- (f) Inspections.

- (1) Section 1926.1412 (Inspections) applies to tower cranes, except that the term “assembly” is replaced by “erection.” Section 1926.1413 (Wire rope – inspection) applies to tower cranes.
- (2) Pre-erection inspection. Before each crane component is erected, it must be inspected by a qualified person for damage or excessive wear.
  - (i) The qualified person must pay particular attention to components that will be difficult to inspect thoroughly during shift inspections.
  - (ii) If the qualified person determines that a component is damaged or worn to the extent that it would create a safety hazard if used on the crane, that component must not be erected on the crane unless it is repaired and, upon reinspection by the qualified person, found to no longer create a safety hazard.
  - (iii) If the qualified person determines that, though not presently a safety hazard, the component needs to be monitored, the employer must ensure that the component is checked in the monthly inspections. Any such determination must be documented, and the documentation must be available to any individual who conducts a monthly inspection.
- (3) Post-erection inspection. In addition to the requirements in 1926.1412(c), the following requirements must be met:
  - (i) A load test using certified weights, or scaled weights using a certified scale with a current certificate of calibration, must be conducted after each erection.
  - (ii) The load test must be conducted in accordance with the manufacturer’s instructions when available. Where these instructions are unavailable, the test must be conducted in accordance with written load test procedures developed by a registered professional engineer familiar with the type of equipment involved.
- (4) Monthly. The following additional items must be included:
  - (i) Tower (mast) bolts and other structural bolts (for loose or dislodged condition) from the base of the tower crane up or, if the crane is tied to or braced by the structure, those above the upper-most brace support.
  - (ii) The upper-most tie-in, braces, floor supports and floor wedges where the tower crane is supported by the structure, for loose or dislodged components.

- (5) Annual. In addition to the items that must be inspected under 1926.1412(f), all turntable and tower bolts must be inspected for proper condition and torque.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.

## 1926.1436 Derricks

- (a) This section contains supplemental requirements for derricks, whether temporarily or permanently mounted; all sections of this subpart apply to derricks unless specified otherwise. A derrick is powered equipment consisting of a mast or equivalent member that is held at or near the end by guys or braces, with or without a boom, and its hoisting mechanism. The mast/equivalent member and/or the load is moved by the hoisting mechanism (typically base-mounted) and operating ropes. Derricks include: A-frame, basket, breast, Chicago boom, gin pole (except gin poles used for erection of communication towers), guy, shearleg, stiffleg, and variations of such equipment.
- (b) Operation – procedures.
- (1) Section 1926.1417 (Operation) applies except for 1926.1417(c) (Accessibility of procedures).
  - (2) Load chart contents. Load charts must contain at least the following information:
    - (i) Rated capacity at corresponding ranges of boom angle or operating radii.
    - (ii) Specific lengths of components to which the rated capacities apply.
    - (iii) Required parts for hoist reeving.
    - (iv) Size and construction of rope must be included on the load chart or in the operating manual.
  - (3) Load chart location.
    - (i) Permanent installations. For permanently installed derricks with fixed lengths of boom, guy, and mast, a load chart must be posted where it is visible to personnel responsible for the operation of the equipment.
    - (ii) Non-permanent installations. For derricks that are not permanently installed, the load chart must be readily available at the job site to personnel responsible for the operation of the equipment.
- (c) Construction.

(1) General requirements.

- (i) Derricks must be constructed to meet all stresses imposed on members and components when installed and operated in accordance with the manufacturer's/ builder's procedures and within its rated capacity.
- (ii) Welding of load sustaining members must conform to recommended practices in ANSI/AWS D14.3-94 (incorporated by reference, see 1926.6) or AWS D1.1/D1.1M:2002 (incorporated by reference, see 1926.6).

(2) Guy derricks.

- (i) The minimum number of guys must be 6, with equal spacing, except where a qualified person or derrick manufacturer approves variations from these requirements and revises the rated capacity to compensate for such variations.
- (ii) Guy derricks must not be used unless the employer has the following guy information from the manufacturer or a qualified person, when not available from the manufacturer:
  - (A) The number of guys.
  - (B) The spacing around the mast.
  - (C) The size, grade, and construction of rope to be used for each guy.
- (iii) For guy derricks manufactured after December 18, 1970, in addition to the information required in paragraph (c)(2)(ii) of this section, the employer must have the following guy information from the manufacturer or a qualified person, when not available from the manufacturer:
  - (A) The amount of initial sag or tension.
  - (B) The amount of tension in guy line rope at anchor.
- (iv) The mast base must permit the mast to rotate freely with allowance for slight tilting of the mast caused by guy slack.
- (v) The mast cap must:
  - (A) Permit the mast to rotate freely.
  - (B) Withstand tilting and cramping caused by the guy loads.
  - (C) Be secured to the mast to prevent disengagement during erection.
  - (D) Be provided with means for attaching guy ropes.

(3) Stiffleg derricks.

- (i) The mast must be supported in the vertical position by at least two stifflegs; one end of each must be connected to the top of the mast and the other end securely anchored.
  - (ii) The stifflegs must be capable of withstanding the loads imposed at any point of operation within the load chart range.
  - (iii) The mast base must:
    - (A) Permit the mast to rotate freely (when necessary).
    - (B) Permit deflection of the mast without binding.
  - (iv) The mast must be prevented from lifting out of its socket when the mast is in tension.
  - (v) The stiffleg connecting member at the top of the mast must:
    - (A) Permit the mast to rotate freely (when necessary).
    - (B) Withstand the loads imposed by the action of the stifflegs.
    - (C) Be secured so as to oppose separating forces.
- (4) Gin pole derricks.
- (i) Guy lines must be sized and spaced so as to make the gin pole stable in both boomed and vertical positions. Exception: Where the size and/or spacing of guy lines do not result in the gin pole being stable in both boomed and vertical positions, the employer must ensure that the derrick is not used in an unstable position.
  - (ii) The base of the gin pole must permit movement of the pole (when necessary).
  - (iii) The gin pole must be anchored at the base against horizontal forces (when such forces are present).
- (5) Chicago boom derricks. The fittings for stepping the boom and for attaching the topping lift must be arranged to:
- (i) Permit the derrick to swing at all permitted operating radii and mounting heights between fittings.
  - (ii) Accommodate attachment to the upright member of the host structure.
  - (iii) Withstand the forces applied when configured and operated in accordance with the manufacturer's/builder's procedures and within its rated capacity.
  - (iv) Prevent the boom or topping lift from lifting out under tensile forces.

(d) Anchoring and guying.

- (1) Load anchoring data developed by the manufacturer or a qualified person must be used.
- (2) Guy derricks.
  - (i) The mast base must be anchored.
  - (ii) The guys must be secured to the ground or other firm anchorage.
  - (iii) The anchorage and guying must be designed to withstand maximum horizontal and vertical forces encountered when operating within rated capacity with the particular guy slope and spacing specified for the application.
- (3) Stiffleg derricks.
  - (i) The mast base and stifflegs must be anchored.
  - (ii) The mast base and stifflegs must be designed to withstand maximum horizontal and vertical forces encountered when operating within rated capacity with the particular stiffleg spacing and slope specified for the application.

(e) Swingers and hoists.

- (1) The boom, swinger mechanisms and hoists must be suitable for the derrick work intended and must be anchored to prevent displacement from the imposed loads.
- (2) Hoists.
  - (i) Base mounted drum hoists must meet the requirements in the following sections of ASME B30.7-2001 (incorporated by reference, see 1926.6):
    - (A) Sections 7-1.1 (“Load ratings and markings”).
    - (B) Section 7-1.2 (“Construction”), except: 7-1.2.13 (“Operator’s cab”); 7-1.2.15 (“Fire extinguishers”).
    - (C) Section 7-1.3 (“Installation”).
    - (D) Applicable terms in section 7-0.2 (“Definitions”).
  - (ii) Load tests for new hoists. The employer must ensure that new hoists are load tested to a minimum of 110% of rated capacity, but not more than 125% of rated capacity, unless otherwise recommended by the manufacturer. This requirement is met where the manufacturer has conducted this testing.

