DIVISION 2/T – COMMERCIAL DIVING OPERATIONS

Authority: Sections 4, 6, and 8 of the Occupational Safety and Health Act of 1970 (29 U.S.C. 653, 655, and 657); Section 107, Contract Work Hours and Safety Standards Act (the Construction Safety Act) (40 U.S.C. 333); Section 41, Longshore and Harbor Workers’ Compensation Act (33 U.S.C. 941); Secretary of Labor’s Order No. 8-76 (41 FR 25059), 9-83 (48 FR 35736), 1-90 (55 FR 9033), 6-96 (62 FR 111), 3-2000 (65 FR 50017), or 5-2002 (67 FR 65008), as applicable; 29 CFR part 1911.

§1910.401 SCOPE AND APPLICATION.

(a) Scope.

(1) This subdivision (standard) applies to every place of employment within the waters of the United States, or within any State, the District of Columbia, the Commonwealth of Puerto Rico, the Virgin Islands, American Samoa, Guam, the Trust Territory of the Pacific Islands, Wake Island, Johnston Island, the Canal Zone, or within the Outer Continental Shelf lands as defined in the Outer Continental Shelf Lands Act (67 Stat. 462, 43 U.S.C. 1331), where diving and related support operations are performed.

(2) This standard applies to diving and related support operations conducted in connection with all types of work and employments, including general industry, construction, ship repairing, shipbuilding, shipbreaking and longshoring. However, this standard does not apply to any diving operation:

(i) Performed solely for instructional purposes, using open-circuit, compressed-air SCUBA and conducted within the no-decompression limits;

(ii) Performed solely for search, rescue, or related public safety purposes by or under the control of a governmental agency; or

(iii) Governed by 45 CFR Part 46 (Protection of Human Subjects, U.S. Department of Health and Human Services) or equivalent rules or regulations established by another federal agency, which regulate research, development, or related purposes involving human subjects.
(iv) Defined as scientific diving and which is under the direction and control of a diving program containing at least the following elements:

(A) Diving safety manual which includes at a minimum: Procedures covering all diving operations specific to the program; procedures for emergency care, including recompression and evacuation; and criteria for diver training and certification.

(B) Diving control (safety) board, with the majority of its members being active divers, which shall at a minimum have the authority to: Approve and monitor diving projects; review and revise the diving safety manual; assure compliance with the manual; certify the depths to which a diver has been trained; take disciplinary action for unsafe practices; and, assure adherence to the buddy system (a diver is accompanied by and is in continuous contact with another diver in the water) for SCUBA diving.

(3) Alternative requirements for recreational diving instructors and diving guides. Employers of recreational diving instructors and diving guides are not required to comply with the decompression-chamber requirements specified by paragraphs (b)(2) and (c)(3)(iii) of Sec. 1910.423 and paragraph (b)(1) of Sec. 1910.426 when they meet all of the following conditions:

(i) The instructor or guide is engaging solely in recreational diving instruction or dive-guiding operations;

(ii) The instructor or guide is diving within the no-decompression limits in these operations;

(iii) The instructor or guide is using a nitrox breathing-gas mixture consisting of a high percentage of oxygen (more than 22% by volume) mixed with nitrogen;

(iv) The instructor or guide is using an open-circuit, semi-closed-circuit, or closed-circuit self-contained underwater breathing apparatus (SCUBA); and

(v) The employer of the instructor or guide is complying with all requirements of Appendix C of this subpart.

(b) Application in emergencies. An employer may deviate from the requirements of this standard to the extent necessary to prevent or minimize a situation which is likely to cause death, serious physical harm, or major environmental damage, provided that the employer:
(1) Notifies the Area Director, Occupational Safety and Health Administration within 48 hours of the onset of the emergency situation indicating the nature of the emergency and extent of the deviation from the prescribed regulations; and

(2) Upon request from the Area Director, submits such information in writing.

(c) Employer obligation. The employer shall be responsible for compliance with:

(1) All provisions of this standard of general applicability; and

(2) All requirements pertaining to specific diving modes to the extent diving operations in such modes are conducted.

Stat. Auth.: ORS 654.025(2) and 656.726(4).
Stats. Implemented: ORS 654.001 through 654.295.

OR-OSHA Admin. Order 2-2004, f. 5/20/04, ef. 5/20/04.

