Craft distilleries

Oregon distilleries have been growing since 2008 when Oregon law created new business opportunities for distillery owners. Federal OSHA defines a distillery as “a plant or that portion of a plant where flammable liquids produced by fermentation are concentrated and where the concentrated products may also be mixed, stored, or packaged.”

Fire and explosion hazards
The primary hazards in craft distilling are fire and explosion. Fire can occur when vapors from flammable organic compounds such as ethanol are released from leaks in tanks, casks, and equipment such as transfer pumps, pipes, and flexible hoses. Dust from processing grain and combustion from wood floors, casks, and racks can also cause fires or explosions. A vapor explosion can occur if enough vapors are released in an enclosed space with ignition sources present.

Ignition sources include:
- Open flames
- Torch cutting and welding
- Sparks (static, electrical, and mechanical)
- Hot surfaces
- Heat from friction
- Radiant heat

Other hazards related to distilling
- Hazardous chemicals – Cleaners, chemicals for mash pH adjustment.
- Air contaminants – Byproducts of mashing and distilling.
- Physical hazards – Noise, pressure in distillation equipment, boiling liquids, and hot surfaces.
- Ergonomic risk factors – Working in awkward postures, lifting excessive loads, and repetitive activities.
- Electrical hazards – Electrically fired boilers and ignition sources.
- Brewing hazards – Carbon dioxide and sanitation chemicals.
- Confined spaces – Vats, tanks, and vessels may be permit-required confined spaces. Learn more about confined spaces on Oregon OSHA’s confined space web page.
Hazard controls
The best way to prevent a fire is to control flammable vapors and ignition sources.

- Design normal and emergency building venting so that flammable vapors inside the building do not accumulate. When installing new tanks, direct breather and emergency vents to push vapors outside of the building.
- Make sure the electrical system in rooms where distilling or blending flammable liquids is done conforms to the National Electrical Code Class I Division 1 Hazardous Location for Group D Flammable Liquids.
- Use a proper ground and bonding technique when pouring ethanol from the storage container to the still container and when decanting large amounts of finished product or byproduct. See a bonding and grounding diagram in Oregon OSHA’s flammable liquids fact sheet. Make sure that clothing and tools do not produce sparks from static buildup or friction.
- Keep heaters and natural gas appliances that use pilot lights at least 10 feet away from the pouring and distilling areas.
- Ensure that fire sprinkler systems meet the fire jurisdiction’s requirements for extinguishing an ethanol distillery fire.

Safe practices for distilling
Never leave a still unattended.

- Keep the distilling area well ventilated so that vapors will not build up if there is a small leak in equipment.
- Charge the still boiler with wash at alcohol concentrations below 40 percent. Charging the boiler with wash higher than 40 percent creates an explosion risk.
- Keep the distilled alcohol receiver at as low a level as possible, which can reduce risk of a spill if the container tips.
- Use a receiver that has a small filling opening, which reduces the vapor escaping into the room and saves alcohol. If a fire occurs at the receiver, it will burn at the small opening and can be easily controlled.

- Place the receiver in a large, nonflammable, ethanol-resistant container, which can control an accidental overflow. The container should be capable of holding at least an hour’s worth of output if the receiver spills or leaks.
- Dilute alcohol before storing it to lower its flash point.

Important Oregon OSHA requirements for distillers
- Division 2, Subdivision E, Means of Egress
- Division 2, Subdivision G, Occupational Health and Environmental Control
- Division 2, Subdivision H, Hazardous Materials
- Division 2, Subdivision I, Personal Protective Equipment
- Division 2, Subdivision K, Medical and First Aid
- Division 2, Subdivision L, Fire Protection
- Division 2, Subdivision S, Electrical
- Division 2, Subdivision Z, Toxic and Hazardous Substances