- (iii) Repaired or modified hoists. Hoists that have had repairs, modifications or additions affecting their capacity or safe operation must be evaluated by a qualified person to determine if a load test is necessary. If it is, load testing must be conducted in accordance with paragraphs (e)(2)(ii) and (iv) of this section.
- (iv) Load test procedure. Load tests required by paragraphs (e)(2)(ii) or (e)(2)(iii) of this section must be conducted as follows:
  - (A) The test load must be hoisted a vertical distance to assure that the load is supported by the hoist and held by the hoist brake(s).
  - (B) The test load must be lowered, stopped and held with the brake(s).
  - (C) The hoist must not be used unless a competent person determines that the test has been passed.
- (f) Operational aids.
  - (1) Section 1926.1416 (Operational aids) applies, except for 1926.1416(d)(1) (Boom hoist limiting device), 1926.1416(e)(1) (Boom angle or radius indicator), and 1926.1416(e)(4) (Load weighing and similar devices).
  - (2) Boom angle aid. A boom angle indicator is not required but if the derrick is not equipped with a functioning one, the employer must ensure that either:
    - (i) The boom hoist cable must be marked with caution and stop marks. The stop marks must correspond to maximum and minimum allowable boom angles. The caution and stop marks must be in view of the operator, or a spotter who is in direct communication with the operator; or
    - (ii) An electronic or other device that signals the operator in time to prevent the boom from moving past its maximum and minimum angles, or automatically prevents such movement, is used.
  - (3) Load weight/capacity devices.
    - (i) Derricks manufactured more than one year after November 8, 2010 with a maximum rated capacity over 6,000 pounds must have at least one of the following: load weighing device, load moment indicator, rated capacity indicator, or rated capacity limiter. Temporary alternative measures: The weight of the load must be determined from a source recognized by the industry (such as the load's manufacturer), or by a calculation method recognized by the industry (such as calculating a steel beam from measured dimensions and a known per foot weight), or by other equally reliable means. This information must be provided to the operator prior to the lift. See 1926.1417(j) for additional requirements.

- (ii) A load weight/capacity device that is not working properly must be repaired no later than 30 days after the deficiency occurs. Exception: If the employer documents that it has ordered the necessary parts within 7 days of the occurrence of the deficiency, and the part is not received in time to complete the repair in 30 days, the repair must be completed within 7 days of receipt of the parts.
- (g) Post-assembly approval and testing – new or reinstalled derricks.
  - (1) Anchorages.
    - (i) Anchorages, including the structure to which the derrick is attached (if applicable), must be approved by a qualified person.
    - (ii) If using a rock or hairpin anchorage, the qualified person must determine if any special testing of the anchorage is needed. If so, it must be tested accordingly.
  - (2) Functional test. Prior to initial use, new or reinstalled derricks must be tested by a competent person with no hook load to verify proper operation. This test must include:
    - (i) Lifting and lowering the hook(s) through the full range of hook travel.
    - (ii) Raising and lowering the boom through the full range of boom travel.
    - (iii) Swinging in each direction through the full range of swing.
    - (iv) Actuating the anti two-block and boom hoist limit devices (if provided).
    - (v) Actuating locking, limiting and indicating devices (if provided).
  - (3) Load test. Prior to initial use, new or reinstalled derricks must be load tested by a competent person. The test load must meet the following requirements:
    - (i) Test loads must be at least 100% and no more than 110% of the rated capacity, unless otherwise recommended by the manufacturer or qualified person, but in no event must the test load be less than the maximum anticipated load.
    - (ii) The test must consist of:
      - (A) Hoisting the test load a few inches and holding to verify that the load is supported by the derrick and held by the hoist brake(s).
      - (B) Swinging the derrick, if applicable, the full range of its swing, at the maximum allowable working radius for the test load.
      - (C) Booming the derrick up and down within the allowable working radius for the test load.

- (D) Lowering, stopping and holding the load with the brake(s).
- (iii) The derrick must not be used unless the competent person determines that the test has been passed.
- (4) Documentation. Tests conducted under this paragraph must be documented. The document must contain the date, test results and the name of the tester. The document must be retained until the derrick is re-tested or dismantled, whichever occurs first. All such documents must be available, during the applicable document retention period, to all persons who conduct inspections in accordance with 1926.1412.
- (h) Load testing repaired or modified derricks. Derricks that have had repairs, modifications or additions affecting the derrick's capacity or safe operation must be evaluated by a qualified person to determine if a load test is necessary. If it is, load testing must be conducted and documented in accordance with paragraph (g) of this section.
- (i) [Reserved.]
- (j) Power failure procedures. If power fails during operations, the derrick operator must safely stop operations. This must include:
- (1) Setting all brakes or locking devices.
  - (2) Moving all clutch and other power controls to the off position.
- (k) Use of winch heads.
- (1) Ropes must not be handled on a winch head without the knowledge of the operator.
  - (2) While a winch head is being used, the operator must be within reach of the power unit control lever.
- (l) [Reserved.]
- (m) Securing the boom.
- (1) When the boom is being held in a fixed position, dogs, pawls, or other positive holding mechanisms on the boom hoist must be engaged.
  - (2) When taken out of service for 30 days or more, the boom must be secured by one of the following methods:
    - (i) Laid down.
    - (ii) Secured to a stationary member, as nearly under the head as possible, by attachment of a sling to the load block.

- (iii) For guy derricks, lifted to a vertical position and secured to the mast.
- (iv) For stiffleg derricks, secured against the stiffleg.
- (n) The process of jumping the derrick must be supervised by the A/D director.
- (o) Derrick operations must be supervised by a competent person.
- (p) Inspections. In addition to the requirements in 1926.1412, the following additional items must be included in the inspections:
  - (1) Daily: Guys for proper tension.
  - (2) Annual.
    - (i) Gudgeon pin for cracks, wear, and distortion.
    - (ii) Foundation supports for continued ability to sustain the imposed loads.
- (q) Qualification and Training. The employer must train each operator of a derrick on the safe operation of equipment the individual will operate. Section 1926.1427 of this subpart (Operator qualification and certification) does not apply.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.

### **1926.1437 Floating cranes/derricks and land cranes/derricks on barges**

- (a) This section contains supplemental requirements for floating cranes/derricks and land cranes/derricks on barges, pontoons, vessels or other means of flotation (i.e., vessel/flotation device). The sections of this subpart apply to floating cranes/derricks and land cranes/derricks on barges, pontoons, vessels or other means of flotation, unless specified otherwise. The requirements of this section do not apply when using jacked barges when the jacks are deployed to the river, lake, or sea bed and the barge is fully supported by the jacks.
- (b) General requirements. The requirements in paragraphs (c) through (k) of this section apply to both floating cranes/derricks and land cranes/derricks on barges, pontoons, vessels or other means of flotation.
- (c) Work area control.
  - (1) The requirements of 1926.1424 (Work area control) apply, except for 1926.1424(a)(2)(ii).
  - (2) The employer must either:

- (i) Erect and maintain control lines, warning lines, railings or similar barriers to mark the boundaries of the hazard areas; or
  - (ii) Clearly mark the hazard areas by a combination of warning signs (such as, “Danger – Swing/Crush Zone”) and high visibility markings on the equipment that identify the hazard areas. In addition, the employer must train each employee to understand what these markings signify.
- (d) Keeping clear of the load. Section 1926.1425 does not apply.
- (e) Additional safety devices. In addition to the safety devices listed in 1926.1415, the following safety devices are required:
  - (1) Barge, pontoon, vessel or other means of flotation list and trim device. The safety device must be located in the cab or, when there is no cab, at the operator’s station.
  - (2) Positive equipment house lock.
  - (3) Wind speed and direction indicator. A competent person must determine if wind is a factor that needs to be considered; if wind needs to be considered, a wind speed and direction indicator must be used.
- (f) Operational aids.
  - (1) An anti two-block device is required only when hoisting personnel or hoisting over an occupied cofferdam or shaft.
  - (2) Section 1926.1416(e)(4) (Load weighing and similar devices) does not apply to dragline, clamshell (grapple), magnet, drop ball, container handling, concrete bucket, and pile driving work performed under this section.
- (g) Accessibility of procedures applicable to equipment operation. If the crane/derrick has a cab, the requirements of 1926.1417(c) apply. If the crane/derrick does not have a cab, the employer must ensure that:
  - (1) Rated capacities (load charts) are posted at the operator’s station. If the operator’s station is moveable (such as with pendant-controlled equipment), the load charts are posted on the equipment.
  - (2) Procedures applicable to the operation of the equipment (other than load charts), recommended operating speeds, special hazard warnings, instructions and operators manual, must be readily available on board the vessel/flotation device.