§1910.402   DEFINITIONS.

As used in this standard, the listed terms are defined as follows:

“Acfm”: Actual cubic feet per minute.

“ASME Code or equivalent”: ASME (American Society of Mechanical Engineers) Boiler and Pressure Vessel Code, Section VIII, or an equivalent code which the employer can demonstrate to be equally effective.

“ATA”: Atmosphere absolute.

“Bell”: An enclosed compartment, pressurized (closed bell) or unpressurized (open bell), which allows the diver to be transported to and from the underwater work area and which may be used as a temporary refuge during diving operations.

“Bottom time”: The total elapsed time measured in minutes from the time when the diver leaves the surface in descent to the time that the diver begins ascent.

“Bursting pressure”: The pressure at which a pressure containment device would fail structurally.

“Cylinder”: A pressure vessel for the storage of gases.
“Decompression chamber”: A pressure vessel for human occupancy such as a surface decompression chamber, closed bell, or deep diving system used to decompress divers and to treat decompression sickness.

“Decompression sickness”: A condition with a variety of symptoms which may result from gas or bubbles in the tissues of divers after pressure reduction.

“Decompression table”: A profile or set of profiles of depth-time relationships for ascent rates and breathing mixtures to be followed after a specific depth-time exposure or exposures.

“Dive-guiding operations” means leading groups of sports divers, who use an open-circuit, semi-closed-circuit, or closed-circuit self-contained underwater breathing apparatus, to local undersea diving locations for recreational purposes.

“Dive location”: A surface or vessel from which a diving operation is conducted.

“Dive-location reserve breathing gas”: A supply system of air or mixed-gas (as appropriate) at the dive location which is independent of the primary supply system and sufficient to support divers during the planned decompression.

“Dive team”: Divers and support employees involved in a diving operation, including the designated person-in-charge.

“Diver”: An employee working in water using underwater apparatus which supplies compressed breathing gas at the ambient pressure.

“Diver-carried reserve breathing gas”: A diver-carried supply of air or mixed gas (as appropriate) sufficient under standard operating conditions to allow the diver to reach the surface, or another source of breathing gas, or to be reached by a standby diver.

“Diving mode”: A type of diving requiring specific equipment, procedures and techniques (SCUBA, surface-supplied air, or mixed gas).

“Fsw”: Feet of seawater (or equivalent static pressure head).

“Heavy gear”: Diver-worn deep-sea dress including helmet, breastplate, dry suit, and weighted shoes.

“Hyperbaric conditions”: Pressure conditions in excess of surface pressure.

“Inwater stage”: A suspended underwater platform which supports a diver in the water.

“Liveboating”: The practice of supporting a surfaced-supplied air or mixed gas diver from a vessel which is underway.
“Mixed-gas diving”: A diving mode in which the diver is supplied in the water with a breathing gas other than air.

“No-decompression limits”: The depth-time limits of the “no-decompression limits and repetitive dive group designation table for no-decompression air dives”, U.S. Navy Diving Manual or equivalent limits which the employer can demonstrate to be equally effective.

“Psi(g)”: Pounds per square inch (gauge).

“Recreational diving instruction” means training diving students in the use of recreational diving procedures and the safe operation of diving equipment, including an open-circuit, semi-closed-circuit, or closed-circuit self-contained underwater breathing apparatus, during dives.

“Scientific diving” means diving performed solely as a necessary part of a scientific, research, or educational activity by employees whose sole purpose for diving is to perform scientific research tasks. Scientific diving does not include performing any tasks usually associated with commercial diving such as: Placing or removing heavy objects underwater; inspection of pipelines and similar objects; construction; demolition; cutting or welding; or the use of explosives.

“SCUBA diving”: A diving mode independent of surface supply in which the diver uses open circuit self-contained underwater breathing apparatus.

“Standby diver”: A diver at the dive location available to assist a diver in the water.

“Surface-supplied air diving”: A diving mode in which the diver in the water is supplied from the dive location with compressed air for breathing.

“Treatment table”: A depth-time and breathing gas profile designed to treat decompression sickness.

“Umbilical”: The composite hose bundle between a dive location and a diver or bell, or between a diver and a bell, which supplies the diver or bell with breathing gas, communications, power, or heat as appropriate to the diving mode or conditions, and includes a safety line between the diver and the dive location.

“Volume tank”: A pressure vessel connected to the outlet of a compressor and used as an air reservoir.

“Working pressure”: The maximum pressure to which a pressure containment device may be exposed under standard operating conditions.

APPENDIX C TO SUBDIVISION T – ALTERNATIVE CONDITIONS UNDER §1910.401(a)(3) FOR RECREATIONAL DIVING INSTRUCTORS AND DIVING GUIDES (MANDATORY)

Paragraph (a)(3) of §1910.401 specifies that an employer of recreational diving instructors and diving guides (hereafter, “divers” or “employees”) who complies with all of the conditions of this appendix need not provide a decompression chamber for these divers as required under §§1910.423(b)(2) or (c)(3) or 1910.426(b)(1).

1. Equipment Requirements for Rebreathers.

(a) The employer must ensure that each employee operates the rebreather (i.e., semi-closed-circuit and closed-circuit self-contained underwater breathing apparatuses (hereafter, “SCUBAs”)) according to the rebreather manufacturer's instructions.

(b) The employer must ensure that each rebreather has a counterlung that supplies a sufficient volume of breathing gas to their divers to sustain the divers’ respiration rates, and contains a baffle system and/or other moisture separating system that keeps moisture from entering the scrubber.

(c) The employer must place a moisture trap in the breathing loop of the rebreather, and ensure that:

   (i) The rebreather manufacturer approves both the moisture trap and its location in the breathing loop; and

   (ii) Each employee uses the moisture trap according to the rebreather manufacturer's instructions.

(d) The employer must ensure that each rebreather has a continuously functioning moisture sensor, and that:

   (i) The moisture sensor connects to a visual (e.g., digital, graphic, analog) or auditory (e.g., voice, pure tone) alarm that is readily detectable by the diver under the diving conditions in which the diver operates, and warns
the diver of moisture in the breathing loop in sufficient time to terminate
the dive and return safely to the surface; and

(ii) Each diver uses the moisture sensor according to the rebreather
manufacturer’s instructions.

(e) The employer must ensure that each rebreather contains a continuously
functioning CO₂ sensor in the breathing loop, and that:

(i) The rebreather manufacturer approves the location of the CO₂ sensor
in the breathing loop;

(ii) The CO₂ sensor is integrated with an alarm that operates in a visual
(e.g., digital, graphic, analog) or auditory (e.g., voice, pure tone) mode that
is readily detectable by each diver under the diving conditions in which
the diver operates; and

(iii) The CO₂ alarm remains continuously activated when the inhaled CO₂
level reaches and exceeds 0.005 atmospheres absolute (ATA).

(f) Before each day’s diving operations, and more often when necessary, the
employer must calibrate the CO₂ sensor according to the sensor
manufacturer’s instructions, and ensure that:

(i) The equipment and procedures used to perform this calibration are
accurate to within 10 percent of a CO₂ concentration of 0.005 ATA or less;

(ii) The equipment and procedures maintain this accuracy as required by
the sensor manufacturer’s instructions; and

(iii) The calibration of the CO₂ sensor is accurate to within 10 percent of a
CO₂ concentration of 0.005 ATA or less.

(g) The employer must replace the CO₂ sensor when it fails to meet the
accuracy requirements specified in paragraph 1(f)(iii) of this appendix, and
ensure that the replacement CO₂ sensor meets the accuracy requirements
specified in paragraph 1(f)(iii) of this appendix before placing the rebreather
in operation.

(h) As an alternative to using a continuously functioning CO₂ sensor, the
employer may use a schedule for replacing CO₂-sorbent material provided by
the rebreather manufacturer. The employer may use such a schedule only
when the rebreather manufacturer has developed it according to the canister-
testing protocol specified below in Condition 11, and must use the canister
within the temperature range for which the manufacturer conducted its
scrubber canister tests following that protocol. Variations above or below the
range are acceptable only after the manufacturer adds that lower or higher temperature to the protocol.

(i) When using CO$_2$-sorbent replacement schedules, the employer must ensure that each rebreather uses a manufactured (i.e., commercially pre-packed), disposable scrubber cartridge containing a CO$_2$-sorbent material that:

(i) Is approved by the rebreather manufacturer;

(ii) Removes CO$_2$ from the diver’s exhaled gas; and

(iii) Maintains the CO$_2$ level in the breathable gas (i.e., the gas that a diver inhales directly from the regulator) below a partial pressure of 0.01 ATA.