- (h) Inspections. In addition to meeting the requirements of 1926.1412 for inspecting the crane/derrick, the employer must inspect the barge, pontoons, vessel or other means of flotation used to support a floating crane/derrick or land crane/derrick, and ensure that:
- (1) Shift. For each shift inspection, the means used to secure/attach the equipment to the vessel/flotation device is in proper condition, including wear, corrosion, loose or missing fasteners, defective welds, and (when applicable) insufficient tension.
  - (2) Monthly. For each monthly inspection:
    - (i) The means used to secure/attach the equipment to the vessel/flotation device is in proper condition, including inspection for wear, corrosion, and, when applicable, insufficient tension.
    - (ii) The vessel/flotation device is not taking on water.
    - (iii) The deckload is properly secured.
    - (iv) The vessel/flotation device is watertight based on the condition of the chain lockers, storage, fuel compartments, and hatches.
    - (v) The firefighting and lifesaving equipment is in place and functional.
  - (3) The shift and monthly inspections are conducted by a competent person, and:
    - (i) If any deficiency is identified, an immediate determination is made by a qualified person whether the deficiency constitutes a hazard.
    - (ii) If the deficiency is determined to constitute a hazard, the vessel/flotation device is removed from service until the deficiency has been corrected.
  - (4) Annual: external vessel/flotation device inspection. For each annual inspection:
    - (i) The external portion of the barge, pontoons, vessel or other means of flotation used is inspected annually by a qualified person who has expertise with respect to vessels/flotation devices and that the inspection includes the following items:
      - (A) The items identified in paragraphs (h)(1) (Shift) and (h)(2) (Monthly) of this section.
      - (B) Cleats, bitts, chocks, fenders, capstans, ladders, and stanchions, for significant corrosion, wear, deterioration, or deformation that could impair the function of these items.

- (C) External evidence of leaks and structural damage; evidence of leaks and damage below the waterline may be determined through internal inspection of the vessel/flotation device.
- (D) Four-corner draft readings.
- (E) Firefighting equipment for serviceability.
- (ii) Rescue skiffs, lifelines, work vests, life preservers and ring buoys are inspected for proper condition.
- (iii) If any deficiency is identified, an immediate determination is made by the qualified person whether the deficiency constitutes a hazard or, though not yet a hazard, needs to be monitored in the monthly inspections.
  - (A) If the qualified person determines that the deficiency constitutes a hazard, the vessel/flotation device is removed from service until it has been corrected. See requirements in 1926.1417(f).
  - (B) If the qualified person determines that, though not presently a hazard, the deficiency needs to be monitored, the deficiency is checked in the monthly inspections.
- (5) Four-year: internal vessel/flotation device inspection. For each four-year inspection:
  - (i) A marine engineer, marine architect, licensed surveyor, or other qualified person who has expertise with respect to vessels/flotation devices surveys the internal portion of the barge, pontoons, vessel, or other means of flotation.
  - (ii) If the surveyor identifies a deficiency, an immediate determination is made by the surveyor as to whether the deficiency constitutes a hazard or, though not yet a hazard, needs to be monitored in the monthly or annual inspections, as appropriate.
    - (A) If the surveyor determines that the deficiency constitutes a hazard, the vessel/flotation device is removed from service until it has been corrected.
    - (B) If the surveyor determines that, though not presently a hazard, the deficiency needs to be monitored, the deficiency is checked in the monthly or annual inspections, as appropriate.

- (6) Documentation. The monthly and annual inspections required in paragraphs (h)(2) and (h)(4) of this section are documented in accordance with 1926.1412 (e)(3) and 1926.1412(f)(7), respectively, and that the four-year inspection required in paragraph (h)(5) of this section is documented in accordance with 1926.1412(f)(7), except that the documentation for that inspection must be retained for a minimum of 4 years. All such documents must be made available, during the applicable document retention period, to all persons who conduct inspections in accordance with 1926.1412.
- (i) [Reserved.]
- (j) Working with a diver. The employer must meet the following additional requirements when working with a diver in the water:
- (1) If a crane/derrick is used to get a diver into and out of the water, it must not be used for any other purpose until the diver is back on board. When used for more than one diver, it must not be used for any other purpose until all divers are back on board.
  - (2) The operator must remain at the controls of the crane/derrick at all times.
  - (3) In addition to the requirements in 1926.1419 through 1926.1422 (Signals), either:
    - (i) A clear line of sight must be maintained between the operator and tender; or
    - (ii) The signals between the operator and tender must be transmitted electronically.
  - (4) The means used to secure the crane/derrick to the vessel/flotation device (see paragraph (n)(5) of this section) must not allow any amount of shifting in any direction.
- (k) Manufacturer's specifications and limitations.
- (1) The employer must ensure that the barge, pontoons, vessel, or other means of flotation must be capable of withstanding imposed environmental, operational and in-transit loads when used in accordance with the manufacturer's specifications and limitations.
  - (2) The employer must ensure that the manufacturer's specifications and limitations with respect to environmental, operational, and in-transit loads for a barge, pontoon, vessel, or other means of flotation are not exceeded or violated.

- (3) When the manufacturer's specifications and limitations are unavailable, the employer must ensure that the specifications and limitations established by a qualified person with respect to environmental, operational and in-transit loads for the barge, pontoons, vessel, or other means of flotation are not exceeded or violated.

(l) [Reserved.]

(m) Floating cranes/derricks. For equipment designed by the manufacturer (or employer) for marine use by permanent attachment to barges, pontoons, vessels or other means of flotation:

(1) Load charts.

(i) The employer must not exceed the manufacturer load charts applicable to operations on water. When using these charts, the employer must comply with all parameters and limitations (such as dynamic and environmental parameters) applicable to the use of the charts.

(ii) The employer must ensure that load charts take into consideration a minimum wind speed of 40 miles per hour.

(2) The employer must ensure that the requirements for maximum allowable list and maximum allowable trim as specified in Table M1 of this section are met.

Table M1

Rated capacity	Maximum allowable list (degrees)	Maximum allowable list (degrees)
Equipment designed for marine use by permanent attachment (other than derricks):		
25 tons or less	5	5
Over 25 tons	7	7
Derricks designed for marine use by permanent attachment:		
Any rated capacity	10	10

(3) The employer must ensure that the equipment is stable under the conditions specified in Tables M2 and M3 of this section. (Note: Freeboard is the vertical distance between the water line and the main deck of the vessel.)