(j) As an alternative to manufactured, disposable scrubber cartridges, the employer may fill CO$_2$ scrubber cartridges manually with CO$_2$-sorbent material when:

(i) The rebreather manufacturer permits manual filling of scrubber cartridges;

(ii) The employer fills the scrubber cartridges according to the rebreather manufacturer’s instructions;

(iii) The employer replaces the CO$_2$-sorbent material using a replacement schedule developed under paragraph 1(h) of this appendix; and

(iv) The employer demonstrates that manual filling meets the requirements specified in paragraph 1(i) of this appendix.

(k) The employer must ensure that each rebreather has an information module that provides:

(i) A visual (e.g., digital, graphic, analog) or auditory (e.g., voice, pure tone) display that effectively warns the diver of solenoid failure (when the rebreather uses solenoids) and other electrical weaknesses or failures (e.g., low battery voltage);

(ii) For a semi-closed circuit rebreather, a visual display for the partial pressure of CO$_2$, or deviations above and below a preset CO$_2$ partial pressure of 0.005 ATA; and

(iii) For a closed-circuit rebreather, a visual display for: partial pressures of O$_2$ and CO$_2$, or deviations above and below a preset CO$_2$ partial
pressure of 0.005 ATA and a preset O² partial pressure of 1.40 ATA or lower; gas temperature in the breathing loop; and water temperature.

(I) Before each day’s diving operations, and more often when necessary, the employer must ensure that the electrical power supply and electrical and electronic circuits in each rebreather are operating as required by the rebreather manufacturer’s instructions.

2. Special Requirements for Closed-Circuit Rebreathers.

(a) The employer must ensure that each closed-circuit rebreather uses supply-pressure sensors for the O² and diluent (i.e., air or nitrogen) gases and continuously functioning sensors for detecting temperature in the inhalation side of the gas-loop and the ambient water.

(b) The employer must ensure that:

   (i) At least two O² sensors are located in the inhalation side of the breathing loop; and

   (ii) The O² sensors are: functioning continuously; temperature compensated; and approved by the rebreather manufacturer.

(c) Before each day’s diving operations, and more often when necessary, the employer must calibrate O² sensors as required by the sensor manufacturer’s instructions. In doing so, the employer must:

   (i) Ensure that the equipment and procedures used to perform the calibration are accurate to within 1 percent of the O² fraction by volume;

   (ii) Maintain this accuracy as required by the manufacturer of the calibration equipment;

   (iii) Ensure that the sensors are accurate to within 1 percent of the O² fraction by volume;

   (iv) Replace O² sensors when they fail to meet the accuracy requirements specified in paragraph 2(c)(iii) of this appendix; and

   (v) Ensure that the replacement O² sensors meet the accuracy requirements specified in paragraph 2(c)(iii) of this appendix before placing a rebreather in operation.

(d) The employer must ensure that each closed-circuit rebreather has:
(i) A gas-controller package with electrically operated solenoid O₂-supply valves;

(ii) A pressure-activated regulator with a second-stage diluent-gas addition valve;

(iii) A manually operated gas-supply bypass valve to add O₂ or diluent gas to the breathing loop; and

(iv) Separate O₂ and diluent-gas cylinders to supply the breathing-gas mixture.

3. O₂ Concentration in the Breathing Gas.

The employer must ensure that the fraction of O₂ in the nitrox breathing-gas mixture:

(a) Is greater than the fraction of O₂ in compressed air (i.e., exceeds 22 percent by volume);

(b) For open-circuit SCUBA, never exceeds a maximum fraction of breathable O₂ of 40 percent by volume or a maximum O₂ partial pressure of 1.40 ATA, whichever exposes divers to less O₂; and

(c) For a rebreather, never exceeds a maximum O₂ partial pressure of 1.40 ATA.

4. Regulating O₂ Exposures and Diving Depth.

(a) Regarding O₂ exposure, the employer must:

(i) Ensure that the exposure of each diver to partial pressures of O₂ between 0.60 and 1.40 ATA does not exceed the 24-hour single-exposure time limits specified either by the 2001 National Oceanic and Atmospheric Administration Diving Manual (the “2001 NOAA Diving Manual”), or by the report entitled “Enriched Air Operations and Resource Guide” published in 1995 by the Professional Association of Diving Instructors (known commonly as the “1995 DSAT Oxygen Exposure Table”); and

(ii) Determine a diver’s O₂-exposure duration using the diver’s maximum O₂ exposure (partial pressure of O₂) during the dive and the total dive time (i.e., from the time the diver leaves the surface until the diver returns to the surface).
(b) Regardless of the diving equipment used, the employer must ensure that no diver exceeds a depth of 130 feet of sea water (“fsw”) or a maximum $O_2$ partial pressure of 1.40 ATA, whichever exposes the diver to less $O_2$.

5. Use of No-Decompression Limits.

(a) For diving conducted while using nitrox breathing-gas mixtures, the employer must ensure that each diver remains within the no-decompression limits specified for single and repetitive air diving and published in the 2001 NOAA Diving Manual or the report entitled “Development and Validation of No-Stop Decompression Procedures for Recreational Diving: The DSAT Recreational Dive Planner,” published in 1994 by Hamilton Research Ltd. (known commonly as the “1994 DSAT No-Decompression Tables”).

(b) An employer may permit a diver to use a dive-decompression computer designed to regulate decompression when the dive-decompression computer uses the no-decompression limits specified in paragraph 5(a) of this appendix, and provides output that reliably represents those limits.

6. Mixing and Analyzing the Breathing Gas.

(a) The employer must ensure that:

(i) Properly trained personnel mix nitrox-breathing gases, and that nitrogen is the only inert gas used in the breathing-gas mixture; and

(ii) When mixing nitrox-breathing gases, they mix the appropriate breathing gas before delivering the mixture to the breathing-gas cylinders, using the continuous-flow or partial-pressure mixing techniques specified in the 2001 NOAA Diving Manual, or using a filter-membrane system.

(b) Before the start of each day’s diving operations, the employer must determine the $O_2$ fraction of the breathing-gas mixture using an $O_2$ analyzer. In doing so, the employer must:

(i) Ensure that the $O_2$ analyzer is accurate to within 1 percent of the $O_2$ fraction by volume.

(ii) Maintain this accuracy as required by the manufacturer of the analyzer.

(c) When the breathing gas is a commercially supplied nitrox breathing-gas mixture, the employer must ensure that the $O_2$ meets the medical USP specifications (Type I, Quality Verification Level A) or aviator’s breathing-
oxygen specifications (Type I, Quality Verification Level E) of CGA G-4.3-2000 ("Commodity Specification for Oxygen"). In addition, the commercial supplier must:

(i) Determine the O₂ fraction in the breathing-gas mixture using an analytic method that is accurate to within 1 percent of the O₂ fraction by volume;

(ii) Make this determination when the mixture is in the charged tank and after disconnecting the charged tank from the charging apparatus;

(iii) Include documentation of the O₂-analysis procedures and the O₂ fraction when delivering the charged tanks to the employer.

(d) Before producing nitrox breathing-gas mixtures using a compressor in which the gas pressure in any system component exceeds 125 pounds per square inch (psi), the:

(i) Compressor manufacturer must provide the employer with documentation that the compressor is suitable for mixing high-pressure air with the highest O₂ fraction used in the nitrox breathing-gas mixture when operated according to the manufacturer's operating and maintenance specifications;

(ii) Employer must comply with paragraph 6(e) of this appendix, unless the compressor is rated for O₂ service and is oil-less or oil-free; and

(iii) Employer must ensure that the compressor meets the requirements specified in paragraphs (i)(1) and (i)(2) of §1910.430 whenever the highest O₂ fraction used in the mixing process exceeds 40 percent.

(e) Before producing nitrox breathing-gas mixtures using an oil-lubricated compressor to mix high-pressure air with O₂, and regardless of the gas pressure in any system component, the:

(i) Employer must use only uncontaminated air (i.e., air containing no hydrocarbon particulates) for the nitrox breathing-gas mixture;

(ii) Compressor manufacturer must provide the employer with documentation that the compressor is suitable for mixing the high-pressure air with the highest O₂ fraction used in the nitrox breathing-gas mixture when operated according to the manufacturer's operating and maintenance specifications;

(iii) Employer must filter the high-pressure air to produce O₂-compatible air;
The filter-system manufacturer must provide the employer with documentation that the filter system used for this purpose is suitable for producing O₂-compatible air when operated according to the manufacturer’s operating and maintenance specifications; and

Employer must continuously monitor the air downstream from the filter for hydrocarbon contamination.