Table M2

Operated at	Wind speed (mph)	Maximum freeboard (ft)
Rated capacity	60	2
Rated capacity plus 25%	60	1
High boom, no load	60	2

Table M3

Operated at	Wind speed
For backward stability of the boom:	
High boom, no load, full back list (least stable condition)	90 mph

- (4) If the equipment is employer-made, it must not be used unless the employer has documents demonstrating that the load charts and applicable parameters for use meet the requirements of paragraphs (m)(1) through (3) of this section. Such documents must be signed by a registered professional engineer who is a qualified person with respect to the design of this type of equipment (including the means of flotation).
- (5) The employer must ensure that the barge, pontoons, vessel or other means of flotation used:
  - (i) Are structurally sufficient to withstand the static and dynamic loads of the crane/derrick when operating at the crane/derrick’s maximum rated capacity with all planned and actual deck loads and ballasted compartments.
  - (ii) Have a subdivided hull with one or more longitudinal watertight bulkheads for reducing the free-surface effect.
  - (iii) Have access to void compartments to allow for inspection and pumping.
- (n) Land cranes/derricks. For land cranes/derricks used on barges, pontoons, vessels or other means of flotation, the employer must ensure that:
  - (1) The rated capacity of the equipment (including but not limited to modification of load charts) applicable for use on land is reduced to:
    - (i) Account for increased loading from list, trim, wave action, and wind.
    - (ii) Be applicable to a specified location(s) on the specific barge, pontoons, vessel or other means of flotation that will be used, under the environmental conditions expected and encountered.

- (iii) The conditions required in paragraphs (n)(3) and (n)(4) of this section are met.
- (2) The rated capacity modification required in paragraph (n)(1) of this section is performed by the equipment manufacturer, or a qualified person who has expertise with respect to both land crane/derrick capacity and the stability of vessels/flotation devices.
- (3) For list and trim.
  - (i) The maximum allowable list and the maximum allowable trim for the barge, pontoon, vessel or other means of flotation must not exceed the amount necessary to ensure that the conditions in paragraph (n)(4) of this section are met. In addition, the maximum allowable list and the maximum allowable trim does not exceed the least of the following: 5 degrees, the amount specified by the crane/derrick manufacturer, or, when, an amount is not so specified, the amount specified by the qualified person.
  - (ii) The maximum allowable list and the maximum allowable trim for the land crane/derrick does not exceed the amount specified by the crane/derrick manufacturer, or, when, an amount is not so specified, the amount specified by the qualified person.
- (4) For the following conditions:
  - (i) All deck surfaces of the barge, pontoons, vessel or other means of flotation used are above water.
  - (ii) The entire bottom area of the barge, pontoons, vessel or other means of flotation used is submerged.
- (5) Physical attachment, corralling, rails system and centerline cable system meet the requirements in Option (1), Option (2), Option (3), or Option (4) of this section, and that whichever option is used also meets the requirements of paragraph (n)(5)(v) of this section.
  - (i) Option (1) – Physical attachment. The crane/derrick is physically attached to the barge, pontoons, vessel or other means of flotation. Methods of physical attachment include crossed-cable systems attached to the crane/derrick and vessel/flotation device, bolting or welding the crane/derrick to the vessel/flotation device, strapping the crane/derrick to the vessel/flotation device with chains, or other methods of physical attachment.

- (ii) Option (2) – Corraling. The crane/derrick is prevented from shifting by installing barricade restraints (i.e., a corraling system). Employers must ensure that corraling systems do not allow the equipment to shift by any amount of shifting in any direction.
- (iii) Option (3) – Rails. The crane/derrick must be prevented from shifting by being mounted on a rail system. Employers must ensure that rail clamps and rail stops are used unless the system is designed to prevent movement during operation by other means.
- (iv) Option (4) – Centerline cable system. The crane/derrick is prevented from shifting by being mounted to a wire rope system. The employer must ensure that the wire rope system meets the following requirements:
  - (A) The wire rope and attachments are of sufficient size and strength to support the side load of crane/derrick.
  - (B) The wire rope is attached physically to the vessel/flotation device.
  - (C) The wire rope is attached to the crane/derrick by appropriate attachment methods (such as shackles or sheaves) on the undercarriage, and that the method used will allow the crew to secure the crane/derrick from movement during operation and to move the crane/derrick longitudinally along the vessel/flotation device for repositioning.
  - (D) Means are installed to prevent the crane/derrick from passing the forward or aft end of the wire rope attachments.
  - (E) The crane/derrick is secured from movement during operation.
- (v) The systems/means used to comply with Option (1), Option (2), Option (3), or Option (4) of this section are designed by a marine engineer, registered professional engineer familiar with floating crane/derrick design, or qualified person familiar with floating crane/derrick design.
- (6) Exception. For mobile auxiliary cranes used on the deck of a floating crane/derrick, the requirement specified by paragraph (n)(5) of this section to use Option (1), Option (2), Option (3), or Option (4) does not apply when the employer demonstrates implementation of a plan and procedures that meet the following requirements:
  - (i) A marine engineer or registered professional engineer familiar with floating crane/derrick design develops and signs a written plan for the use of the mobile auxiliary crane.

- (ii) The plan is designed so that the applicable requirements of this section are met despite the position, travel, operation, and lack of physical attachment (or corralling, use of rails or cable system) of the mobile auxiliary crane.
  - (iii) The plan specifies the areas of the deck where the mobile auxiliary crane is permitted to be positioned, travel, and operate, and the parameters and limitations of such movements and operation.
  - (iv) The deck is marked to identify the permitted areas for positioning, travel, and operation.
  - (v) The plan specifies the dynamic and environmental conditions that must be present for use of the plan.
  - (vi) If the dynamic and environmental conditions in paragraph (n)(6)(v) of this section are exceeded, the mobile auxiliary crane is attached physically or corralled in accordance with Option (1), Option (2) or Option (4) of paragraph (n)(5) of this section.
- (7) The barge, pontoons, vessel or other means of flotation used:
- (i) Are structurally sufficient to withstand the static and dynamic loads of the crane/derrick when operating at the crane/derrick's maximum rated capacity with all anticipated deck loads and ballasted compartments.
  - (ii) Have a subdivided hull with one or more longitudinal watertight bulkheads for reducing the free surface effect.
  - (iii) Have access to void compartments to allow for inspection and pumping.

## 1926.1438 Overhead & gantry cranes

- (a) Permanently installed overhead and gantry cranes. The requirements of 1910.179, except for 1910.179(b)(1), and not the requirements of this subpart CC, apply to the following equipment when used in construction and permanently installed in a facility: overhead and gantry cranes, including semigantry, cantilever gantry, wall cranes, storage bridge cranes, and others having the same fundamental characteristics.
- (b) Overhead and gantry cranes that are not permanently installed in a facility.

- (1) This paragraph applies to the following equipment when used in construction and not permanently installed in a facility: overhead and gantry cranes, overhead/bridge cranes, semigantry, cantilever gantry, wall cranes, storage bridge cranes, launching gantry cranes, and similar equipment having the same fundamental characteristics, irrespective of whether it travels on tracks, wheels, or other means.
- (2) The following requirements apply to equipment identified in paragraph (b)(1) of this section:
  - (i) Sections 1926.1400 through 1926.1414; 1926.1417 through 1926.1425; 1926.1426(d), 1926.1427 through 1926.1434; 1926.1437, 1926.1439, and 1926.1441.
  - (ii) The following portions of 1910.179:
    - (A) Paragraphs (b)(5), (6), (7); (e)(1), (3), (5), (6); (f)(1), (4); (g); (h)(1), (3); (k); and (n) of 1910.179.
    - (B) The definitions in 1910.179(a) except for “hoist” and “load.” For those words, the definitions in 1926.1401 apply.
    - (C) Section 1910.179(b)(2), but only where the equipment identified in paragraph (b)(1) of this section (1926.1438) was manufactured before September 19, 2001.
  - (iii) For equipment manufactured on or after September 19, 2001, the following sections of ASME B30.2-2005 (incorporated by reference, see 1926.6) apply: 2-1.3.1; 2-1.3.2; 2-1.4.1; 2-1.6; 2-1.7.2; 2-1.8.2; 2-1.9.1; 2-1.9.2; 2-1.11; 2-1.12.2; 2-1.13.7; 2-1.14.2; 2-1.14.3; 2-1.14.5; 2-1.15.; 2-2.2.2; 2-3.2.1.1. In addition, 2-3.5 applies, except in 2-3.5.1(b), “29 CFR 1910.147” is substituted for “ANSI Z244.1.”