The employer must ensure that diving equipment using nitrox breathing-gas mixtures or pure O₂ under high pressure (i.e., exceeding 125 psi) conforms to the O₂-service requirements specified in paragraphs (i)(1) and (i)(2) of §1910.430.

(a) Regardless of the type of diving equipment used by a diver (i.e., open-circuit SCUBA or rebreathers), the employer must ensure that the equipment contains (or incorporates) an open-circuit emergency-egress system (a “bail-out” system) in which the second stage of the regulator connects to a separate supply of emergency breathing gas, and the emergency breathing gas consists of air or the same nitrox breathing-gas mixture used during the dive.

(b) As an alternative to the “bail-out” system specified in paragraph 7(a) of this appendix, the employer may use:

(i) For open-circuit SCUBA, an emergency-egress system as specified in §1910.424(c)(4); or

(ii) For a semi-closed-circuit and closed-circuit rebreather, a system configured so that the second stage of the regulator connects to a reserve supply of emergency breathing gas.

(c) The employer must obtain from the rebreather manufacturer sufficient information to ensure that the bail-out system performs reliably and has sufficient capacity to enable the diver to terminate the dive and return safely to the surface.

8. Treating Diving-Related Medical Emergencies.

(a) Before each day’s diving operations, the employer must:
(i) Verify that a hospital, qualified health-care professionals, and the nearest Coast Guard Coordination Center (or an equivalent rescue service operated by a state, county, or municipal agency) are available to treat diving-related medical emergencies;

(ii) Ensure that each dive site has a means to alert these treatment resources in a timely manner when a diving-related medical emergency occurs; and

(iii) Ensure that transportation to a suitable decompression chamber is readily available when no decompression chamber is at the dive site, and that this transportation can deliver the injured diver to the decompression chamber within four (4) hours travel time from the dive site.

(b) The employer must ensure that portable O² equipment is available at the dive site to treat injured divers. In doing so, the employer must ensure that:

(i) The equipment delivers medical-grade O² that meets the requirements for medical USP oxygen (Type I, Quality Verification Level A) of CGA G-4.3-2000 (“Commodity Specification for Oxygen”);

(ii) The equipment delivers this O² to a transparent mask that covers the injured diver's nose and mouth; and

(iii) Sufficient O² is available for administration to the injured diver from the time the employer recognizes the symptoms of a diving-related medical emergency until the injured diver reaches a decompression chamber for treatment.

(c) Before each day's diving operations, the employer must:

(i) Ensure that at least two attendants, either employees or non-employees, qualified in first-aid and administering O² treatment, are available at the dive site to treat diving-related medical emergencies; and

(ii) Verify their qualifications for this task.

9. Diving Logs and No-Decompression Tables.

(a) Before starting each day's diving operations, the employer must:

(i) Designate an employee or a non-employee to make entries in a diving log; and
(ii) Verify that this designee understands the diving and medical terminology, and proper procedures, for making correct entries in the diving log.

(b) The employer must:

(i) Ensure that the diving log conforms to the requirements specified by paragraph (d) ("Record of dive") of §1910.423; and

(ii) Maintain a record of the dive according to §1910.440 ("Recordkeeping requirements").

(c) The employer must ensure that a hard-copy of the no-decompression tables used for the dives (as specified in paragraph 6(a) of this appendix) is readily available at the dive site, whether or not the divers use dive-decompression computers.

10. Diver Training.

The employer must ensure that each diver receives training that enables the diver to perform work safely and effectively while using open-circuit SCUBAs or rebreathers supplied with nitrox breathing-gas mixtures. Accordingly, each diver must be able to demonstrate the ability to perform critical tasks safely and effectively, including, but not limited to: recognizing the effects of breathing excessive CO₂ and O₂; taking appropriate action after detecting excessive levels of CO₂ and O₂; and properly evaluating, operating, and maintaining their diving equipment under the diving conditions they encounter.