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 1-2011, f. 2/9/11, ef. 2/9/11.

## 1926.1439 Dedicated pile drivers

- (a) The provisions of subpart CC apply to dedicated pile drivers, except as specified in this section.
- (b) Section 1926.1416(d)(3) (Anti two-blocking device) does not apply.
- (c) Section 1926.1416(e)(4) (Load weighing and similar devices) applies only to dedicated pile drivers manufactured after November 8, 2011.

(d) In 1926.1433, only 1926.1433(d) and (e) apply to dedicated pile drivers.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.  
Hist: OR-OSHA Admin. Order 1-2011, f. 2/9/11, ef. 2/9/11.

## 1926.1440 Sideboom cranes

- (a) The provisions of this standard apply, except 1926.1402 (Ground conditions), 1926.1415 (Safety devices), 1926.1416 (Operational aids), and 1926.1427 (Operator qualification and certification).
- (b) Section 1926.1426 (Free fall and controlled load lowering) applies, except 1926.1426 (a)(2)(i). Sideboom cranes in which the boom is designed to free fall (live boom) are permitted only if manufactured prior to November 8, 2010.
- (c) Sideboom cranes mounted on wheel or crawler tractors must meet all of the following requirements of ASME B30.14-2004 (incorporated by reference, see 1926.6):
- (1) Section 14-1.1 (“Load Ratings”).
  - (2) Section 14-1.3 (“Side Boom Tractor Travel”).
  - (3) Section 14-1.5 (“Ropes and Reeving Accessories”).
  - (4) Section 14-1.7.1 (“Booms”).
  - (5) Section 14-1.7.2 (“General Requirements – Exhaust Gases”).
  - (6) Section 14-1.7.3 (“General Requirements – Stabilizers (Wheel-Type Side Boom Tractors”).
  - (7) Section 14-1.7.4 (“General Requirements – Welded Construction”).
  - (8) Section 14-1.7.6 (“General Requirements – Clutch and Brake Protection”).
  - (9) Section 14-2.2.2 (“Testing – Rated Load Test”), except that it applies only to equipment that has been altered or modified.
  - (10) In section 14-3.1.2 (“Operator Qualifications”), paragraph (a), except the phrase “When required by law.”
  - (11) In section 14-3.1.3 (“Operating Practices”), paragraphs (e), (f)(1) – (f)(4), (f)(6), (f)(7), (h), and (i).
  - (12) In section 14-3.2.3 (“Moving the Load”), paragraphs (j), (l), and (m).

## **1926.1441 Equipment with a rated hoisting/lifting capacity of 2,000 pounds or less**

The following paragraphs of this section specify requirements for employers using equipment with a maximum rated hoisting/lifting capacity of 2,000 pounds or less.

(a) The employer using this equipment must comply with the following provisions of this subpart: 1926.1400 (Scope); 1926.1401 (Definitions); 1926.1402 (Ground conditions); 1926.1403 (Assembly/disassembly—selection of manufacturer or employer procedures); 1926.1406 (Assembly/disassembly—employer procedures); 1926.1407 through 1926.1411 (Power line safety); 1926.1412(c) (Post-assembly); 1926.1413 through 1926.1414 (Wire rope); 1926.1418 (Authority to stop operation); 1926.1419 through 1926.1422 (Signals); 1926.1423 (Fall protection); 1926.1425 (Keeping clear of the load) (except for 1926.1425 (c)(3) (qualified rigger)); 1926.1426 (Free fall and controlled load lowering); 1926.1432 (Multiple crane/derrick lifts—supplemental requirements); 1926.1434 (Equipment modifications); 1926.1435 (Tower cranes); 1926.1436 (Derricks); 1926.1437 (Floating cranes/derricks and land cranes/derricks on barges); 1926.1438 (Overhead & gantry cranes).

(b) Assembly/disassembly.

(1) In addition to compliance with 1926.1403 (Assembly/disassembly—selection of manufacturer or employer procedures) and 1926.1406 (Assembly/disassembly—employer procedures), the employer must also comply with 1926.1441(b)(2)-(3).

(2) Components and configuration. The employer must ensure that:

(i) The selection of components, and the configuration of the equipment, that affect the capacity or safe operation of the equipment complies with either the:

(A) Manufacturer instructions, recommendations, limitations, and specifications. When these documents and information are unavailable, a registered professional engineer familiar with the type of equipment involved must approve, in writing, the selection and configuration of components; or

(B) Approved modifications that meet the requirements of 1926.1434 (Equipment modifications).

(ii) Post-assembly inspection. Upon completion of assembly, the equipment is inspected to ensure that it is in compliance with paragraph (b)(2)(i) of this section (see 1926.1412(c) for post-assembly inspection requirements).

(3) Manufacturer prohibitions. The employer must comply with applicable manufacturer prohibitions.

(c) Operation – procedures.

(1) The employer must comply with all manufacturer procedures applicable to the operational functions of the equipment, including its use with attachments.

(2) Unavailable operation procedures. The employer must:

(i) When the manufacturer's procedures are unavailable, develop, and ensure compliance with, all procedures necessary for the safe operation of the equipment and attachments.

(ii) Ensure that procedures for the operational controls are developed by a qualified person.

(iii) Ensure that procedures related to the capacity of the equipment are developed and signed by a registered professional engineer familiar with the equipment.

(3) Accessibility. The employer must ensure that:

(i) The load chart is available to the operator at the control station;

(ii) Procedures applicable to the operation of the equipment, recommended operating speeds, special hazard warnings, instructions, and operator's manual are readily available for use by the operator.

(iii) When rated capacities are available at the control station only in electronic form and a failure occurs that makes the rated capacities inaccessible, the operator immediately ceases operations or follows safe shut-down procedures until the rated capacities (in electronic or other form) are available.

(d) Safety devices and operational aids.

(1) The employer must ensure that safety devices and operational aids that are part of the original equipment are maintained in accordance with manufacturer procedures.

(2) Anti two-blocking. The employer must ensure that equipment covered by this section manufactured more than one year after November 8, 2010 have either an anti two-block device that meets the requirements of 1926.1416(d)(3), or is designed so that, in the event of a two-block situation, no damage or load failure will occur (for example, by using a power unit that stalls in response to a two-block situation).

- (e) Operator qualifications. The employer must train each operator, prior to operating the equipment, on the safe operation of the type of equipment the operator will be using.
- (f) Signal person qualifications. The employer must train each signal person in the proper use of signals applicable to the use of the equipment.
- (g) [Reserved.]
- (h) Inspections. The employer must ensure that equipment is inspected in accordance with manufacturer procedures.
- (i) [Reserved.]
- (j) Hoisting personnel. The employer must ensure that equipment covered by this section is not used to hoist personnel.
- (k) Design. The employer must ensure that the equipment is designed by a qualified engineer.

## 1926.1442 Severability

Should a court of competent jurisdiction hold any provision(s) of subpart CC to be invalid, such action shall not affect any other provision of the subpart.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.

## Appendix A to Subpart CC of Part 1926 – Standard Hand Signals

**STOP** – With arm extended horizontally to the side, palm down, arm is swung back and forth.

**EMERGENCY STOP** – With both arms extended horizontally to the side, palms down, arms are swung back and forth.

**HOIST** – With upper arm extended to the side, forearm and index finger pointing straight up, hand and finger make small circles.

**RAISE BOOM** – With arm extended horizontally to the side, thumb points up with other fingers closed.

**SWING** - With arm extended horizontally, index finger points in direction that boom is to swing.

**RETRACT TELESCOPING BOOM** - With hands to the front at waist level, thumbs point at each other with other fingers closed.

**RAISE THE BOOM AND LOWER THE LOAD** - With arm extended horizontally to the side and thumb pointing up, fingers open and close while load movement is desired.

**DOG EVERYTHING** - Hands held together at waist level.

**LOWER** - With arm and index finger pointing down, hand and finger make small circles.

**LOWER BOOM** - With arm extended horizontally to the side, thumb points down with other fingers closed.

**EXTEND TELESCOPING BOOM** - With hands to the front at waist level, thumbs point outward with other fingers closed.

**TRAVEL/TOWER TRAVEL** - With all fingers pointing up, arm is extended horizontally out and back to make a pushing motion in the direction of travel.

**LOWER THE BOOM AND RAISE THE LOAD** - With arm extended horizontally to the side and thumb pointing down, fingers open and close while load movement is desired.

**MOVE SLOWLY** - A hand is placed in front of the hand that is giving the action signal.

**USE AUXILIARY HOIST (whipline)** - With arm bent at elbow and forearm vertical, elbow is tapped with other hand. Then regular signal is used to indicate desired action.

**CRAWLER CRANE TRAVEL, BOTH TRACKS** - Rotate fists around each other in front of body; direction of rotation away from body indicates travel forward; rotation towards body indicates travel backward.

**USE MAIN HOIST** - A hand taps on top of the head. Then regular signal is given to indicate desired action.

**CRAWLER CRANE TRAVEL, ONE TRACK** - Indicate track to be locked by raising fist on that side. Rotate other fist in front of body in direction that other track is to travel.

**TROLLEY TRAVEL** - With palm up, fingers closed and thumb pointing in direction of motion, hand is jerked horizontally in direction trolley is to travel.

## **Appendix B to Subpart CC of Part 1926 – Assembly/Disassembly: Sample Procedures for Minimizing the Risk of Unintended Dangerous Boom Movement**

1. Section 1926.1404(f)(1) provides that when pins (or similar devices) are being removed, employees must not be under the boom, jib, or other components, except where the requirements of 1926.1404(f)(2) are met. The exception in 1926.1404(f)(2) applies when the employer demonstrates that site constraints require one or more employees to be under the boom, jib, or other components when pins (or similar devices) are being removed. In such a situation, the A/D director must implement procedures that minimize the risk of unintended dangerous movement and minimize the duration and extent of exposure under the boom.

The following scenario is an example of how the exception applies: A boom cannot be disassembled on the ground because of aboveground piping (as might be found, for example, in an oil refinery) that precludes lowering the boom to the ground. The boom must therefore be disassembled in the air, and the employees who remove the pins must perform that work from an aerial lift whose base is positioned on one side (the near side) of the boom. To gain access to the pins on the far side, the aerial lift basket must move under the boom, since, due to lack of room, the aerial lift cannot be repositioned on the far side. Due to lack of room, the aerial lift cannot be repositioned on the far side, so the aerial basket must move under the boom to gain access to the pins on the far side.

To minimize the risk of unintended dangerous movement while the pins are removed, the A/D director uses an assist crane that is rigged to support the boom section that is being detached, using particular care to ensure that the section end that is near the employee(s) removing the pins is well supported. The duration and extent of exposure is minimized by removing the far side pins first, moving the aerial lift basket as soon as possible to the near side so that the employees are no longer under the boom, and then removing the near side pins.

2. Section 1926.1404(h)(6)(i) provides that, during assembly/disassembly, the center of gravity of the load must be identified if that is necessary for the method used for maintaining stability. Section 1926.1404(h)(6)(ii) states that, where there is insufficient information to accurately identify the center of gravity, measures designed to prevent unintended dangerous movement resulting from an inaccurate identification of the center of gravity must be used.

An example of the application of 1926.1404(h)(6)(ii) is as follows: The boom is assembled by lowering boom sections sequentially into place using an assist crane. The A/D director's plan is to keep the boom sections stable while they are lowered into place by attaching the assist crane hoist line above the center of gravity of each section. However, in assembling the non-symmetrical top section of the boom, the A/D director is not able to determine where to attach the assist crane hoist line so that it is above the center of gravity. In this situation, before raising the section, all personnel are kept clear of the section and the section is first raised a few inches to determine whether it tips when raised (if it did tip, it would indicate it is not rigged over the center of gravity). If this occurs, the hoist line is repositioned and the procedure repeated (with employees kept clear of the section while it is raised) until the A/D director determines that it is rigged over the center of gravity and can be moved into place without dangerous movement.

Stat. Auth.: ORS 654.025(2) and 656.726(4).

Stats. Implemented: ORS 654.001 through 654.295.

Hist: OR-OSHA Admin. Order 1-2011, f. 2/9/11, ef. 2/9/11.

## **Appendix C to Subpart CC of Part 1926 – Operator Certification: Written Examination: Technical Knowledge Criteria**

This appendix contains information for employers, accredited testing organizations, auditors and government entities developing criteria for a written examination to test an individual's technical knowledge relating to the operation of cranes.

(a) General technical information.

- (1) The functions and limitations of the crane and attachments.
- (2) Wire rope:
  - (i) Background information necessary to understand the inspection and removal from service criteria in 1926.1413 and 1926.1414.
  - (ii) Capacity and when multi-part rope is needed.
  - (iii) Relationship between line pull and safe working load.
  - (iv) How to determine the manufacturer's recommended rope for the crane.
- (3) Rigging devices and their use, such as:
  - (i) Slings.
  - (ii) Spreaders.
  - (iii) Lifting beams.
  - (iv) Wire rope fittings, such as clips, shackles and wedge sockets.
  - (v) Saddles (softeners).
  - (vi) Clamps (beams).
- (4) The technical limitations of protective measures against electrical hazards:
  - (i) Grounding.
  - (ii) Proximity warning devices.
  - (iii) Insulated links.
  - (iv) Boom cages.
  - (v) Proximity to electric power lines, radii, and microwave structures.
- (5) The effects of load share and load transfer in multi-crane lifts.
- (6) Basic crane terms.
- (7) The basics of machine power flow systems.

- (i) Mechanical.
  - (ii) Electrical.
  - (iii) Pneumatic.
  - (iv) Hydraulic.
  - (v) Combination.
- (8) The significance of the instruments and gauge readings.
  - (9) The effects of thermal expansion and contraction in hydraulic cylinders.
  - (10) Background information necessary to understand the requirements of pre-operation and inspection.
  - (11) How to use the safety devices and operational aids required under 1926.1415 and 1926.1416.
  - (12) The difference between duty-cycle and lifting operations.
  - (13) How to calculate net capacity for every possible configuration of the equipment using the manufacturer's load chart.
  - (14) How to use manufacturer-approved attachments and their effect on the equipment.
  - (15) How to obtain dimensions, weight, and center of gravity of the load.
  - (16) The effects of dynamic loading from:
    - (i) Wind.
    - (ii) Stopping and starting.
    - (iii) Impact loading.
    - (iv) Moving with the load.
  - (17) The effect of side loading.
  - (18) The principles of backward stability.
- (b) Site information.
- (1) How to identify the suitability of the supporting ground/surface to support the expected loads of the operation. Elements include:
    - (i) Weaknesses below the surface (such as voids, tanks, loose fill).
    - (ii) Weaknesses on the surface (such as retaining walls, slopes, excavations, depressions).