(a) The employer must ensure that the rebreather manufacturer has used the following procedures for determining that the CO₂-sorbent material meets the specifications of the sorbent material’s manufacturer:

(i) The North Atlantic Treating Organization CO₂ absorbent-activity test;

(ii) The RoTap shaker and nested-sieves test;

(iii) The Navy Experimental Diving Unit ("NEDU")-derived Schlegel test; and

(iv) The NEDU MeshFit software.
(b) The employer must ensure that the rebreather manufacturer has applied
the following canister-testing materials, methods, procedures, and statistical
analyses:

(i) Use of a nitrox breathing-gas mixture that has an \( O^2 \) fraction
maintained at 0.28 (equivalent to 1.4 ATA of \( O^2 \) at 130 fsw, the maximum
\( O^2 \) concentration permitted at this depth);

(ii) While operating the rebreather at a maximum depth of 130 fsw, use of
a breathing machine to continuously ventilate the rebreather with
breathing gas that is at 100 percent humidity and warmed to a
temperature of 98.6 degrees F (37 degrees C) in the heating-humidification
chamber;

(iii) Measurement of the \( O^2 \) concentration of the inhalation breathing gas
delivered to the mouthpiece;

(iv) Testing of the canisters using the three ventilation rates listed in
Table I below (with the required breathing-machine tidal volumes and
frequencies, and \( CO^2 \)-injection rates, provided for each ventilation rate):

\[
\begin{array}{|c|c|c|c|}
\hline
\text{Ventilation} & \text{Breathing machine} & \text{Breathing machine} & \text{CO2 injection rates} \\
\text{rates (Lpm, } & \text{tidal volumes (L)} & \text{frequencies} & \text{(Lpm, STPD\textsuperscript{2})} \\
\text{ATPS\textsuperscript{1}} & & \text{(breaths per min.)} & \\
\hline
22.5 & 1.5 & 15 & 0.90 \\
40.0 & 2.0 & 20 & 1.35 \\
62.5 & 2.5 & 25 & 2.25 \\
\hline
\end{array}
\]

\textsuperscript{1} ATPS means ambient temperature and pressure, saturated with water.
\textsuperscript{2} STPD means standard temperature and pressure, dry; the standard
temperature is 32 degrees F (0 degrees C).

(v) When using a work rate (i.e., breathing-machine tidal volume and
frequency) other than the work rates listed in the table above, addition of
the appropriate combinations of ventilation rates and \( CO^2 \)-injection rates;

(vi) Performance of the \( CO^2 \) injection at a constant (steady) and
continuous rate during each testing trial;

(vii) Determination of canister duration using a minimum of four (4) water
temperatures, including 40, 50, 70, and 90 degrees F (4.4, 10.0, 21.1, and
32.2 degrees C, respectively);

(viii) Monitoring of the breathing-gas temperature at the rebreather
mouthpiece (at the “chrome T” connector), and ensuring that this
temperature conforms to the temperature of a diver’s exhaled breath at the water temperature and ventilation rate used during the testing trial;¹

(ix) Implementation of at least eight (8) testing trials for each combination of temperature and ventilation-CO²-injection rates (for example, eight testing trials at 40 degrees F using a ventilation rate of 22.5 Lpm at a CO²-injection rate of 0.90 Lpm);

(x) Allowing the water temperature to vary no more than 2.0 degrees F (1.0 degree C) between each of the eight testing trials, and no more than 1.0 degree F (0.5 degree C) within each testing trial;

(xi) Use of the average temperature for each set of eight testing trials in the statistical analysis of the testing-trial results, with the testing-trial results being the time taken for the inhaled breathing gas to reach 0.005 ATA of CO² (i.e., the canister-duration results);

(xii) Analysis of the canister-duration results using the repeated-measures statistics described in NEDU Report 2-99;

(xiii) Specification of the replacement schedule for the CO²-sorbent materials in terms of the lower prediction line (or limit) of the 95 percent confidence interval; and

(xiv) Derivation of replacement schedules only by interpolating among, but not by extrapolating beyond, the depth, water temperatures, and exercise levels used during canister testing.

¹ NEDU can provide the manufacturer with information on the temperature of a diver’s exhaled breath at various water temperatures and ventilation rates, as well as techniques and procedures used to maintain these temperatures during the testing trials.