- (2) Proper use of mats, blocking/cribbing, outriggers, stabilizers, or crawlers.
  - (3) Identification of site hazards such as power lines, piping, and traffic.
  - (4) How to review operation plans with supervisors and other workers (such as the signal person), including how to determine working height, boom length, load radius, and travel clearance.
  - (5) How to determine if there is adequate room for extension of crawlers or outriggers/stabilizers and counterweights.
- (c) Operations.
- (1) How to pick, carry, swing and place the load smoothly and safely on rubber tires and on outriggers/stabilizers or crawlers (where applicable).
  - (2) How to communicate at the site with supervisors, the crew and the signal person.
  - (3) Proper procedures and methods of reeving wire ropes and methods of reeving multiple-part lines and selecting the proper load block and/or ball.
  - (4) How to react to changes in conditions that affect the safe operation of the equipment.
  - (5) How to shut down and secure the equipment properly when leaving it unattended.
  - (6) Know how to apply the manufacturer's specifications for operating in various weather conditions, and understand how environmental conditions affect the safe operation of the equipment.
  - (7) How to properly level the equipment.
  - (8) How to verify the weight of the load and rigging prior to initiating the lift.
  - (9) How to determine where the load is to be picked up and placed and how to verify the radii.
  - (10) Know basic rigging procedures.
  - (11) How to carry out the shift inspection required in this subpart.
  - (12) Know that the following operations require specific procedures and skill levels:
    - (i) Multi-crane lifts.
    - (ii) Hoisting personnel.

- (iii) Clamshell/dragline operations.
  - (iv) Pile driving and extracting.
  - (v) Concrete operations, including poured-in-place and tilt-up.
  - (vi) Demolition operations.
  - (vii) Operations on water.
  - (viii) Magnet operations.
  - (ix) Multi-drum operations.
- (13) Know the proper procedures for operating safely under the following conditions:
- (i) Traveling with suspended loads.
  - (ii) Approaching a two-block condition.
  - (iii) Operating near power lines.
  - (iv) Hoisting personnel.
  - (v) Using other than full outrigger/crawler or stabilizer extensions.
  - (vi) Lifting loads from beneath the surface of the water.
  - (vii) Using various approved counterweight configurations.
  - (viii) Handling loads out of the operator's vision ("operating in the blind").
  - (ix) Using electronic communication systems for signal communication.
- (14) Know the proper procedures for load control and the use of hand-held tag lines.
- (15) Know the emergency response procedure for:
- (i) Fires.
  - (ii) Power line contact.
  - (iii) Loss of stability.
  - (iv) Control malfunction.
  - (v) Two-blocking.
  - (vi) Overload.
  - (vii) Carrier or travel malfunction.
- (16) Know how to properly use outriggers and stabilizers in accordance with manufacturer specifications.

(d) Use of load charts.

- (1) Know the terminology necessary to use load charts.
- (2) Know how to ensure that the load chart is the appropriate chart for the equipment in its particular configuration and application.
- (3) Know how to use load charts. This includes knowing:
  - (i) The operational limitations of load charts and footnotes.
  - (ii) How to relate the chart to the configuration of the crane, crawlers, or outriggers/stabilizers extended or retracted, jib erected or offset, and various counterweight configurations.
  - (iii) The difference between structural capacity and capacity limited by stability.
  - (iv) What is included in capacity ratings.
  - (v) The range diagram and its relationship to the load chart.
  - (vi) The work area chart and its relationship to the load chart.
  - (vii) Where to find and how to use the “parts-of-line” information.
- (4) Know how to use the load chart together with the load indicators and/or load moment devices.

Stat. Auth.: ORS 654.025(2) and 656.726(4).  
Stats. Implemented: ORS 654.001 through 654.295.

## Historical Notes for Subdivision CC

**Note:** This rulemaking is to keep Oregon OSHA in harmony with recent changes to federal OSHA's standards. Oregon OSHA held two public hearings in January 2011. Testimony was received at the hearings as well as written comments submitted throughout the comment period. All comments were carefully considered before proceeding with this final rulemaking.

Oregon OSHA adopted most of the federal OSHA changes as they appear in the August 9, 2010 Federal Register. These changes revise the construction industry crane and derrick rules found in new Subpart CC of 29 CFR Part 1926. The Oregon OSHA differences are outlined in this document. The crane and derrick construction standard was revised to update and specify industry work practices necessary to protect employees. This final standard also addresses advances in the designs of cranes and derricks, related hazards, and the qualifications of employees needed to operate them safely. Under this final rule, employers must determine whether the ground is sufficient to support the anticipated weight and associated loads of hoisting equipment. The employer is also required to assess hazards within the work zone that would affect the safe operation of hoisting equipment, such as power lines and objects or personnel that would be within the work zone or swing radius of the hoisting equipment. Finally, the employer is required to ensure that the equipment is in safe operating condition through required inspections and that employees in the work zone are trained to recognize hazards associated with the use of the equipment and any related duties that they are assigned to perform.

Federal OSHA in 1926.1427, Operator qualification and certification, paragraph (k), implemented a phase-in period based on a number of comments that Option (1) of the section (operator certification by an accredited testing organization) is the only viable option for many employers. Concern was also expressed about the availability of sufficient accredited testing organizations to meet the demand that this rule would create. Therefore, in the final rule, federal OSHA has provided a four-year phase-in period for compliance. Oregon OSHA is keeping the current Oregon administrative rule (OAR 437-003-0081 Crane operator safety training requirements) until such time that the 1926.1427(k) phase-in period has expired, November 10, 2014.

Federal OSHA established minimum clearance distances for power line safety up to 350 kV for equipment in accordance with Table A of 1926.1408 Power line safety (up to 350 kV)- Equipment operations. Table A is based upon the same formula that was used in subpart N (the 10-foot rule) and is similar to Table 1 in ASME B30.5-2004. Unlike Subpart N, which required employers to calculate the minimum clearance distance from a formula, Table A sets specified clearance distances in a readily understood table and requires no calculations. Oregon OSHA's Crane Advisory Committee (CAC) pointed out that Table A of the final rule specified alternating current (AC) and did not address minimum clearance distances for direct current (DC). Therefore, Oregon OSHA is inserting a note clarifying that the clearance distances for power line safety up to 350 kV (AC) for equipment established in Table A, will apply to (DC) electrical distribution and transmission power lines as well. A note will also be placed in section 1926.1411 Power line safety while travelling under or near power lines with no lead, to emphasize (DC) voltages.

Section 1926.1423 Fall protection, of the federal OSHA rule, contains provisions designed to protect workers on equipment covered by Subpart CC from fall hazards. Falls have traditionally been the leading cause of deaths among construction workers. The federal Crane and Derrick Advisory Committee (CDAC) determined that safety would be enhanced by addressing the problem of fall hazards associated with cranes and derricks comprehensively and that putting requirements in Subpart CC would make it easier for employers to readily determine the applicable fall protection requirements.

The Oregon OSHA CAC recommended revising portions of the fall protection section in 1926.1423. Specifically, it was decided not to adopt the following sections in 1926.1423: (d) Personal fall arrest and fall restraint systems, (e) Fall protection requirements for non-assembly/Disassembly work, (f) Assembly/Disassembly, (h) Tower cranes, (j) Anchoring to the load line, and portions of (g) anchorage criteria, and (k) training.

To maintain consistency throughout the Oregon construction industry, the committee felt that changing paragraphs (d), (e), (f), and (h) to one fall height of ten (10) feet would give clarity to this new rule and parallel Oregon's current rule regarding general fall protection requirements under OAR 437-003-1501 General Fall Protection. Adopted new OAR 437-003-1423 Fall protection will: -Replace 1926.1423(d) with 437-003-1423(1), - replace 1926.1423(e) and (f) with 437-003-1423(2), - replace 1926.1423(g)(1) with 437-003-1423(3), - replace 1926.1423(h) with 437-003-1423(4), - replace 1926.1423(j) with 437-003-1423(5), - be added to 1926.1423(k) as 437-003-1423(6). Federal OSHA also made changes in the following areas in construction. Oregon OSHA adopted these changes except where specified. - Subpart A General, new rule 1926.6 is added which is an incorporation by reference of agencies of the US Government and other organizations. 1926.31 is removed with the majority of the text included in the new 1926.6. The new 1926.6 will parallel the existing standard 1910.6 in general industry. - Subpart C general safety and health provisions, 1926.31 was removed and reserved. - Subpart L scaffolds 1926.450, scope, application and definitions applicable to the subpart was revised to say the section does not apply to crane or derrick suspended personnel platforms and the criteria for aerial lifts are set out exclusively in 1926.453. - Subpart M Fall Protection, 1926.500 scope, application, and definitions applicable to the subpart, 1926.500 was amended by revising paragraph (a)(2)(ii), adding paragraph (a)(3)(v), and revising paragraph (a)(4). - New Subpart DD, consisting of section 1926.1500 was added to apply only to employers engaged in demolition work covered by sections 1926.800. The subpart applies in lieu of 1926 Subpart CC. - The Subpart N heading was revised. 1926.550 was redesignated as 1926.1501 in new subpart DD. 1926.550 is reserved and 1926.553 was amended by adding paragraph (c) base-mounted drum hoists. Oregon OSHA relocated 437-003-0080 Wind Velocity device, and 437-003-0081 Crane operator safety training requirements, into new Subpart CC, 1926.1427. - Subpart O Motorized vehicles, 1926.600 was amended by revising paragraph (a)(6). Oregon OSHA is not adopting 1926.600(a)(6)(i), (a)(6)(ii), and (a)(6)(v), but adopted new rule 437-003-3600 Equipment, to replace federal OSHA language of "crane" with "equipment" in the three paragraphs. - Subpart R Steel Erection, 1926.753 was amended by revising paragraphs (a) and (c)(4) to reflect provisions of Subpart CC. - Subpart S 1926.800 was amended by revising paragraph (t), hoisting unique to underground construction. - Subpart T, 1926.856 was amended by revising paragraph (c) as well as 1926.858 is amended by revising paragraph (b). - Subpart V 1926.952 was amended by revising paragraph (c). - Subpart X, 1926.1050 was amended by revising paragraph (a). - Subparts AA and BB reserved.

This is Oregon OSHA Administrative Order 1-2011, filed and effective February 9, 2011.

**Note:** In December 2012, Oregon OSHA proposed to make the federal OSHA amendments published in the November 9, 2012 Federal Register. In 1926.1400, Scope, to broaden the exemption for digger derricks, and in 1926.952 Mechanical Equipment. However, on February 7, 2013, OSHA published in the Federal Register a withdrawal of the direct final rulemaking (November 9, 2012 Federal Register) and instead, moved forward with proposed rulemaking that was published at the same time as the direct final. Therefore, Oregon OSHA did not proceed with rulemaking adoption concerning the digger derricks exemption at that time. Federal OSHA then published in the May 29, 2013 Federal Register their final rule revising the exemption for digger derricks. Comparing the Federal Registers, they are essentially identical in rule amendments, with a slight clarifying sentence structure change in 1926.952. The intent remains the same. Oregon OSHA makes the amendments from the May 29, 2013 Federal Register in construction, Division 3/V and 3/CC.

This is Oregon OSHA Administrative Order 5-2013, filed and effective September 13, 2013.

**Note:** Oregon OSHA has adopted federal OSHA amendments to 1926.1427(k), extending the phase-in expiration date for crane operator certification and the employer duty to ensure competent and safe crane operations to November 10, 2017, as they appear in the September 26, 2014 Federal Register. In February 2011, Oregon OSHA adopted by reference federal OSHA's cranes and derricks in construction standard. Oregon phase-in period for crane operator certification and employer duties contained in 1926.1427 paragraph (k) in Division 3/CC has an expiration date of November 10, 2014. On February 10, 2014, federal OSHA published in the Federal Register a proposal to extend the phase-in expiration date by three years to November 10, 2017 to allow time to address national stakeholder concerns about equating certification with qualification as well as the requirement for operators to be certified by both type and capacity of cranes. Oregon OSHA agreed that the phase-in date deadline in 1926.1427 paragraph (k) should be delayed.

When Oregon OSHA proposed rulemaking in August, federal OSHA has not yet finalized extending the crane operator certification date. Oregon, at that time, proposed to repeal paragraph (k) of 1926.1427 and adopt a new Oregon-initiated rule for the purpose of extending the crane operator certification and employer duties phase-in expiration date to November 10, 2017. We also stated in the proposed rulemaking that in the event that federal OSHA, published their final rule extending the phase-in expiration before Oregon OSHA completed the rule adoption process, Oregon OSHA would adopt the federal amendment as published. Oregon OSHA received one comment during the open comment period which closed on October 10, 2014. The comment was in favor of extending the deadline date for operator certification for cranes and derricks in construction.

This is Oregon OSHA Administrative Order 7-2014, filed November 7, 2014 and effective November 9, 2014.

**Note:** In November 2014, Oregon OSHA proposed to adopt federal OSHA final rules for electric power generation, transmission, and distribution, that were published in the April 11, 2014 Federal Register. The proposal included Oregon-initiated changes to the federal rule. Three public hearings were held during November and December of 2014 resulting in several written comments and oral testimony before the comment period close on December 12, 2014. Most of the comments received concerned the two worker rule exceptions. As a result of the comments received, Oregon OSHA decided not to adopt the rule as proposed in 2014, but to consider an alternative approach. Two stakeholder meetings were conducted in the first half of 2015 to discuss comments along with potential changes to the 2014 proposal. Oregon OSHA received input and support from stakeholders to combine the electric power generation, transmission, and distribution standards in Divisions 2/R and 3/V into one rule. Oregon OSHA merged 1910.269 in Division 2/R and Division 3/V standards into the new Division 2/RR. Unifying language and Oregon-unique rules for power generation, transmission, and distribution for general industry and construction were incorporated into one standard.

In July 2015, Oregon OSHA re-proposed rules for electric power generation, transmission, and distribution. Three public hearings were held during August and September 2015. Most of the oral and written comments received concerned: the duties of a safety watch, the exception to the two-worker rule, and helicopters. Changes to the final rule include: - Safety watch text was added to the final rule 437-002-2311(13). - 437-002-2311(2)(b)(B) was changed to clarify that 437-002-2311(2)(b)(E) must be followed for routine switching of load break elbows. - Paragraphs were removed which were already addressed by, or were in conflict with, other regulatory agencies, or were unnecessarily restrictive based upon accepted industry practices.

On October 5, 2015 federal OSHA published in the Federal Register minor language clarifications in rules related to Line Clearance Tree Trimming as well as correcting errors in Table R-6. The note for enclosed spaces was removed from Appendix A-3 and placed in Appendix A-5. These corrections have been incorporated in Oregon OSHA's final rules.

This is Oregon OSHA Administrative Order 3-2015, filed October 9, 2015, effective January 1, 2016.

**Note:** Oregon OSHA proposed this rule in response to a federal OSHA rule adoption on November 9, 2018. This rule amended the operator certification requirements for cranes and derricks used in construction work. The federal rule process began in an exploratory capacity in 1998 and rulemaking began in earnest in 2004. The final rule was adopted in 2010 after extensive rulemaking committee meetings and comment periods. The rule was due to take full effect in 2014, but extensions through November 2018 with additional comment periods added up to an adoption timeframe of roughly 20 years. During these years, Oregon OSHA adopted crane operator certification rules for Oregon, with the intent to provide more stringent training requirements than those federally mandated during the extended rulemaking process. The latest of these rules were adopted in April 2002 with the intent that Oregon OSHA's rulemaking on crane and derrick operator qualifications would reopen with the final adoption of the federal rules that were then being worked on. The nature of Oregon OSHA's state plan certification required that Oregon-specific rules be at least as effective as federal rules. OAR 437-003-0081 was judged more effective than the federal rules in effect at the time of adoption. Now that the federal rules have been adopted, this is no longer the case, especially the requirement for "nationally accredited" training program completion for operators. Oregon OSHA saw no feasible modifications to the federal rule that would be more effective.

Oregon OSHA held a public hearing for this rule on March 21, 2019. There were no comments on the record at this hearing. Public comments were received via email during the comment period leading up to the hearing. All the comments received during the comment period were considered in this rulemaking.

This is Oregon OSHA Administrative Order 1-2019, filed and effective May 9, 2019.
